2015 IECC Real World Applications - Residential

Colorado Code Consulting, LLC
For
Colorado Energy Office, 2016

Look how houses have changed

1910 2010
What do we know about the 100 year old house?

• Drafty, uncomfortable, yet very durable houses
  – Why?

• Expectation?

Building and Selling a House Today

What are our expectations today?

• What have we done to houses to meet expectations?
  • Thermal Insulation
  • Tighter Building Envelopes
  • Heating & Cooling Systems

• Yet some of our House are not
  • comfortable
  • Durable
  • Safe
  • Energy Efficient
  • Environmental

• How can we meet the Expectation?
The House as a System

(EEBA Builders Guide) www.eeba.org

• “Residential Construction is a complex operation including thousands of processes by dozens of industries, bringing together hundreds of components and sub-systems into a house.”

Systems Integration + Applied Building Science

Synergy

• Two or more things working together to achieve something they could not achieve alone

  • Envelope + Mechanical + Lighting

  • Touch one system, affect another System.
The look and layout of the 2015 IECC

- chapters C1-6 Commercial (CE)
  - and
- chapters R1-6 Residential (RE)

2015 IECC – Intent

- This code shall regulate the design and construction of buildings for the effective use and conservation of energy over the useful life of each building.
2015 IECC – Intent

- This code is intended to **provide flexibility** to permit innovative approaches and techniques to achieve this objective.

2015 IECC – Intent

- The code is **not intended** to **abridge safety, health or environmental requirements** contained in other applicable codes or ordinances.
Residential VS Commercial

Definition of Residential per IECC is different than that found in the IRC and IBC:

RESIDENTIAL BUILDING. For this code, includes detached one and two family dwellings and multiple single family dwellings (townhouses) as well as R-2, R-3 and R-4 buildings three stories or less in height above grade plane.

COMMERCIAL BUILDING. For this code, all buildings that are not included in the definition of "Residential buildings."

Construction Documentation

R103

- Submitted details must be able to show full compliance with each code requirement including:
  - Insulation types, locations and R-Values
  - Fenestration types, locations and U-Factors/SHGC
  - Mechanical and water heating size, type and efficiency
  - Equipment and system controls
  - Duct sealing and insulation locations
  - Air sealing details
  - DEPICTION OF THE THERMAL ENVELOPE (R103.2.1)

R103.3: Code Official can hire someone else to do plan review as long as they were/are not affiliated with the design or construction of the building.
R202: CONDITIONED SPACE

Area, room or space enclosed within thermal envelope

Directly or Indirectly heated or cooled

Communicates through openings with conditioned spaces
Separated from conditioned spaces by uninsulated walls, floors or ceilings
Contain uninsulated ducts, piping or other sources of heating or cooling

Climate Zones
2015 IECC - Chapter 3

New Tropical Climate Zone in IECC Includes:
- Still listed as Zone 1A*. *-warm humid climate

Determining Your Climate Zone is one of the First Steps in the Process
IECC Residential Compliance Options

1. **Prescriptive:**
   - By the book approach

   OR

2. **Prescriptive Options**
   - R402.1.4 U-factor Alternative

   OR

3. **Simulated Performance Approach**
   - R405 – Building Performance based on Building Energy Cost.

   OR

4. **Energy Rating Index (ERI)**
   - R406 – Building Performance based on HERS Index Score

2015 Prescriptive R-value Table Compliance Specification

Declare to the Code official that the pathway for compliance is the prescriptive path

For SI: 1 foot = 304.8 mm

- a. R-values are minimums. U-factors and SHGC are maximums. When insulation is installed in a cavity which is less than the label or design thickness of the insulation, the installed R-value of the insulation shall not be less than the R-value specified in the table.
- b. The fenestration U-factor column excludes skylights. The SHGC column applies to all glazed fenestration. Exceptions: Skylights may be excluded from glazed fenestration SHGC requirements in Climate Zones 1 through 3 where the SHGC for such skylights does not exceed 0.30.
- c. "15/19" means R-15 continuous insulation on the interior or exterior of the home or R-19 cavity insulation at the interior of the basement wall. Thus R-15 shall be permitted to be met with R-15 cavity insulation on the interior or exterior of the home and R-13 for insulation on the interior or exterior of the basement wall. It is not required to be met with R-13 cavity insulation on the interior of the basement wall. R-10 shall be permitted to be reduced by no more than R-3 in the locations where structural sheathing is used. It is not required to be met with R-13 cavity insulation on the interior of the basement wall.
- d. R-values shall be added to the required slab edge R-values for heated slabs. Insulation depth shall be the depth of the footing or 2 feet, whichever is less. R-values for heated slabs are determined by Figure R304.1.1 and Table R301.1.1.
- e. The ERI includes the R-value of the at least 5 inches of R-13 cavity insulation or R-15 continuous insulation on the interior or exterior of the home or 20% of the wall's R-value of the entire wall. The ERI shall be calculated as the ERI + 0.04 for each additional inch of R-13 cavity insulation or R-15 continuous insulation on the interior or exterior of the home. The ERI shall be calculated as the ERI + 0.04 for each additional inch of R-15 continuous insulation on the interior or exterior of the home.
R402.1.4 U-factor Alternative

An assembly with a U-factor equal to or less than that specified in Table R402.1.4 shall be permitted as an alternative to the R-value in Table R402.1.2.

Example: Climate zone 5 framed wall
- U = 0.060 = R-16.67
- R-value table requires cavity insulation at R20 or 13+5
- 1/20 = U.05 Plus sheathing, air film, etc.

R402.1.5 Total UA alternative

A method for performing conductive energy trade-offs
- Trading off the R-values and U-values of the thermal envelope
- Mathematically making the R-value and U-value paths equal

If the total building thermal envelope UA (sum of U-factor times assembly area) is less than or equal to the total UA resulting from using the U-factors in Table R402.1.3 (multiplied by the same assembly area as in the proposed building), the building shall be considered in compliance with Table R402.1.1. The UA calculation shall include the thermal bridging effects of framing materials.
Simulated Performance Path

- Leverages the applied building science and systems thinking that is built into the code.
- Holistic approach rather than a component approach.
  - Air Flow
  - Thermal Flow
  - Moisture Flow

R405.3 Performance-based compliance

- Energy Analysis
  - A method for performing whole house performance energy trade offs
    - **Conduction** - Trading off R-values and U-values
    - **Convection** – Energy moving with air infiltration and exfiltration
    - **Radiation** – Trade offs created by energy moving form areas of high concentrations to low concentration through open space.
The Reference Home/Twin Home Concept Used by **modeling software for Code**

<table>
<thead>
<tr>
<th>2015 reference design house Built from table 405.5.2(1)</th>
<th>vs. Rated Home: Builders desired house</th>
</tr>
</thead>
<tbody>
<tr>
<td>• The reference home is the <strong>geometric twin</strong> of the rated home <strong>configured to a standard set of thermal performance characteristics</strong>:</td>
<td>• The home you are building and evaluating, compared to the “Reference” home in order to quantify performance and demonstrate compliance with the Energy code.</td>
</tr>
<tr>
<td>• i.e. The 2015 IECC Prescriptive path</td>
<td></td>
</tr>
</tbody>
</table>

---

**Energy Costs?**

- **405.3 Performance-based compliance.** Compliance based on simulated energy performance requires that a proposed residence (proposed design) be shown to have an **annual energy cost** that is less than or equal to the annual energy cost of the standard reference design.
Simulated Performance Path

- R405.2 Mandatory Requirements
  - Compliance with this section requires that the mandatory provisions identified in section R401.2 be met.

Section R406 of the 2015 IECC
Energy Rating Index Compliance Alternative

- What is an Energy Rating Index
Mandatory sections of the 2015 IECC

• R402.4 Air leakage (Mandatory)
  • Table R402.4.1.1
  • R402.4.1.2 Testing
    • Air leakage rate not exceeding 5 air changes per hour in Climate Zones 1 and 2, and 3 air changes per hour in Climate Zones 3 through 8

R406.1 Mandatory Requirements

• The building thermal envelope shall be **greater than or equal** to levels of efficiency and Solar Heat Gain Coefficient in Table 402.1.1 or 402.1.3 of the *2009 International Energy Conservation Code*.

- Compliance based on an ERI analysis requires that the *rated design* be shown to have an ERI less than or equal to the appropriate value listed in Table R406.3, when compared to the *ERI reference design*

Features that Impact the ERI
(Lower the score)

- Mechanical equipment
  - High efficiency furnace
  - High efficiency AC
  - High efficiency water heater
- More R-value than required by the 2009 IECC
- House orientation with the ERI
- House tightness below 3 ACH50
- Duct leakage to the outside
- Duct location
- Whole house fan
- CFL or LED Lighting above 75%
- High efficiency appliances
- Solar
R402.4.1.2 Testing (Mandatory)

- The building or dwelling unit **shall be tested** and verified as having an air leakage rate not exceeding:
  - 5 ACH@50 in Climate Zones 1 and 2
  - 3 ACH@50 in Climate Zones 3 through 8

- Testing shall be conducted by an approved third party

- Reporting
Air leakage Testing

\[ \text{Air out} = \text{Air in} \]

The principle behind the blower door

---

402.4 Air Leakage and Air Barriers (Mandatory)

- The building thermal envelope shall be constructed to limit air leakage in accordance with the requirements of Sections R402.4.1 through R402.4.4.

- The components of the building thermal envelope as listed in Table R402.4.1.1 shall be installed in accordance with the manufacturer's instructions and the criteria listed in Table R402.4.1.1.
Why Is Air Movement a Problem?

Air is an effective transport mechanism!
- Moisture / energy / pollutants
- Random leakage though random holes
- What kind of air is it? What is it carrying?
- What Problems can it create
- Control the air / control the house / gain predictability

Air In = Air Out
Air Out = Air In

Transport Mechanism

Air flow basics
- Air is a fluid – like water
- Two requirements for air flow
  - Hole or path
  - Driving force = pressure difference
How we thought it worked

A. Warm (less dense) air rises

B. Additional warm air expands, increasing pressure and pushing household air out through cracks/gaps

C. Air leaving the house creates negative pressure in the cooler, lower levels - outdoor air is drawn in through any cracks or gaps

Note: Assumes calm conditions (no wind)

Vented Crawl Space

Moisture removed from house

Ventilation Air
Vented Crawl Space

How it really works

Moisture transported into house &/or attic

Air moving out high side hole

Air moving through low side hole

Conditioned Crawl Space

A building science solution

- Moisture controlled at sourced
- Thermal envelope defined
- Connection between crawl and house OK
- Short basement

Conditioned Crawl
System Effect

Having supply and return air not equal or dominant leakage on the ducts

Sends basement negative

Vapor Flow
Moisture

Moisture = #1 enemy of most building materials

Small amount of repeated wetting can lead to:
- Reduced R-value
- Mold, mildew
- Deterioration, rot

Moisture sources
- Bulk water
- Vapor diffusion
- Air movement

Courtesy of DOW Building Materials

Bulk Water

- Finds path of least resistance
- Generally follows gravity
- Can be drawn upward or sideways
  - Capillary action
  - Best practice
Vapor Diffusion

- Moisture moving directly through a material
  - From More to Less
  - Vapor pressure pushes water at a microscopic level through a material

- Function of
  - Temperature
  - Relative humidity

Vapor Diffusion a Slow Small Process

4x8 sheet of gypsum board
Interior at 70°F and 40% RH

1/3 quart of water

32 Square feet

From EEBA Builder’s Guide to Cold Climates by Joseph Lstiburek
The Problem with Air - the 4 M’s

- Much
- More
- Moisture
- Movement

Table 402.4.1.1
Component – General Air barrier/Thermal barrier

<table>
<thead>
<tr>
<th>Air Barrier Criteria</th>
<th>Insulation Installation Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>• A continuous air barrier shall be installed in the building envelope</td>
<td>• Air-permeable insulation shall not be used as a sealing material</td>
</tr>
<tr>
<td>• Exterior thermal envelope contains a continuous air barrier.</td>
<td></td>
</tr>
<tr>
<td>• Breaks or joints in the air barrier shall be sealed</td>
<td></td>
</tr>
</tbody>
</table>
Insulation

Insulation traps pockets of air

Stagnate Air Pockets create the R-value

Air Barrier

Stopping the movement of air from scrubbing away the stagnate air pocket

Now it works

Air-permeable insulation shall not be used as a sealing material

Ceiling Access Openings

Add R-value to a knee-wall door by adhering rigid insulation boards (sandwiched together with construction adhesive and screws) to the back of the door. Pay special attention to the clearance between the insulation and the door frame and air sealing details.
R402.2.1 Ceilings with attic spaces

- R-38 shall be deemed to satisfy the requirement for R-49 wherever the full height of uncompressed R-38 insulation extends over the wall top plate at the eaves.

R402.2.3 Eave baffle

- For air permeable insulations in vented attics, a baffle shall be installed adjacent to soffit and eave vents
- Baffles shall maintain an opening equal or greater than the size of the vent
- The baffle shall extend over the top of the attic insulation
Table 402.4.1.1
Component – Walls

### Rooms Containing Fuel-burning Appliances
*Section R402.4.4*

- Appliances and combustion air openings to be located outside the building thermal envelope or enclosed in a room isolated from inside the thermal envelope in Climate Zones 3-8
- Where open combustion air ducts provide combustion air to open combustion space conditioning fuel-burning appliances
- Rooms to be sealed and insulated per envelope requirements
- Doors into the rooms fully gasketed
- Water lines and ducts insulated
- Combustion air ducts that pass through conditioned space, insulated to ≥ R-8

#### Exceptions:
- Direct vent appliances with both intake and exhaust pipes installed continuous to the outside
- Fireplaces and stoves complying with 901-905 IMC and Section 2111.13 IBC

---

**Build Tight Ventilate Right**
R403.6 Mechanical ventilation *(Mandatory)*

- The building shall be provided with ventilation that meets the requirements of the International Residential Code or International Mechanical Code
- Outdoor air intakes and exhausts shall have automatic or gravity dampers that close when the ventilation system is not operating

**R403.5.1 Whole-house mechanical ventilation system fan efficacy**

- Mechanical ventilation system fans shall meet the efficacy requirements of Table R403.5.1. *(Efficient fans needed)*
- Exception: Where mechanical ventilation fans are integral to tested and listed HVAC equipment, they shall be powered by an *electronically commutated motor*

---

**M1507.3 Whole-house mechanical ventilation system**

- **M1507.3.1 System design:** The whole-house ventilation system shall consist of: Supply Side, Exhaust Side, Balanced systems, or combination there of
- **M1507.3.2 System controls:** The whole-house mechanical ventilation system shall be provided with controls that enable manual override
- **M1507.3.3 Mechanical ventilation rate:** The whole house mechanical ventilation system shall provide outdoor air at a continuous rate of not less than that determined in accordance with Table M1507.3.3(1).
  - **Exception:** Permitted to operate intermittently where the system has controls that enable operation for not less than 25-percent of each 4-hour segment and the ventilation rate prescribed is multiplied by the factor determined in accordance with Table M1507.3.3(2).
TABLE M1507.3.3(1)
CONTINUOUS WHOLE-HOUSE MECHANICAL VENTILATION SYSTEM AIRFLOW RATE REQUIREMENTS

- Simulated Performance and ASHRAE 62.2 Formula:
- Ventilation can’t be greater than what is calculated by formula

\[
\text{Fan flow (CFM) = 0.01 CFM} \times \text{your floor area} + 7.5 \times (\text{your number of bedrooms} + 1)
\]

- For a 1,510 square foot 4-bedroom home,

\[
(0.01 \times 1510) + (7.5 \times \text{5})
\]

Formula Result: 52.5 CFM
Chart Result: 75 CFM

R403.3 Ducts

- Insulation (Prescriptive): Attics get R-8 or R-6, elsewhere it’s R-6 and R4.2 (dependent on duct size)

- Sealing (Mandatory): new exceptions brought in if using spray foam products or if there is a static pressure less than 2” w.c. with welded joints and seams or certain locking-type joints and seams.

- Testing (Mandatory): You must test either at rough-in or final and a report provided to the code official, but...

- Duct Leakage (Prescriptive): The amount of leakage can now be traded off.
R403.7 Equipment Sizing

- Heating and cooling equipment shall be sized in accordance with ACCA Manual S based on building loads calculated in accordance with ACCA Manual J or other approved heating and cooling calculation technologies.

Building/Fire Code and Energy Code

Not on the same page

- 2009 IECC
  - Common wall: Air barrier is installed in common wall between dwelling units

- 2012 and 2015 IECC
  - Not mentioned in the table
The Problem

Common wall between Dwelling Units taken out of the code table

- Energy Code and Building/Fire Code are not in alignment
- Potential swapping of like materials
  - Fire rated foam for rock wool fire stop
  - Blown fiberglass for fiberglass batt
What constitutes the assembly?

Fill the gap
• Treat Common / Party Walls Like Exterior Walls and require all air sealing and air barriers adjacent to the assembly

QUESTIONS?
Thank You!!!
