## INTRODUCTION

This publication contains the Public Comment Agenda for consideration at the Public Comment Hearings of the International Code Council on September 30 – October 5, 2015 at the Long Beach Convention Center in Long Beach, CA (see page 1). See page xxxi for the hearing schedule.

This publication contains information necessary for consideration of public comments on the proposed code changes which have been considered at the ICC Committee Action Hearings held on April 19 – 27, 2015, at the Memphis Cook Convention Center in Memphis, TN. More specifically, this agenda addresses hearings on public comments on proposed code changes to the *International Building Code (Egress, Fire Safety and General)*, *International Existing Building Code (Non-Structural)*, *International Fuel Gas Code*, *International Mechanical Code*, *International Plumbing Code*, *International Property Maintenance Code*, *International Private Sewage Disposal Code*, *International Residential Code (Mechanical and Plumbing)* and the *International Swimming Pool and Spa Code*.

### ICC GOVERNMENTAL MEMBER REPRESENTATIVES

*Council Policy #28, Code Development* (page xi) requires that applications for Governmental Membership must have been received by March 20 of this year in order for the representatives of the Governmental Member to be eligible to vote at this Public Comment Hearing and the Online Governmental Consensus Vote which occurs approximately two weeks after the hearings. Further, *CP#28* requires that ICC Governmental Member Representatives reflect the eligible voters **30 days prior** to the start of the Public Comment Hearings. This includes new, as well as changes, to voting status. Sections 9.1 and 9.2 of *CP#28* (page xxvii) read as follows:

- 9.1 Eligible Final Action Voters:** Eligible Final Action voters include ICC Governmental Member Voting Representatives and Honorary Members in good standing who have been confirmed by ICC in accordance with the Electronic Voter Validation System. Such confirmations are required to be revalidated annually. Eligible Final Action voters in attendance at the Public Comment Hearing and those participating in the Online Governmental Consensus Vote shall have one vote per eligible voter on all Codes. Individuals who represent more than one Governmental Member shall be limited to a single vote.
- 9.2 Applications:** Applications for Governmental Membership must be received by the ICC at least 30 days prior to the Committee Action Hearing in order for its designated representatives to be eligible to vote at the Public Comment Hearing or Online Governmental Consensus Vote. Applications, whether new or updated, for Governmental Member Voting Representative status must be received by the Code Council 30 days prior to the commencement of the first day of the Public Comment Hearing in order for any designated representative to be eligible to vote. An individual designated as a Governmental Member Voting Representative shall provide sufficient information to establish eligibility as defined in the ICC Bylaws. The Executive Committee of the ICC Board, in its discretion, shall have the authority to address questions related to eligibility.

As such, new and updated eligible voter status must be received by ICC's Member Services Department **by August 31, 2015**. This applies to both voting at the Public Comment Hearings as well as the Online Governmental Consensus Vote which occurs approximately two weeks after the hearings. This must be done via the Electronic Voter Designation System. Access the Electronic Voter Designation System directly by logging on to [www.iccsafe.org/EVDS](http://www.iccsafe.org/EVDS) and using the email address and password connected to your Primary Representative account. The online form can also be accessed by logging onto "My ICC" and selecting "Designate Voters" or through the Electronic Voter Designation link in the left hand menu on the ICC home page at [www.iccsafe.org](http://www.iccsafe.org). These records will be used to verify eligible voter status for the Public Comment Hearing and the Online Governmental Consensus Vote. Voting members are strongly encouraged to review their membership record for accuracy so that any necessary changes are made prior to the August 31 deadline. **Representatives of any Governmental Member that has made application for membership after March 20 will not be able to vote.**

## **ICC POLICY ON FINANCIAL ASSISTANCE FOR GOVERNMENTAL MEMBER VOTING REPRESENTATIVES**

ICC Council Policy 36 Financial Assistance defines the circumstances under which it is permissible for Governmental Member Voting Representatives to accept funds to enable a Governmental Member Voting Representative to attend ICC code hearings. The policy seeks to prohibit, or appropriately regulate financial assistance which is designed to increase Participation by a Particular interest group or by those supporting a Particular position on a proposed code change.

As part of the registration process (see below), eligible voting members are required to verify their voting status in order to receive a voting device. Improper acceptance of financial assistance, or misrepresentation by a Governmental Member Voting Representative about compliance with CP 36, which are discovered after a code hearing, may result in sanctions regarding voting at future hearings by the Governmental Member Voting Representative or by other Governmental Member Voting Representatives from the same governmental member. CP 36 provides, in pertinent Part:

- 2.0. Contributions.** To allow industry and the public to contribute to the goals of the ICC in transparent and accountable processes, organizations and individuals are permitted to contribute financial assistance to Governmental Members to further ICC Code Development Activities provided that:
  - 2.1** Contributions of financial assistance to Governmental Member Voting Representatives for the purposes of enabling participation in ICC Code Development Activities are prohibited except for reimbursements by the ICC or its subsidiaries, a regional, state, or local chapter of the ICC, or the local, state or federal unit of government such Governmental Member Voting Representative is representing. For the purposes of this policy financial assistance includes the payment of expenses on behalf of the Governmental Member or Governmental Member Voting Representative. Governmental Member Voting Representatives may self-fund for purposes of participating in ICC Activities.
  - 2.2** A Governmental Member accepting contributions of financial assistance from industry or other economic interests shall do so by action of its elected governing body or chief administrative authority. A Governmental Member Voting Representative may not directly accept financial assistance from industry or other economic interests.
  - 2.3** Any contributions to a Governmental Member of the ICC shall comply with applicable law, including but not limited to a Governmental Member's ethics, conflict of interest or other similar rules and regulations.

## **ADVANCE REGISTRATION**

The Public Comment Hearings are only one component of the 2015 ICC Annual Conference and Group A Public Comment Hearings. **All attendees to the Public Comment Hearings are required to register. Registration for the Public Comment Hearings is FREE, and is necessary to verify voting status (see above). You are encouraged to register prior to the Public Comment Hearings. To register for the full Conference, the Education Program, or the Public Comment Hearings, go to <https://www.eiseverywhere.com/ehome/icconference/284335/> or go to [www.iccsafe.org](http://www.iccsafe.org) and click on the ICC 2015 Long Beach box on the ICC Home Page.**

**NOTICE:** If you or your companion require special accommodations to participate fully, please advise ICC of your needs.

## AGENDA FORMAT

This Public Comment Hearing Agenda includes the Consent Agenda and the Individual Consideration Agenda for the code change proposals that comprise the 2015 Code Development Cycle. This will complete the Public Comment Hearings for the 2015 Code Development Cycle.

The Consent Agenda is comprised of proposed changes to the *International Building Code (Egress, Fire Safety and General)*, *International Existing Building Code (Non-Structural)*, *International Fuel Gas Code*, *International Mechanical Code*, *International Plumbing Code*, *International Property Maintenance Code*, *International Private Sewage Disposal Code*, *International Residential Code (Mechanical and Plumbing)* and the *International Swimming Pool and Spa Code* which did not receive a successful assembly action or public comment, and therefore are not listed on the Individual Consideration Agenda.

The Individual Consideration Agenda is comprised of proposed changes which either received a successful assembly action or received a public comment in response to the Code Committee's action at the Committee Action Hearings.

Items on the Individual Consideration Agenda are published with information as originally published for the Committee Action Hearing as well as the published hearing results. Following the hearing results is the reason that the item is on the Individual Consideration Agenda followed by the public comments which were received.

Public testimony will follow the procedures given in *CP#28-05 Code Development* as published on page xxiv. Refer to the tentative hearing order on page xxxiii.

## MODIFICATIONS & PUBLIC COMMENTS

In addition to modifications made by a committee at the Committee Action Hearings, *CP#28 Code Development* allows successful modifications which were voted on during the Online Assembly Vote following the Committee Action Hearings. In addition modifications can be proposed in form of a Public Comment following the Committee Action Hearings. The Public Comment deadline was July 17, 2015 and all Public Comments received have been incorporated into this document. **Further modifications are not permitted beyond those published in this agenda.**

Proposed changes on the Individual Consideration Agenda at the Public Comment Hearings may have up to five possible motions - Approval as Submitted, Approval as Modified by the Code Committee, Approval as Modified by a successful Assembly Action, Approval as Modified by a Public Comment, or Disapproval. A Public Comment Hearings Discussion Guide will be posted and copies available at the hearing which includes a list of allowable motions for each code change proposal.

## CONSENT AGENDA

The Public Comment Consent Agenda consists of proposals which received neither a successful assembly action nor a public comment. The Public Comment Consent Agenda for each code will be placed before the assembly at the beginning of each code with a motion and vote to ratify final action in accordance with the results of the Committee Action Hearing.

## INDIVIDUAL CONSIDERATION AGENDA

The Public Comment Hearing Individual Consideration Agenda is comprised of proposals which have a successful assembly action or public comment. For each code, the proposed changes on the Individual Consideration Agenda shall be placed before the assembly for individual consideration of each item. The hearing order is found on page xxxiii and the agenda starts on page 1.

### ICC PUBLIC COMMENT HEARING PROCESS

The hearing process will follow CP #28. The process is summarized as follows and will occur for each code noted in the hearing order (CP #28 sections noted):

1. At the start of the hearings:
  - Requests to withdraw code changes
  - Requests to withdraw public comments
  - Requests to revise the hearing order
  - Consent Agenda voted (Section 7.5.4)
2. The first code change on the hearing order brought to the floor with a standing motion to sustain the committee action.
3. If the Committee Action is not Disapproval, a motion to approve a modification by a public comment may be presented (Section 7.5.8.6).
4. Public testimony on either the Committee Action (if Disapproval) or the public comment (Section 5.5.1)
5. ICC Governmental Member Representatives and Honorary Members (“eligible voters”) in attendance vote on the motion under consideration. (See page i)
6. Depending on the motion and action determined by the vote, subsequent allowable motions in accordance with Sections 7.3.8.6 can be considered or voting on the main motion in accordance with 7.5.8.7 is taken. (A Public Comment Hearing Discussion Guide will be posted and copies available at the hearing which includes a listing of allowable motions.)
7. The public comment hearing result on the code change determined by a vote of the eligible voters is announced. In accordance with Section 7.3.6, reconsideration is not permitted. This result will be placed on the Online Governmental Consensus Vote (Section 8.0), which will be open approximately two weeks after the hearings are complete (see page v).
8. Repeat 2 – 7 for subsequent code changes
9. Go the next code indicated on the hearing order and repeat 1 – 8.

# **ELECTRONIC VOTING**

## **PUBLIC COMMENT HEARING FOLLOWED BY ONLINE GOVERNMENTAL CONSENSUS VOTE**

The public comment hearing is the first step in the process to arrive at Final Action on code changes – Public Comment Hearing (PCH) voting followed by the Online Governmental Consensus Vote (OGCV) utilizing cdpACCESS®. Be sure to review the deadlines and eligible voter information on page i. The sections noted below are the applicable sections of CP #28 which is published on page xi.

### Public Comment Hearing Vote

The first step is the voting that will occur at the Public Comment Hearing. This process is regulated by Section 7.5.8 of CP #28. The hearings will be run in much the same way as in the past with a couple of changes.

The Consent Agenda will be voted with a motion to ratify the action taken at the Committee Action Hearings. This will be the Final Action on those code changes and they will not be considered in the Online Governmental Consensus Vote (Section 7.5.4).

As part of the Individual Consideration Agenda, individual motions for modifications to the main motion will be dealt with by a hand vote followed by the electronic vote if the outcome of the hand vote cannot be determined by the moderator. However, in accordance with Section 7.5.8.7, the vote on the main motion to determine the PCH action must be taken electronically with the vote recorded since this is necessary for the second step in the process. As noted in Section 7.5.8.8, if the motion is not successful, motions for Approval as Submitted or Approval as Modified are in order. A motion for Disapproval is not in order. The voting majorities have not changed and are indicated in Section 7.6. As in the past, if the code change proposal does not receive any of the required majorities in accordance with Section 7.6, Section 7.5.8.9 stipulates that the PCH action will be Disapproval. However, the vote recorded will be the vote count on the main motion in accordance with Section 7.5.8.7.

### Online Governmental Consensus Vote

The second step in the final action process is the Online Governmental Consensus Vote (OGCV). This is a new process which was first used in the 2014 Cycle, which is built into cdpACCESS and is regulated by Section 8.0. It is anticipated that the ballot period will start approximately two weeks after the Public Comment Hearings and will be open for two weeks.

The results of the PCH set the agenda and ballot options for the OGCV. This is stipulated in Section 8.1. For example, if the action taken at the PCH is AMPC 1, 3, 7 (Approved as Modified by Public Comments 1,3 and 7) then the ballot will be structured to allow eligible voters to vote for either AMPC 1,3, 7 or Disapproval in accordance with the table. The voting majority required for AMPC 1, 3, 7 at the PCH was a 2/3 majority which is the same majority that applies to the OGCV. The vote tally from the PCH will be combined with the vote tally from the OGCV to determine the Final Action. In the example cited, the combined vote tally would be required to meet the 2/3 majority in order for the final action to be AMPC 1, 3, 7. If the voting majority is less than the 2/3 required, Section 10.3 stipulates the Final Action to be Disapproval.

Be sure to review Section 8.2 which identifies the composition of the ballot. Of note is item 4 where the PCH action is Approved as Modified. The resulting text will be presented in the ballot with the modification(s) incorporated into the original code change in order for the voter to see how the text would appear in the code. A key part of this ballot is also item 10 where the voter will have access to the hearing video from both hearings.

Non-eligible voters will also be able to log-in and view the OGCV ballot, but will not be permitted to vote.

#### Final Action on Proposed Code Changes

Section 10.0 regulates the tabulation, certification and posting of the final action results. In accordance with Section 10.4, the Final Action will be published as soon as practicable and will include the action and vote counts from both the PCH and OGCV.

### **VIEW THE PUBLIC COMMENT HEARINGS ON YOUR PC**

The Public Comment Hearings are scheduled to be “webcast”. Streaming video broadcast over the Internet will provide a gateway for all International Code Council members, the construction industry and other interested parties anywhere in the world to view and listen to the hearings. Logging on to the Internet broadcast will be as simple as going to the International Code Council web site, [www.iccsafe.org](http://www.iccsafe.org) and clicking on a link. [Actual site to be determined - be sure to check the ICC web site for further details].

The hearings can be seen free by anyone with Internet access. Minimum specifications for viewing the hearings are an Internet connection, sound card and Microsoft Windows Media Player. DSL, ISDN, Cable Modems or other leased-line connections are recommended for the best viewing experience. A dial-up modem connection will work, but with reduced video performance.

### **FINAL ACTION ON CODE CHANGE PROPOSAL G193**

Code change proposal G193, considered by the IBC-General Committee, addresses the scope and application of the *International Building Code*, Chapter 29. As reported at the Committee Action Hearing, the action taken by the IBC-General Committee on this proposal coupled with the action taken at the 2015 Public Comment Hearings and subsequent Online Governmental Consensus Vote will be limited to an advisory recommendation to the ICC Board of Directors who will determine the final disposition on this proposed change in accordance with Section 1.3 of CP 28, which stipulates that the Board determines the scope of the I-Codes.

### **ICC WEBSITE - [WWW.ICCSAFE.ORG](http://WWW.ICCSAFE.ORG)**

While great care has been exercised in the publication of this document, there may be errata posted for the Public Comment Agenda. Errata, if any, identified prior to the Public Comment Hearings will be posted as updates to the Public Comment Hearing Agenda on the ICC website at [www.iccsafe.org](http://www.iccsafe.org). Users are encouraged to periodically review the ICC Website for updates to the 2015 Public Comment Hearing Agenda.

# 2015/2016/2017 ICC CODE DEVELOPMENT SCHEDULE

(Updated August 5, 2015 – Group C Code Cycle cancelled, explanatory note added.)

STEP IN CODE DEVELOPMENT CYCLE	DATE			
	2015 – Group A Codes IBC- E, IBC - FS, IBC -G, IEBC, IFGC, IMC, IPC, IPMC, IPSDC, IRC – M, IRC- P, ISPSC, IZC	2016 – Group B Codes Admin, IBC-S, IECC-C, IECC/IRC-R, IFC, IRC - B, IWUIC	2017 – Group C Code IgCC  <b>CANCELLED</b>  <b>SEE NOTES</b>	
2015 EDITION OF I-CODES PUBLISHED	June 2, 2014		March 31, 2015 (approx.)	
DEADLINE FOR RECEIPT OF APPLICATIONS FOR ALL CODE COMMITTEES	June 2, 2014 for the 2015/2016/2017 Cycle. Call for committee posted January 31, 2014 June 1, 2017 for the 2018/2019 Cycle. Call for committee to be posted in January/2017.			
DEADLINE FOR cdpACCESS ONLINE RECEIPT OF CODE CHANGE PROPOSALS	January 12, 2015	January 11, 2016	<b>CANCELLED</b> 	
WEB POSTING OF “PROPOSED CHANGES TO THE I-CODES”	March 13, 2015	March 8, 2016

WEB POSTING OF “REPORT OF THE COMMITTEE ACTION HEARING”	June 5, 2015	June 1, 2016		
DEADLINE FOR cdpACCESS ONLINE RECEIPT OF PUBLIC COMMENTS	July 17, 2015	July 22, 2016		
WEB POSTING OF “PUBLIC COMMENT AGENDA”	August 28, 2015	September 9, 2016		
PUBLIC COMMENT HEARING (PCH)  ANNUAL CONFERENCE DATES NOTED BY AC	September 30 – October 7, 2015 Long Beach Convention Center Long Beach, CA AC: September 27 - 29	October 19 – 25, 2016 Kansas City Convention Center Kansas City, MO AC: October 16 – 18		
ONLINE GOVERNMENTAL CONSENSUS VOTING PERIOD	Starts approx. two weeks after last day of PCH. Open for 2 weeks.	Starts approx. two weeks after last day of PCH. Open for 2 weeks.		<b>CANCELLED</b>

#### Group A Codes/Code committees:

- IBC-E: IBC Egress provisions. Chapters 10 and 11
- IBC-FS: IBC Fire Safety provisions. Chapters 7, 8, 9 (partial), 14 and 26. Majority of IBC Chapter 9 is maintained by the IFC in Group B. See notes
- IBC-G: IBC General provisions. Chapters 3 – 6, 12, 13, 27 – 33
- IEBC: IEBC non structural provisions. See notes
- IFGC
- IMC
- IPC
- IPMC (code changes heard by the IPMZC code committee)
- IPSDC (code changes heard by the IPC code committee)
- IRC-M: IRC Mechanical provisions. Chapters 12 – 23 (code changes heard by the IRC - MP code committee)
- IRC-P: IRC Plumbing provisions. Chapters 25 – 33 (code changes heard by the IRC - MP code committee)
- ISPSC
- IZC (code changes heard by the IPMZC code committee)

#### Group B Codes/Code committees:

- Admin: Chapter 1 of all the I-Codes except the IECC, IgCC and IRC. Also includes the update of currently referenced standards in all of the 2015 Codes except IgCC. See notes regarding IgCC
- IBC-S: IBC Structural provisions. IBC Chapters 15 – 25 and IEBC structural provisions. See notes
- IECC-C: IECC Commercial energy provisions
- IECC/IRC-R: IECC Residential energy provisions and IRC Energy provisions in Chapter 11
- IFC: The majority of IFC Chapter 10 is maintained by IBC-E in Group A. See notes
- IRC-B: IRC Building provisions. Chapters 1 – 10
- IWUIC (code changes heard by the IFC code committee)

#### Notes:

- Be sure to review the document entitled “2015/2016/2017 Code Committee Responsibilities” which will be posted. This identifies responsibilities which are different than Group A, and B codes and committees which may impact the applicable code change cycle and resulting code change deadline. As an example, throughout Chapter 9 of the IBC (IBC- Fire Safety, a Group A code committee), there are numerous sections which include the designation “[F]” which indicates that the provisions of the section are maintained by the IFC code committee (a Group B code committee). Similarly, there are numerous sections in the IEBC which include the designation “[BS]”. These are structural provisions which will be heard in Group B by the IBC – Structural committee while the non structural provisions will be maintained in the 2015 Group A Cycle by the IEBC code committee. The designations in the code are identified in the Code Committee Responsibilities document.
- Proposed changes to the ICC Performance Code will be heard by the code committee noted in brackets ([ ]) in the section of the code and in the Code Committee Responsibilities document.
- Definitions. Be sure to review the brackets ([ ]) in Chapter 2 of the applicable code and the Code Committee Responsibilities document to determine which code committee will consider proposed changes to the definitions.
- As reported in the July 21, 2015 ICC News Release, ICC and ASHRAE have agreed to consolidate the IgCC and ASHRAE Standard 189.1. ICC’s responsibility for the 2018 IgCC will be Chapter 1, and ASHRAE will have responsibility for all the technical provisions. Thus the 2017 Group C cycle becomes unnecessary, and has been cancelled.
- There will be no code change activity for Chapter 1 of the IgCC in 2016. However, going forward, any code change proposals for Chapter 1 of the IgCC will be the responsibility of the Administrative Code Development Committee. Code Change Proposals will next be heard for Chapter 1 of the IgCC during the Group B Cycle in 2019.

## 2015 – 2017 ICC CODE DEVELOPMENT CYCLE & cdpACCESS® Update

### International Green Construction Code to be Joint Responsibility of ASHRAE and ICC.

On July 21, 2015 ICC announced that the International Code Council (ICC) and ASHRAE have signed the final agreement that outlines each organization's role in the development and maintenance of the new version of the *International Green Construction Code* (IgCC) sponsored by the American Institute of Architects (AIA), ASHRAE, ICC, the Illuminating Engineering Society (IES) and the U.S. Green Building Council (USGBC). The code, scheduled to be released in 2018, will be powered by ANSI/ASHRAE/ICC/IES/USGBC Standard 189.1, *Standard for the Design of High-Performance, Green Buildings Except Low-Rise Residential Buildings* developed using the American National Standards Institute (ANSI) approved ASHRAE consensus process. The joint Standing Standards Project Committee 189.1 (SSPC) will serve as the consensus body that will work to ensure the standard is consistent and coordinated with the ICC Family of Codes.

The ICC will be responsible for Chapter 1, Scope and Administration. For the 2018 IgCC, ICC will coordinate the technical provisions developed by ASHRAE with the provisions in Chapter 1 of the 2015 IgCC. As a result, the 2016 Group B Cycle will not include Chapter 1 of the IgCC for code changes. With ASHRAE developing technical provisions, ICC's 2017 Group C cycle to develop the 2018 IgCC has been cancelled. Part of the development process for the 2018 technical provisions will include the SSPC review of the 2015 IgCC and consideration of content for inclusion in 189.1-2017 along with changes generated by the committee and proposals submitted by stakeholders. Following the completion of the 2018 IgCC, Chapter 1 of the IgCC will be developed for subsequent editions by ICC using its consensus code development process.

As a result of this change in the IgCC development, the hearing schedule, the 2015 – 2017 Group A, Group B, and Group C committee responsibility matrix, and the ICC Code Development pages at [www.iccsafe.org](http://www.iccsafe.org) have been updated.

### Submittal of Group B Code Change Proposals on cdpACCESS open

cdpACCESS is open to accept code change proposals for the 2016 (Group B) code development cycle. Code changes will be accepted for the IBC-Structural provisions, IECC Commercial provisions, the IECC-Residential Provisions and Chapter 11 of the IRC, IRC-Building provisions (Chapters 1 – 10), the IFC, and the IWUIC. In addition code change proposals for Chapter 1 of all codes except the IECC, IgCC, and IRC, and any updates to standards currently referenced in the I-Codes will be considered by the Administrative Code Development Committee and code change proposals will also be considered for the portions of the *ICC Performance Code* and Group A codes as listed in the 2015 – 2017 Group A and Group B Committee Responsibilities for the Group B cycle posted on the ICC website. The deadline for 2016 (Group B) change proposals is January 11, 2016.

### New Feature Added to cdpACCESS

The newest feature added to cdpACCESS is My cdpACCESS. Users can access this page after logging into cdpACCESS.com by clicking on their name in the top right corner of the page or visiting <https://cdpaccess.com/mycdpaccess/>. By selecting a Group, users can view and download shared proposals, floor modifications, public comments, and voting information from that Group -- their own as well as those shared through collaboration. This historical data will be permanently available to users through this page.

### GROUP B (2016)

# CP #28-05 CODE DEVELOPMENT

Approved: 9/24/05

Revised: 9/27/14

---

## 1.0 Introduction

- 1.1 **Purpose:** The purpose of this Council Policy is to prescribe the Rules of Procedure utilized in the continued development and maintenance of the International Codes (Codes).
- 1.2 **Objectives:** The ICC Code Development Process has the following objectives:
  - 1.2.1 The timely evaluation and recognition of technological developments pertaining to construction regulations.
  - 1.2.2 The open discussion of code change proposals by all parties desiring to participate.
  - 1.2.3 The final determination of Code text by public officials actively engaged in the administration, formulation or enforcement of laws, ordinances, rules or regulations relating to the public health, safety and welfare and by honorary members.
  - 1.2.4 The increased participation of all parties desiring to participate through an online submittal and voting process that includes opportunities for online collaboration.
- 1.3 **Code Publication:** The ICC Board of Directors (ICC Board) shall determine the title and the general purpose and scope of each Code published by the ICC.
  - 1.3.1 **Code Correlation:** The provisions of all Codes shall be consistent with one another so that conflicts between the Codes do not occur. A Code Scoping Coordination Matrix shall determine which Code shall be the primary document, and therefore which code development committee shall be responsible for maintenance of the code text where a given subject matter or code text could appear in more than one Code. The Code Scoping Coordination Matrix shall be administered by the Code Correlation Committee as approved by the ICC Board. Duplication of content or text between Codes shall be limited to the minimum extent necessary for practical usability of the Codes, as determined in accordance with Section 4.5.
- 1.4 **Process Maintenance:** The review and maintenance of the Code Development Process and these Rules of Procedure shall be by the ICC Board. The manner in which Codes are developed embodies core principles of the organization. One of those principles is that the final content of the Codes is determined by a majority vote of the governmental and honorary members. It is the policy of the ICC Board that there shall be no change to this principle without the affirmation of two-thirds of the governmental and honorary members responding.
- 1.5 **Secretariat:** The Chief Executive Officer shall assign a Secretariat for each of the Codes. All correspondence relating to code change proposals and public comments shall be addressed to the Secretariat. The Secretariat shall have the authority to

facilitate unforeseen situations which arise in the implementation of this council policy. Staff shall maintain a record of such actions.

- 1.6 Recording:** Individuals requesting permission to record any meeting or hearing, or portion thereof, shall be required to provide the ICC with a release of responsibility disclaimer and shall acknowledge that ICC shall retain sole ownership of the recording, and that they have insurance coverage for liability and misuse of recording materials. Equipment and the process used to record shall, in the judgment of the ICC Secretariat, be conducted in a manner that is not disruptive to the meeting. The ICC shall not be responsible for equipment, personnel or any other provision necessary to accomplish the recording. An unedited copy of the recording shall be forwarded to ICC within 30 days of the meeting. Recordings shall not otherwise be copied, reproduced or distributed in any manner. Recordings shall be returned to ICC or destroyed upon the request of ICC.

## **2.0 Code Development Cycle**

- 2.1 Intent:** The code development cycle shall consist of the complete consideration of code change proposals in accordance with the procedures herein specified, commencing with the deadline for submission of code change proposals (see Section 3.5) and ending with publication of the Final Action on the code change proposals (see Section 10.4).
- 2.2 New Editions:** The ICC Board shall determine the schedule for publishing new editions of the Codes. Each new edition shall incorporate the results of the code development activity since the previous edition.
- 2.3 Supplements:** The results of code development activity between editions may be published.
- 2.4 Emergency Action Procedures:**
- 2.4.1 Scope:** Emergency actions are limited to those issues representing an immediate threat to health and safety that warrant a more timely response than allowed by the Code Development Process schedule.
- 2.4.2 Initial Request:** A request for an emergency action shall be based upon perceived threats to health and safety and shall be reviewed by the Codes and Standards Council for referral to the ICC Board for action with their analysis and recommendation.
- 2.4.3 Board and Member Action:** In the event that the ICC Board determines that an emergency amendment to any Code or supplement thereto is warranted, the same may be adopted by the ICC Board. Such action shall require an affirmative vote of at least two-thirds of the ICC Board.

The ICC membership shall be notified within ten days after the ICC Boards' official action of any emergency amendment. At the next Annual Business Meeting, any emergency amendment shall be presented to the members for ratification by a majority of the Governmental Member Voting Representatives and Honorary Members present and voting.

All code revisions pursuant to these emergency procedures and the reasons for such corrective action shall be published as soon as practicable after ICC Board action. Such revisions shall be identified as an emergency amendment.

Emergency amendments to any Code shall not be considered as a retro-active requirement to the Code. Incorporation of the emergency amendment into the adopted Code shall be subjected to the process established by the adopting

authority.

**2.5 Code Development Record.** The code development record shall include the official documents and records developed in support of the given code development cycle. This includes the following:

1. Code Change Agenda (Section 4.8)
2. Audio and video recording of the Committee Action Hearing (Section 5.1)
3. The Online Assembly Floor Motion Ballot (Section 5.7.3)
4. Report of the Committee Action Hearing (Section 5.8)
5. Public Comment Agenda (Section 6.6)
6. Public Comment Hearing results (Section 7.5.8.10)
7. Audio and video recording of the Public Comment Hearing (Section 7.1)
8. The Online Governmental Consensus Ballot (Section 8.2)
9. Final Action results (Section 10.4)
10. Errata to the documents noted above

The information resulting from online collaboration between interested parties shall not be part of the code development record.

### **3.0 Submittal of Code Change Proposals**

**3.1 Intent:** Any interested person, persons or group may submit a code change proposal which will be duly considered when in conformance to these Rules of Procedure.

**3.2 Withdrawal of Proposal:** A code change proposal may be withdrawn by the proponent (WP) at any time prior to public comment consideration of that proposal. All actions on the code change proposal shall cease immediately upon the withdrawal of the code change proposal.

**3.3 Form and Content of Code Change Submittals:** Each code change proposal shall be submitted separately and shall be complete in itself. Each submittal shall contain the following information:

**3.3.1 Proponent:** Each code change proposal shall include the name, title, mailing address, telephone number, and email address of the proponent. Email addresses shall be published with the code change proposals unless the proponent otherwise requests on the submittal form.

**3.3.1.1** If a group, organization or committee submits a code change proposal, an individual with prime responsibility shall be indicated.

**3.3.1.2** If a proponent submits a code change proposal on behalf of a client, group, organization or committee, the name and mailing address of the client, group, organization or committee shall be indicated.

**3.3.2 Code Reference:** Each code change proposal shall relate to the applicable code sections(s) in the latest edition of the Code.

**3.3.2.1** If more than one section in the Code is affected by a code change proposal, appropriate proposals shall be included for all such affected sections.

**3.3.2.2** If more than one Code is affected by a code change proposal, appropriate proposals shall be included for all such affected Codes and appropriate cross referencing shall be included in the supporting information.

- 3.3.3 Multiple Code Change Proposals to a Code Section.** A proponent shall not submit multiple code change proposals to the same code section. When a proponent submits multiple code change proposals to the same section, the proposals shall be considered as incomplete proposals and processed in accordance with Section 4.3. This restriction shall not apply to code change proposals that attempt to address differing subject matter within a code section.
- 3.3.4 Text Presentation:** The text of the code change proposal shall be presented in the specific wording desired with deletions shown struck out with a single line and additions shown underlined with a single line.
- 3.3.4.1** A charging statement shall indicate the referenced code section(s) and whether the code change proposal is intended to be an addition, a deletion or a revision to existing Code text.
- 3.3.4.2** Whenever practical, the existing wording of the text shall be preserved with only such deletions and additions as necessary to accomplish the desired change.
- 3.3.4.3** Each code change proposal shall be in proper code format and terminology.
- 3.3.4.4** Each code change proposal shall be complete and specific in the text to eliminate unnecessary confusion or misinterpretation.
- 3.3.4.5** The proposed text shall be in mandatory terms.
- 3.3.5 Supporting Information:** Each code change proposal shall include sufficient supporting information to indicate how the code change proposal is intended to affect the intent and application of the Code.
- 3.3.5.1 Purpose:** The proponent shall clearly state the purpose of the code change proposal (e.g. clarify the Code; revise outdated material; substitute new or revised material for current provisions of the Code; add new requirements to the Code; delete current requirements, etc.)
- 3.3.5.2 Reasons:** The proponent shall justify changing the current Code provisions, stating why the code change proposal is superior to the current provisions of the Code. Code change proposals which add or delete requirements shall be supported by a logical explanation which clearly shows why the current Code provisions are inadequate or overly restrictive, specifies the shortcomings of the current Code provisions and explains how such code change proposals will improve the Code.
- 3.3.5.3 Substantiation:** The proponent shall substantiate the code change proposal based on technical information and substantiation. Substantiation provided which is reviewed in accordance with Section 4.2 and determined as not germane to the technical issues addressed in the code change proposal may be identified as such. The proponent shall be notified that the code change proposal is considered an incomplete proposal in accordance with Section 4.3 and the proposal shall be held until the deficiencies are corrected. The proponent shall have the right to appeal this action in accordance with the policy of the ICC Board. The burden of providing substantiating material lies with the proponent of the code change proposal. All substantiating material published by ICC is material that has been provided by the proponent and in so publishing ICC makes no representations or warranties about its quality or accuracy.
- 3.3.5.4 Bibliography:** The proponent shall submit a bibliography of any

substantiating material submitted with the code change proposal. The bibliography shall be published with the code change proposal and the proponent shall make the substantiating materials available for review at the appropriate ICC office and during the public hearing.

**3.3.5.5 Copyright Release:** The proponent of code change proposals, floor modifications and public comments shall sign a copyright release reading: "I hereby grant and assign to ICC all rights in copyright I may have in any authorship contributions I make to ICC in connection with any proposal and public comment, in its original form submitted or revised form, including written and verbal modifications submitted in accordance Section 5.5.2. I understand that I will have no rights in any ICC publications that use such contributions in the form submitted by me or another similar form and certify that such contributions are not protected by the copyright of any other person or entity."

**3.3.5.6 Cost Impact:** The proponent shall indicate one of the following regarding the cost impact of the code change proposal: 1) the code change proposal will increase the cost of construction; or 2) the code change proposal will not increase the cost of construction. The proponent shall submit information which substantiates either assertion. This information will be considered by the code development committee and will be included in the bibliography of the published code change proposal. Any proposal submitted which does not include the requisite cost information shall be considered incomplete and shall not be processed.

**3.4 Online Submittal:** Each code change proposal and all substantiating information shall be submitted online at the website designated by ICC. Two copies of each proposed new referenced standard in hard copy or one copy in electronic form shall be submitted. Additional copies may be requested when determined necessary by the Secretariat to allow such information to be distributed to the code development committee. Where such additional copies are requested, it shall be the responsibility of the proponent to send such copies to the respective code development committee.

**3.5 Submittal Deadline:** ICC shall establish and post the submittal deadline for each cycle. The posting of the deadline shall occur no later than 120 days prior to the code change deadline. Each code change proposal shall be submitted online at the website designated by ICC by the posted deadline. The submitter of a code change proposal is responsible for the proper and timely receipt of all pertinent materials by the Secretariat.

**3.6 Referenced Standards:** In order for a standard to be considered for reference or to continue to be referenced by the Codes, a standard shall meet the following criteria:

**3.6.1 Code References:**

- 3.6.1.1** The standard, including title and date, and the manner in which it is to be utilized shall be specifically referenced in the Code text.
- 3.6.1.2** The need for the standard to be referenced shall be established.

**3.6.2 Standard Content:**

- 3.6.2.1** A standard or portions of a standard intended to be enforced shall be written in mandatory language.
- 3.6.2.2** The standard shall be appropriate for the subject covered.
- 3.6.2.3** All terms shall be defined when they deviate from an ordinarily accepted meaning or a dictionary definition.

- 3.6.2.4 The scope or application of a standard shall be clearly described.
- 3.6.2.5 The standard shall not have the effect of requiring proprietary materials.
- 3.6.2.6 The standard shall not prescribe a proprietary agency for quality control or testing.
- 3.6.2.7 The test standard shall describe, in detail, preparation of the test sample, sample selection or both.
- 3.6.2.8 The test standard shall prescribe the reporting format for the test results. The format shall identify the key performance criteria for the element(s) tested.
- 3.6.2.9 The measure of performance for which the test is conducted shall be clearly defined in either the test standard or in Code text.
- 3.6.2.10 The standard shall not state that its provisions shall govern whenever the referenced standard is in conflict with the requirements of the referencing Code.
- 3.6.2.11 The preface to the standard shall announce that the standard is promulgated according to a consensus procedure.

### 3.6.3 Standard Promulgation:

- 3.6.3.1 Code change proposals with corresponding changes to the code text which include a reference to a proposed new standard or a proposed update of an existing referenced standard shall comply with this section. The standard shall be completed and readily available prior to the Public Comment Hearing based on the cycle of code development which includes the code change proposal. In order for a new standard to be considered for reference by the Code, such standard shall be submitted in at least a consensus draft form in accordance with Section 3.4. If a new standard is not submitted in at least draft form, the code change proposal shall be considered incomplete and shall not be processed. Updating of standards without corresponding code text changes shall be accomplished administratively in accordance with Section 4.6.
- 3.6.3.2 The standard shall be developed and maintained through a consensus process such as ASTM or ANSI.

## 4.0 Processing of Code Change Proposals

- 4.1 **Intent:** The processing of code change proposals is intended to ensure that each proposal complies with these Rules of Procedure and that the resulting published code change proposal accurately reflects that proponent's intent.
- 4.2 **Review:** Upon receipt in the Secretariat's office, the code change proposals will be checked for compliance with these Rules of Procedure as to division, separation, number of copies, form, language, terminology, supporting statements and substantiating data. Where a code change proposal consists of multiple parts which fall under the maintenance responsibilities of different code committees, the Secretariat shall determine the code committee responsible for determining the committee action in accordance with Section 5.6 and the Code Scoping Coordination Matrix (see Section 1.3.1).
- 4.3 **Incomplete Code Change Proposals:** When a code change proposal is submitted with incorrect format, without the required information or judged as not in compliance with these Rules of Procedure, the Secretariat shall notify the proponent of the specific deficiencies and the proposal shall be held until the deficiencies are corrected, with a final date set for receipt of a corrected submittal. If the Secretariat receives the corrected code change proposal after the final date, the proposal shall be held over until the next code development cycle. Where there are otherwise no deficiencies

addressed by this section, a code change proposal that incorporates a new referenced standard shall be processed with an analysis of the referenced standard's compliance with the criteria set forth in Section 3.6.

- 4.4 Editorial Code Change Proposals.** When a code change proposal is submitted that proposes an editorial or format change that, in the opinion of the Secretariat, does not affect the scope or application of the code, the proposal shall be submitted to the Code Correlation Committee who shall deem the code change proposal as editorial or send the proposal back to the Secretariat to be considered by the appropriate code development committee. To be deemed editorial, such proposal shall require a majority vote of the Code Correlation Committee. Editorial proposals shall be published in the Code Change Agenda. Such proposals shall be added to the hearing agenda for consideration by the appropriate code development committee upon written request to ICC by any individual. The deadline to submit such requests shall be 14 days prior to the first day of the Committee Action Hearing. Code Correlation Committee proposals that are not added to a code development committee hearing agenda shall be published in the next edition of the code with no further consideration.
- 4.5 Copy Editing Code Text:** The Chief Executive Officer shall have the authority at all times to make editorial style and format changes to the Code text, or any approved changes, consistent with the intent, provisions and style of the Code. Such editorial style or format changes shall not affect the scope or application of the Code requirements.
- 4.6 Updating Standards Referenced in the Codes:** The updating of standards referenced by the Codes shall be accomplished administratively by the Administrative Code Development Committee in accordance with these full procedures except that the deadline for availability of the updated standard and receipt by the Secretariat shall be December 1 of the third year of each code cycle. The published version of the new edition of the Code which references the standard will refer to the updated edition of the standard. If the standard is not available by the deadline, the edition of the standard as referenced by the newly published Code shall revert back to the reference contained in the previous edition and an errata to the Code issued. Multiple standards to be updated may be included in a single proposal.
- 4.7 Preparation:** All code change proposals in compliance with these procedures shall be prepared in a standard manner by the Secretariat and be assigned separate, distinct and consecutive numbers. The Secretariat shall coordinate related proposals submitted in accordance with Section 3.3.2 to facilitate the hearing process.
- 4.8 Code Change Agenda:** All code change proposals shall be posted on the ICC website at least 30 days prior to the Committee Action Hearing on those proposals and shall constitute the agenda for the Committee Action Hearing. Any errata to the Code Change Agenda shall be posted on the ICC website as soon as possible. Code change proposals which have not been published in the original posting or subsequent errata shall not be considered.

## **5.0 Committee Action Hearing**

- 5.1 Intent:** The intent of the Committee Action Hearing is to permit interested parties to present their views including the cost and benefits on the code change proposals on the published agenda. The code development committee will consider such comments as may be presented in the development of their action on the disposition of such code change proposals. At the conclusion of the code development committee deliberations, the committee action on each code change proposal shall be placed before the hearing assembly for consideration in accordance with Section 5.7.
- 5.2 Committee:** The Codes and Standards Council shall review all applications and make committee appointment recommendations to the ICC Board. The Code Development

Committees shall be appointed by the ICC Board.

- 5.2.1 Chairman/Moderator:** The Chairman and Vice-Chairman shall be appointed by the Codes and Standards Council from the appointed members of the committee. The ICC President shall appoint one or more Moderators who shall act as presiding officer for the Committee Action\_Hearing.
- 5.2.2 Conflict of Interest:** A committee member shall withdraw from and take no part in those matters with which the committee member has an undisclosed financial, business or property interest. The committee member shall not participate in any committee discussion or any committee vote on the matter in which they have an undisclosed interest. A committee member who is a proponent of a code change proposal shall not participate in any committee discussion on the matter or any committee vote. Such committee member shall be permitted to participate in the floor discussion in accordance with Section 5.5 by stepping down from the dais.
- 5.2.3 Representation of Interest:** Committee members shall not represent themselves as official or unofficial representatives of the ICC except at regularly convened meetings of the committee.
- 5.2.4 Committee Composition:** The committee may consist of representation from multiple interests. A minimum of thirty-three and one-third percent (33.3%) of the committee members shall be regulators.
- 5.3 Date and Location:** The date and location of the Committee Action Hearing shall be announced not less than 60 days prior to the date of the hearing.
- 5.4 General Procedures:** *The Robert's Rules of Order* shall be the formal procedure for the conduct of the Committee Action Hearing except as a specific provision of these Rules of Procedure may otherwise dictate. A quorum shall consist of a majority of the voting members of the committee.
  - 5.4.1 Chair Voting:** The Chairman of the committee shall vote only when the vote cast will break a tie vote of the committee.
  - 5.4.2 Open Hearing:** The Committee Action Hearing is an open hearing. Any interested person may attend and participate in the floor discussion and assembly consideration portions of the hearing. Only code development committee members may participate in the committee action portion of the hearings (see Section 5.6). Participants shall not advocate a position on specific code change proposals with committee members other than through the methods provided in this policy.
  - 5.4.3 Presentation of Material at the Public Hearing:** Information to be provided at the hearing shall be limited to verbal presentations and modifications submitted in accordance with Section 5.5.2. Each individual presenting information at the hearing shall state their name and affiliation, and shall identify any entities or individuals they are representing in connection with their testimony. Audio-visual presentations are not permitted. Substantiating material submitted in accordance with Section 3.3.5.3 and other material submitted in response to a code change proposal shall be located in a designated area in the hearing room and shall not be distributed to the code development committee at the public hearing.
  - 5.4.4 Agenda Order:** The Secretariat shall publish a Code Change Agenda for the Committee Action Hearing, placing individual code change proposals in a logical order to facilitate the hearing. Any public hearing attendee may move to revise the agenda order as the first order of business at the public hearing, or

at any time during the hearing except while another code change proposal is being discussed. Preference shall be given to grouping like subjects together, and for moving items back to a later position on the agenda as opposed to moving items forward to an earlier position. A motion to revise the agenda order is subject to a 2/3 vote of those present and voting.

**5.4.5 Reconsideration:** There shall be no reconsideration of a code change proposal after it has been voted on by the committee in accordance with Section 5.6.

**5.4.6 Time Limits:** Time limits shall be established as part of the agenda for testimony on all code change proposals at the beginning of each hearing session. Each person requesting to testify on a code change proposal shall be given equal time. In the interest of time and fairness to all hearing participants, the Moderator shall have limited authority to modify time limitations on debate. The Moderator shall have the authority to adjust time limits as necessary in order to complete the hearing agenda.

**5.4.6.1 Time Keeping:** Keeping of time for testimony by an individual shall be by an automatic timing device. Remaining time shall be evident to the person testifying. Interruptions during testimony shall not be tolerated. The Moderator shall maintain appropriate decorum during all testimony.

**5.4.6.2 Proponent Testimony:** The Proponent is permitted to waive an initial statement. The Proponent shall be permitted to have the amount of time that would have been allocated during the initial testimony period plus the amount of time that would be allocated for rebuttal. Where the code change proposal is submitted by multiple proponents, this provision shall permit only one proponent of the joint submittal to be allotted additional time for rebuttal.

**5.4.7 Points of Order:** Any person participating in the public hearing may challenge a procedural ruling of the Moderator or the Chairman. A majority vote of ICC Members in attendance shall determine the decision.

**5.5 Floor Discussion:** The Moderator shall place each code change proposal before the hearing for discussion by identifying the proposal and by regulating discussion as follows:

**5.5.1 Discussion Order:**

1. Proponents. The Moderator shall begin by asking the proponent and then others in support of the code change proposal for their comments.
2. Opponents. After discussion by those in support of a code change proposal, those opposed hereto, if any, shall have the opportunity to present their views.
3. Rebuttal in support. Proponents shall then have the opportunity to rebut points raised by the opponents.
4. Re-rebuttal in opposition. Opponents shall then have the opportunity to respond to the proponent's rebuttal.

**5.5.2 Modifications:** Modifications to code change proposals may be suggested from the floor by any person participating in the public hearing. The person proposing the modification is deemed to be the proponent of the modification.

**5.5.2.1 Submission.** All modifications shall be submitted electronically to the ICC\_Secretariat in a format determined by ICC unless

determined by the Chairman to be either editorial or minor in nature. The modification will be forwarded electronically to the members of the code development committee during the hearing and will be projected on the screen in the hearing room.

**5.5.2.2 Criteria.** The Chairman shall rule proposed modifications in or out of order before they are discussed on the floor. A proposed modification shall be ruled out of order if it:

1. is not legible, unless not required to be written in accordance with Section 5.5.2.1; or
2. changes the scope of the original code change proposal; or
3. is not readily understood to allow a proper assessment of its impact on the original code change proposal or the Code.

The ruling of the Chairman on whether or not the modification is in or out of order shall be final and is not subject to a point of order in accordance with Section 5.4.7.

**5.5.2.3 Testimony.** When a modification is offered from the floor and ruled in order by the Chairman, a specific floor discussion on that modification is to commence in accordance with the procedures listed in Section 5.5.1.

**5.6 Committee Action:** Following the floor discussion of each code change proposal, one of the following motions shall be made and seconded by members of the committee:

1. Approve the code change proposal As Submitted (AS) or
2. Approve the code change proposal As Modified with specific modifications (AM), or
3. Disapprove the code change proposal (D)

Discussion on this motion shall be limited to code development committee members. If a committee member proposes a modification which had not been proposed during floor discussion, the Chairman shall rule on the modification in accordance with Section 5.5.2.2. If a committee member raises a matter of issue, including a proposed modification, which has not been proposed or discussed during the floor discussion, the Moderator shall suspend the committee discussion and shall reopen the floor discussion for comments on the specific matter or issue. Upon receipt of all comments from the floor, the Moderator shall resume committee discussion.

The code development committee shall vote on each motion with the majority dictating the committee's action. Committee action on each code change proposal shall be completed when one of the motions noted above has been approved. Each committee vote shall be supported by a reason.

The code development committee shall maintain a record of its proceedings including the action on each code change proposal.

**5.7 Assembly Consideration:** At the conclusion of the committee's action on a code change proposal and before the next code change proposal is called to the floor, the Moderator shall ask for a motion from the public hearing attendees who may object to the committee's action. If a motion in accordance with Section 5.7.1 is not brought forward on the committee's action, the results of the Committee Action\_Hearing shall be established by the committee's action.

**5.7.1 Assembly Floor Motion:** Any attendee may raise an objection to the committee's action in which case the attendee will be able to make a motion to:

1. Approve the code change proposal As Submitted from the Floor (ASF), or

2. Approve the code change proposal As Modified from the Floor (AMF) with a specific modification that has been previously offered from the floor and ruled in order by the Chairman during floor discussion (see Section 5.5.2) or has been offered by a member of the Committee and ruled in order by the Chairman during committee discussion (see Section 5.6), or
3. Disapprove the code change proposal from the floor (DF).

**5.7.2 Assembly Floor Motion Consideration:** On receipt of a second to the floor motion, the Moderator shall accept the motion and the second and notify the attendees that the motion will be considered in an online ballot following the hearing in accordance with Section 5.7.3. No additional testimony shall be permitted.

**5.7.3 Online Assembly Floor Motion Ballot:** Following the Committee Action Hearing, all assembly floor motions which received a second shall be compiled into an online ballot. The ballot will include:

1. The code change proposal as published.
2. The committee action and reason from the Committee Action Hearing.
3. The floor motion, including modifications which are part of the floor motion.
4. Access to the audio and video of the Committee Action Hearing proceedings.
5. Identification of the ballot period for which the online balloting will be open.

**5.7.4 Eligible Online Assembly Motion Voters:** All members of ICC shall be eligible to vote on online assembly floor motions. Each member is entitled to one vote, except that each Governmental Member Voting Representative may vote on behalf of its Governmental Member. Individuals who represent more than one Governmental Member shall be limited to a single vote. Application, whether new or updated, for ICC membership must be received by the Code Council 30 days prior to the first day of the Committee Action Hearing. The ballot period will not be extended beyond the published period except as approved by the ICC Board.\_

**5.7.5 Assembly Action:** A successful assembly action shall be a majority vote of the votes cast by eligible voters (see Section 5.7.4). A successful assembly action results in an automatic public comment to be considered at the Public Comment Hearing (see Section 7.4).

**5.8 Report of the Committee Action Hearing:** The results of the Committee Action Hearing, including committee action and reason, online assembly floor motion vote results and the total vote count for each assembly floor motion shall be posted on the ICC website not less than 60 days prior to the Public Comment Hearing, except as approved by the ICC Board.

## **6.0 Public Comments**

**6.1 Intent:** The public comment process gives attendees at the Public Comment Hearing an opportunity to consider specific objections to the results of the Committee Action Hearing and more thoughtfully prepare for the discussion for public comment consideration. The public comment process expedites the Public Comment Hearing by limiting the items discussed to the following:

1. Consideration of items for which a public comment has been submitted; and
2. Consideration of items which received a successful assembly action.

**6.2 Deadline:** The deadline for receipt of a public comment to the results of the Committee Action Hearing shall be announced at the Committee Action Hearing but shall not be less than 30 days subsequent to the availability of the Report of the Committee Action

Hearing (see Section 5.8).

**6.3 Withdrawal of Public Comment:** A public comment may be withdrawn by the public commenter at any time prior to public comment consideration of that comment. A withdrawn public comment shall not be subject to public comment consideration. If the only public comment to a code change proposal is withdrawn by the public commenter prior to the vote on the consent agenda in accordance with Section 7.5.4, the proposal shall be considered as part of the consent agenda. If the only public comment to a code change proposal is withdrawn by the public commenter after the vote on the consent agenda in accordance with Section 7.5.4, the proposal shall continue as part of the individual consideration agenda in accordance with Section 7.5.5, however the public comment shall not be subject to public comment consideration.

**6.4 Form and Content of Public Comments:** Any interested person, persons, or group may submit a public comment to the results of the Committee Action Hearing which will be considered when in conformance to these requirements. Each public comment to a code change proposal shall be submitted separately and shall be complete in itself. Each public comment shall contain the following information:

**6.4.1 Public comment:** Each public comment shall include the name, title, mailing address, telephone number and email address of the public commenter. Email addresses shall be published with the public comments unless the commenter otherwise requests on the submittal form.

If a group, organization, or committee submits a public comment, an individual with prime responsibility shall be indicated. If a public comment is submitted on behalf a client, group, organization or committee, the name and mailing address of the client, group, organization or committee shall be indicated. The scope of the public comment shall be consistent with the scope of the original code change proposal, committee action or successful assembly action. Public comments which are determined as not within the scope of the code change proposal, committee action or successful assembly action shall be identified as such. The public commenter shall be notified that the public comment is considered an incomplete public comment in accordance with Section 6.5.1 and the public comment shall be held until the deficiencies are corrected. A copyright release in accordance with Section 3.3.5.5 shall be provided with the public comment.

**6.4.2 Code Reference:** Each public comment shall include the code change proposal number.

**6.4.3 Multiple public comments to a code change proposal.** A proponent shall not submit multiple public comments to the same code change proposal. When a proponent submits multiple public comments to the same code change proposal, the public comments shall be considered as incomplete public comments and processed in accordance with Section 6.5.1. This restriction shall not apply to public comments that attempt to address differing subject matter within a code section.

**6.4.4 Desired Final Action:** In order for a public comment to be considered, the public comment shall indicate the desired Final Action as one of the following:

1. Approve the code change proposal As Submitted (AS), or
2. Approve the code change proposal As Modified by the committee modification published in the Report of the Committee Action Hearing (AM) or published in a public comment in the Public Comment Agenda (AMPC),  
or
3. Disapprove the code change proposal (D)

- 6.4.5 Supporting Information:** The public comment shall include a statement containing a reason and justification for the desired Final Action on the code change proposal. Reasons and justification which are reviewed in accordance with Section 6.5 and determined as not germane to the technical issues addressed in the code change proposal or committee action may be identified as such. The public commenter shall be notified that the public comment is considered an incomplete public comment in accordance with Section 6.5.1 and the public comment shall be held until the deficiencies are corrected. The public commenter shall have the right to appeal this action in accordance with the policy of the ICC Board. A bibliography of any substantiating material submitted with a public comment shall be published with the public comment and the substantiating material shall be made available at the Public Comment Hearing. All substantiating material published by ICC is material that has been provided by the proponent and in so publishing ICC makes no representations or warranties about its quality or accuracy.
- 6.4.6 Online submittal:** Each public comment and substantiating information shall be submitted online at the website designated by ICC. Additional copies may be requested when determined necessary by the Secretariat.
- 6.4.7 Submittal Deadline:** ICC shall establish and post the submittal deadline for each cycle. The posting of the deadline shall occur no later than 120 days prior to the public comment deadline. Each public comment shall be submitted online at the website designated by ICC by the posted deadline. The submitter of a public comment is responsible for the proper and timely receipt of all pertinent materials by the Secretariat.
- 6.5 Review:** The Secretariat shall be responsible for reviewing all submitted public comments from an editorial and technical viewpoint similar to the review of code change proposals (see Section 4.2).
- 6.5.1 Incomplete Public Comment:** When a public comment is submitted with incorrect format, without the required information or judged as not in compliance with these Rules of Procedure, the public comment shall not be processed. The Secretariat shall notify the public commenter of the specific deficiencies and the public comment shall be held until the deficiencies are corrected, or the public comment shall be returned to the public commenter with instructions to correct the deficiencies with a final date set for receipt of the corrected public comment.
- 6.5.2 Duplications:** On receipt of duplicate or parallel public comments, the Secretariat may consolidate such public comments for public comment consideration. Each public commenter shall be notified of this action when it occurs.
- 6.5.3 Deadline:** Public comments received by the Secretariat after the deadline set for receipt shall not be published and shall not be considered as part of the public comment consideration. This deadline shall not apply to public comments submitted by the Code Correlation Committee. In order to correlate submitted public comments with action taken at the Committee Action Hearing on code change proposals that did receive a public comment, the Code Correlation Committee, in conjunction with staff processing of public comments, shall review the submitted public comments and submit the necessary public comments in order to facilitate the coordination of code change proposals. Such review and submittal shall not delay the posting of the Public Comment Agenda as required in Section 6.6.
- 6.6 Public Comment Agenda:** The Committee Action Hearing results on code change proposals that have not received a public comment and code change proposals which

received public comments or successful assembly actions shall constitute the Public Comment Agenda. The Public Comment Agenda shall be posted on the ICC website at least 30 days prior the Public Comment Hearing. Any errata to the Public Comment Agenda shall be posted on the ICC website as soon as possible. Code change proposals and public comments which have not been published in the original posting or subsequent errata shall not be considered.

## **7.0 Public Comment Hearing**

- 7.1 Intent:** The Public Comment Hearing is the first of two steps to make a final determination on all code change proposals which have been considered in a code development cycle by a vote cast by eligible voters (see Section 9.0). The second step, which follows the Public Comment Hearing, is the Online Governmental Consensus Vote that is conducted in accordance with Section 8.0.
- 7.2 Date and Location:** The date and location of the Public Comment Hearing shall be announced not less than 60 days prior to the date of the hearing.
- 7.3 Moderator:** The ICC President shall appoint one or more Moderators who shall act as presiding officer for the Public Comment Hearing.
- 7.4 Public Comment Agenda:** The Public Comment Consent Agenda shall be comprised of code change proposals which have neither a successful assembly action nor public comment. The agenda for public testimony and individual consideration shall be comprised of proposals which have a successful assembly action or public comment (see Section 6.1).
- 7.5 Procedure:** *The Robert's Rules of Order* shall be the formal procedure for the conduct of the Public Comment Hearing except as these Rules of Procedure may otherwise dictate.
- 7.5.1 Open Hearing:** The Public Comment Hearing is an open hearing. Any interested person may attend and participate in the floor discussion.
- 7.5.2 Agenda Order:** The Secretariat shall publish a Public Comment Agenda for the Public Comment Hearing, placing individual code change proposals and public comments in a logical order to facilitate the hearing. The proponents or opponents of any code change proposal or public comment may move to revise the agenda order as the first order of business at the public hearing, or at any time during the hearing except while another proposal is being discussed. Preference shall be given to grouping like subjects together and for moving items back to a later position on the agenda as opposed to moving items forward to an earlier position. A motion to revise the agenda order is subject to a 2/3 vote of those present and voting.
- 7.5.3 Presentation of Material at the Public Comment Hearing:** Information to be provided at the hearing shall be limited to verbal presentations. Each individual presenting information at the hearing shall state their name and affiliation, and shall identify any entities or individuals they are representing in connection with their testimony. Audio-visual presentations are not permitted. Substantiating material submitted in accordance with Section 6.4.5 and other material submitted in response to a code change proposal or public comment shall be located in a designated area in the hearing room.
- 7.5.4 Public Comment Consent Agenda:** The Public Comment Consent Agenda (see Section 7.4) shall be placed before the assembly with a single motion for Final Action in accordance with the results of the Committee Action Hearing. When the motion has been seconded, the vote shall be taken with no testimony being allowed. A simple majority (50% plus one) based on the number of votes cast by eligible voters shall decide the motion. This action shall not be subject

to the Online Governmental Consensus Vote following the Public Comment Hearing (see Section 8.0).

- 7.5.5 Public Comment Individual Consideration Agenda:** Upon completion of the Public Comment Consent Agenda vote, all code change proposals not on the Public Comment Consent Agenda shall be placed before the assembly for individual consideration of each item (see Section 7.4).
- 7.5.6 Reconsideration:** There shall be no reconsideration of a code change proposal after it has been voted on in accordance with Section 7.5.8.
- 7.5.7 Time Limits:** Time limits shall be established as part of the agenda for testimony on all code change proposals at the beginning of each hearing session. Each person requesting to testify on a code change proposal shall be given equal time. In the interest of time and fairness to all hearing participants, the Moderator shall have limited authority to modify time limitations on debate. The Moderator shall have the authority to adjust time limits as necessary in order to complete the hearing agenda.
- 7.5.7.1 Time Keeping:** Keeping of time for testimony by an individual shall be by an automatic timing device. Remaining time shall be evident to the person testifying. Interruptions during testimony shall not be tolerated. The Moderator shall maintain appropriate decorum during all testimony.
- 7.5.8 Discussion and Voting:** Discussion and voting on code change proposals being individually considered shall be in accordance with the following procedures and the voting majorities in Section 7.6:
- 7.5.8.1 Proponent testimony:** The Proponent of a public comment is permitted to waive an initial statement. The Proponent of the public comment shall be permitted to have the amount of time that would have been allocated during the initial testimony period plus the amount of time that would be allocated for rebuttal. Where a public comment is submitted by multiple proponents, this provision shall permit only one proponent of the joint submittal to waive an initial statement.
- 7.5.8.2 Points of Order:** Any person participating in the public hearing may challenge a procedural ruling of the Moderator. A majority vote of ICC Members in attendance shall determine the decision.
- 7.5.8.3 Eligible voters:** Voting shall be limited to eligible voters in accordance with Section 9.0.
- 7.5.8.4 Allowable Final Action Motions:** The only allowable motions for Final Action are Approval as Submitted (AS), Approval as Modified by the committee (AM) or by one or more modifications published in the Public Comment Agenda (AMPC), and Disapproval (D).
- 7.5.8.5 Initial Motion:** The code development committee action shall be the initial motion considered.
- 7.5.8.6 Motions for Modifications:** Whenever a motion under consideration is for Approval as Submitted or Approval as Modified, a subsequent motion and second for a modification published in the Public Comment Agenda may be made (see Section 6.4.4). Each subsequent motion for modification, if any, shall be individually discussed and voted before returning to the main motion. A two-thirds majority based on the number of votes cast by eligible voters shall be required for a successful motion on all

modifications.

**7.5.8.7 Voting:** After dispensing with all motions for modifications, if any, and upon completion of discussion on the main motion, the Moderator shall then ask for the vote on the main motion. The vote on the main motion shall be taken electronically with the vote recorded and each vote assigned to the eligible voting member. If the motion fails to receive the majority required in Section 7.6, the Moderator shall ask for a new motion.

**7.5.8.8 Subsequent Motion:** If the initial motion is unsuccessful, a motion for either Approval as Submitted or Approval as Modified by one or more published modifications is in order. A motion for Disapproval is not in order. The vote on the main motion shall be taken electronically with the vote recorded and each vote assigned to the eligible voting member. If a successful vote is not achieved, Section 7.5.8.9 shall apply.

**7.5.8.9 Failure to Achieve Majority Vote at the Public Comment Hearing.** In the event that a code change proposal does not receive any of the required majorities in Section 7.6, the results of the Public Comment Hearing for the code change proposal in question shall be Disapproval. The vote count that will be reported as the Public Comment Hearing result will be the vote count on the main motion in accordance with Section 7.5.8.7.

**7.5.8.10 Public Comment Hearing Results:** The result and vote count on each code change proposal considered at the Public Comment Hearing shall be announced at the hearing. The results shall be posted and included in the Online Governmental Consensus Ballot (see Section 8.2).

**7.6 Majorities for Final Action:** The required voting majority for code change proposals individually considered shall be based on the number of votes cast of eligible voters at the Public Comment Hearing shall be in accordance with the following table:

Committee Action	Desired Final Action		
	AS	AM/AMPC	D
AS	Simple Majority	2/3 Majority	Simple Majority
AM	2/3 Majority	Simple Majority to sustain the Committee Action or; 2/3 Majority on each additional modification and 2/3 Majority on entire code change proposal for AMPC	Simple Majority
D	2/3 Majority	2/3 Majority	Simple Majority

**8.0 Online Governmental Consensus Vote**

**8.1 Public Comment Hearing Results:** The results from the Individual Consideration Agenda at the Public Comment Hearing (see Sections 7.5.5 and 7.5.8.10) shall be the basis for the Online Governmental Consensus Vote. The ballot shall include the voting options in accordance with the following table:

<b>Committee Action</b>	<b>Public Comment Hearing result and Voting Majority</b>	<b>Online Governmental Consensus Ballot and Voting Majority</b>	
<b>AS</b>	<b>AS:</b> Simple Majority	<b>AS:</b> Simple Majority	<b>D:</b> Simple Majority
	<b>AMPC:</b> 2/3 Majority	<b>AMPC:</b> 2/3 Majority	<b>D:</b> Simple Majority
	<b>D:</b> Simple Majority	<b>AS:</b> Simple Majority	<b>D:</b> Simple Majority
<b>AM</b>	<b>AS:</b> 2/3 Majority	<b>AS:</b> 2/3 Majority	<b>D:</b> Simple Majority
	<b>AM:</b> Simple Majority	<b>AM:</b> Simple Majority	<b>D:</b> Simple Majority
	<b>AMPC:</b> 2/3 Majority	<b>AMPC:</b> 2/3 Majority	<b>D:</b> Simple Majority
	<b>D:</b> Simple Majority	<b>AM:</b> Simple Majority	<b>D:</b> Simple Majority
<b>D</b>	<b>AS:</b> 2/3 Majority	<b>AS:</b> 2/3 Majority	<b>D:</b> Simple Majority
	<b>AMPC:</b> 2/3 Majority	<b>AMPC:</b> 2/3 Majority	<b>D:</b> Simple Majority
	<b>D:</b> Simple Majority	<b>AS:</b> 2/3 Majority	<b>D:</b> Simple Majority

**8.2 Online Governmental Consensus Ballot:** The ballot for each code change proposal considered at the Public Comment Hearing will include:

1. The Public Comment Hearing result and vote count.
2. The allowable Online Governmental Consensus Vote actions in accordance with Section 8.1.
3. Where the Public Comment Hearing result is As Submitted (AS) or Disapprove (D), the original code change proposal will be presented.
4. Where the Public Comment Hearing result is As Modified by the committee (AM) or As Modified by one or more Public Comments (AMPC), the original code change and approved modification(s) will be presented.
5. The committee action taken at the Committee Action Hearing.
6. ICC staff identification of correlation issues.
7. For those who voted at the Public Comment Hearing, the ballot will indicate how they voted.
8. An optional comment box to provide comments.
9. Access to the Public Comment Agenda which includes: the original code change, the report of the committee action and the submitted public comments.
10. Access to the audio and video of the Committee Action and Public Comment Hearing proceedings.
11. Identification of the ballot period for which the online balloting will be open.

**8.3 Voting process:** Voting shall be limited to eligible voters in accordance with Section 9.0. Eligible voters are authorized to vote during the Public Comment Hearing and during the Online Governmental Consensus Vote; however, only the last vote cast will be included in the final vote tabulation. The ballot period will not be extended beyond the published period except as approved by the ICC Board.

## **9.0 Eligible Final Action Voters**

**9.1 Eligible Final Action Voters:** Eligible Final Action voters include ICC Governmental Member Voting Representatives and Honorary Members in good standing who have been confirmed by ICC in accordance with the Electronic Voter Validation System. Such

confirmations are required to be revalidated annually. Eligible Final Action voters in attendance at the Public Comment Hearing and those participating in the Online Governmental Consensus Vote shall have one vote per eligible voter on all Codes. Individuals who represent more than one Governmental Member shall be limited to a single vote.

**9.2 Applications:** Applications for Governmental Membership must be received by the ICC at least 30 days prior to the Committee Action Hearing in order for its designated representatives to be eligible to vote at the Public Comment Hearing or Online Governmental Consensus Vote. Applications, whether new or updated, for Governmental Member Voting Representative status must be received by the Code Council 30 days prior to the commencement of the first day of the Public Comment Hearing in order for any designated representative to be eligible to vote. An individual designated as a Governmental Member Voting Representative shall provide sufficient information to establish eligibility as defined in the ICC Bylaws. The Executive Committee of the ICC Board, in its discretion, shall have the authority to address questions related to eligibility.

## **10.0 Tabulation, certification and posting of results**

**10.1 Tabulation and Validation:** Following the closing of the online ballot period, the votes received will be combined with the vote tally at the Public Comment Hearing to determine the final vote on the code change proposal. ICC shall retain a record of the votes cast and the results shall be certified by a validation committee appointed by the ICC Board. The validation committee shall report the results to the ICC Board, either confirming a valid voting process and result or citing irregularities in accordance with Section 10.2.

**10.2 Voting Irregularities:** Where voting irregularities or other concerns with the Online Governmental Consensus Voting process which are material to the outcome or the disposition of a code change proposal(s) are identified by the validation committee, such irregularities or concerns shall be immediately brought to the attention of the ICC Board. The ICC Board shall take whatever action necessary to ensure a fair and impartial Final Action vote on all code change proposals, including but not limited to:

1. Set aside the results of the Online Governmental Consensus Vote and have the vote taken again.
2. Set aside the results of the Online Governmental Consensus Vote and declare the Final Action on all code change proposals to be in accordance with the results of the Public Comment Hearing.
3. Other actions as determined by the ICC Board.

**10.3 Failure to Achieve Majority Vote:** In the event a code change proposal does not receive any of the required majorities for Final Action in Section 8.0, Final Action on the code change proposal in question shall be Disapprove.

**10.4 Final Action Results:** The Final Action on all code change proposals shall be published as soon as practicable after certification of the results. The results shall include the Final Action taken, including the vote tallies from both the Public Comment Hearing and Online Governmental Consensus Vote, as well as the required majority in accordance with Section 8.0. ICC shall maintain a record of individual votes for auditing purposes, however, the record shall not be made public. The exact wording of any resulting text modifications shall be made available to any interested party.

## **11.0 Code Publication**

**11.1 Next Edition of the Codes:** The Final Action results on code change proposals shall be the basis for the subsequent edition of the respective Code.

**11.2 Code Correlation:** The Code Correlation Committee is authorized to resolve technical or editorial inconsistencies resulting from actions taken during the code development process by making appropriate changes to the text of the affected code. Any such changes to a Code shall require a 2/3 vote of the Code Correlation Committee. Technical or editorial inconsistencies not resolved by the Code Correlation Committee shall be forwarded to the ICC Board for resolution.

## **12.0 Appeals**

**12.1 Right to Appeal:** Any person may appeal an action or inaction in accordance with Council Policy 1 Appeals. Any appeal made regarding voter eligibility, voter fraud, voter misrepresentation or breach of ethical conduct must be supported by credible evidence and must be material to the outcome of the final disposition of a code change proposal(s).

The following actions are not appealable:

1. Variations of the results of the Public Comment Hearing compared to the Final Action result in accordance with Section 10.4.
2. Denied requests to extend the voter balloting period in accordance with Sections 5.7.4 or 8.3.
3. Lack of access to the internet based online collaboration and voting platform to submit a code change proposal, to submit a public comment or to vote.
4. Code Correlation Committee changes made in accordance with Section 11.2.

## **13.0 Violations**

**13.1 ICC Board Action on Violations:** Violations of the policies and procedures contained in this Council Policy shall be brought to the immediate attention of the ICC Board for response and resolution. Additionally, the ICC Board may take any actions it deems necessary to maintain the integrity of the code development process.

## WITHDRAWN CODE CHANGE PROPOSALS

The following code change proposals were withdrawn subsequent to the Committee Action Hearings:

P72-15  
P74-15  
P200-15  
P201-15  
M7-15

Code change proposals withdrawn prior to the end of the committee action hearings are indicated as such in the 2015 Report of Committee Action Hearings.

**2015 PUBLIC COMMENT HEARINGS SCHEDULE**  
**September 30 – October 5, 2015**  
**Long Beach Convention Center**  
**Long Beach, CA**

The upcoming 2015 ICC Annual Conference, Group A Public Comment Hearings and Expo will be utilizing the same schedule as last year. The Annual Business meeting will be on Monday, September 28<sup>th</sup> and the conference activities will conclude on Tuesday, September 29<sup>th</sup> with the Annual Banquet. [Click here](#) for the conference schedule.

The Public Comment Hearings will start on Wednesday, September 30<sup>th</sup> at 8:00 am. The schedule anticipates that the hearings will be completed no later than 7:00 pm on Monday, October 5<sup>th</sup>. This may require adjustments to the daily start/end times based on hearing progress. As was done for the Committee Action Hearings, the codes are scheduled with the Plumbing/Mechanical/Fuel Gas (PMG) codes followed by the Building related codes, starting with the IPMZC.

Unless noted by “Start no earlier than 11:00 am”, the hearing on each code will begin immediately upon completion of the hearing for the prior code. This includes moving the code up or back from the day indicated based on hearing progress. Actual start times for each code cannot be stipulated due to uncertainties in hearing progress. Be sure to review the tentative hearing order in the Public Comment Agenda (to be posted by August 28<sup>th</sup>) for code changes that are heard with a code other than that indicated by the code change prefix (see note 4).

<b>Wednesday September 30</b>	<b>Thursday October 1</b>	<b>Friday October 2</b>	<b>Saturday October 3</b>	<b>Sunday October 4</b>	<b>Monday October 5</b>
<b>Start 8 am</b> ISPSC IFGC IPC/IPSDC IRC – P IRC - M  <b>End 7 pm</b>	<b>Start 8 am</b> IRC – M IMC IPMZC (Start no earlier than 11:00 am) IEBC  <b>End 7 pm</b>	<b>Start 8 am</b> IEBC IBC – E IBC – FS  <b>End 7 pm</b>	<b>Start 8 am</b> IBC – FS IBC - G  <b>End 7 pm</b>	<b>Start 10 am</b> IBC – G  <b>End 7 pm</b>	<b>Start 8 am</b> IBC - G  <b>Finish 7 pm</b>

**SEE NEXT PAGE FOR NOTES AND LIST OF CODES**

**Hearing Schedule Notes:**

1. Daily start and end hearing times are subject to change based on progress.
2. Mid-morning, lunch and mid-afternoon breaks to be announced. The hearings are scheduled without a dinner break.
3. Due to the uncertainties in the hearing process, the start time indicated as "Start no earlier than 11 am" is conservatively estimated and is not intended to be a scheduled target.
4. Consult the hearing order for code changes to be heard with a code other than the code under which the code change is designated.

**Codes: (be sure to consult the Cross Index of Proposed Code Changes with Public Comments for changes heard with a different code)**

IBC – E: International Building Code – Egress provisions

IBC – FS: International Building Code – Fire Safety provisions

IBC – G: International Building Code – General provisions

IEBC: Non-structural provisions in the International Existing Building Code

IFGC: International Fuel Gas Code

IMC: International Mechanical Code

IPC/IPSDC: International Plumbing/Private Sewage Disposal Code (no public comments received to the IPSDC)

IPMZC: International Property Maintenance and Zoning Codes (no code changes received to the IZC)

IRC – M: Mechanical provisions in the IRC

IRC – P: Plumbing provisions in the IRC

ISPSC: International Swimming Pool and Spa Code

## TENTATIVE HEARING ORDER FOR EACH INDIVIDUAL CONSIDERATION AGENDA

**Note:** Code changes to be heard out of numerical order or to be heard with a different code designation are indented. Be sure to review the cross index on page xxxvi for code change which affect codes other than those under their respective code change number prefix.

## 2015 ICC CODE DEVELOPMENT CYCLE CROSS INDEX OF PROPOSED CODE CHANGES ON THE PUBLIC COMMENT AGENDA FOR INDIVIDUAL CONSIDERATION

Some of the proposed code changes include sections that are outside of the scope of the chapters or the code listed in the table of 2015-2017 Staff Secretaries on page xi. This is done in order to facilitate coordination among the International Codes which is one of the fundamental principles of the International Codes.

Listed in this cross index are proposed code changes that include sections of codes or codes other than those listed on page ix. For example, IBC Section 2602.1 is proposed for revision in code change G22-15, which was heard by the IBC-General Committee. This section of the IBC is typically the responsibility of the IBC-Fire Safety. It is therefore identified in this cross index. Another example is Section 607.5.2 of the International Mechanical Code. The International Mechanical Code is normally maintained by the IMC Committee, but Section 607.5.2 will be considered for revision in proposed code change FS112-15 which was on the IBC-Fire Safety Committee agenda. In some instances, there are other subsections that are revised by an identified code change that is not included in the cross index.

This information is provided to assist users in locating all of the proposed code changes that would affect a certain section or chapter. For example, to find all of the proposed code changes that would affect Chapter 4 of the IBC, review the proposed code changes in the portion of the monograph for the IBC-General Code Development Committee (listed with a G prefix) then review this cross reference for Chapter 4 of the IBC for proposed code changes published in other code change groups. While care has been taken to be accurate, there may be some omissions in this list.

Letter prefix: Each proposed change number has a letter prefix that will identify where the proposal is published. The letter designations for proposed changes and the corresponding publications are as follows:

<b>PREFIX</b>	<b>PROPOSED CHANGE GROUP (see monograph table of contents for location)</b>
E	International Building Code - Egress
EB	International Existing Building Code
FG	International Fuel Gas Code

# SP2-15

## 202 (New),

### **Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

## **2015 International Swimming Pool and Spa Code**

**Add new definition as follows:**

### **SECTION 202 DEFINITIONS**

**ACCESS (TO).** That which enables a fixture, appliance or equipment to be reached by ready access or by a means that first requires the removal or movement of a panel, door similar obstruction (see "Ready access").

### **SECTION 202 DEFINITIONS**

**READY ACCESS.** That which enables a fixture, appliance or equipment to be directly reached without requiring the removal or movement of any panel, door or similar obstruction and without the use of a portable ladder, step stool or similar device.

**Reason:** There are several locations where these terms are used in the ISPC however, without these definitions, the true meaning of the terms are not clear. These definitions are identical to the IMC definitions for these terms. The IMC has scoping control of these defined terms where they are used in all codes except for the IRC.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 108.

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

SP2-15 : 202-ACCESS  
(TO) (New)-SNYDER4141

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** These definitions conflict with how these terms are used in the National Electric Code and in APSP-15.

**Assembly Motion:**  
**Online Vote Results:**

**As Submitted**  
**Successful**

Support: 53.57% (75) Oppose: 46.43% (65)

**Assembly Action :**

**Approved as Submitted**

---

**Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Assembly Action  
requests Approve as Submitted.**

**Commenter's Reason:** This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. The assembly action for Approve as Submitted was successful by a vote of 53.57% (75) to 46.43% (65) by eligible members online during the period of May 14 - May 28, 2015.

---

**SP2-15**

202

## Proposed Change as Submitted

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

### 2015 International Swimming Pool and Spa Code

Revise as follows:

#### SECTION 202 DEFINITIONS

**SWIMOUT.** An underwater seat area that is placed completely outside of the ~~perimeter shape~~ diving envelope of the a pool. ~~Where located at the deep end, swimouts are permitted to be used as the deep end means of entry or exit to the pool.~~ \_

**Reason:** A swimout is not required to be outside of the perimeter shape of a pool. Many times they are located on those areas but they are not required to be. This revised wording agrees with Figure 322.2.

The second sentence is a requirement and requirements should not be in code definitions. Requirements belong in the code text (Chapters 3 through 10). There was no need to add this requirement to the code as it is already in Sections 411.1.3 and 809.2

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 13.

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

SP4-15 : 202-SWIMOUT-  
SNYDER4143

---

### Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** The form of the diving water envelope allows elements such as swimouts to be anywhere in a pool including the deep end , just as long as the element does not encroach on the diving water envelope.

**Assembly Action :**

**None**

---

### Individual Consideration Agenda

## *Public Comment 1:*

**Proponent : Janine Snyder, representing Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Swimming Pool and Spa Code SECTION 202 DEFINITIONS**

**SWIMOUT.** An underwater seat area that is placed completely outside of the diving envelope of a pool.- Where located at the deep end, swimouts are permitted to be used as the deep-end means of entry or exit to the pool.

**Commenter's Reason:** A swimout can be used for exit and entry into a pool. The public comment brings the deleted last sentence back into this definition.

---

SP4-15

# SP9-15

## 305.2.4.1 (New), 305.2.10

### Proposed Change as Submitted

**Proponent :** Jennifer Hatfield, J. Hatfield & Associates, PL,  
representing Association of Pool & Spa Professionals  
(jhatfield@apsp.org)

## 2015 International Swimming Pool and Spa Code

### Add new text as follows:

**305.2.4.1 Setback for mesh fences** The location of a mesh fence from the inside of the fence to the nearest edge of the water of a pool or spa shall be not less than 20 inches (508 mm).

### Delete without substitution:

~~**305.2.10 Poolside barrier setbacks.** The pool or spa side of the required barrier shall be not less than 20 inches (508 mm) from the water's edge.~~

**Reason:** This proposal clarifies the original intent of Section 305.2.10, which was to apply only to mesh fences, which are removable child barriers otherwise known as baby barriers. The setback requirement was never intended to apply to walls, screen enclosures, other types of fencing, etc. The way the code is currently written it could be construed as applying to all types of barriers and not just the mesh fencing as intended. Therefore, this proposal simply deletes Section 305.2.10 and instead places the setback requirement as a subsection of the mesh fencing section, so it is applied to only that type of barrier fence.

**Bibliography:** See 2007 Florida Building Code, Code Commentary for Section R4101.17.1.13 which clearly provides that the intent of the setback is only for mesh fencing.

**Cost Impact:** Will not increase the cost of construction  
This will not increase the cost of construction, as it simply clarifies the original intent of a code provision.

SP9-15 : 305.2.4.1  
(New)-HATFIELD5780

---

## Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** The intent of this proposals is good but the language needs improved to make it clear that the mesh fence is a baby fence and not the type of temporary mesh fence that a contractor might use for protecting a work area.

**Assembly Action :**

**None**

---

## Individual Consideration Agenda

*Public Comment 1:*

**Proponent : Jennifer Hatfield, J. Hatfield & Associates, PL,  
representing Association of Pool & Spa Professionals  
(jhatfield@apsp.org) requests Approve as Submitted.**

**Commenter's Reason:** The committee's concern was that this type of mesh fence would also included the type of plastic fencing used to keep people out of a construction site and not just one that is considered a baby barrier around a swimming pool. However, what was not explained at the first hearing is that possibility does not exist due to the fact this new subsection (which already exists in the ISPSC but is simply being moved to the correct place in the code from where it currently resides, per the reasoning provided in the original proposal) falls under section 305.2.4, titled "Mesh fence as a barrier." Therefore, this new subsection 305.2.4.1 falls within section 305.2.4, which details what requirements the mesh fence must meet in order to be considered a barrier around a pool. Therefore, there is no way for this to be misapplied to a temporary plastic "construction" fence because those type of fences simply would not be able to meet the requirements listed under section 305.2.4.

It is impertative this proposal be adopted because it clarifies the original intent of Section 305.2.10, which was to apply only to mesh fences, which are removable child barriers otherwise known as baby barriers. The setback requirement was never intended to apply to walls, screen enclosures, other types of fencing, etc. The way the code is currently written it could be construed as applying to all types of barriers and not just the mesh fencing as intended. Therefore, this proposal simply deletes Section 305.2.10 and instead places the setback requirement as a subsection of the mesh fencing section, so it is applied to only that type of barrier fence. See 2007 Florida Building Code, Code Commentary for Section R4101.17.1.13 which clearly provides that the intent of the setback is only for mesh fencing.

## 305.2.10 (New)

### Proposed Change as Submitted

**Proponent :** Jennifer Hatfield, J. Hatfield & Associates, PL  
(jhatfield@apsp.org)

## 2015 International Swimming Pool and Spa Code

**Add new text as follows:**

**305.2.10 Flexible plastic netting** Flexible plastic mesh fencing and netting shall not be used for a required barrier. This section shall not apply to factory-manufactured mesh fence assemblies made and installed in accordance with Section 305.2.4.

**Reason:** This new section is being proposed to clarify that certain plastic fencing is not intended for use as a pool barrier. For example, the plastic fencing one uses at construction sites to warn people to stay out of the area could possibly be argued as meeting the barrier provisions if this new section is not added. This is possible due to the fact the vertical post spacing could be 15 to 20 feet, the "holes" could meet the width maximum and the top edge is supported by a tension wire. However, the "holes" could be widened by a foot being inserted and weight on the top could pull it down to less than 48 inches above grade. Further, the bottom of this type of fence rarely is supported by a tension wire; therefore, it could be possible for someone to push under it and get into the pool. All of these factors represent a safety concern if this type of product were used to meet the barrier requirements, which is why this new section is needed to prevent that from happening. However, the second sentence is needed to clarify this is NOT intended to eliminate the mesh fencing that is manufactured specifically as a "baby barrier" around a pool, under Section 305.2.4.

**Cost Impact:** Will not increase the cost of construction

This will not increase the cost of construction, as it just clarifies that a certain type of plastic netting that was never intended to be a pool barrier and is not, in fact, a pool barrier.

SP10-15 : 305.2.10  
(New)-HATFIELD5487

---

### Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** The term "netting" could be confusing. This proposal should be coordinated with what proposal SP9 was trying to accomplish and brought back in Public Comment.

**Assembly Action :**

**None**

---

### Individual Consideration Agenda

*Public Comment 1:*

**Proponent : Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

## **2015 International Swimming Pool and Spa Code**

**305.2.10 Flexible plastic ~~netting~~ fencing** Flexible plastic ~~mesh~~-fencing ~~and netting~~ shall not be used for a required barrier. This section shall not apply to factory-manufactured mesh fence assemblies made and installed in accordance with Section 305.2.4.

**Commenter's Reason:** This public comment addresses the committees concerns by removing the wording "netting" and "mesh" to ensure it is not confused with any other type of fencing. This section is being added to make clear that flexible plastic fencing that is used around construction sites are not used to meet the pool barrier requirements. The proposal clearly distinguishes this type of fencing from the mesh fencing that is allowed in Section 305.2.4, the latter must follow a series of requirements laid out within Section 305.2.4 in order to be used as a proper pool barrier.

---

SP10-15

# SP11-15

## 305.3

### **Proposed Change as Submitted**

**Proponent :** Timothy Pate, , City and County of Broomfield, representing the Colorado Chapter of ICC Code Change Committee, representing City and County of Broomfield (tpate@broomfield.org)

## **2015 International Swimming Pool and Spa Code**

### **Revise as follows:**

**305.3 Gates.** Access gates shall comply with the requirements of Sections 305.3.1 through 305.3.3 and shall be equipped to accommodate a locking device. Pedestrian access gates shall open outward away from the pool or spa, shall be self-closing and shall have a self-latching device.

Where the combined occupant load of the pool deck area and the pool water area is calculated to be 50 persons or more based on the swimming pool occupant load factors in Table 1004.1.2 of the International Building Code, not less than two pedestrian access gates shall serve as the means of egress gates for the combined area. The means of egress gates shall be separated in accordance with Section 1007.1.1 of the IBC. Where more than one means of egress gate from the area is required, all means of egress gates from the area shall have panic hardware installed in accordance with Section 1010.1.10 of the IBC.

**Reason:** This proposed change is to add language that would require checking the occupant load using IBC Table 1004.1.2 which has pool and pool deck listed as a function of space. Once the space exceeds the 49 it would need exits which would match what is done for a building or space within a building. There has been confusion as to how exterior pools are treated in regards to means of egress since they are not technically an occupancy. I do not believe the best way to solve this is to change language to call these spaces occupancies since you would then have to also use Chapter 29 to determine required numbers of plumbing fixtures. I believe some building departments use IBC section 1004.5 for these outdoor areas but this section says you need means of egress but the definition of means of egress only talks to occupied portions of buildings or structures. This leads to a lot of confusion for building departments and designers. I feel that adding this specific language to the swimming pool barrier section will help clear up this confusion.

**Cost Impact:** Will increase the cost of construction  
This would increase the cost in the jurisdictions that have not interpreted this section to require the panic hardware already.

SP11-15 : 305.3-  
PATE3935

---

## **Public Hearing Results**

## Committee Action:

**Disapproved**

**Committee Reason:** With where this section is placed, the new language would apply to both residential and public pools, These requirements are only necessary for public pools. The new language seems to imply that only gates could be used for egress purposes. What about doors? All this might already be covered by the IBC.

## Assembly Action :

**None**

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : Timothy Pate, representing City and County of Broomfield (tpate@broomfield.org) requests Approve as Modified by this Public Comment.**

#### **Replace Proposal as Follows:**

### **2015 International Swimming Pool and Spa Code**

**305.8 Means of egress** Outdoor public pools provided with barriers shall have means of egress as required by Chapter 10 of the *International Building Code*. Where the combined occupant load of the pool deck and the pool water area is calculated to be 50 or more based on the swimming pool occupant load factors in Table 1004.1.2 of the *International Building Code*, the number of exit doors or gates shall comply with the requirements of Section 1006 of the *International Building Code* and shall be separated in accordance with Section 1007.1.1 of the *International Building Code*. Such doors or gates shall comply with the requirements of Section 1010 of the *International Building Code*.

-  
**Commenter's Reason:** I am proposing this modification based on the excellent comments made by the committee. This revision will add a new section which will deal with general means of egress requirements out of the outdoor public pool and pool deck areas.

This new section will only apply to public pools and not for private pools.

This new section will also give requirements for means of egress for either exit paths that extend out through barrier gates or through buildings that are attached to pool deck area and are a part of the barrier.

IBC section 1007.1.1 requires that the required exits be separated by at least 50% of the longest diagonal dimension.

IBC Section is titled "Doors, Gates, and Turnstiles" and has all requirements for sizes (widths), hardware, swings, landings, etc.

# SP12-15

## 305.3, 305.3.3, 305.4

### Proposed Change as Submitted

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

## 2015 International Swimming Pool and Spa Code

### Revise as follows:

**305.3 Gates.** Access gates shall comply with the requirements of Sections 305.3.1 through 305.3.3 and shall be equipped to accommodate a locking device. Pedestrian access gates shall open outward away from the pool or spa, shall be self-closing and shall have a self-latching device.

**305.3.3 Latches.** For residential pools, the operable parts of the latch release for the self-latching device shall be located at 54 inches (1372 mm) maximum above the finished floor or ground. Where the latch release mechanism of the self-latching device is located less than 54 inches (1372 mm) from grade above the finished floor or ground, the latch release mechanism shall be located on the pool or spa side of the gate not less than 3 inches (76 mm) below the top of the gate, and the gate and barrier shall not have openings greater than  $1\frac{1}{2}$  inch (12.7 mm) within 18 inches (457 mm) of the release mechanism. For public pools, for latches on gates along the accessible route, the operable parts of the self-latching devices shall comply with Section 1010.1.9.2 of the International Building Code.

**305.4 Structure wall as a barrier.** Where a wall of a dwelling or structure serves as part of the barrier and where doors or windows provide direct access to the pool or spa through that wall, one of the following shall be required:

1. Operable windows having a sill height of less than 48 inches (1219 mm) above the indoor finished floor and doors shall have an alarm that produces an audible warning when the window, door or their screens are opened. The alarm shall be *listed* and *labeled* as a water hazard entrance alarm in accordance with UL 2017. In ~~dwelling units~~ dwelling units not required to be Accessible units, Type A units or Type B units, the operable parts of the alarm deactivation switches shall be located 54 inches (1372 mm) or more above the finished floor. In ~~dwelling units~~ dwelling units required to be Accessible units, Type A units or Type B units, or in structures where the swimming pool is required to be accessible, the operable parts of the alarm deactivation switches shall be located not greater than 54 inches (1372 mm) and not less than 48 inches (1219 mm) above the finished floor.
2. A *safety cover* that is *listed* and *labeled* in accordance with ASTM F 1346 is installed for the pools and spas.
3. An *approved* means of protection, such as self-closing doors with self-latching devices, is provided. Such means of protection shall provide a degree of protection that is not less than the protection

afforded by Item 1 or 2.

**Reason:** The intent of the changes is to coordinate the locking arrangements on gates and doors for public pools with the allowances worked out in the IBC as part of the coordination with ADA. The definition for public pool and residential pool would determine where accessibility is appropriate.

The 2015 IBC reads as follows:

IBC 1010.1.9.2 Hardware height. Door handles, pulls, latches, locks and other operating devices shall be installed 34 inches (864 mm) minimum and 48 inches (1219 mm) maximum above the finished floor. Locks used only for security purposes and not used for normal operation are permitted at any height.

Exception: Access doors or gates in barrier walls and fences protecting pools, spas and hot tubs shall be permitted to have operable parts of the release of latch on self-latching devices at 54 inches (1370 mm) maximum above the finished floor or ground, provided the self-latching devices are not also self-locking devices operated by means of a key, electronic opener or integral combination lock.

IBC 1109.13 Controls, operating mechanisms and hardware. Controls, operating mechanisms and hardware intended for operation by the occupant, including switches that control lighting and ventilation and electrical convenience outlets, in accessible spaces, along accessible routes or as parts of accessible elements shall be accessible.

**Exceptions:**

1. Operable parts that are intended for use only by service or maintenance personnel shall not be required to be accessible.
2. Electrical or communication receptacles serving a dedicated use shall not be required to be accessible.
3. Where two or more outlets are provided in a kitchen above a length of counter top that is uninterrupted by a sink or appliance, one outlet shall not be required to be accessible.
4. Floor electrical receptacles shall not be required to be accessible.
5. HVAC diffusers shall not be required to be accessible.
6. Except for light switches, where redundant controls are provided for a single element, one control in each space shall not be required to be accessible.
7. Access doors or gates in barrier walls and fences protecting pools, spas and hot tubs shall be permitted to comply with Section 1010.1.9.2.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is CTC/PMG Proposal Item 4.

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

SP12-15 : 305.3.3-  
SNYDER4147

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The introduction of "residential" and "public" in this section

adds confusion as to the required latch height for gates for pools and spas. Some pools are "residential" such as a pool at an apartment complex. Accessibility requirements really need to be covered in the public pools chapter.

<b>Assembly Motion:</b>	<b>As Submitted</b>
<b>Online Vote Results:</b>	<b>Failed</b>
Support: 42.66% (61) Oppose: 57.34% (82)	
<b>Assembly Action :</b>	<b>None</b>

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : Janine Snyder, representing Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org) requests Approve as Submitted.**

**Commenter's Reason:** The Committee's statement about pools and spas for apartment complexes being *residential* pools is incorrect. Those are *public* pools.

#### *Public Comment 2:*

**Proponent : Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org) requests Approve as Modified by this Public Comment.**

#### **Modify as Follows:**

### **2015 International Swimming Pool and Spa Code**

**305.3.3 Latches.** ~~For residential pools, the operable~~ Operable parts of the latch release for the self-latching device that is located on the side of the gate away from the pool or spa shall be located not less than 54 inches (1372 mm) above the finished floor or ground, whichever is higher. For public pools and public spas, such latch release shall be located at 54 inches (1372 mm) maximum above the finished floor or ground , whichever is higher. ~~Where~~ For residential pools and residential spas, where the latch release of the self-latching device is located on the pool or spa side of the gate and is less than 54 inches (1372) above the finished floor or ground, the latch release shall be located ~~on the pool or spa side of the gate~~ not less than 3 inches (76 mm) below the top of the gate, and the gate and barrier shall not have openings greater than 1/2 inch (12.7 mm) within 18 inches (457 mm) of the latch release mechanism. ~~For public pools, for latches on gates along the accessible route, the operable parts of the self latching devices shall comply with Section 1010.1.9.2 of the International Building Code.~~

**Commenter's Reason:** This public comment makes changes to the latch subsection to ensure that the latch is not under 54 inches, as this should not be permitted for safety reasons. All other existing barrier codes and standards require a minimum 54 inches from the ground or floor to ensure a child cannot access the pool or spa without adult supervision.

# SP18-15

## 311.3, 311.3.1 (New), 311.3.2 (New)

### Proposed Change as Submitted

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

## 2015 International Swimming Pool and Spa Code

**Revise as follows:**

**311.3 Water velocity.** The water velocity in suction and return lines piping shall comply with either Section 311.3.1 or 311.3.2. Pool piping sizes shall be chosen so that at the rated flows for the filtering and cleaning equipment, the operating head of the pump is not exceed 8 feet (2.4 m) per second exceeded. The water velocity in suction copper and copper alloy piping shall be as required by Section 310. not exceed 8 fps (2.4 mps).

**311.3.1 Public pool and spas.** For public pools and spas, suction piping water velocity shall not exceed 6 fps (1.8 mps), return piping water velocity shall not exceed 10 fps (3.0 mps) and water velocity through grates shall not exceed 1.5 fps (0.5 mps) except where compliance with Section 310 further limits the water velocities in piping and through grates.

**311.3.2 Residential pool and spas.** For residential pools and spas, the water velocity in suction piping and return piping shall not exceed 8 fps (2.4 mps) except where compliance with Section 310 further limits the water velocities in suction and return piping.

**Reason:** APSP 7-2013 (which is referenced by the 2015 ISPSC) has some different requirements (than the previous edition) with respect to sizing of circulation piping. The ISPSC needs to be updated and clarified so that there is not confusion when comparing the requirements of APSP and the code.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 8.

**Cost Impact:** Will increase the cost of construction

This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. Specifically, in some cases, the suction piping might have to be larger in order to control the velocity through the suction outlet grate. The requirement for larger piping will have additional cost in both material and labor.

SP18-15 : 311.3-  
SNYDER4154

---

## Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** Th proposed text would make the code inconsistent with what the APSP standard indicates for maximum flow velocity through grates.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Swimming Pool and Spa Code**

**311.3 Water velocity.** The water velocity in suction and return piping shall comply with either Section 311.3.1 or 311.3.2. ~~Pool piping sizes shall be chosen so that at the rated flows for the filtering and cleaning equipment, the operating head of the pump is not exceeded.~~ The water velocity in copper and copper alloy piping shall not exceed 8 fps (2.4 mps).

**311.3.1 Public pool and spas.** For *public* pools and spas, suction piping water velocity shall not exceed 6 fps (1.8 mps), return piping water velocity shall not exceed ~~10~~ 8 fps (~~3.0~~ 2.4 mps) and water velocity through grates shall not exceed ~~1.5~~ 0.5 mps ~~except where compliance comply with Section 310 further limits the water velocities in piping and through grates APSP-16.~~

**Commenter's Reason:** This public comment addresses the committees concerns with the original proposal by making changes to ensure consistency with APSP standards. Specifically it ensures that 8 fps is provided as the maximum water velocity of the return piping to ensure consistency with energy efficiency standards. Further, the reference to APSP-16 is provided because this is the standard manufacturers of drain covers must test to, which results in the water velocity limit expressed in gallons per minute. Large, public pool grates, in practice, are designed to 1.5 fps, however it is not required within APSP-16 and therefore, should be removed. Section 310 refers you to APSP 7, which then refers you to APSP 16 on water velocity; therefore, this proposal sends the user directly to APSP-16 when addressing water velocity.

---

**SP18-15**

# SP19-15

## 313.7, 202 (New)

### Proposed Change as Submitted

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

## 2015 International Swimming Pool and Spa Code

**Revise as follows:**

**313.7 Emergency shutoff switch.** An emergency shutoff switch shall be provided to disconnect all power to recirculation and jet system pumps and air blowers. Emergency shutoff switches shall be provided with ready access; be located within sight of the pool or spa; and be located not less than 5 feet (~~1524 mm~~ 1524mm) horizontally from ~~the~~ an inside walls of the pool or spa; that is served by the pumps and blowers controlled by the switch.

**Exception:** *Onground storable pools, permanent inground residential swimming pools, residential spas and residential water features.*

**Add new definition as follows:**

### SECTION 202 DEFINITIONS

**READY ACCESS.** That which enables a fixture, appliance or equipment to be directly reached without requiring the removal or movement of any panel, door or similar obstruction and without the use of a portable ladder, step stool or similar device.

**Reason:** The emergency shutoff switch should be out in the open and not behind a panel so it is obvious where the switch is for fast access. Using the term "ready access" along with the IMC definition, will make this clear.

The definition is identical to the IMC definition for this term. The IMC has scoping control of this defined term where it is used in all codes except for the IRC.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 107.

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

SP19-15 : 313.7-  
SNYDER4155

---

## Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** Exterior (outdoor) switches used for this purpose typically have a protective cover that could be construed as not providing ready access. The new definition indicates that a "panel door" cannot be in the way of the switch. Also, the definition was already disapproved in SP2.

**Assembly Motion:**

**As Submitted**

**Online Vote Results:**

**Failed**

Support: 29.66% (43) Oppose: 70.34% (102)

**Assembly Action :**

**None**

**Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

**2015 International Swimming Pool and Spa Code**

**313.7 Emergency shutoff switch.** An emergency shutoff switch shall be provided to disconnect all power to recirculation and jet system pumps and air blowers. Emergency shutoff switches shall be provided with ready access, be located within sight of the pool or spa, and be located not less than 5 feet (1524mm) horizontally from an inside wall of the pool or spa that is served by the pumps and blowers controlled by the switch. The ready access for such switches shall not be construed as prohibiting weatherproof covers for the switches as allowed for by NFPA 70.

**Exception:** Onground storable pools, permanent inground residential swimming pools, residential spas and residential water features.

**Commenter's Reason:** This public comment addresses a concern of the committee that outdoor switches that have weatherproof covers could be construed as not providing ready access. The additional language provided makes the necessary clarification to prevent this from occurring, ensuring weatherproof covers over outdoor switches can still be utilized.

**SP19-15**

# SP20-15

**316.2, Table 316.2, 316.4, 316.6 (New), 316.6.1 (New), 316.6.2 (New), Chapter 11**

## **Proposed Change as Submitted**

**Proponent :** Jennifer Hatfield, J. Hatfield & Associates, PL,  
representing Association of Pool & Spa Professionals  
(jhatfield@apsp.org)

## **2015 International Swimming Pool and Spa Code**

**Revise as follows:**

**316.2 Listed and labeled.** Heaters and hot water storage tanks shall be *listed* and *labeled* in accordance with the applicable standard listed in Table 316.2.

**TABLE 316.2  
WATER HEATERS**

<b>DEVICE</b>	<b>STANDARD</b>
Electric water heater	UL 1261, UL 1563 or CSA C22.2 No. 218.1
Gas-fired water heater	ANSI Z21.56/CSA 4.7a
Heat exchanger	<del>NSF 50</del> AHRI 400
Heat pump water heater	UL 1995, AHRI 1160, CSA C22.2 No. 236
Photovoltaic solar water heaters	<del>NSF 50</del>
Thermal radiant solar water heater	<del>NSF 50</del>

**316.4 Installation.** Heaters shall be installed in accordance with the manufacturer's specifications and the *International Fuel Gas Code*, *International Mechanical Code*, *International Energy Conservation Code*, NFPA 70 or *International Residential Code*, as applicable in accordance with Section 102.7.1. Solar thermal water heaters shall be installed in accordance with Section 316.6.

**Add new text as follows:**

**316.6 Solar thermal water heaters.** Solar thermal heaters utilized for pools and spas shall comply with Sections 316.6.1 through 316.6.2.

**316.6.1 Installation.** Solar thermal water heaters shall be installed in accordance with the International Mechanical Code or International Residential Code, as applicable in accordance with Section 102.7.1.

**316.6.2 Collectors and panels.** Solar thermal collectors and panels shall be listed and labeled in accordance with SRCC 100 or SRCC 600. Collectors and panels shall be permanently marked with the manufacturer's name, model number, and serial number. Such markings shall be located on each collector in a position that is readily viewable after installation of the collector or panel.

**Add new standard(s) as follows:**

AHRI 400-01 Liquid to Liquid Heat Exchangers with Addenda 1 and 2

SRCC 100 - 13 Standard 100 for Solar Collectors

SRCC 300 - 13 Standard 100 for Solar Water Heating Systems

**Reason:** This proposal add requirements for solar thermal water heater collectors that appears in the IRC to ensure safety and performance of these devices. It also removes references to NSF 50 for solar thermal and PV water heaters since they are outside the scope of NSF 50. Further, it adds reference to AHRI 400 for heat exchangers to align with an existing requirement in the IECC.

**Cost Impact:** Will not increase the cost of construction  
This proposal will not increase the cost of construction, rather it aligns requirements with what already exists in other codes.

**Analysis:** A review of the standard proposed for inclusion in the code, AHRI 400-01, SRCC 100 - 13, SRCC 300 - 13, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

SP20-15 : 316.2-  
HATFIELD5761

---

## **Public Hearing Results**

**Committee Action:**

**Approved as Submitted**

**Committee Reason:** Photovoltaic systems have nothing to do with standard NSF50.

**Assembly Action :**

**None**

**Analysis.** For staff analysis of the content of AHRI 400-01, SRC 100 - 13 and SRCC 300 - 13 with regard to the ICC criteria for referenced standards (Section 3.6 of CP #28), please visit: <http://www.iccsafe.org/wp-content/uploads/2015-Proposed-Standards-Group-A-Final.pdf>

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Jeremy Brown, NSF International, representing NSF International (brown@nsf.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Swimming Pool and Spa Code**

**316.6.2 Collectors and panels.** Solar thermal collectors and panels shall be listed and labeled in accordance with NSF 50, SRCC 100 or SRCC 600. Collectors and panels shall be permanently marked with the manufacturer's name, model number, and serial number. Such markings shall be located on each collector in a position that is readily viewable after installation of the collector or panel.

**Commenter's Reason:** SP-20 would completely remove NSF 50 from the code as it pertains to pool heating. This is unacceptable since NSF has been listing solar panels and collectors to NSF 50 for years. This public comment will bring the standard back where it belongs. There were two main issues brought forth at the committee hearing. 1) NSF 50 should be removed from the heat exchanger table. This is okay since we are adding NSF 50 in the new section on solar panels and collectors. 2) some committee members did not like that NSF 50 did not have a specific section of the standard covering pool heating. This is correct. In the past, NSF certified pool heating equipment such as solar panels and collectors to NSF 50 using a certification specification to house the performance requirements. Since the committee meeting, NSF has brought those requirements to a specific section of the standard.

The updated version of NSF 50 complete with a section on pool heating equipment is available for free at [http://www.nsf.org/media/enevs/documents/nsf\\_50\\_150715.pdf](http://www.nsf.org/media/enevs/documents/nsf_50_150715.pdf) or by emailing brown@nsf.org.

If SP-20 were to pass without this public comment, it would be a problematic because it would be removing viable products and a viable standard that have been previously referenced by this code. NSF 50 is also the only standard that deals with the material health safety issues of pool products. Solar panels used for pool heating probably have the highest surface area to volume ratio of any other pool material and therefore the material safety issues are paramount. I urge your support to help retain NSF 50 where it belongs.

---

**SP25-15**

**402.1, 402.2, 402.3, 402.4, 402.5, 402.12, Table 402.12, Figure 402.12, Table 402.12(2) (New), Table 402.12(3) (New), Table 402.12(4) (New), Table 402.12(5) (New), Table 402.12(6) (New), Figure 402.12 (6) (New)**

**Proposed Change as Submitted**

**Proponent :** Donald Leas, representing Self (donleas@hotmail.com)

**2015 International Swimming Pool and Spa Code**

**Revise as follows:**

**402.1 General.** This section covers diving requirements for Class A, Class B, Class C, and Class E pools. Manufactured and fabricated diving equipment and appurtenances shall not be installed on Type O pools.

**402.2 Manufactured and fabricated diving equipment.** Manufactured and fabricated diving equipment shall be in accordance with ~~Section 808~~ this section and shall be designed for swimming pool use.

**402.3 Installation.** The installation of manufactured diving equipment shall be in accordance with Sections 402.3 through 402.14. Manufactured diving equipment shall be located in the deep area of the pool so as to provide the minimum dimensions shown in ~~Table 402.12~~ Tables 402.12(1) through (6) and shall be installed in accordance with the manufacturer's instructions. Installation and use instructions for manufactured diving equipment shall be provided by the manufacturer and shall specify the minimum water dimensions required for each diving board and diving stand combination. The manufacturer's instructions shall refer to the water envelope type by dimensionally relating their products to Point A on the water envelopes shown in ~~Table 402.12~~ Tables 402.12(1) through (6). The diving board manufacturer shall specify which boards fit on the design pool geometry types as indicated in ~~Table 402.12~~ Tables 402.12(1) through (6) as related to Figures 402.12(1), (2), and (6), as applicable.

**402.4 Slip resistance.** Diving equipment shall have slipresistant walking surfaces.

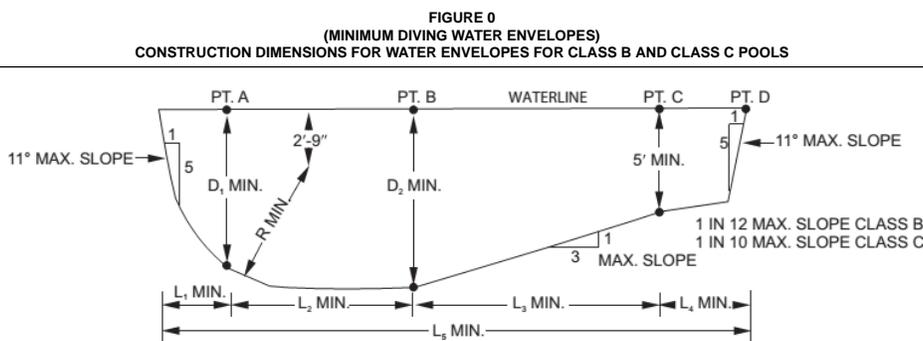

**402.5 Point A.** For the application of ~~Table 402.12~~ Tables 402.12(1) through (6), Point A shall be the point from which dimensions of width, length, depth, and depth height are established for the minimum diving water envelope. If the tip of the diving board or diving platform is located at a distance of WA (see Figure 804.1) or A (see Figure 402.12(2)) or greater from the deep end wall and the water depth at that location is equal to or greater than the water depth requirement at Point A, the point on the water surface directly below the center of the tip of the diving board or diving platform shall be identified as Point A.

**402.12 Water envelopes.** The minimum diving water envelopes shall be in accordance with ~~Table 402.12~~ Tables 402.12(1) through (6).

**TABLE 402.12 402.12(1)**  
**MINIMUM DIVING WATER ENVELOPES FOR CLASS B AND C POOLS**

FIGURE [Add # Here]  
 FIGURE FOR TABLE 402.12(6)

**MINIMUM DIVING WATER ENVELOPE FOR HIGH SCHOOL POOLS WITH TWO 1 METER SPRINGBOARDS**

**Overhead View**

**Side View**

**Reason:** Architects, contractors, and zoning officers have often asked for a conversion table of the FINA dimensions to U. S. dimensions. The three national governing bodies have different diemnsional conversion standards. This information needs to be in this publication so that there is not misinterpretation of what is required in USA Diving, NCAA, and high school diving facilities to guard against a facility not being able to a sanction for competition.

**Cost Impact:** Will not increase the cost of construction  
These dimensions are already a requirement for competition pools and therefore, there is no change in the cost of construction. Having this information all in one place might eliminate rework costs and lower the cost of installing these pools.

SP25-15 : 402.1-LEAS5115

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The proponent wanted to present a floor modification to eliminate much of the proposal, however, the modification was ruled out of order by the committee chair. Therefore, the committee did not want to consider the proposal as submitted as the proponent wanted to make major changes.

**Assembly Action :**

None

---

### **Individual Consideration Agenda**

**Public Comment 1:**

Proponent : **Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org) requests Approve as Modified by this Public Comment.**

**Replace Proposal as Follows:**

**2015 International Swimming Pool and Spa Code**

**402.2 Manufactured and fabricated diving equipment.** Manufactured and fabricated diving equipment shall be in accordance with ~~Section 808~~ this section and shall be designed for swimming pool use.

**402.3 Installation.** The installation of manufactured diving equipment shall be in accordance with Sections 402.3 through 402-12 ~~402.14~~. Manufactured diving equipment shall be located in the deep area of the pool so as to provide the minimum dimensions shown in Table 402.12 and shall be installed in accordance with the manufacturer's instructions. Installation and use instructions for manufactured diving equipment shall be provided by the manufacturer and shall specify the minimum water dimensions required for each diving board and diving stand combination. The manufacturer's instructions shall refer to the water envelope type by dimensionally relating their products to Point A on the water envelopes shown in Table 402.12. The diving board manufacturer shall specify which boards fit on the design pool geometry types as indicated in Table 402.12.

**Commenter's Reason:** This public comment removes most of the original proposal but leaves two changes that are necessary. First, it removes the reference to Section 808, which is residential inground pool diving requirements and correctly references the public pool diving section, which is Section 402 (the section being addressed in this public comment). Second, it changes 402.12 to 402.14 to capture all of the subsections within 402, to ensure that manufactured diving equipment is installed per all the requirements found within Section 402.

f.	<u>Water depth at any point 2' to 5' in front of the end of the board, must be 12' (3.658m) or more, except for pools constructed prior to January 1987, where water depth 2 to 5 feet in front of the end of the board must be a minimum of 10 feet (3.045m).</u>	<u>1m</u>	<u>12' /10'</u>	<u>3.658 / 3.048m</u>

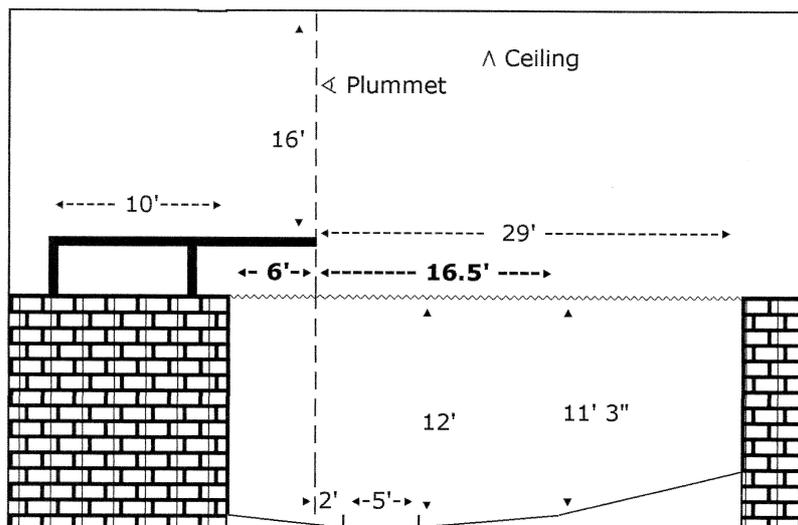

g.	<u>Maximum depth reduction rate of diving pools which do not exceed minimum depth requirement shall be 6 1/4% for a distance of 16.5' (5.0m) forward (6.096m) from the end of the board and 6' (1.829m) back and to the sides. Deeper pools may have proportionally steeper depth reduction rates.</u>	<u>1m</u>	<u>**</u>	<u>**</u>

**FIGURE [Add # Here]  
FIGURE FOR TABLE 402.12(6)**

**MINIMUM DIVING WATER ENVELOPE FOR HIGH SCHOOL POOLS  
WITH TWO 1 METER SPRINGBOARDS**

**Overhead View**

**Side View**

**Reason:** Architects, contractors, and zoning officers have often asked for a conversion table of the FINA dimensions to U. S. dimensions. The three national governing bodies have different diemnsional conversion standards. This information needs to be in this publication so that there is not misinterpretation of what is required in USA Diving, NCAA, and high school diving facilities to guard against a facility not being able to a sanction for competition.

**Cost Impact:** Will not increase the cost of construction  
 These dimensions are already a requirement for competition pools and therefore, there is no change in the cost of construction. Having this information all in one place might eliminate rework costs and lower the cost of installing these pools.

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The proponent wanted to present a floor modification to eliminate much of the proposal, however, the modification was ruled out of order by the committee chair. Therefore, the committee did not want to consider the proposal as submitted as the proponent wanted to make major changes.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org) requests Approve as Modified by this Public Comment.**

**Replace Proposal as Follows:**

### **2015 International Swimming Pool and Spa Code**

#### **402.2 Manufactured and fabricated diving equipment.**

Manufactured and fabricated diving equipment shall be in accordance with ~~Section 808~~ this section and shall be designed for swimming pool use.

**402.3 Installation.** The installation of manufactured diving equipment shall be in accordance with Sections 402.3 through ~~402.12~~ 402.14. Manufactured diving equipment shall be located in the deep area of the pool so as to provide the minimum dimensions shown in Table 402.12 and shall be installed in accordance with the manufacturer's instructions. Installation and use instructions for manufactured diving equipment shall be provided by the manufacturer and shall specify the minimum water dimensions required for each diving board and diving stand combination. The manufacturer's instructions shall refer to the water envelope type by dimensionally relating their products to Point A on the water envelopes shown in Table 402.12. The diving board manufacturer shall specify which boards fit on the design pool geometry types as indicated in Table 402.12.

**Commenter's Reason:** This public comment removes most of the original proposal but leaves two changes that are necessary. First, it removes the reference to Section 808, which is residential inground pool diving requirements and correctly references the public pool diving section, which is Section 402 (the section being addressed in this public comment). Second, it changes 402.12 to 402.14 to capture all of the subsections within 402, to ensure that manufactured diving equipment is installed per all the requirements found within Section 402.

# SP30-15

## SECTION 612 (New)

### Proposed Change as Submitted

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

## 2015 International Swimming Pool and Spa Code

Add new text as follows:

### SECTION 612 SPRAY PADS

**612.1 General.** Spray pads shall comply with this section.

**612.2 Safety hazards.** Parts of the spray pad that can be accessed by the users of the spray pad shall be designed and constructed to not present safety hazards to the users.

**612.3 Walking surface at perimeter.** A walking surface of not less than 4 foot (1296 mm) in width shall be provided around the perimeter of the splash zone. The walking surface shall be sloped away from the splash zone. The drainage from the perimeter walking surface shall be directed to deck drains or other surface water disposal systems. Walking surfaces shall not drain to the surge basin for the spray pad.

**612.4 Splash zone.** The splash zone shall comply with Sections 612.4.2 through 612.4.5.

**612.4.1 Absence of standing water.** Surfaces in the splash zone shall be designed to not have standing water.

**612.4.2 Slope to drain.** The surfaces of the splash zone shall slope to drain water to the surge basin of the circulation system for the spray pad.

**612.4.3 Nozzles on walking surfaces.** Water nozzles that spray from walking surfaces shall be flush with those surfaces. Openings in such nozzles shall not exceed ½ inch (12.7 mm).

**612.4.4 Other nozzles.** Nozzles, other than those on walking surfaces, shall be designed to be clearly visible.

**612.4.5 Potable water for foggers and misters.** Foggers and misters that produce finely atomized water mists shall be supplied only with potable water. Foggers and misters shall not be supplied with water from the surge basin.

**612.5 Circulation system.** The circulation system shall consist of the equipment covered in Sections 612.5.1 through 612.5.3

**612.5.1 Catch screen.** A catch screen or basket shall be provided for splash zone drainage piping connections to the surge basin. The screen or basket shall be designed to prevent larger debris from entering the surge basin.

### **612.5.2 Surge basin.**

A surge basin shall be provided having a capacity of not less than 4000 gallons or the number of gallons that can be pumped in one minute by the combination of all spray pad and recirculation pumps, whichever is greater.

**612.5.2.1 Basin materials and design.** The basin shall be constructed of materials which are inert, corrosion resistant and non toxic. Basins shall be constructed of concrete, fiberglass, high density polyethylene, stainless steel or other approved materials. The design of basins shall anticipate all anticipated loadings under full and empty conditions. Such loading conditions shall be determined by a design professional who has experience with the design of public pools.

**612.5.2.2 Basin access.** The basin shall be designed for access for cleaning and inspection. Not less than one access of opening of not less than 3 foot by 3 foot (914mm by 914 mm) shall be provided for placement of a ladder into the basin. All access opening covers shall be locked or shall require tools to open.

### **612.5.2.3 Circulation pump.**

The circulation pump shall be sized to turnover the surge basin capacity in ½ hour or less. The intake for the pump shall be located at the lowest elevation of the surge basin. Where separate pumps are installed for the circulation system and the spray nozzles system, the suction intakes for those pumps shall be located on opposite ends of the basin.

-

**612.5.2.4 Spray nozzles and water feature pumps.** Spray nozzles and water feature systems shall be supplied water from the discharge of the recirculation pump or from separate pumps. Where separate pumps are installed for the recirculation system and a spray nozzles or water feature system, the suction intakes for spray nozzles and water feature pump systems shall be located adjacent to the recirculation pump discharge point in the basin.

**612.5.2.5 Pump control.** The controls for spray nozzles and water feature pump systems shall prevent operation of those pumps when the recirculation pump is not operating.

**612.5.2.6 Disinfection system.** In addition to filtration and sanitizing equipment required by Chapter 3 and this chapter, the recirculation system shall be equipped with an ultraviolet light disinfection unit. The unit shall listed and labeled to NSF 50. Where a method other than ultraviolet disinfection is being considered as an alternative method in accordance with Section 104.9, such method shall provide a reduction in the level of cryptosporidium that is equal to or greater than the ultraviolet light method. The alternative method's cryptosporidium reduction capability shall be determined by a nationally recognized testing laboratory.

### **612.5.2.6.1 UV unit location.**

The ultraviolet light disinfection unit shall be located on the recirculation system and upstream of any water connection for, or separate pump intake for, supplying spray nozzles or water features.

**612.5.2.6.2 UV intensity meter.** The chamber of the ultraviolet light disinfection unit shall be equipped with a ultraviolet light intensity meter that is located opposite and at the greatest water depth from the ultraviolet light

source. The meter shall be filtered to restrict its sensitivity to the disinfection spectrum.

#### **612.5.2.7 Control of pumps by UV meter.**

The ultraviolet light intensity meter shall interlock with the controls for pumps that supply water for the spray nozzles and water features systems. Where the ultraviolet light intensity meter senses an ultraviolet dosage rate of less than 40 mJ/cm<sup>2</sup>, the interlock shall lock out those pumps from operation.

#### **612.5.2.8 Make-up water system.**

The surge basin shall be provided with a make-up water system that is supplied with potable water. The potable water supply shall be protected against backflow in accordance with the *International Plumbing Code*.

**612.5.3 Diverter valve.** The drainage piping for the splash zone shall have a diverter valve to divert splash zone drainage away from the surge basin when the spray pad is not in operation. The diverted drainage shall be to an approved place of disposal.

**612.6 Operating instructions.** Operating instructions for spray pads shall require that the circulation system be operated continuously for not less than 4 turnovers prior to the pumps for the spray nozzles and water features systems being turned on for use of the spray pad.

**612.7 Lighting.** Where a spray pad will be in operation at night or during periods of inadequate natural lighting, artificial lighting shall be provided. Such lighting shall be installed in accordance with the manufacturer's instructions and NFPA 70.

**Reason:** In the last cycle, the APSP organization proposed similar language for these highly popular water play areas that are rapidly becoming an alternative for some public swimming pools in many jurisdictions across the country. The technical committee disapproved the proposal because the term that was used in the proposed language for naming these attractions was a trademarked term. (The proposed SPRAY PADS is not, to our knowledge, a trademarked term.) There was no disagreement by the committee that this information was needed for the code but the trademarked term just had to be changed. Unfortunately, the proposal was disapproved by the membership at final action hearing.

Waterparks have included these attractions in their array of fun things to do at the park for many years. As large waterparks are highly focused on the safety and cleanliness of all water used at the park, regulations didn't seem to be necessary for these attractions - the waterparks knew what to do, how to do it and have an excellent track record. However, as these types of attractions move into the public sector, many people who are responsible for choosing and operating this equipment might be lacking the (waterparks') knowledge about what is critical for a safe installation. Those involved in the pool and spa industry and those involved in operating public pools in jurisdictions across the country are well aware of a water contamination occurrence in one of these attractions at a Traverse City, MI city park not so long ago.

The ISPSC is the best place to install these requirements within the I-code family of codes as these attractions involve circulated and filtered water (similar to what a pool or spa uses) for recreational use even though such attractions do not involve users "bathing" (immersing themselves) in bodies of water.

The most recent edition of the California Building Code is reflective of many of the proposed concepts and details of the language of this proposal.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International

Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 10.

**Cost Impact:** Will increase the cost of construction

This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. Specifically, the code is currently silent about these types of attractions which means that any supplier of these attractions could provide any kind of equipment (of safe design or not). In some cases, having these regulations in code will make the cost of some suppliers' attraction packages be more than if they did not have to comply with these minimum safety requirements. For other suppliers, these requirements are already included in their standard packages.

SP30-15 : 612 (New)-  
SNYDER4164

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** Play areas such as these might be covered under amusement device regulations. Having a minimum surge tank size of the 4000 gallons might be excessive for a small spray pad area. However, this proposal is heading in the right direction.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Swimming Pool and Spa Code**

**612.4 Splash zone.** The splash zone shall comply with Sections 612.4.2 through ~~612.4.5~~ 612.4.4.

**612.4.3 Nozzles on walking surfaces within the spray pad splash zone.** Water nozzles that spray from walking surfaces within the spray pad splash zone shall be flush with those surfaces. Openings in such nozzles shall not exceed ½ inch (12.7 mm).

**612.4.4 Other nozzles.** Nozzles, other than those on walking surfaces within the spray pad splash zone, shall be designed to be clearly visible.

**612.5.1 Catch screen.** A catch screen, filter or basket shall be provided for splash zone ~~drainage piping connections to the surge basin~~ recirculation and feature pumps. The screen, filter or basket shall be designed with

openings that do not exceed No. 20 United States standard mesh (0.0331 inches) [0.841 mm]. The screen, filter or basket assembly shall have the capacity to prevent larger debris from entering the surge basin. that is not less than would be expected to accumulate in a 24 hour period.

**612.5.2 Surge basin.** A surge basin shall be provided ~~having~~ . The basin shall have a capacity of not less than 4000 1000 gallons or ten times the maximum number of gallons that can be pumped to water features in one minute by the combination of all spray pad and recirculation pumps, whichever is greater. The surge basin shall be configured to limit the basin water level drop to not more than 15 percent of the basin's maximum water depth when all pumps are operating and the pump discharge piping is completely filled with water.

**612.5.2.1 Basin materials and design.** The basin shall be constructed of materials which are inert, corrosion resistant and non toxic. Basins shall be constructed of concrete, fiberglass, high density polyethylene, stainless steel or other *approved* materials. ~~The design of basins~~ Basin materials in contact with the water shall anticipate comply with material standards for potable water tanks. Basins shall be designed for all anticipated loadings under full and empty conditions. Such loading conditions shall be determined by a design professional who has experience with the design of public pools.

**612.5.2.3 Circulation pump.** The circulation pump shall be sized to turnover the surge basin capacity in ~~1/2 hour~~ 30 minutes or less. The intake for the pump shall be located at the lowest elevation of the surge basin. Where separate pumps are installed for the circulation system and the spray nozzles system, the suction intakes for those pumps shall be located ~~on opposite ends of~~ as recommended by the basin manufacturer or design professional.

~~**612.4.5 Potable water for foggers and misters.** Foggers and misters that produce finely atomized water mists shall be supplied only with potable water. Foggers and misters shall not be supplied with water from the surge basin.~~

~~**612.5.2.6.2 UV intensity meter.** The chamber of the ultraviolet light disinfection unit shall be equipped with a ultraviolet light intensity meter that is located opposite and at the greatest water depth from the ultraviolet light source. The meter shall be filtered to restrict its sensitivity to the disinfection spectrum.~~

~~**612.5.2.7 Control of pumps by UV meter.** he ultraviolet light intensity meter shall interlock with the controls for pumps that supply water for the spray nozzles and water features systems. Where the ultraviolet light intensity meter senses an ultraviolet dosage rate of less than 40 mJ/cm<sup>2</sup>, the interlock shall lock out those pumps from operation.~~

~~**612.5.3 Diverter valve.** The drainage piping for the splash zone shall have a diverter valve to divert splash zone drainage away from the surge basin when the spray pad is not in operation. The diverted drainage shall be to an approved place of disposal.~~

**Commenter's Reason:** Spray pads are currently not addressed in the ISPSC, but they are a type of water containment system used for aquatic recreation across the

country. Therefore, it is imperative this type of feature be added to the ISPSC to ensure minimum standards exist to safeguard the public who uses them. Various standards exist across the country and in some places no standards exist. This public comment addresses concerns of the committee by making changes to certain sections of the original proposal to better align with industry best practices in the area of spray pads. Specifically this public comment provides the following:

- 612.4.3 & 612.4.4 - clarity that the nozzles are within the spray pad splash zone; without this addition the terminology is vague and could be misinterpreted.
- 612.5.1 - includes filter as another alternative device to keep debris from surge tank and allows design professionals to size debris collection device to anticipated debris loads for each spray pad installation.
- 612.5.2 - changes the minimum surge tank from 4000 to 1000 gallons due to the fact 4000 gallons is more than needed in small spray pads; the goal is to have enough water not to allow the tank level to drop and cause cavitation or lose prime.
- 612.5.2.1 - provides for consistency with water tower standards in regard to surface standard.
- 612.5.2.3 - changes hours to minutes to be consistent with what is used elsewhere in the code when timeframes are less than 1 hour and refers one to either the manufacturers recommendations or design professional in regard to placement of suction intakes due to the fact multiple options exist; the original language boxed one in to only one acceptable means of placement.
- 612.4.5 - removes this section because it is not needed, as all features must run through a UV system.
- 612.5.2.6.2 & 612.5.2.7 — removes sections that restrict design professionals to a single method of determining UV disinfection levels that has proven unreliable in prior installations.
- 612.5.3 - removes section that adds design complexity by requiring automated valving or that relies on daily operation of manual valves to ensure proper splash zone drainage in favor of design professionals properly sizing surge tanks.

**SP30-15**

# SP32-15

809.3

## **Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

## **2015 International Swimming Pool and Spa Code**

**Revise as follows:**

**809.3 Secondary entries and exits.** Where water depth in the deep area of a pool exceeds 5 feet (1524 mm), a means of entry and exit shall be provided in the deep area of the pool.

**Exception:** Where a means of exit from the deep end of a pool would present a potential hazard, handholds shall be provided for the means of exit.

**Reason:** Since the APSP-5 2011 standard was published, several calls have been received from builders and fiberglass pool manufacturers expressing concern that the language in Section 6.1 of APSP-5 is creating problems both in construction and for fiberglass pool manufacturers with existing molds. According to the language in the 2011 edition of APSP-5, these existing molds can no longer be used. The existing language has been modified to help clarify and remedy this section. Hopefully, it will eliminate the problems encountered by builders and manufacturers, while at the same time, eliminate the misperception of a shallow end being the deep end based on the assumption that a ladder signifies the deep end.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 9.

**Cost Impact:** Will not increase the cost of construction  
This proposal will not increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

SP32-15 : 809.3-  
SNYDER4171

---

## **Public Hearing Results**

**Committee Action:** **Approved as Submitted**

**Committee Reason:** The language aligns the code with the APSP 5 standard.

**Assembly Action :** **None**

---

## **Individual Consideration Agenda**

## *Public Comment 1:*

**Proponent : Jennifer Hatfield, J. Hatfield & Associates, PL, representing Association of Pool & Spa Professionals (jhatfield@apsp.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Swimming Pool and Spa Code**

**809.3 Secondary entries and exits.** Where water depth in the deep area of a pool exceeds 5 feet (1524 mm), a means of entry and exit as indicated in Section 809.2 shall be provided in the deep area of the pool.

**Exception:** Where the required placement of a means of exit from the deep end of a pool would present a potential hazard, handholds shall be provided as an alternative for the means of exit.

**Commenter's Reason:** The original proposal addressed concerns that certain types of pools would not be allowed if this exception were not added (which was consistent with this also having been addressed in the ANSI/APSP/ICC 5 Residential Inground Standard). However, an additional modification to the proposal needs to be made due to the fact a handhold is not a means of exit under the ISPSC, but the way the proposal is currently written would suggest it is; therefore, we are suggesting the public comment to address this concern.

The public comment ensures that a handhold can be utilized in lieu of a means of exit, at the same time clarifying that a handhold is not a means of exit. If, for example, a vanishing edge pool on a mountainside was being built, if a means of exit were provided it would constitute a potential hazard as the user could end up over the side of the mountain if they exited on the vanishing end of the pool. Without the public comment it would imply a handhold is a means of exit, meaning a handhold could be used to exit over a mountainside, which we believe is not the intent.

Rather, the public comment defines the handhold as an alternative to exiting; allowing the bather to "hand-walk" along the edge to safety.

**SP32-15**

## Proposed Change as Submitted

**Proponent :** James Ranfone, representing American Gas Association (jranfone@aga.org)

### 2015 International Fuel Gas Code

Revise as follows:

#### SECTION 202 DEFINITIONS

##### THERMOSTAT.

###### **Electric switch type.**

A device that senses changes in temperature and controls electrically, by means of separate components, the flow of gas to the burner(s) to maintain selected temperatures.

~~**Integral gas valve type.** An automatic device, actuated by temperature changes, designed to control the gas supply to the burner(s) in order to maintain temperatures between predetermined limits, and in which the thermal actuating element is an integral part of the device.~~

- ~~1. Graduating thermostat. A thermostat in which the motion of the valve is approximately in direct proportion to the effective motion of the thermal element induced by temperature change.~~
- ~~2. Snap-acting thermostat. A thermostat in which the thermostatic valve travels instantly from the closed to the open position, and vice-versa.~~

**Reason:** The term integral gas valve type thermostat does not appear in the IFGC.

**Cost Impact:** Will not increase the cost of construction  
There are no specific code requirements for this type of thermostat.

FG9-15 : 202-  
THERMOSTAT-  
RANFONE4947

---

## Public Hearing Results

**Committee Action:**

**Approved as Submitted**

**Committee Reason:** Approval was based on the proponent's published reason statements.

**Assembly Motion:**

**Disapprove**

**Online Vote Results:**

**Successful**

Support: 53.15% (59) Oppose: 46.85% (52)

**Assembly Action :**

**Disapproved**

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Assembly Action requests Disapprove.**

**Commenter's Reason:** This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. The assembly action for Disapprove was successful by a vote of 53.15% (59) to 46.85% (52) by eligible members online during the period of May 14 - May 28, 2015.

### *Public Comment 2:*

**Proponent : Brent Ursenbach, representing Utah Chapter ICC (bursenbach@slco.org) requests Disapprove.**

**Commenter's Reason:** The reason statement for the original proposal; stating the term integral gas valve type thermostat does not appear in the IFGC is not completely accurate. Referring to ***IFGC Section 615 Sauna Heaters, 615.6 Heat and time controls. Sauna heaters shall be equipped with a thermostat which will limit room temperature to 194°F (90°C). If the thermostat is not an integral part of the sauna heater, the heat-sensing element shall be located within 6 inches (152 mm) of the ceiling. If the heat-sensing element is a capillary tube and bulb, the assembly shall be attached to the wall or other support, and shall be protected against physical damage.***

The last sentence in this section refers to a *heat sensing element that is a capillary tube and bulb*. Capillary tube and bulb thermostats/heat sensing units often are integral with the gas valve. They are not electric, rather they are an integral type gas valve.

Integral type thermostats are found in various gas appliances including decorative appliances, cooking appliances, wall furnaces, floor furnaces and sauna heaters.

An example of an integral gas valve type thermostat is a Robertshaw 4290-006 hydraulic thermostat, manufactured specifically for gas cooking appliances. The dial for temperature selection, the hydraulic sensing bulb and the gas valve are all integral, all part of a single assembly.

This definition should not be removed from the code.

---

**FG9-15**

# FG10-15

## Proposed Change as Submitted

**Proponent :** James Ranfone, representing American Gas Association (jranfone@aga.org)

### 2015 International Fuel Gas Code

Delete and substitute as follows:

#### SECTION 202 DEFINITIONS

##### UNIT HEATER.

~~**High-static pressure type.** A self-contained, automatically controlled, vented *appliance* having integral means for circulation of air against 0.2 inch (15 mm H<sub>2</sub>O) or greater static pressure. Such *appliance* is equipped with provisions for attaching an outlet air duct and, where the *appliance* is for indoor installation remote from the space to be heated, is also equipped with provisions for attaching an inlet air duct.~~

~~**Low-static pressure type.** A self-contained, automatically controlled, vented *appliance*, intended for installation in the space to be heated without the use of ducts, having integral means for circulation of air. Such units are allowed to be equipped with louvers or face extensions made in accordance with the manufacturer's specifications.~~

A self-contained, automatically controlled, vented, fuel-gas-burning space-heating appliance, intended for installation in the space to be heated without the use of ducts, and having integral means for circulation of air.

**Reason:** The IFGC code requirements do not differentiate between high- and low-static unit heaters and the terms do not appear in the code. The revised simplified definition is taken from the revised definition in the 2015 *National Fuel Gas Code*, ANSI Z223.1/NFPA 54. This proposal is offered solely for the purpose of coordinating the IFGC with ANSI Z223.1 (NFGC). This text is offered "as is" for the IFGC and it is not intended that such text be modified from a technical standpoint. The subject text was revised in the 2015 NFGC (ANSI Z223.1) and this proposal will cause the IFGC text to be consistent with such revised text in ANSI Z223.1 (NFGC).

**Cost Impact:** Will not increase the cost of construction  
The definition does not change the installation requirements for unit heaters.

FG10-15 : 202-UNIT  
HEATER (New)-  
RANFONE4938

---

## Public Hearing Results

**Assembly Action :**

**Approved as Modified**

**Online Floor Modification:**

**UNIT HEATER.** A self-contained, automatically controlled, vented, fuel-gas-burning space-heating appliance, intended for installation in the space to be heated ~~without the use of ducts,~~ and having integral means for circulation of air.

---

**Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Assembly Action**

**requests Approve as Modified by Successful Assembly Action.**

**UNIT HEATER.** A self-contained, automatically controlled, vented, fuel-gas-burning space-heating appliance, intended for installation in the space to be heated ~~without the use of ducts,~~ and having integral means for circulation of air.

**Commenter's Reason:** This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. The assembly action for Approve as Modified was successful by a vote of 80.18% (89) to 19.82% (22) by eligible members online during the period of May 14 - May 28, 2015.

*Public Comment 2:*

**Proponent : Brent Ursenbach, representing Utah Chapter ICC (bursenbach@slco.org) requests Approve as Modified by Successful Assembly Action.**

**UNIT HEATER.** A self-contained, automatically controlled, vented, fuel-gas-burning space-heating appliance, intended for installation in the space to be heated ~~without the use of ducts,~~ and having integral means for circulation of air.

**Commenter's Reason:** The successful assembly action deleted the phrase ~~without the use of ducts~~ from the original proposal. The original proposal failed to recognize many unit heater manufacturers produce unit heaters designed with centrifugal high static blower, specifically to move air through duct systems. The original proposal essentially defines in code, that all unit heaters are intended for installation without the use of ducts. Code officials will through this definition, cite unit heaters with ducts, to be in violation of the code. See the following websites for unit heaters in current production, designed for use with ducts.

The Reznor Unit Heater Catalog includes Models UDBS, UDBP and B, all equipment with centrifugal (duct-able) blowers capable of handling up to .5" w.c. of external static pressure on smaller models and up .75" w.c. external static pressure on larger models. [http://www.rezspec.com/files/C-UH\\_vH11.pdf](http://www.rezspec.com/files/C-UH_vH11.pdf)

The Modine Unit Heater Catalog includes Models HDB, BDP, BTS and BTC, all with centrifugal blowers designed for use with ducts.

# FG11-15

## 303.3

### **Proposed Change as Submitted**

**Proponent :** Timothy Manz, representing Association of Minnesota Building Officials (tmanz@ci.blaine.mn.us)

## **2015 International Fuel Gas Code**

### **Revise as follows:**

**303.3 Prohibited locations.** Appliances shall not be located in sleeping rooms, bathrooms, toilet rooms, storage closets or surgical rooms, or in a space that opens only into such rooms or spaces, except where the installation complies with one of the following:

1. The *appliance* is a direct-vent *appliance* installed in accordance with the conditions of the listing and the manufacturer's instructions.
2. Vented room heaters, wall furnaces, vented decorative appliances, vented gas fireplaces, vented gas fireplace heaters and decorative appliances for installation in vented solid fuel-burning fireplaces are installed in rooms that meet the required volume criteria of Section 304.5.
3. A single wall-mounted unvented room heater is installed in a bathroom and such unvented room heater is equipped as specified in Section 621.6 and has an input rating not greater than 6,000 Btu/h (1.76 kW). The bathroom shall meet the required volume criteria of Section 304.5.
4. A single wall-mounted unvented room heater is installed in a bedroom and such unvented room heater is equipped as specified in Section 621.6 and has an input rating not greater than 10,000 Btu/h (2.93 kW). The bedroom shall meet the required volume criteria of Section 304.5.
5. The *appliance* is installed in a room or space that opens only into a bedroom or bathroom, and such room or space is used for no other purpose and is provided with a solid weather-stripped door equipped with an *approved* self-closing device. All *combustion air* shall be taken directly from the outdoors in accordance with Section 304.6.
6. A gas clothes dryer is installed in a bathroom or toilet room and a permanent opening having an area of not less than 100 square inches is provided that allows the toilet room or bathroom to communicate with a common hallway or common space.

**Reason:** In older homes the electrical service is not large enough for an electric dryer, so installing a gas dryer is the only option. In many homes it is desirable to have the gas dryer in an over-sized bathroom or toilet room on an upper floor. This provision provides a safe installation by requiring a minimum 100 square inch opening to a common space that ensures adequate natural ventilation is provided.

**Cost Impact:** Will not increase the cost of construction  
This provision will not increase the cost of construction since it provides flexibility in the dryer installation.

## **Public Hearing Results**

**Committee Action:**

**Approved as Modified**

**Modification:**

**303.3 Prohibited locations.** Appliances shall not be located in sleeping rooms, bathrooms, toilet rooms, storage closets or surgical rooms, or in a space that opens only into such rooms or spaces, except where the installation complies with one of the following:

1. The *appliance* is a direct-vent *appliance* installed in accordance with the conditions of the listing and the manufacturer's instructions.
2. Vented room heaters, wall furnaces, vented decorative appliances, vented gas fireplaces, vented gas fireplace heaters and decorative appliances for installation in vented solid fuel-burning fireplaces are installed in rooms that meet the required volume criteria of Section 304.5.
3. A single wall-mounted unvented room heater is installed in a bathroom and such unvented room heater is equipped as specified in Section 621.6 and has an input rating not greater than 6,000 Btu/h (1.76 kW). The bathroom shall meet the required volume criteria of Section 304.5.
4. A single wall-mounted unvented room heater is installed in a bedroom and such unvented room heater is equipped as specified in Section 621.6 and has an input rating not greater than 10,000 Btu/h (2.93 kW). The bedroom shall meet the required volume criteria of Section 304.5.
5. The *appliance* is installed in a room or space that opens only into a bedroom or bathroom, and such room or space is used for no other purpose and is provided with a solid weather-stripped door equipped with an *approved* self-closing device. All *combustion air* shall be taken directly from the outdoors in accordance with Section 304.6.
6. A gas clothes dryer is installed in a residential bathroom or toilet room ~~and~~ having a permanent opening ~~having with~~ an area of not less than 100 square inches ~~is~~

~~provided that allows the toilet room or bathroom to communicate~~ communicates with a common hallway space outside of a sleeping room, bathroom, toilet room, or common space storage closet.

**Committee Reason:** Approval was based on the proponent's published reason statement. The modification replaced the undefined terms common hallway and common space with references to the spaces outside of the room containing the dryer.

**Assembly Motion:**

**Disapprove**

**Online Vote Results:**

**Successful**

Support: 70.09% (75) Oppose: 29.91% (32)

**Assembly Action :**

**Disapproved**

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : Bruce Swiecicki, representing Self (bswiczicki@npga.org) requests Approve as Modified by Committee.**

**Commenter's Reason:** The fact is that gas clothes dryers are being installed and used in residential bathrooms. This is necessary because of the shift to scaled down living spaces being utilized today. It is necessary for the code to address these installations so they can be made in a safe manner.

#### *Public Comment 2:*

**Proponent : Steven Rosenstock, Edison Electric Institute, representing Edison Electric Institute (srosenstock@eei.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Fuel Gas Code**

**303.3 Prohibited locations.** Appliances shall not be located in sleeping rooms, bathrooms, toilet rooms, storage closets or surgical rooms, or in a space that opens only into such rooms or spaces, except where the installation complies with one of the following:

1. The *appliance* is a direct-vent *appliance* installed in accordance with the conditions of the listing and the manufacturer's instructions.
2. Vented room heaters, wall furnaces, vented decorative appliances, vented gas fireplaces, vented gas fireplace heaters and decorative appliances for installation in vented solid fuel-burning fireplaces are installed in rooms that meet the required volume criteria of Section 304.5.
3. A single wall-mounted unvented room heater is installed in a bathroom and such unvented room heater is equipped as

- specified in Section 621.6 and has an input rating not greater than 6,000 Btu/h (1.76 kW). The bathroom shall meet the required volume criteria of Section 304.5.
4. A single wall-mounted unvented room heater is installed in a bedroom and such unvented room heater is equipped as specified in Section 621.6 and has an input rating not greater than 10,000 Btu/h (2.93 kW). The bedroom shall meet the required volume criteria of Section 304.5.
  5. The *appliance* is installed in a room or space that opens only into a bedroom or bathroom, and such room or space is used for no other purpose and is provided with a solid weather-stripped door equipped with an *approved* self-closing device. All *combustion air* shall be taken directly from the outdoors in accordance with Section 304.6.
  6. A gas clothes dryer is installed in a residential bathroom or toilet room having a permanent opening with an area of not less than 100 square inches that communicates with aspace outside of a sleeping room, bathroom, toilet room, or storage closet.

**Commenter's Reason:** This addition will clarify the code, and avoid confusion if a different type of dryer (such as an electric dryer) is installed.

### *Public Comment 3:*

**Proponent : Assembly Action requests Disapprove.**

**Commenter's Reason:** This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. The assembly action for Disapprove was successful by a vote of 70.09% (75) to 29.91% (32) by eligible members online during the period of May 14 - May 28, 2015.

---

FG11-15

# FG12-15

## 303.3.1 (New)

### **Proposed Change as Submitted**

**Proponent:** John Williams, CBO, Chair, representing Adhoc Health Care Committee (AHC@iccsafe.org)

## 2015 International Fuel Gas Code

**Add new text as follows:**

### **303.3.1 Fireplaces and decorative appliances in Group I-2**

**Condition 2 occupancies.** Gas fireplace appliances and decorative gas appliances shall be prohibited in Group I-2, condition 2 occupancies except in public lobby and waiting areas that are not within smoke compartments containing patient sleeping areas. Such fireplace appliances and decorative appliances shall be installed in accordance with all of the following:

1. The appliances shall be vented to the outdoors.
2. The appliances be of the direct-vent type.
3. The appliances shall automatically shut off upon activation of the fire alarm system serving the occupancy.
4. The appliance controls shall be located where they can be accessed only by facility staff.
5. A carbon monoxide detector with a local alarm shall be provided and installed in accordance with Section 915 of the *International Fire Code*.

**Reason:** The AHC committee is recommending limitations for the use of fuel gas-fired fireplaces and decorative equipment and the restriction of solid-fuel burning fireplaces and appliances in the Group I-2, Condition 2 occupancy. Please note: these are not new requirements for the Group I-2 Occupancy facilities but are needed in the I-Codes for coordination of the long-standing provision of the construction and operational requirements for healthcare facilities.

It is standard practice and operational procedure to control the ignition sources in healthcare occupancies that can contain combustible, flammable (and sometimes even explosive) material. Fire risks need to be limited to the maximum extent feasible and specific requirements for these facilities are not currently or are not completely addressed in the I-Codes.

The language proposed in the IFGC prescribes limitations and conditions to provide the necessary safety and limitations of hazards from within the healthcare environments to the fire and ignition sources inherent to all gas-fired fireplaces and appliances. Combustion air has been restricted from being drawn from healthcare environments extending beyond the last decade and is not a new requirement.

The physical separation of the combustion chambers of gas-fired fireplaces and equipment is required to separate and provide a barrier between the ignition sources and the environmental air within healthcare occupancies. All combustion air is required to be taken directly from the exterior of the building in accordance with an existing exception that is provided for in IFGC Section 303.3.

The placement of solid fuel burning fireplaces and appliances, both decorative and heating, creates conditions where open flames that are not otherwise able to be controlled or extinguished like the similar gas-fed and fired appliances. This is why the Adhoc Healthcare Committee is proposing their restriction instead of

a limitation with operational and special control equipment.

The code sections that address the installation limitations of fuel gas-fired fireplaces and appliances will also provide alternative means for compliance for existing facilities. Given the hazards present with these appliances in the Group I-2, Condition 2 Occupancies, the proposed IFC requirements will be 'retro-active' requirements for healthcare occupancies (Group I-2);

The proposals to the IFC that are being put forth by the Adhoc Healthcare Committee have been drafted to clarify, restrict and limit the ignition source hazards in healthcare occupancies and also will reference similar requirements being proposed in the IBC, IMC AND IFGC. For instance, solid fuel heating appliances are limited by other requirements of the IMC which is why heating appliances are not needed to be referenced in this section of the IFGC.

*There was a concern mentioned during testimony at the code hearings for the 2012 I-codes that the AHC code change proposals placing restrictions on solid fuel burning fireplaces and appliances and fuel gas-fired fireplaces and appliances might be misinterpreted to prohibit mechanical heating equipment elsewhere regulated in the IMC.*

*The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website. <http://www.iccsafe.org/cs/AHC/Pages/default.aspx>*

**Cost Impact:** Will not increase the cost of construction  
Wood burning fireplaces are not permitted by the federal CMS regulations, therefore, there is no change in cost of construction.

FG12-15 : 303.3.1  
(New)-WILLIAMS4239

---

## **Public Hearing Results**

**Committee Action:**

**Approved as Modified**

**Modification:**

**303.3.1 Fireplaces and decorative appliances in Group I-2 Condition 2 occupancies.** Gas fireplace appliances and decorative gas appliances shall be prohibited in Group I-2, condition 2 occupancies except where such appliances are direct-vent appliances installed in public lobby and waiting areas that are not within smoke compartments containing patient sleeping areas. ~~Such fireplace appliances and decorative appliances shall be installed in accordance with all of the following:~~

- ~~1. The appliances shall be vented to the outdoors.~~
- ~~2. The appliances be of the direct vent type.~~
- ~~3. The appliances shall automatically shut off upon activation~~

- ~~of the fire alarm system serving the occupancy.~~
- ~~4. The appliance controls shall be located where they can be accessed only by facility staff.~~
  - ~~5. A carbon monoxide detector with a local alarm shall be provided and installed in accordance with Section 915 of the International Fire Code.~~

**Committee Reason:** Approval was based on the proponent's published reason statements. The modification deletes the list of 5 requirements, some of which are already addressed by the codes. Items 1 and 2 in the list are appropriately combined and located in the main paragraph. Item 4 would be difficult to enforce.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : John Williams, CBO, representing Adhoc Healthcare Committee (AHC@iccsafe.org) requests Approve as Modified by this Public Comment.**

**Further Modify as Follows:**

#### **2015 International Fuel Gas Code**

**303.3.1 Fireplaces and decorative appliances in Group I-2 Condition 2 occupancies.** Gas fireplace appliances and decorative gas appliances shall be prohibited in Group I-2, condition 2 occupancies except where such appliances are *direct-vent appliances* installed in public lobby and waiting areas that are not within smoke compartments containing patient sleeping areas. The appliance controls shall be located where they can be accessed only by facility staff. Such fireplaces shall comply with Sections 501.2 and 604.1 and Section 915 of the *International Fire Code*.

**Commenter's Reason:** The committee was concerned that the other criteria are already addressed elsewhere, which is generally the case. However due to the unique application to Group I-2 Condition 2 occupancies the sections addressing these criteria need to be referenced. The one criteria that is not addressed is the access only by facility staff, which is a key requirement to meet current federal regulations. This type of access can be in a separate room, located at a nurses station or similar staff area, or a key switch at the unit where the staff is the only group carrying the key. The language selected for this public comment would cover any of those solutions.

The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website at: [Adhoc Healthcare](#).

# FG13-15

303.7

## Proposed Change as Submitted

**Proponent :** Guy McMann, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

### 2015 International Fuel Gas Code

**Revise as follows:**

**303.7 Pit locations.** Appliances installed in pits or excavations shall not come in direct contact with the surrounding soil and shall be installed not less than 6 inches above the pit or excavation floor. The sides of the pit or excavation shall be held back a minimum of 12 inches (305 mm) from the *appliance*. Where the depth exceeds 12 inches (305 mm) below adjoining grade, the walls of the pit or excavation shall be lined with concrete or masonry, such concrete or masonry shall extend a minimum of 4 inches (102 mm) above adjoining grade and shall have sufficient lateral load-bearing capacity to resist collapse. Excavation on the control side of the appliance shall extend not less than 30 inches (762 mm) horizontally from the appliance. The *appliance* shall be protected from flooding in an *approved* manner.

**Reason:** This section lacks some detail in floor and control side language. This modification completes this section and has all the information necessary for a code compliant installatoin.

**Cost Impact:** Will not increase the cost of construction  
There will be no additional cost as this is only a correlation between codes to make them consistent with each other.

FG13-15 : 303.7-  
MCMANN3367

---

## Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** The proposed requirement will increase the cost of construction by enlarging the pit on the control side of the appliance. There is no substantiation for the elevation height above the pit floor.

**Assembly Motion:**

**As Modified**

**Online Vote Results:**

**Successful**

Support: 60.91% (67) Oppose: 39.09% (43)

**Assembly Action :**

**Approved as Modified**

**Online Floor Modification:**

**303.7 Pit locations.** Appliances installed in pits or excavations shall not come in direct contact with the surrounding soil and shall be installed not less than ~~6~~3 inches

above the pit or excavation floor. The sides of the pit or excavation shall be held back a minimum of 12 inches (305 mm) from the appliance. Where the depth exceeds 12 inches (305 mm) below adjoining grade, the walls of the pit or excavation shall be lined with concrete or masonry, such concrete or masonry shall extend a minimum of 4 inches (102 mm) above adjoining grade and shall have sufficient lateral load-bearing capacity to resist collapse. Excavation on the control side of the appliance shall extend not less than 30 inches (762 mm) horizontally from the appliance. The appliance shall be protected from flooding in an approved manner.

#### *Public Comment 1:*

**Proponent : Assembly Action**

**requests Approve as Modified by Successful Assembly Action.**

**303.7 Pit locations.** Appliances installed in pits or excavations shall not come in direct contact with the surrounding soil and shall be installed not less than ~~6~~3 inches above the pit or excavation floor. The sides of the pit or excavation shall be held back a minimum of 12 inches (305 mm) from the appliance. Where the depth exceeds 12 inches (305 mm) below adjoining grade, the walls of the pit or excavation shall be lined with concrete or masonry, such concrete or masonry shall extend a minimum of 4 inches (102 mm) above adjoining grade and shall have sufficient lateral load-bearing capacity to resist collapse. Excavation on the control side of the appliance shall extend not less than 30 inches (762 mm) horizontally from the appliance. The appliance shall be protected from flooding in an approved manner.

**Commenter's Reason:** This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. The assembly action for Approve as Modified was successful by a vote of 60.91% (67) to 39.09% (43) by eligible members online during the period of May 14 - May 28, 2015.

#### *Public Comment 2:*

**Proponent : Bruce Swiecicki, representing National Propane Gas Association (bswiczicki@npga.org) requests Disapprove.**

**Commenter's Reason:** The submitter does not indicate that there are problems in the field, only that the section "lacks detail." This is hardly a good reason to impose a non-justified 30-inch spacing requirement to access controls on the appliance. This is not a safety issue.

# FG14-15

## 304.13(IFGS) (New)

### Proposed Change as Submitted

**Proponent :** James Ranfone, American Gas Association, representing American Gas Association (jranfone@aga.org)

## 2015 International Fuel Gas Code

**Add new text as follows:**

**304.13(IFGS) Existing appliances.** Where an existing appliance is located within the conditioned space of an existing building envelope and where a building envelope component, other than roofing material, is replaced or altered, the appliance installation shall be inspected to verify compliance with the provisions of Section 304 and Chapter 5. Where an appliance installation does not comply with Section 304 and Chapter 5, it shall be altered as necessary to be in compliance with such.

**Reason:** AGA is proposing an extract of section 9.1.24 from ANSI Z223.1, National Fuel Gas Code.

The code requirement would address renovations to existing buildings that could impact the supply of combustion air and the performance of venting systems. AGA is aware of weatherization programs that fail to consider the importance of ensuring that existing gas appliance installations continue to meet the IFGC combustion air and venting requirements when efforts to reduce air infiltration are undertaken. This proposal is offered solely for the purpose of coordinating the IFGC with ANSI Z223.1 (NFGC). This text is offered "as is" for the IFGC and it is not intended that such text be modified from a technical standpoint. The subject text was revised in the 2015 NFGC (ANSI Z223.1) and this proposal will cause the IFGC text to be consistent with such revised text in ANSI Z223.1 (NFGC).

**Cost Impact:** Will increase the cost of construction

The cost to inspect appliances will be added to projects that alter exterior building components. There may be additional costs to bring the appliance installation up to compliance with the IFGC. These are necessary costs to ensure the life-safety of the building occupants.

FG14-15 : 304.13 (IFGS)  
(New)-RANFONE4964

**FG14-15**

# FG20-15

## 401.10

### **Proposed Change as Submitted**

**Proponent :** Bruce Swiecicki, representing National Propane Gas Association (bswecicki@npga.org)

## **2015 International Fuel Gas Code**

**Delete and substitute as follows:**

**401.10 Third-party testing and certification. Piping materials standards.** ~~Piping, tubing and fittings shall comply with the applicable referenced standards, specifications and performance criteria of this code and shall be identified in accordance with Section 401.9. Piping, tubing and fittings shall either be tested by an approved third party testing agency or certified by an approved thirdparty certification agency.~~  
Piping, tubing and fittings shall be manufactured to the applicable referenced standards, specifications and performance criteria listed in Section 403 of this code and shall be identified in accordance with Section 401.9.

**Reason:** This requirement in the International Fuel Gas Code has far ranging impact that wasn't anticipated at the code development hearings. In many cases, there are no certification or testing requirements to use for flare nuts, tees, pipe nipples, etc. The current requirement in section 401.10 is extremely onerous to the fuel gas industry with very little, if any, benefit to society. Piping, tubing and fittings are fabricated to various materials standards, such as those published by the American Society for Testing and Materials (ASTM) and the American Society of Mechanical Engineers (ASME). The material standards are shown in Section 403 of the IFGC. Third party testing or certification is a needless and unjustified expense to the industry. There has been no data presented to indicate that piping and fittings have been failing in the field.

**Cost Impact:** Will not increase the cost of construction  
This proposal will markedly decrease the cost of construction without affecting the safety of the piping installation. The reason is that manufacturers will not be required to pay for a needless exercise of obtaining a third party certification to verify that their manufactured products comply with the appropriate material standards.

FG20-15 : 401.10-  
SWIECICKI5663

### **Public Hearing Results**

**Committee Action:**

**Approved as Submitted**

**Committee Reason:** Approval is based the proponent's published reason statements.

**Assembly Motion:**

**Disapprove**

**Online Vote Results:**

**Failed**

Support: 49.53% (53) Oppose: 50.47% (54)

**Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Curtis Dady, representing Viega, LLC  
(curtis.dady@viega.us) requests Disapprove.**

**Commenter's Reason:** The purpose of a 3rd party listing/certification is to confirm that a product has been independently evaluated other than by the manufacturer. Fuel gases are inherently dangerous and 3rd party certification requirements are a reasonable precaution to hold manufacturers to a minimum level of accountability, especially in the case of new and/or imported products. Viega strongly urges reconsideration of the previous approval.

**FG20-15**

# FG22-15

404.6

## Proposed Change as Submitted

**Proponent :** James Ranfone, American Gas Association, representing American Gas Association (jranfone@aga.org)

### 2015 International Fuel Gas Code

Revise as follows:

#### **404.6 ~~Underground penetrations prohibited.~~ Piping through foundation wall.** Gas

Underground piping shall not penetrate building installed through the outer foundation walls at any point below grade. Gas piping shall enter and exit or basement wall of a building at , shall be encased in a point above grade and the annular protective sleeve or protected by an approved device or method. The space between the pipe gas piping and the sleeve and between the sleeve and the wall shall be sealed to prevent entry of gas and water.

**Reason:** A change adopted into the 2015 edition prohibits gas piping from penetrating a foundation or basement wall below grade. This change was adopted without evidence that such penetrations have resulted in a safety concern. Below grade penetrations have a long been permitted and have proven to be a safe installation method. The revised language would reinstate this allowance. At least one State, Georgia, has amended the IFGC to delete the prohibition and allow below grade penetration similar to the proposed text. GA test is as follows: "404.6 Piping through foundation wall. Underground piping where installed below grade through the foundation or basement wall of a building, shall be encased in a protective pipe sleeve. The annular space between the gas piping and the sleeve shall be sealed."

**Cost Impact:** Will not increase the cost of construction  
The reinstated installation practice will decrease installation costs.

**FG22-15**

# FG27-15

## 408.4

### **Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

## **2015 International Fuel Gas Code**

### **Revise as follows:**

**408.4 Sediment trap.** Where a sediment trap is not incorporated as part of the appliance, a sediment trap shall be installed downstream of the appliance shutoff valve as close to the inlet of the appliance as practical. The sediment trap shall be ~~either a tee fitting having a capped nipple of any length installed vertically in the bottommost opening of the run of the tee as illustrated in Figure 408.4 or other device approved as an effective sediment trap.~~ Illuminating appliances, ranges, clothes dryers, decorative vented appliances for installation in vented fireplaces, gas fireplaces and outdoor grills need not be so equipped.

**Reason:** The option for an "other device approved as an effective sediment trap" has been misinterpreted to allow configurations of tees that allow debris to pass over a nipple and cap installed in the branch opening of a tee. The current option was meant to address factory-built sediment trap devices, but they are not known to exist. This proposal clarifies the intent by referring to the run of tee which is consistent with the current FIGURE 408.4 of the code. The intent is not to allow the nipple cap to be connected to the branch opening of a tee because debris can simply jump over the branch opening.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

FG27-15 : 408.4-  
SNYDER3279

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The code official could always approve an alternative sediment trap device with or without the deleted text..

**Assembly Motion:**

**FG27-15**

# FG30-15

## 409.5.3

### **Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

## **2015 International Fuel Gas Code**

### **Revise as follows:**

**409.5.3 Located at manifold.** Where the *appliance* shutoff valve is installed at a manifold, such shutoff valve shall be located within 50 feet (15 240 mm) of the *appliance served*, shall be located on the same floor level as the *appliance served* and shall be readily accessible and permanently identified. The *pipng* from the manifold to within 6 feet (1829 mm) of the *appliance* shall be designed, sized and installed in accordance with Sections 401 through 408.

**Reason:** Section 409.5.3 allows the appliance shutoff valve to be located up to 50 feet from the appliance served. The code does not specify how the 50 foot limit is to be measured, therefore, it could be a straight line passing through walls and floors. This allowance could mean that a furnace in an attic could have its shutoff valve on a manifold that is located in the basement in a one, two or even 3 story building. Not only is this terribly inconvenient for the service personnel, but it could also be hazardous. In such cases, the service personnel would likely have to install a second shutoff valve at the appliance to save the hassle of running back and forth between the basement and the attic. There is no justification for allowing the only service shutoff valve to be so remote. The required shutoff valve is recognized as being there for servicing the appliance, however, it is not useful for servicing an appliance if it is located where it is impractical to access.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

FG30-15 : 409.5.3-  
SNYDER3281

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** There is no history of a problem or evidence of a hazard with the current code allowance. The code already allows a redundant shutoff valve to be installed at the appliance location.

**Assembly Motion:  
Online Vote Results:**

**As Submitted  
Successful**

Support: 54.72% (58) Oppose: 45.28% (48)

**Assembly Action :**

**Approved as Submitted**

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : Assembly Action  
requests Approve as Submitted.**

**Commenter's Reason:** This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. The assembly action for Approve as Submitted was successful by a vote of 54.72% (58) to 45.28% (48) by eligible members online during the period of May 14 - May 28, 2015.

#### *Public Comment 2:*

**Proponent : Bruce Swiecicki, representing National Propane Gas Association (bswicicki@npga.org) requests Disapprove.**

**Commenter's Reason:** The proponent's reason is mostly concerned with doing away with an inconvenience for the service personnel. But there is nothing in the code that would prevent the installer from putting an appliance shutoff valve at each appliance.

So looking at the safety aspect, where is the problem? It actually would be safer to permit the shutoff valve at the manifold in a basement (which is commonly done) because the gas to the appliance can be shut off without having to move the appliance, which is commonly needed with cook-stoves and clothes dryers that are installed in tight spaces. This avoids the hazards associated with moving an appliance to access the shutoff valve behind it in order to repair a leaking appliance connector.

The proponent's claim that the cost of construction would not be increased is blatantly incorrect. The cost of construction would definitely increase due to the additional piping and shutoff valves required.

In summary, the configuration of a manifolded CSST system is commonly used in basements of houses and other buildings. It has worked well and without a true safety reason to prohibit this type of installation, this code change should be disapproved.

Here is a picture of a typical CSST manifold. Note the red shutoff valve that can serve all the branches. This does not preclude the installation of separate shutoff valves at each appliance where deemed necessary.

FG30-15

# FG34-15

## 411.1, 411.4 (New)

### Proposed Change as Submitted

**Proponent :** James Ranfone, American Gas Association, representing American Gas Association (jranfone@aga.org)

## 2015 International Fuel Gas Code

### Revise as follows:

**411.1 Connecting appliances.** Except as required by Section 411.1.1, *appliances* shall be connected to the *pipng* system by one of the following:

1. Rigid metallic pipe and fittings.
2. Corrugated stainless steel tubing (CSST) where installed in accordance with the manufacturer's instructions.
3. Semirigid metallic tubing and metallic fittings. Lengths shall not exceed 6 feet (1829 mm) and shall be located entirely in the same room as the *appliance*. Semirigid metallic tubing shall not enter a motor-operated *appliance* through an unprotected knockout opening.
4. *Listed and labeled appliance* connectors in compliance with ANSI Z21.24 and installed in accordance with the manufacturer's instructions and located entirely in the same room as the *appliance*.
5. *Listed and labeled* quick-disconnect devices used in conjunction with *listed and labeled appliance* connectors.
6. *Listed and labeled* convenience outlets used in conjunction with *listed and labeled appliance* connectors.
7. *Listed and labeled outdoor appliance* connectors in compliance with ANSI Z21.75/CSA 6.27 and installed in accordance with the manufacturer's instructions.
8. *Listed outdoor gas hose* connectors in compliance with ANSI Z21.54 used to connect portable outdoor appliances. The gas hose connection shall be made only in the outdoor area where the appliance is used, and shall be to the gas *pipng* supply at an appliance shutoff valve, a listed quick-disconnect device or listed gas convenience outlet.
9. Gas hose connectors for use in laboratories and educational facilities in accordance with Section 411.4

### Add new text as follows:

**411.4 Injection Bunsen-type burners** Injection Bunsen-type burners used in laboratories and educational facilities shall be connected to the gas supply system by either a listed or unlisted hose.

**Reason:** The IFGC is currently silent on the use of unlisted connectors for injection burners commonly referred to as Bunsen burners. Unlisted hoses are the only readily available product for such installations and their use is common place. The new code requirement will allow the use of unlisted hoses approved by the AHJ. The revision is based on similar code requirement adopted into the 2015 National Fuel Gas Code, ANSI Z223.1/NFPA 54.

**Cost Impact:** Will not increase the cost of construction  
Recongionizes a product that is already used.

FG34-15 : 411.1-  
RANFONE5075

---

### **Public Hearing Results**

**Committee Action:** **Approved as Submitted**

**Committee Reason:** Approval was based on the proponent's published reason statement. Code officials have been requiring listed gas connectors instead of the historically used surgical tubing.

**Assembly Motion:** **Disapprove**  
**Online Vote Results:** **Successful**

Support: 66.04% (70) Oppose: 33.96% (36)

**Assembly Action :** **Disapproved**

---

*Public Comment 1:*

**Proponent : Assembly Action**  
**requests Disapprove.**

**Commenter's Reason:** This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. The assembly action for Disapprove was successful by a vote of 66.04% (70) to 33.96% (36) by eligible members online during the period of May 14 - May 28, 2015.

FG34-15

---

# FG35-15

## 411.2

### **Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

## **2015 International Fuel Gas Code**

**Revise as follows:**

**411.2 Manufactured home connections.** The connection between the gas distribution piping system for a manufactured home and the gas service shall be located outside of the footprint of the home. Manufactured homes shall be connected to the distribution *piping* system by one of the following materials:

1. Metallic pipe in accordance with Section 403.4.
2. Metallic tubing in accordance with Section 403.5.
3. *Listed and labeled* connectors in compliance with ANSI Z21.75/CSA 6.27 and installed in accordance with the manufacturer's instructions.

**Reason:** Current Section 404.6 expresses the concern for gas piping entering a building at some point below grade. Likewise there is a concern for gas service piping running underground to a point underneath a manufactured home. Such homes will have skirting that creates what is, in effect, a crawl space. Any gas leakage from an underground lateral and riser pipe will collect under the home. If there is no underground riser and connection is made directly to a meter setting, the meter and service regulator should not be under the home. Also, having the gas service riser outside of the footprint of the home will help protect it from damage when a home is moved in or out.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

FG35-15 : 411.2-  
SNYDER3282

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** There is no evidence of a problem with such connections under a manufactured home. Gas piping and connectors are allowed in crawl spaces. The term "gas service" could be confused with the utility service which is not

within the scope of the code.

**Assembly Motion:**

**As Submitted**

**Online Vote Results:**

**Failed**

Support: 40.57% (43) Oppose: 59.43% (63)

**Assembly Action :**

**None**

---

**Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Janine Snyder, representing Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

**2015 International Fuel Gas Code**

**411.2 Manufactured home connections.** ~~The connection between the Underground gas distribution piping system for a manufactured home and the gas service supply risers shall not be located outside of the footprint of the under a manufactured home.~~ Manufactured homes shall be connected to the distribution *piping* system by one of the following materials:

1. Metallic pipe in accordance with Section 403.4.
2. Metallic tubing in accordance with Section 403.5.
3. *Listed and labeled* connectors in compliance with ANSI Z21.75/CSA 6.27 and installed in accordance with the manufacturer's instructions.

**Commenter's Reason:** The committee thought that the words "gas service" could be confused with the utility owned equipment, so the text was revised to refer to underground gas supply risers, which are downstream of the meter setting. The purpose of the proposal is to prevent underground laterals and risers from being under a trailer where they are subject to damage while moving the trailer and where the piping could leak under the trailer. Current Section 404.6 prohibits piping from entering a building below grade and this proposal is a logical extension of that prohibition.

---

**FG35-15**

# FG38-15

## 618.4

### **Proposed Change as Submitted**

**Proponent :** Guy McMann, Jefferson County, Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

## **2015 International Fuel Gas Code**

### **Revise as follows:**

**618.4 Prohibited sources.** Outdoor or return air for forced air heating and cooling systems shall not be taken from the following locations:

1. Closer than 10 feet (3048 mm) from an *appliance* vent outlet, a vent opening from a plumbing drainage system or the discharge outlet of an exhaust fan, unless the outlet is 3 feet (914 mm) above the outside air inlet.
2. Where there is the presence of objectionable odors, fumes or flammable vapors; or where located less than 10 feet (3048 mm) above the surface of any abutting public way or driveway; or where located at grade level by a sidewalk, street, alley or driveway.
3. A hazardous or insanitary location or a refrigeration machinery room as defined in the *International Mechanical Code*.
4. A room or space, the volume of which is less than 25 percent of the entire volume served by such system. Where connected by a permanent opening having an area sized in accordance with Section 618.2, adjoining rooms or spaces shall be considered as a single room or space for the purpose of determining the volume of such rooms or spaces.

**Exception:** The minimum volume requirement shall not apply where the amount of return air taken from a room or space is less than or equal to the amount of supply air delivered to such room or space.

5. A room or space containing an *appliance* where such a room or space serves as the sole source of return air.

**Exception:** This shall not apply where:

1. The *appliance* is a direct-vent *appliance* or an *appliance* not requiring a vent in accordance with Section 501.8.
2. The room or space complies with the following requirements:
  - 2.1. The return air shall be taken from a room or space having a volume exceeding 1 cubic foot for each 10 Btu/h (9.6L/W) of combined input rating of all fuel-burning appliances therein.
  - 2.2. The volume of supply air discharged back into the same space shall be

approximately equal to the volume of return air taken from the space.

- 2.3. Return-air inlets shall not be located within 10 feet (3048 mm) of a draft hood in the same room or space or the combustion chamber of any atmospheric burner *appliance* in the same room or space.
3. Rooms or spaces containing solid fuel-burning appliances, provided that return-air inlets are located not less than 10 feet (3048 mm) from the firebox of such appliances.
6. A closet, bathroom, toilet room, kitchen, garage, boiler room, furnace room or unconditioned attic.  
**Exceptions:**
  1. Where return air intakes are located not less than 10 feet (3048 mm) from cooking appliances and serve only the kitchen area, taking return air from a kitchen area shall not be prohibited.
  2. Dedicated forced air systems serving only a garage shall not be prohibited from obtaining return air from the garage.
7. A crawl space by means of direct connection to the return side of a forced-air system. Transfer openings in the crawl space enclosure shall not be prohibited.
8. Indoor swimming pool enclosures and associated deck areas except where such spaces are dehumidified.

**Reason:** It's not desirable to pull return air from swimming pool areas due to the negative effects it would have on the system from humidity to chemical odors associated with such places. A dedicated system would be required, a combination of supply and exhaust or the air should be dehumidified. This scenario is consistent with the same dwelling unit built under the IMC.

**Cost Impact:** Will not increase the cost of construction  
No cost impact provided dehumidification is not required.

FG38-15 : 618.4-  
MCMANN3560

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The proposed text would not allow a dedicated HVAC system for the pool area. No technical justification was offered for the prohibition. There is no evidence that humidity negatively affects appliances.

**Assembly Motion:**

**As Modified  
Successful**

**Online Vote Results:**

Support: 60.19% (65) Oppose: 39.81% (43)

**Assembly Action :**

**Approved as Modified**

**Online Floor Modification:**

Outdoor or return air for forced air heating and cooling

systems shall not be taken from the following locations:

1. Closer than 10 feet (3048 mm) from an *appliance* vent outlet, a vent opening from a plumbing drainage system or the discharge outlet of an exhaust fan, unless the outlet is 3 feet (914 mm) above the outside air inlet.
2. Where there is the presence of objectionable odors, fumes or flammable vapors; or where located less than 10 feet (3048 mm) above the surface of any abutting public way or driveway; or where located at grade level by a sidewalk, street, alley or driveway.
3. A hazardous or insanitary location or a refrigeration machinery room as defined in the *International Mechanical Code*.
4. A room or space, the volume of which is less than 25 percent of the entire volume served by such system. Where connected by a permanent opening having an area sized in accordance with Section 618.2, adjoining rooms or spaces shall be considered as a single room or space for the purpose of determining the volume of such rooms or spaces.

**Exception:** The minimum volume requirement shall not apply where the amount of return air taken from a room or space is less than or equal to the amount of supply air delivered to such room or space.

5. A room or space containing an *appliance* where such a room or space serves as the sole source of return air.

**Exception:** This shall not apply where:

1. The *appliance* is a direct-vent *appliance* or an *appliance* not requiring a vent in accordance with Section 501.8.
2. The room or space complies with the following requirements:
  1. The return air shall be taken from a room or space having a volume exceeding 1 cubic foot for each 10 Btu/h (9.6L/W) of combined input rating of all fuel-burning appliances therein.
  2. The volume of supply air discharged back into the same space shall be approximately equal to the volume of return air taken from the space.
  3. Return-air inlets shall not be located within

- 10 feet (3048 mm) of a draft hood in the same room or space or the combustion chamber of any atmospheric burner *appliance* in the same room or space.
3. Rooms or spaces containing solid fuel-burning appliances, provided that return-air inlets are located not less than 10 feet (3048 mm) from the firebox of such appliances.
6. A closet, bathroom, toilet room, kitchen, garage, boiler room, furnace room or unconditioned attic.

**Exceptions:**

1. Where return air intakes are located not less than 10 feet (3048 mm) from cooking appliances and serve only the kitchen area, taking return air from a kitchen area shall not be prohibited.
  2. Dedicated forced air systems serving only a garage shall not be prohibited from obtaining return air from the garage.
7. A crawl space by means of direct connection to the return side of a forced-air system. Transfer openings in the crawl space enclosure shall not be prohibited.
8. Indoor swimming pool enclosures and associated deck areas except where the air from such spaces are/is dehumidified in accordance with Section 403.2.1 Item # 2 of the International Mechanical Code.

---

**Individual Consideration Agenda**

**Public Comment 1:**

**Proponent : Assembly Action  
requests Approve as Modified by Successful Assembly Action.**

Outdoor or return air for forcedair heating and cooling systems shall not be taken from the following locations:

1. Closer than 10 feet (3048 mm) from an *appliance* vent outlet, a vent opening from a plumbing drainage system or the discharge outlet of an exhaust fan, unless the outlet is 3 feet (914 mm) above the outside air inlet.
2. Where there is the presence of objectionable odors, fumes or flammable vapors; or where located less than 10 feet (3048 mm) above the surface of any abutting public way or driveway; or where located at grade level by a sidewalk, street, alley or driveway.
3. A hazardous or insanitary location or a refrigeration machinery room as

defined in the *International Mechanical Code*.

4. A room or space, the volume of which is less than 25 percent of the entire volume served by such system. Where connected by a permanent opening having an area sized in accordance with Section 618.2, adjoining rooms or spaces shall be considered as a single room or space for the purpose of determining the volume of such rooms or spaces.

**Exception:** The minimum volume requirement shall not apply where the amount of return air taken from a room or space is less than or equal to the amount of supply air delivered to such room or space.

5. A room or space containing an *appliance* where such a room or space serves as the sole source of return air.

**Exception:** This shall not apply where:

1. The *appliance* is a direct-vent *appliance* or an *appliance* not requiring a vent in accordance with Section 501.8.
  2. The room or space complies with the following requirements:
    1. The return air shall be taken from a room or space having a volume exceeding 1 cubic foot for each 10 Btu/h (9.6L/W) of combined input rating of all fuel-burning appliances therein.
    2. The volume of supply air discharged back into the same space shall be approximately equal to the volume of return air taken from the space.
    3. Return-air inlets shall not be located within 10 feet (3048 mm) of a draft hood in the same room or space or the combustion chamber of any atmospheric burner *appliance* in the same room or space.
  3. Rooms or spaces containing solid fuel-burning appliances, provided that return-air inlets are located not less than 10 feet (3048 mm) from the firebox of such appliances.
6. A closet, bathroom, toilet room, kitchen, garage, boiler room, furnace room or unconditioned attic.

**Exceptions:**

1. Where return air intakes are located not less than 10 feet (3048 mm) from cooking appliances and serve only the kitchen area, taking return air from a kitchen area shall not be prohibited.
  2. Dedicated forced air systems serving only a garage shall not be prohibited from obtaining return air from the garage.
7. A crawl space by means of direct connection to the return side of a forced-air system. Transfer openings in the crawl space enclosure shall not be prohibited.
  8. Indoor swimming pool enclosures and associated deck areas except where the air from such spaces are dehumidified in accordance with Section 403.2.1 Item # 2 of the International Mechanical Code.

**Commenter's Reason:** This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. The assembly action for Approve as Modified was successful by a vote of 60.19% (65) to 39.81% (43) by eligible members online during the period of May 14 - May 28, 2015.

## *Public Comment 2:*

**Proponent : Brent Ursenbach, representing Utah Chapter ICC**

**(bursenbach@slco.org) requests Approve as Modified by this Public Comment.**

**Replace Proposal as Follows:**

**2015 International Fuel Gas Code**

**618.4 Prohibited sources.** Outdoor or return air for forced air heating and cooling systems shall not be taken from the following locations:

1. Closer than 10 feet (3048 mm) from an *appliance* vent outlet, a vent opening from a plumbing drainage system or the discharge outlet of an exhaust fan, unless the outlet is 3 feet (914 mm) above the outside air inlet.
2. Where there is the presence of objectionable odors, fumes or flammable vapors; or where located less than 10 feet (3048 mm) above the surface of any abutting public way or driveway; or where located at grade level by a sidewalk, street, alley or driveway.
3. A hazardous or insanitary location or a refrigeration machinery room as defined in the *International Mechanical Code*.
4. A room or space, the volume of which is less than 25 percent of the entire volume served by such system. Where connected by a permanent opening having an area sized in accordance with Section 618.2, adjoining rooms or spaces shall be considered as a single room or space for the purpose of determining the volume of such rooms or spaces.

**Exception:** The minimum volume requirement shall not apply where the amount of return air taken from a room or space is less than or equal to the amount of supply air delivered to such room or space.

5. A room or space containing an *appliance* where such a room or space serves as the sole source of return air.

**Exception:** This shall not apply where:

1. The *appliance* is a direct-vent *appliance* or an *appliance* not requiring a vent in accordance with Section 501.8.
2. The room or space complies with the following requirements:
  - 2.1. The return air shall be taken from a room or space having a volume exceeding 1 cubic foot for each 10 Btu/h (9.6L/W) of combined input rating of all fuel-burning appliances therein.
  - 2.2. The volume of supply air discharged back into the same space shall be approximately equal to the volume of return air taken from the space.
  - 2.3. Return-air inlets shall not be located within 10 feet (3048 mm) of a draft hood in the same room or space or the combustion chamber of any atmospheric burner *appliance* in the same room or space.

3. Rooms or spaces containing solid fuel-burning appliances, provided that return-air inlets are located not less than 10 feet (3048 mm) from the firebox of such appliances.
6. A closet, bathroom, toilet room, kitchen, garage, boiler room, furnace room or unconditioned attic.

**Exceptions:**

1. Where return air intakes are located not less than 10 feet (3048 mm) from cooking appliances and serve only the kitchen area, taking return air from a kitchen area shall not be prohibited.
2. Dedicated forced air systems serving only a garage shall not be prohibited from obtaining return air from the garage.
7. A crawl space by means of direct connection to the return side of a forced-air system. Transfer openings in the crawl space enclosure shall not be prohibited.
8. Indoor swimming pool enclosures and associated deck areas.

**Exceptions:**

1. Where the air from such spaces is dehumidified in accordance with Section 403.2.1 Item #2 of the International Mechanical Code.
2. Dedicated HVAC systems that serve only such spaces.

**Commenter's Reason:** The original proposal was modified at the Hearings, but disapproved by the committee; however, an Assembly Motion for As Modified was successful. This public comment includes the successful Assembly Motion relocating it into a new Exception 1. This Public Comment adds an additional Exception 2, allowing return air to be drawn from a pool enclosure if a dedicated system, similar to the exception for a garage in item 6 of this code section.

FG38-15

# FG39-15

## 621.4

### **Proposed Change as Submitted**

**Proponent :** Craig Conner, representing self  
(craig.conner@mac.com)

## **2015 International Fuel Gas Code**

### **Revise as follows:**

**621.4 Prohibited locations.** Unvented room heaters shall not be installed within occupancies in Groups A, E and I. Unvented room heaters shall not be installed within new dwelling units. The location of unvented room heaters shall comply with Section 303.3.

**Reason:** Unvented heaters in the newer, more airtight homes present a serious health issue. The solution is simple. Use a vented heater. New homes are much tighter due to the increased stringency in energy codes. Between the 2009 IECC and the 2015 IECC the required air tightness roughly doubled. As homes get rapidly tighter, air quality concerns grow.

Which codes and standards already prohibit unvented room heaters? The IFGC prohibits unvented heaters in occupancy groups A, E and I in Section 621.4. Minnesota and California prohibit them. Wisconsin prohibits them in houses built after 1980. Houston Texas, New York City, and many other cities prohibit unvented heaters. The ASHRAE ventilation standard excludes unvented heaters from its scope, presumably because the ASHRAE ventilation standards are not sufficient for unvented heaters (Section 3.2 , ASHRAE 62.2-2013). Furthermore, many large builders will not install unvented heaters, in part out of concern for liability.

In the last code cycle the IFGC committee disapproved a proposal similar to this. The ICC Report of the Hearing gave three reasons. Each reason is quoted below and responded to:

Committee- "The proposal would prohibit unvented heaters in older homes that have greater air infiltration."

Response- This proposal only applies to new dwelling units, units required to be much more airtight by the new energy code.

Committee- "The nitrogen dioxide levels discussed are more stringent than recommended by the CPSC."

Response- This reason statement notes both the Consumer Products Safety Commission (CPSC) nitrogen dioxide limits and the more recent US EPA National Ambient Air Quality Standards<sup>1</sup> limit. Both standards were exceeded in the measurements cited in the paragraph below.

Committee- "No substantiation was given to demonstrate that the current restrictions for these appliances are inadequate. "

Response- The next two paragraphs cite a study of unvented heaters in actual use.

A study by the Building Research Council (BRC study) at the University of Illinois measured the air quality in 30 homes with unvented heaters<sup>2</sup>. In the short monitoring period (3 to 4 days) several combustion products exceeded health limits in some of the houses. Of greatest concern is the nitrogen dioxide level inside the home. About 40% of the homes exceeded the Consumer Product Safety Council's nitrogen dioxide limit of 0.300 ppm. About 80% of the homes exceeded the US EPA National Ambient Air Quality Standards of 0.100 ppm. The BRC study concluded excessive nitrogen dioxide was inherently associated with unvented heaters: "Levels of NO<sub>2</sub> that exceeded health-based guidelines occurred regardless of usage patterns, so should be considered inherent in the fireplace performance".

Unvented heaters operate like humidifiers, but without humidity controls. Combustion of methane, the main component of natural gas, produces one part carbon dioxide

and two parts water. Depending on the heater size and use duration the water produced could be a fraction of a cup (small heater, limited use) to more than a gallon (large heater, 4+ hours). The BRC study shows that some use unvented heaters for 4 hours or more.

ASHRAE's position paper on unvented heaters drew these conclusions from the BRC study: "This study found that 20% of homes exceeded the EPA and WHO threshold for an 8-hour average CO level of 9 ppm, primarily when they were used for continuous, extended periods of time. This usage pattern is contrary to industry recommendations, which state that unvented heaters should be used as supplemental heaters, not primary heaters or for excessive periods of time." As the ASHRAE position paper noted, the BRC study calls into question industry assumptions of only 2-hour usage periods in their safety studies. "Of the 30 homes, one used the fireplace as the sole source of heat for the home." And "... five were used continuously at least once for longer than 4 hours." The BRC study found longer period of use were associated with pollutant levels that exceeded health standards. Industry safety analysis usage assumptions need to be revised to include longer periods of use.

Yes, the unvented heaters have an "oxygen depletion sensor" (ODS). It is perhaps stating the obvious, but an oxygen sensor monitors oxygen, but not nitrogen dioxide or carbon monoxide. This sensor does not protect against other pollutants, such as the nitrogen dioxide and carbon monoxide levels the BRC study measured as exceeding the CSPC and EPA standards<sup>1</sup> in real homes.

In conclusion, the Consumer Product Safety Commission<sup>3</sup> suggests removing air quality issues at the source: "Usually the most effective way to improve indoor air quality is to eliminate individual sources of pollution or to reduce their emissions." The CPSC recommends unvented heater users reduce the exposure to unvented heater combustion products in homes with unvented heaters- "While a space heater is in use, open a door from the room where the heater is located to the rest of the house and open a window slightly." This would seem antithetical to good energy efficiency practice. Building codes cannot and should not require doors or windows to be open to let in extra air to address health concerns.

Using a vented heater in a new, airtight home is a simple solution.

**Bibliography:** "Measured concentrations of combustion gases from the use of unvented gas fireplaces". P. W. Francisco, J. R. Gordon, B. Rose. 2010. Indoor Air journal. Volume 20. Pages 370-379.

**Cost Impact:** Will increase the cost of construction  
Vented heaters require a vent and are more limited in the practical locations where they can be placed. Vented heaters cost more to purchase.  
Using these devices as heaters, as is sometimes [recommended by the "vent-free" industry](#), is not an acceptable trade of health/safety for \$\$ savings.

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** No technical justification was offered. The Z21/83 standards have no issues with these appliances. The added moisture is beneficial humidification.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : Craig Conner, representing self (craig.conner@mac.com) requests Approve as Submitted.**

**Commenter's Reason:** Unvented heaters exhaust all combustion products, including pollutants, into the indoor air. These pollutants, such as nitrogen dioxide that is the focus of this reason statement, can accumulate to unsafe levels. These levels can exceed the EPA's air quality standards.

EPA identifies nitrogen dioxide as one of "six principal pollutants". (1) The levels of nitrogen dioxide allowed in unvented heater exhaust by the unvented heater "safety standard" greatly exceed EPA's air quality standard (details below). The pollutant levels allowed in heater exhaust can rapidly raise the pollutant levels in minimum sized rooms to well above the EPA air quality standards. The IMC, IFGC and IRC require most heating devices to be vented to the outside. Likewise, the unvented heater problem is not hard to fix. Just use the vented version of these heaters in new dwellings.

In this code cycle, there was a proposal to add unvented alcohol-burning devices to the IMC (M106-15). The unvented alcohol burning device safety standard has the same nitrogen dioxide limit for its flue gases. (2) The IMC committee disapproved M106-15, stating "*The allowable NOx emissions are above the EPA limits for such.*" (3) So the IMC committee rejected a "safety standard" for exhaust combustion products that exceeded the EPA air quality standard. Consistency is needed here for indoor air quality and enforcement.

How much does the unvented heater "safety standard" allow exhaust to exceed the Environmental Protection Agency's (EPA's) National Ambient Air Quality Standards? (4) A lot. The gas unvented heater safety standard is ANSI Z21-11.2. It limits nitrogen dioxide in unvented heater flue gases to 20,000 ppb (parts per billion). (5) EPA's "primary" air quality standard for nitrogen dioxide is 100 ppb. (6) Therefore, the exhaust flue gas pollutants, which vent directly into the room air, can be 200 TIMES that of EPA's air quality standard.

One measure of chemical toxicity is the IDLH level (Immediately Dangerous to Life and Health). The National Institute for Occupational Safety and Health's value for IDLH for nitrogen dioxide is the same level the "safety standard" allows unvented heaters to exhaust. (7) Unvented heaters rely on diluting their exhaust pollutants in indoor air, the same air the occupants breath. Using indoor air to dilute pollutant levels is a very poor way to manage pollutants.

How does the flue gas exhaust volume from one hour of unvented heater use

compare to the volume of the code-required minimum-size room? The IFGC and IRC specify a minimum of 1 cf of room for each 20 btu/hr of unvented heater. (8) This means bigger rooms for bigger heaters, and conversely smaller rooms for smaller heaters. But the flue gas volume from one hour of use is about 16.5% of the minimum room volume. (9) If these gases from one hour of use stayed in the room, would they exceed the EPA air quality standard? Yes, and would be more than 33 TIMES the EPA air quality standard in that one hour. (10)

Opponents of this change might counter with "Wouldn't some nitrogen dioxide leave the room or be dissipated?". Yes, some nitrogen dioxide reacts with surfaces of the room, moves into other rooms or is indirectly exhausted outside after being vented into the indoor air. Some lump these nitrogen dioxide reductions together into a "decay rate". The decay rate might cut the nitrogen dioxide by half, which still puts the code-minimum room above the EPA's air quality standard. (11) In the second hour of unvented heater use the room starts with the nitrogen dioxide from the previous hour (a level already above the EPA standard). And it just keeps getting worse because pollutant levels build.

What are the health effects of increased nitrogen dioxide? According to the American Lung Association (12): inflamed airways, cough and wheezing, reduced lung function, increased asthma attacks, more emergency room and hospital admissions, increased respiratory infection, such as influenza. The ALA notes unvented heaters as one source for nitrogen dioxide.

Some homes have nitrogen dioxide from other sources. Homes with gas stoves or ovens usually start with low, but safe, levels of nitrogen dioxide. Homes near busy roads, freeways or airports tend to start with higher levels. Large urban areas tend to be worse; for example Chicago, Detroit, Atlanta, Los Angeles, and the northeast corridor are worse. (12) Unvented heaters in those homes with other sources of nitrogen dioxide will more quickly exceed safe levels of nitrogen dioxide.

Proponents of this change may ask if the unvented heater safety device, the Oxygen Depletion Sensor (ODS), would also protect against high levels of nitrogen dioxide. The answer is no. As the name suggests, the ODS responds to oxygen levels, not nitrogen dioxide levels. The nitrogen dioxide limit is exceeded long before the ODS stops the heater for a low oxygen level.

Why focus on new dwelling units? People spend a great deal of time in their homes, and new homes are the tightest.

Unvented heaters pollute the living space. The code should require vented heaters in the living space.

Notes:

(1) From the EPA web site:

*"The Clean Air Act ... requires EPA to set National Ambient Air Quality Standards ... for pollutants considered harmful to public health and the environment." "EPA has set National Ambient Air Quality Standards for six principal pollutants..."* <http://www.epa.gov/air/criteria.html>

(2) Section 13.10 of UL 1370 limits nitrogen dioxide in the exhaust (called "air free sample") to the same limits as the gas unvented heaters, "0.002 %" or 20000 ppb.

(3) 2015 Report of the Committee Action Hearings on M106-15, page 160  
<http://www.iccsafe.org/wp-content/uploads/2015-ReportCAHResults.pdf>

(4) National Ambient Air Quality Standards <http://www.epa.gov/air/criteria.html>

(5) IFGC requires ANSI Z21-11.2, titled *Gas-fired Room Heaters-Volume II-Unvented*

Room Heaters, for unvented heaters. ANSI Z21-11.2-2013 Section 5.4.4 gives "0.002%" as the limit for nitrogen dioxide in unvented heater flue gases (exhaust). In ppb, the units of the EPA air quality standard, this is 20000 ppb.

(6) From the EPA website:

The 100 ppb is a "primary standard" intended to "provide public health protection, including protecting the health of 'sensitive' populations such as asthmatics, children, and the elderly". <http://www.epa.gov/air/criteria.html>

The unvented heater manufacturers would prefer to use an older standard for air quality from EPA's Consumer Product Safety Commission (CPSC), which set at 300 ppb limit; however the unvented heater flue gas exhaust "safety standard" greatly exceeds even the older CPSC standard.

(7) National Institute for Occupational Safety and Health guide to chemical hazards for nitrogen dioxide. <http://www.cdc.gov/niosh/npg/npgd0454.html>

(8) The IFGC/IRC minimum size room is in IFGC Sections 621.5 and 501.8; also in IRC Section G2425.8.

(9) The calculation of exhaust volume compared to room volume:

Natural gas has 1028 btu/cf. <http://www.eia.gov/tools/faqs/faq.cfm?id=45&t=8>

Each cf of natural gas vents 8.5 cf of air [http://www.engineeringtoolbox.com/fuels-air-flue-gas-d\\_170.html](http://www.engineeringtoolbox.com/fuels-air-flue-gas-d_170.html) (Air is only 21% oxygen, other gases are not part of combustion, but are vented also.)

20 Btu / cf of room volume is the code minimum room

$20 \text{ Btu} / (1028 \text{ Btu/cf}) * 8.5 = 0.165$  or 16.5%

or 16.5% of room volume is exhausted per hour of heater use.

(10) Exhaust is 200 times EPA air quality standard. It fills 16.5% of the volume.

$200 * 0.165 = 33$  times EPA air quality standard for exhaust mixed into room.

(11) It's complicated. Decay rates vary a lot. I assumed about 1 as an "industry friendly" decay rate. The industry has used similar values, for example values from 0.78 to 1.33 (in Table 2) in *The Impact of Unvented Gas Heating Appliances on Indoor Nitrogen Dioxide Levels in 'Tight' Homes*

[http://www.ahrinet.org/App\\_Content/ahri/files/Product%20Section/Vent-Free%20NO2%20Modeling%20Study%20Final%20Summary%20March%202021%202013.pdf](http://www.ahrinet.org/App_Content/ahri/files/Product%20Section/Vent-Free%20NO2%20Modeling%20Study%20Final%20Summary%20March%202021%202013.pdf)

Pollution is worse in rooms that are not directly supplied with air or vented to the outside.

(12) From the American Lung Association:

<http://www.lung.org/healthy-air/outdoor/resources/nitrogen-dioxide.html>

## Public Comment 2:

**Proponent : Don Denton, Consulting Engineer to the Vent-Free Gas Products Alliance, representing Consulting Engineer to the Vent-Free Gas Products Alliance (ventfree@comcast.net) requests Disapprove.**

**Commenter's Reason:** I agree with the Committee's unanimous disapproval of FG 39.

The proponent alleges that there are increased indoor air quality concerns when unvented gas heaters are installed in unusually tight homes.

Energy efficient homes built more tightly require less heat. Vent-free heaters operate for shorter time periods and have less impact on indoor air quality. This fact has been documented in many research projects over the past 20 years, including those performed by Gas Research Institute (GRI), American Gas Association

Research, Risksciences, Toxcel, and Wilson Environmental.

Moreover, unvented gas heating products meet nationally recognized indoor air quality guidelines for all types of house construction--energy efficient or not--throughout every heating region in the United States. ASHRAE has studied unvented gas fireplaces for 15 years, and it has not proposed any special ventilation requirements, including homes with tight construction.

The CPSC has recognized this industry for its remarkable safety record. CSA, the ANSI Secretariat, has opined that "vent-free (unvented) gas heaters are arguably the safest gas products on the market." All products are certified by an independent certification agency to a national product standard, ANSI Z21.11.2, for safety, performance, and construction. About 23 million units have been used in the last 34 years with a proven safety record.

Similar proposals have been rejected through many code revision cycles, and usually by a unanimous decision. No code permitting unvented gas heaters has ever reversed its decision in the almost twenty years of the ICC's existence.

Consumers should be able to continue using unvented gas heaters as a matter of choice--just as they have done for decades.

# P2-15

## 202 (New)

### **Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

## **2015 International Plumbing Code**

**Add new definition as follows:**

### **SECTION 202 DEFINITIONS**

**CLEAR-WATER WASTE.** A water discharge from equipment that is translucent and devoid of solids.

**Reason:** There are frequent arguments within the plumbing industry about what constitutes clear-water waste. Some believe that such waste water must be as clear as potable water while others believe that is much too severe of definition. The existing code sections that use the term clear-water waste are provided below. From the context of where the term is used in the code, it should be obvious that clear-water might not necessarily be transparent (like looking through window glass) but on the other hand, the water might be a little murky because of suspended solids. In other words, translucent. The intent of including "devoid of solids" is to identify applications where large particles floated along by the water will immediately drop out of the water. How big of solids are of concern? The allowance in Section 802.3 for not having to provide a strainer for clear-water wastes give a hint about the solids size that doesn't seem to be an issue.

Sections in the IPC that use the term "clear water waste:

**709.4.1 Clear-water waste receptors.** Where waste receptors such as floor drains, floor sinks and hub drains receive only clear-water waste from display cases, refrigerated display cases, ice bins, coolers and freezers, such receptors shall have a drainage fixture unit value of one-half.

**801.1 Scope.** This chapter shall govern matters concerning indirect waste piping and special wastes. This chapter shall further control matters concerning food-handling establishments, sterilizers, clear-water wastes, swimming pools, methods of providing air breaks or air gaps, and neutralizing devices for corrosive wastes.

**802.1.3 Potable clear-water waste.** Where devices and equipment, such as sterilizers and relief valves, discharge potable water to the building drainage system, the discharge shall be through an indirect waste pipe by means of an air gap.

**802.1.5 Nonpotable clear-water waste.** Where devices and equipment such as process tanks, filters, drips and boilers discharge nonpotable water to the building drainage system, the discharge shall be through an indirect waste pipe by means of an air break or an air gap.

**802.2 Installation.** Indirect waste piping shall discharge through an air gap or air break into a waste receptor. Waste receptors shall be trapped and vented and shall connect to the building drainage system. All indirect waste piping that exceeds 30 inches (762 mm) in developed length measured horizontally, or 54 inches (1372 mm) in total developed length, shall be trapped.

**Exception:** Where a waste receptor receives only clear-water waste and does not directly connect to a sanitary drainage system, the receptor shall

not require a trap.

**802.3 Waste receptors.** For other than hub drains that receive only clear-water waste and standpipes, a removable strainer or basket shall cover the waste outlet of waste receptors. Waste receptors shall not be installed in concealed spaces. Waste receptors shall not be installed in plenums, crawl spaces, attics, interstitial spaces above ceilings and below floors. Ready access shall be provided to waste receptors.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 19.

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

**P2-15 : 202-CLEAR-WATER WASTE (New)-SNYDER3909**

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** Waste and soil are already clear in the code. There doesn't need to be another definition for waste.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Janine Snyder, representing Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org) requests Approve as Submitted.**

**Commenter's Reason:** The term CLEAR WATER WASTE is used six times in the IPC and needs a definition to clarify what is intended by the code.

**P2-15**

---

**P7-15**  
**202**

**Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

**2015 International Plumbing Code**

**Delete without substitution:**

**~~SECTION 202 DEFINITIONS~~**

**~~SWIMMING POOL.~~** Any structure, basin, chamber or tank containing an artificial body of water for swimming, diving or recreational bathing having a depth of 2 feet (610 mm) or more at any point.

**Reason:** There is no need for such a specific definition for a swimming pool within the context of how the term is used in the few places in the IPC. Water from a swimming pool is handled in the same manner no matter how a swimming pool is actually defined. And this definition conflicts with the definition of a swimming pool according to the International Swimming Pool and Spa Code.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 85.

**Cost Impact:** Will not increase the cost of construction  
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

**P7-15 : 202-SWIMMING  
POOL-SNYDER3914**

---

**Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The IPC needs a definition for a pool. Perhaps the IPSPSC definition should be used instead of the current definition.

**Assembly Action :**

**None**

---

**Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Janine Snyder, representing Plumbing, Mechanical and Fuel Gas Code Committee (PMGCAC@iccsafe.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

## **2015 International Plumbing Code**

### **SECTION 202 DEFINITIONS**

**SWIMMING POOL** A permanent or temporary structure that is intended to be used for swimming, bathing or wading and that is designed and manufactured or built to be connected to a circulation system. A swimming pool can be open to the public regardless of whether a fee is charged for its use or can be accessory to a residential setting where the pool is available only to the household and guests of the household.

**Commenter's Reason:** The Committee recommended that the IPC retain a definition for SWIMMING POOL and suggested that the definition in the ISPSC be used instead of the current definition. The ISPSC does not have a definition for SWIMMING POOL but does have the following definitions:

**PUBLIC SWIMMING POOL (Public Pool).** A pool, other than a residential pool, that is intended to be used for swimming or bathing and is operated by an owner, lessee, operator, licensee or concessionaire, regardless of whether a fee is charged for use.

**RESIDENTIAL SWIMMING POOL (Residential Pool).** A pool intended for use which is accessory to a residential setting and available only to the household and its guests.

These ISPSC definitions are not very informative with respect to how the term SWIMMING POOL is used in the IPC (***swimming pool*** is italicized and bolded in the following only for the purposes of this public comment statement):

**423.1 Water connections.** Baptisteries, ornamental and lily pools, aquariums, ornamental fountain basins, ***swimming pools***, and similar constructions, where provided with water supplies, shall be protected against backflow in accordance with Section 608.

**612.1 Solar systems.** The construction, installation, alterations and repair of systems, equipment and appliances intended to utilize solar energy for space heating or cooling, domestic hot water heating, ***swimming pool*** heating or process heating shall be in accordance with the *International Mechanical Code*.

**801.1 Scope.** This chapter shall govern matters concerning indirect waste piping and special wastes. This chapter shall further control matters concerning food-handling establishments, sterilizers, clear-water wastes, ***swimming pools***, methods of providing air breaks or air gaps, and neutralizing devices for corrosive wastes.

**802.1.4 Swimming pools.** Where waste water from ***swimming pools***, backwash from filters and water from pool deck drains discharge to the building drainage system, the discharge shall be through an indirect waste pipe by means of an *air gap*.

**1302.2 Sources.** Onsite nonpotable water reuse systems shall collect waste discharge from only the following sources: bathtubs, showers, lavatories, clothes washers, and laundry trays. Water from other approved nonpotable sources including ***swimming pool*** backwash operations, air conditioner condensate, rainwater, cooling tower blow-down water, foundation drain water, steam system condensate, fluid cooler discharge water, food steamer discharge water, combination oven discharge water, industrial process water, and fire pump test water shall also be permitted to be collected for reuse by onsite nonpotable water reuse systems, as approved by the code official and as appropriate for the intended application.

The Scope of the ISPSC (Section 101.2) offers additional information about pools that can add clarity for a more meaningful SWMMING POOL definition:

**101.2 Scope.**The provisions of this code shall apply to the construction, alteration, movement, renovation, replacement, repair and maintenance of aquatic recreation facilities, pools and spas. The pools and spas covered by this code are either permanent or temporary, and shall be only those that are designed and manufactured to be connected to a circulation system and that are intended for swimming, bathing or wading.

The proposed new IPC definition for SWMMING POOL proposed in this Public Comment is derived from the ISPSC Scope section and the Public and Residential pool definitions. This definition is the best that the PMGCAC can do to comply with Committee's recommendation to replace the current definition with the "ISPSC definition" of **swimming pool**.

Note however, having this ISPSC-based definition might not add any clarity or insight into the meaning of the IPC sections using the defined term. This raises the question as to whether a definition for swimming pool is needed at all to clarify enforcement of the sections in the IPC. Does the new definition somehow *limit* the extent of coverage that the code sections are intended to cover?

If the voters want the proposed definition, then the PMGCAC does not see any immediate concerns with using the proposed definition.

However, if the voters do not want the proposed definition, the PMGCAC strongly recommends that a motion be made for As Submitted for removal of the current definition. The current definition is not appropriate nor is it in alignment with how the ISPSC covers pools, especially wading pools. ISPSC Section 405.4 limits wading pool depth to a maximum depth of 18 inches. The current IPC definition for **swimming pool** would prevent wading pools from being within the scope of the IPC sections that use the term *swimming pool*. The PMGCAC believes that is not the intent of the IPC sections. The IPC would be better off without a definition as opposed to an improper and a limiting definition.

## **P9-15**

### **303.5 (New)**

#### **Proposed Change as Submitted**

**Proponent :** Bill LeVan, Cast iron Soil Pipe Institute, representing Cast Iron Soil Pipe Institute (blevan@mindspring.com)

### **2015 International Plumbing Code**

**Add new text as follows:**

**303.5 Cast iron soil pipe, fittings and components** Cast iron soil pipes and fittings, and the couplings used to join these products together, shall be third party listed and labeled. Third party certifiers or inspectors shall comply with the minimum inspection requirements of Annex A or Annex A1 of the ASTM and CISPI product standards indicated in the code for such products.

**Reason:** Third Party inspections of manufacturers of cast iron soil pipes and fittings and the couplings used to join these products together are required however not all third party inspectors are familiar with these essential items which must be inspected to assure compliance. The ASTM and CISPI standards were modified adding the minimum requirements which are reasonable and to minimize manufacturing defects. The ASTM and CISPI committees worked closely with third party certifiers to develop these inspection schemes.

**Cost Impact:** Will not increase the cost of construction. Improved inspection procedures at the manufacturing locations will reduce the amount of defects on jobsites before the installation is begun and reduce the amount of time needed for installation.

P9-15 : 303.5 (New)-  
LEVAN4523

---

### **Public Hearing Results**

**Committee Action:**

**Approved as Submitted**

**Committee Reason:** There needs to be emphasis on ensuring quality of the these pipe materials. The Annex in the ASTM standards provides additional requirements to ensure a quality product.

**Assembly Motion:**

**Disapprove**

**Online Vote Results:**

**Successful**

Support: 58.97% (92) Oppose: 41.03% (64)

**Assembly Action :**

**Disapproved**

---

### **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Assembly Action  
requests Disapprove.**

**Commenter's Reason:** This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. The assembly action for Disapprove was successful by a vote of 58.97% (92) to 41.03% (64) by eligible members online during the period of May 14 - May 28, 2015.

**P9-15**

---

# P15-15 Part II

## P2605.2 (New)

### Proposed Change as Submitted

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

**NOTE:** PART I DID NOT RECEIVE A PUBLIC COMMENT AND IS ON THE CONSENT AGENDA. PART I IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY FOLLOWING ALL OF PART II.

## 2015 International Residential Code

**Add new text as follows:**

**P2605.2 Thermal expansion tanks.** A thermal expansion tank shall not be supported by the piping that connects to the thermal expansion tank.

**Reason:** Too often, inspectors see thermal expansion tanks hanging on the piping that the tank connects to. Even the smallest size of tank could weigh up to 16 pounds when full of water. where these tanks are installed at the end of a horizontal rigid pipe from the side outlet of a tee, there is significant moment being applied to the piping. Larger tanks or longer pipes result in bigger moments. And perhaps a significant "moment" when the pipe cracks or breaks off. Although the this proposed section started off trying to identify where it was OK to support the tank from the piping, the realization was made that it would be easiest to just not have the piping support the tank. Strap the tank to the building structure or the water heater tank, or place the tank on top of the water heater where it will not be disturbed (and hopefully not exposed to heat from a nearby flue of a gas water heater.)

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 36.

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P15-15 Part II : P2605.2  
(New)-SNYDER5918

---

### Public Hearing Results

## Part II

**Committee Action:**

**Disapproved**

**Committee Reason:** The language seems to not require the tank to be supported at all. This is a good idea that needs some language rework for a public comment.

**Assembly Motion:**

**As Submitted**

**Online Vote Results:**

**Failed**

Support: 48.75% (78) Oppose: 51.25% (82)

**Assembly Action :**

**None**

---

**Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Janine Snyder, representing Plumbing, Mechanical and Fuel Gas Code Committee (PMGCAC@iccsafe.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

**2015 International Residential Code**

**P2605.2 Thermal expansion tanks.** A thermal expansion tank shall be supported in accordance with the manufacturer's instructions. Thermal expansion tanks shall not be supported by the piping that connects to the ~~thermal expansion~~ such tank.

**Commenter's Reason:** Part I of this proposal was modified by the IPC and for coordination between the plumbing codes, the requirement should be the same.

---

**P15-15 Part II**

## **P15-15 Part I**

### **308.10 (New)**

#### **Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

### **2015 International Plumbing Code**

**Add new text as follows:**

**308.10 Thermal expansion tanks.** A thermal expansion tank shall be supported according to the manufacturer's instructions. Tanks shall not be supported by the piping that connects to the thermal expansion tank.

**Reason:** Too often, inspectors see thermal expansion tanks hanging on the piping that the tank connects to. Even the smallest size of tank could weigh up to 16 pounds when full of water. where these tanks are installed at the end of a horizontal rigid pipe from the side outlet of a tee, there is significant moment being applied to the piping. Larger tanks or longer pipes result in bigger moments. And perhaps a significant "moment" when the pipe cracks or breaks off. Although the this proposed section started off trying to identify where it was OK to support the tank from the piping, the realization was made that it would be easiest to just not have the piping support the tank. Strap the tank to the building structure or the water heater tank, or place the tank on top of the water heater where it will not be disturbed (and hopefully not exposed to heat from a nearby flue of a gas water heater.)

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 36.

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

**P15-15 Part I : 308.10  
(New)-SNYDER5917**

---

### **Public Hearing Results**

## **Part I**

**Committee Action:**

**Approved as Modified**

**Modification:**

**308.10 Thermal expansion tanks.** A thermal expansion tank shall be

supported according to the manufacturer's instructions. Tanks shall not be supported by the piping that connects to the thermal expansion tank.

**Committee Reason:**

For the Modification only:

Some thermal expansion tank manufacturer's instructions do have installation instructions and even though the code requires, in general, the following of installation instructions, this is a good reminder for these components.

For the proposal As Modified:

Some thermal expansion tank manufacturer's instructions do not state anything about support of the tank. As a minimum, piping should not be used to support these tanks.

**Assembly Action :**

**None**

---

# P17-15

## Table 308.5

### Proposed Change as Submitted

**Proponent :** Pennie L Feehan, representing Copper Development Association (penniefeehan@me.com)

## 2015 International Plumbing Code

Revise as follows:

TABLE 308.5  
HANGER SPACING

PIPING MATERIAL	MAXIMUM HORIZONTAL SPACING (feet)	MAXIMUM VERTICAL SPACING (feet)
Brass pipe	10	10
Copper or copper-alloy pipe and tubing	8	10
Copper or copper-alloy tubing, 1/4-inch diameter and smaller	6	10
Copper or copper-alloy tubing, 1/2-inch diameter and larger	10	10

(Portions of table not shown remain unchanged)

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

- The maximum horizontal spacing of cast-iron pipe hangers shall be increased to 10 feet where 10-foot lengths of pipe are installed.
- For sizes 2 inches and smaller, a guide shall be installed midway between required vertical supports. Such guides shall prevent pipe movement in a direction perpendicular to the axis of the pipe

**Reason:** Brass is a copper alloy and the supporting requirements are covered under the Copper and Copper Alloy Pipe and Tubing line. The 6 foot requirement is too restrictive. The Copper Tubing Handbook written by Copper Development Association recommends horizontal support every 8 feet.

**Cost Impact:** Will not increase the cost of construction  
This proposal will not increase the cost of construction as this is only a clarification in the name of a product

P17-15 : T308.5-FEEHAN3788

### Public Hearing Results

#### Committee Action:

**Disapproved**

**Committee Reason:** Many people are not going to understand what copper alloy is especially when the standards for the materials still having a title that includes the term "brass". Would like to see a public comment that retains two separate rows, one for copper alloy pipe at 10 foot horizontal spacing and one for copper alloy tubing at 8 foot horizontal spacing.

**Individual Consideration Agenda**

*Public Comment 1:*

Proponent : **Pennie L Feehan, representing Copper Development Association requests Approve as Modified by this Public Comment.**

Modify as Follows:

**2015 International Plumbing Code**

**TABLE 308.5  
HANGER SPACING**

PIPING MATERIAL	MAXIMUM HORIZONTAL SPACING (feet)	MAXIMUM VERTICAL SPACING (feet)
Copper or copper-alloy pipe and tubing.	8 <sup>1</sup> / <sub>2</sub>	10
<u>Copper or copper-alloy tubing</u>	<u>8</u>	<u>10</u>

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

- a. The maximum horizontal spacing of cast-iron pipe hangers shall be increased to 10 feet where 10-foot lengths of pipe are installed.
- b. For sizes 2 inches and smaller, a guide shall be installed midway between required vertical supports. Such guides shall prevent pipe movement in a direction perpendicular to the axis of the pipe

**Commenter's Reason:** The original proposal combined pipe and tubing into one category and increased the strapping requirement. Brass and copper-alloy are the same materials and there is a conflict in the table. This public comment removes the term brass without changing the strapping requirements for copper and copper alloys pipe and tubing and eliminates the conflict the table.

P17-15

# P20-15 Part I

## 312.1

### **Proposed Change as Submitted**

**Proponent :** Michael Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservices.com)

## **2015 International Plumbing Code**

**Revise as follows:**

**312.1 Required tests.** The permit holder shall make the applicable tests prescribed in Sections 312.2 through 312.10 to determine compliance with the provisions of this code. The permit holder shall give reasonable advance notice to the code official when the plumbing work is ready for tests. The equipment, material, power and labor necessary for the inspection and test shall be furnished by the permit holder and he or she shall be responsible for determining that the work will withstand the test pressure prescribed in the following tests. All plumbing system piping shall be tested with either water or, for piping systems other than plastic, by air. After the plumbing fixtures have been set and their traps filled with water, the entire drainage system shall be submitted to final tests. The code official shall require the removal of any cleanouts if necessary to ascertain whether the pressure has reached all parts of the system.

**Exception:** For plastic piping systems, testing with a compressed gas shall be an alternative to hydrostatic testing where compressed air or other gas pressure testing is specifically authorized by all of the manufacturer's instructions for the plastic pipe and fittings products installed at the time the system is being tested, and compressed air or other gas testing is not otherwise prohibited by applicable codes, laws, or regulations outside of this code.

P20-15 Part I : 312.1-  
CUDAHY5894

---

### **Public Hearing Results**

## **Part I**

**Committee Action:**

**Disapproved**

**Committee Reason:** This exception needs to be more specific about what piping this applies to. Is this only intended for DWV piping?

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent :** Michael Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservices.com) requests Approve

**as Modified by this Public Comment.**

**Modify as Follows:**

## **2015 International Plumbing Code**

**312.1 Required tests.** The permit holder shall make the applicable tests prescribed in Sections 312.2 through 312.10 to determine compliance with the provisions of this code. The permit holder shall give reasonable advance notice to the code official when the plumbing work is ready for tests. The equipment, material, power and labor necessary for the inspection and test shall be furnished by the permit holder and he or she shall be responsible for determining that the work will withstand the test pressure prescribed in the following tests. All plumbing system piping shall be tested with either water or, for piping systems other than plastic, by air. After the plumbing fixtures have been set and their traps filled with water, the entire drainage system shall be submitted to final tests. The code official shall require the removal of any cleanouts if necessary to ascertain whether the pressure has reached all parts of the system.

**Exception:** For plastic piping systems intended for pressure service, testing with a compressed gas shall be an alternative to hydrostatic testing where compressed air or other gas pressure testing is specifically authorized by all of the manufacturer's instructions for the plastic pipe and fittings products installed at the time the system is being tested, and compressed air or other gas testing is not otherwise prohibited by applicable codes, laws, or regulations outside of this code.

**Commenter's Reason:** We stand by our original submittal with a slight modification to limit it to pressure piping systems. There was concern from the committee that this could be applied to DWV systems.

### *Public Comment 2:*

**Proponent : Mary Kimlinger, representing Uponor (mary.kimlinger@uponor.com); Gary Morgan, Viega LLC, representing Viega LLC (gary.morgan@viega.us) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

## **2015 International Plumbing Code**

**312.1 Required tests.** The permit holder shall make the applicable tests prescribed in Sections 312.2 through 312.10 to determine compliance with the provisions of this code. The permit holder shall give reasonable advance notice to the code official when the plumbing work is ready for tests. The equipment, material, power and labor necessary for the inspection and test shall be furnished by the permit holder and he or she shall be responsible for determining that the work will withstand the test pressure prescribed in the following tests. All plumbing system piping shall be tested with either water or, for piping systems other than plastic, by air. After the plumbing fixtures have been set and their traps filled with water, the entire drainage system shall be submitted to final tests. The code official shall require the removal of any cleanouts if necessary to ascertain whether the pressure has reached all parts of the system.

**Exception:** For plastic PEX piping systems, testing with a compressed gas shall be an alternative to hydrostatic testing where compressed air or other gas pressure testing is specifically authorized by all of the manufacturer's instructions for the plastic pipe and fittings products installed at the time the system is being tested, and compressed air or other gas testing is not otherwise prohibited by applicable codes, laws, or regulations outside of this code.

**Commenter's Reason:**

[**KIMLINGER**]: During the CAH the committee voted to disapprove the original change proposal because the term "plastic piping" was too vague to clearly define which piping materials should be allowed to be tested with air. This public comment addresses that concern by changing "plastic" to "PEX". This same change was made via a floor modification during the CAH for the IRC-M (Item #RM45-15) and was approved by that committee. Piping such as PEX will not shatter under pressure and poses no greater risk in an air pressure test than a metallic piping material. In addition, there are certain situations that make testing with water not feasible, such as below freezing temperatures and limited water access during install.

[**MORGAN**]: The intent of this proposal was to simply update the codes to allow for air testing of certain types of non-rigid plastic piping systems which are as safe to test with air as with metallic plumbing systems such as copper. The original proposal was lacking in that rather than specifically state the type of plastic pipe which can be safely tested, the proposal was "vague" and lacking definition that the technical committee was seeking and as a result this proposal was disapproved by the technical committee.

The same exact proposals (M150 & RM45) were made both in the residential mechanical and mechanical codes (which were heard after the plumbing codes) and with only one simple floor modification, both proposals passed unanimously by their respective technical committees.

It is commonly known and understood that PEX, like other polyolefin materials, will NEVER burst in a brittle way and will NEVER shatter unlike the rigid plastic pipes such as CPVC and PVC. If PEX fails during pressure testing it is ALWAYS in a ductile way where no parts of the pipe break into pieces. Therefore the simple addition of "PEX" used in place of "plastic" in the proposed exception statement will make it abundantly clear that PEX can be air tested safely.

This proposed modification simply applies the same exact language to the proposal as done for M150 and RM45.

The opponents of the original proposal spoke of catastrophic failures of plastic pipe where the pipe shattered and caused bodily harm but these same opponents readily admitted that these failures were all those of rigid plastic piping and NOT that of PEX tubing. I urge the voting members to end this unnecessary and long standing prohibition of air testing PEX piping systems which is absolutely no more hazardous to air test than metallic piping systems such as copper.

We urge acceptance of the original proposal as modified.

---

**P20-15 Part I**

# P20-15 Part II

## P2503.7

### **Proposed Change as Submitted**

**Proponent :** Michael Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservices.com)

## **2015 International Residential Code**

### **Revise as follows:**

**P2503.7 Water-supply system testing.** Upon completion of the water-supply system or a section of it, the system or portion completed shall be tested and proved tight under a water pressure of not less than the working pressure of the system or, for piping systems other than plastic, by an air test of not less than 50 psi (345 kPa). This pressure shall be held for not less than 15 minutes. The water used for tests shall be obtained from a potable water source.

**Exception:** For plastic piping systems, testing with a compressed gas shall be an alternative to hydrostatic testing where compressed air or other gas pressure testing is specifically authorized by all of the manufacturer's instructions for the plastic pipe and fittings products installed at the time the system is being tested, and compressed air or other gas testing is not otherwise prohibited by applicable codes, laws, or regulations outside of this code.

**Reason:** PPFA has a new air testing policy, which allows for some limited air testing of plastic piping systems, if a number of conditions are met.

**Bibliography:** PLASTIC PIPE AND FITTINGS ASSOCIATION POLICY ON TESTING PLASTIC PIPE AND FITTINGS INSTALLATIONS WITH COMPRESSED GAS, PPFA, 2014, <http://www.ppfahome.org/ub4.aspx>

Compressed air or any other compressed gases should not be used for pressure testing plastic plumbing systems.

#### EXCEPTIONS:

1.) With trap seal pull testing, where a completed DWV system is vacuum tested with all of its traps filled with water, and the trap seals are tested with a vacuum typically between one and two inches of water column.

2.) For plastic piping systems specifically designed for use with compressed air or gasses;

- Manufacturers' instructions must be strictly followed for installation, visual inspection, testing and use of the systems,

(and)

- Compressed air or other gas testing is not prohibited by the authority having jurisdiction (AHJ).

3.) When compressed air or other gas pressure testing is specifically authorized by the applicable written instructions of the manufacturers of all plastic pipe and plastic pipe fittings products installed at the time the system is being tested and compressed air or other gas testing is not prohibited by the authority having jurisdiction (AHJ).

The manufacturer should be contacted if there is any doubt as to how a specific

system should be tested.

**Cost Impact:** Will not increase the cost of construction

This proposal simply adds another option for air testing some specific piping materials into the code and as such, the option is not requiring that this method be chosen. Thus the code with this proposal added will not cause the cost of construction to increase.

P20-15 Part II : P2503.7-  
CUDAHY4677

---

## **Public Hearing Results**

### **Part II**

**Committee Action:**

**Disapproved**

**Committee Reason:** Air testing (of plastic piping) is not safe to do. This exception could be misunderstood to by inspectors to just allow air testing for plastic piping.

**Assembly Motion:**

**As Submitted**

**Online Vote Results:**

**Failed**

Support: 40.74% (66) Oppose: 59.26% (96)

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Michael Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservices.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Residential Code**

**P2503.7 Water-supply system testing.** Upon completion of the water-supply system or a section of it, the system or portion completed shall be tested and proved tight under a water pressure of not less than the working pressure of the system or, for piping systems other than plastic, by an air test of not less than 50 psi (345 kPa). This pressure shall be held for not less than 15 minutes. The water used for tests shall be obtained from a potable water source.

**Exception:** For plastic piping systems intended for pressure service, testing with a compressed gas shall be an alternative to hydrostatic testing where compressed air or other gas pressure testing is specifically authorized by all of the manufacturer's instructions for the plastic pipe and fittings products installed at the time the system is being tested, and compressed air or other gas testing is not otherwise prohibited by applicable codes, laws, or regulations outside of this code.

**Commenter's Reason:** We would like to submit the following modification to limit this testing exception to only pressure systems as we did for part I.

## *Public Comment 2:*

**Proponent : Mary Kimlinger, representing Uponor (mary.kimlinger@uponor.com); Gary Morgan, representing Viega LLC (gary.morgan@viega.us) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Residential Code**

**P2503.7 Water-supply system testing.** Upon completion of the water-supply system or a section of it, the system or portion completed shall be tested and proved tight under a water pressure of not less than the working pressure of the system or, for piping systems other than plastic, by an air test of not less than 50 psi (345 kPa). This pressure shall be held for not less than 15 minutes. The water used for tests shall be obtained from a potable water source.

**Exception:** For plastic PEX piping systems, testing with a compressed gas shall be an alternative to hydrostatic testing where compressed air or other gas pressure testing is specifically authorized by all of the manufacturer's instructions for the plastic pipe and fittings products installed at the time the system is being tested, and compressed air or other gas testing is not otherwise prohibited by applicable codes, laws, or regulations outside of this code.

**Commenter's Reason:**

**[KIMLINGER]:** During the CAH the committee voted to disapprove the original change proposal because the term "plastic piping" was too vague to clearly define which piping materials should be allowed to be tested with air. This public comment addresses that concern by changing "plastic" to "PEX". This same change was made via a floor modification during the CAH for the IRC-M (Item #RM45-15) and was approved by that committee. Piping such as PEX will not shatter under pressure and poses no greater risk in an air pressure test than a metallic piping material. In addition, there are certain situations that make testing with water not feasible, such as below freezing temperatures and limited water access during install.

**[MORGAN]:** The intent of this proposal was to simply update the codes to allow for air testing of certain types of non-rigid plastic piping systems which are as safe to test with air as with metallic plumbing systems such as copper. The original proposal was lacking in that rather than specifically state the type of plastic pipe which can be safely tested, the proposal was "vague" and lacking definition that the technical committee was seeking and as a result this proposal was narrowly defeated by the residential plumbing committee with a vote of 5/4 for disapproval.

The same exact proposals (M150 & RM45) were made both in the residential mechanical and mechanical codes (which were heard after the plumbing codes) and with only one simple floor modification, both proposals passed unanimously by their respective technical committees.

It is commonly known and understood that PEX, like other polyolefin materials, will NEVER burst in a brittle way and will NEVER shatter unlike the rigid plastic pipes such as CPVC and PVC. If PEX fails during pressure testing it is ALWAYS in a ductile way where no parts of the pipe break into pieces. Therefore the simple addition of "PEX" used in place of "plastic" in the proposed exception statement will make it abundantly clear that PEX can be air tested safely.

This proposed modification simply applies the same exact language to the proposal as done for M150 and RM45.

The opponents of the original proposal spoke of catastrophic failures of plastic pipe where the pipe shattered and caused bodily harm but these same opponents readily admitted that these failures were all those of rigid plastic piping and NOT that of PEX tubing. I urge the voting members to end this unnecessary and long standing prohibition of air testing PEX piping systems which is absolutely no more hazardous to air test than metallic piping systems such as copper.

We urge acceptance of the original proposal as modified.

---

**P20-15 Part II**

# P25-15

## 312.10.1

### **Proposed Change as Submitted**

**Proponent :** Michael Anthony, University of Michigan,  
representing University of Michigan (maanthon@umich.edu)

## **2015 International Plumbing Code**

### **Revise as follows:**

**312.10.1 Inspections.** ~~Annual~~ Periodic inspections shall be made of all backflow prevention assemblies and *air gaps* to determine whether ~~they~~ the assemblies are operable and the *air gaps* exist. The inspection intervals shall be determined by an approved reliability-centered inspection, testing and maintenance program or, in absence of such a program, inspections shall occur annually.

#### **Reason:**

We are over-testing on annual fixed interval testing in some installations and under-testing in others. Reliability centered maintenance is a method used by the airline industry and the military to use resources wisely. Large research universities such as ours prioritize our testing according to hazard and sometimes exceed minimum levels set by the host municipality. In other installations our testing records show that testing intervals should be relaxed in order to reduce maintenance-induced failures.

Utilizing Reliability Centered Maintenance - RCM- principles makes it possible for the process to be data-driven, rather than utilizing an arbitrary prescriptive testing interval, which may result in over-testing. RCM analyzes the failure modes and the mean time between failures. This improvement to the code allows us to present the results of this analysis, along with proposed optimized testing intervals to the ASJ.

#### **Bibliography:** Reliability Centered Maintenance:

[https://en.wikipedia.org/wiki/Reliability\\_centered\\_maintenance](https://en.wikipedia.org/wiki/Reliability_centered_maintenance)

It is generally used to achieve improvements in fields such as the establishment of safe minimum levels of maintenance, changes to operating procedures and strategies and the establishment of capital maintenance regimes and plans. Successful implementation of RCM will lead to increase in cost effectiveness, machine uptime, and a greater understanding of the level of risk that the organization is managing.

The late John Moubray, in his industry leading book RCM2, characterized Reliability-centered Maintenance as a process to establish the safe minimum levels of maintenance. This description echoed statements in the Nowlan and Heap report from United Airlines.

It is defined by the technical standard SAE JA1011, Evaluation Criteria for RCM Processes, which sets out the minimum criteria that any process should meet before it can be called RCM. This starts with the 7 questions below, worked through in the order that they are listed:

1. What is the item supposed to do and its associated performance standards?
2. In what ways can it fail to provide the required functions?
3. What are the events that cause each failure?
4. What happens when each failure occurs?

5. In what way does each failure matter?

6. What systematic task can be performed proactively to prevent, or to diminish to a satisfactory degree, the consequences of the failure?

7. What must be done if a suitable preventive task cannot be found?

Reliability centered maintenance is an engineering framework that enables the definition of a complete maintenance regime. It regards maintenance as the means to maintain the functions a user may require of machinery in a defined operating context. As a discipline it enables machinery stakeholders to monitor, assess, predict and generally understand the working of their physical assets. This is embodied in the initial part of the RCM process which is to identify the operating context of the machinery, and write a Failure Mode Effects and Criticality Analysis (FMECA). The second part of the analysis is to apply the "RCM logic", which helps determine the appropriate maintenance tasks for the identified failure modes in the FMECA. Once the logic is complete for all elements in the FMECA, the resulting list of maintenance is "packaged", so that the periodicities of the tasks are rationalised to be called up in work packages; it is important not to destroy the applicability of maintenance in this phase. Lastly, RCM is kept live throughout the "in-service" life of machinery, where the effectiveness of the maintenance is kept under constant review and adjusted in light of the experience gained.

RCM can be used to create a cost-effective maintenance strategy to address dominant causes of equipment failure. It is a systematic approach to defining a routine maintenance program composed of cost-effective tasks that preserve important functions.

The important functions (of a piece of equipment) to preserve with routine maintenance are identified, their dominant failure modes and causes determined and the consequences of failure ascertained. Levels of criticality are assigned to the consequences of failure. Some functions are not critical and are left to "run to failure" while other functions must be preserved at all cost. Maintenance tasks are selected that address the dominant failure causes. This process directly addresses maintenance preventable failures. Failures caused by unlikely events, non-predictable acts of nature, etc. will usually receive no action provided their risk (combination of severity and frequency) is trivial (or at least tolerable). When the risk of such failures is very high, RCM encourages (and sometimes mandates) the user to consider changing something which will reduce the risk to a tolerable level.

The result is a maintenance program that focuses scarce economic resources on those items that would cause the most disruption if they were to fail.

RCM emphasizes the use of Predictive Maintenance (PdM) techniques in addition to traditional preventive measures.

**Cost Impact:** Will not increase the cost of construction

Likely less, because IT&M costs will be rationalized so that our testing costs are applied proportionate to the risk. Large research universities such as ours prioritize our testing according to hazard and sometimes exceed minimum levels set by the host municipality. In other installations our testing records show that testing intervals should be relaxed in order to reduce maintenance-induced failures.

P25-15 : 312.10.1-  
ANTHONY5302

---

## ***Public Hearing Results***

**Committee Action:**

**Disapproved**

**Committee Reason:** The committee did not know what a "reliability centered program" was. Further explanation is needed to understand this proposal.

---

**Individual Consideration Agenda*****Public Comment 1:***

**Proponent : Michael Anthony, University of Michigan, representing University of Michigan (maanthon@umich.edu) requests Approve as Submitted.**

**Commenter's Reason:**

The Committee's reason seems to indicate that they did not read the extensive bibliography provided in the proposal to understand the concept of Reliability Centered Maintenance (RCM). More importantly, why RCM is a superior method for determining when components need to be tested and preventative maintenance needs performed. The key point to take away from an understanding of RCM is that *fixed interval testing of components frequently causes more failures than it prevents*. The first term of RCM is *Reliability*. Doesn't the plumbing community want *the best possible assurance* that backflow prevention assemblies *will work* when conditions occur that could cause a backflow event ?

Reliability Centered Maintenance is not a new concept and is a decades-proven, established method for obtaining the most reliable service from equipment of a plant, building or site. World-class organizations have been using RCM to "keep the machinery running" at top performance levels to prevent unscheduled downtime and occurrences of unsafe events.

This proposal only allows RCM methods to be used *as an alternate* to fixed interval testing of backflow prevention assemblies. Organizations that don't use RCM can simply inspect on fixed intervals. Those organizations that do use RCM can increase the reliability and safety of backflow prevention assemblies that are in their control.

The decision to approve this proposal should be easy. I urge voters to make a step towards having the code allow for modern inspection interval methods that will provide for greater safety.

---

**P25-15**

**P30-15**

**Table 403.1 (IBC Table 2902.1)**

***Proposed Change as Submitted***

**Proponent :** Stephen DiGiovanni, Clark County Building Department, representing Southern Nevada Chapter of ICC (sdigiovanni@clarkcountynv.gov)

**2015 International Plumbing Code**

Revise as follows:

**TABLE 403.1  
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES<sup>a</sup> (See Sections 403.1.1 and 403.2)**

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS: SEE SECTION 419.2)		LAVATORIES		BATHTUBS/ SHOWERS	DRINKING FOUNTAIN (SEE SECTION 410)	OTHER
				MALE	FEMALE	MALE	FEMALE			
1	Assembly	A-1 <sup>d</sup>	Theaters and other buildings for the performing arts and motion pictures	1 per 125	1 per 65	1 per 200		—	1 per 500	1 service sink
		A-2 <sup>d</sup>	Nightclubs, bars, taverns, dance halls and buildings for similar purposes	1 per 40	1 per 40	1 per 75		—	1 per 500	1 service sink
			Restaurants, banquet halls and food courts	1 per 75	1 per 75	1 per 200		—	1 per 500	1 service sink
			Casinos	1 per 100 for the first 400 and 1 per 250 for the remainder exceeding 400	1 per 50 for the first 400 and 1 per 150 for the remainder exceeding 400	1 per 250 for the first 750 and 1 per 500 for the remainder exceeding 750		—	1 per 1,000	1 service sink
A-3 <sup>d</sup>	Auditoriums without permanent seating, art galleries, exhibition halls, museums, lecture halls, libraries, arcades and gymnasiums	1 per 125	1 per 65	1 per 200		—	1 per 500	1 service sink		

			Passenger terminals and transportation facilities	1 per 500	1 per 500	1 per 750	—	1 per 1,000	1 service sink
			Places of worship and other religious services	1 per 150	1 per 75	1 per 200	—	1 per 1,000	1 service sink

(Portions of table not shown remain unchanged)

- The fixtures shown are based on one fixture being the minimum required for the number of persons indicated or any fraction of the number of persons indicated. The number of occupants shall be determined by the *International Building Code*.
- Toilet facilities for employees shall be separate from facilities for inmates or care recipients.
- A single-occupant toilet room with one water closet and one lavatory serving not more than two adjacent patient sleeping units shall be permitted provided that each patient sleeping unit has direct access to the toilet room and provision for privacy for the toilet room user is provided.
- The occupant load for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of facilities required.
- For business and mercantile occupancies with an occupant load of 15 or fewer, service sinks shall not be required.

**Reason:** The Plumbing Fixture Count Table 403.1 (IBC [P] 2902.1) does not address casinos as a specific use. The building codes are beginning to recognize the unique nature of the use and occupancy for these structures; as an example the code recognizes an occupant load factor of 1:11 for gaming areas. Casinos have been constructed outside of Las Vegas for years and it appears that this trend is continuing nationally. A fixture count for this use is a necessary addition to the code.

As an A-2 occupancy, the code user is currently required to select either the Restaurants/Banquet Halls or Nightclubs/Bars uses under the A-2 occupancy in Table 403.1 (IBC [P] 2902.1) to set fixture counts, 1:75 and 1:40, respectively. The fixture counts provided in this amendment closely resemble the fixture count table used in the Southern Nevada, including the Las Vegas strip. There has been no history in Las Vegas of long lines at Casino restrooms. Casinos represent a unique place where restaurants, gaming, retail and shows are combined into one expansive building. However, even with large crowds on gaming floors, restroom facilities are not so overcrowded as to produce long lines.

Specifically, for a 30,000-ft<sup>2</sup> Casino, Table 403.1 (IBC [P] 2902.1) would require 152% of the number of fixtures that are currently required if Casinos are tabulated as large assembly space (nightclub/bar). As a restaurant or banquet hall, Table 403.1 (IBC [P] 2902.1) would require 238% of the number of fixtures required by Table 403.1 (IBC [P] 2902.1).

This amendment also accounts for increase usage and need for female restroom similar to A-4 and A-5 occupancies.

**Cost Impact:** Will not increase the cost of construction

This proposal provides a more lenient fixture count for casinos, so the cost of construction would presumably decrease.

P30-15 : T403.1 (IBC [P] 2901.1)-  
DIGIOVANNI3854

### Public Hearing Results

The following is errata that was posted on the ICC website:

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS: SEE SECTION 419.2)		LAVATORIES		BATHTUBS/SHOWERS	DRINKING FOUNTAIN (SEE SECTION 410)	OTHER
				MALE	FEMALE	MALE	FEMALE			
1	Assembly	A-1 <sup>d</sup>	Theaters and other buildings for the performing arts and motion pictures	1 per 125	1 per 65	1 per 200		—	1 per 500	1 service sink
		A-2 <sup>d</sup>	Nightclubs, bars, taverns, dance halls and buildings for similar purposes	1 per 40	1 per 40	1 per 75		—	1 per 500	1 service sink
			Restaurants, banquet halls and food courts	1 per 75	1 per 75	1 per 200		—	1 per 500	1 service sink
			Casinos	1 per 100 for the first 400 and 1 per 250 for the remainder exceeding 400	1 per 50 for the first 400 and 1 per 150 for the remainder exceeding 400	1 per 250 for the first 750 and 1 per 500 for the remainder exceeding 750		—	1 per 1,000	1 service sink

		A-3 <sup>d</sup>	Auditoriums without permanent seating, art galleries, exhibition halls, museums, lecture halls, libraries, arcades and gymnasiums	1 per 125	1 per 65	1 per 200	—	1 per 500	1 service sink
			Passenger terminals and transportation facilities	1 per 500	1 per 500	1 per 750	—	1 per 1,000	1 service sink
			Places of worship and other religious services	1 per 150	1 per 75	1 per 200	—	1 per 1,000	1 service sink

(Errata already incorporated into cdpACCESS.)

**Committee Action:**

**Disapproved**

**Committee Reason:** Casinos can have numerous types of uses within the casino building. Putting all casinos under the same row doesn't seem to be what the proponent is intending to accomplish.

Assembly Action :

None

**Individual Consideration Agenda**

**Public Comment 1:**

Proponent : **Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com)** requests **Approve as Submitted.**

**Commenter's Reason:** The justification offered by the Committee for recommending denial is inconsistent with Section 403.1. The Committee expressed concerns with casinos having restaurants or theater. That is addressed in Section 403.1. If there is a different use, the fixture count for that use applies. Currently, there is no appropriate fixture count for casinos. The proposed fixture count is consistent with meeting the needs of individuals at a casino. The Committee had no problem with the fixture count proposed. There only concern was mixed use, which as previously indicated, is addressed in the code. This change should be approved as submitted.

**Public Comment 2:**

Proponent : **Kevin McOsker, representing Southern Nevada Chapter of ICC (ktm@ClarkCountyNV.gov)** requests **Approve as Modified by this Public Comment.**

**Modify as Follows:**

**2015 International Plumbing Code**

**TABLE 403.1  
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES<sup>a</sup> (See Sections 403.1.1 and 403.2)**

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS: SEE SECTION 419.2)		LAVATORIES		BATHTUBS/ SHOWERS	DRINKING FOUNTAIN (SEE SECTION 410)	OTHER
				MALE	FEMALE	MALE	FEMALE			
1	Assembly	A-1 <sup>d</sup>	Theaters and other buildings for the performing arts and motion pictures	1 per 125	1 per 65	1 per 200		—	1 per 500	1 service sink
		A-2 <sup>d</sup>	Nightclubs, bars, taverns, dance halls and buildings for similar	1 per 40	1 per 40	1 per 75		—	1 per 500	1 service sink

			purposes						
			Restaurants, banquet halls and food courts	1 per 75	1 per 75	1 per 200	—	1 per 500	1 service sink
			Casinos <u>Gaming Areas</u>	1 per 100 for the first 400 and 1 per 250 for the remainder exceeding 400	1 per 50 for the first 400 and 1 per 150 for the remainder exceeding 400	1 per 250 for the first 750 and 1 per 500 for the remainder exceeding 750	—	1 per 1,000	1 service sink
		A-3 <sup>d</sup>	Auditoriums without permanent seating, art galleries, exhibition halls, museums, lecture halls, libraries, arcades and gymnasiums	1 per 125	1 per 65	1 per 200	—	1 per 500	1 service sink
			Passenger terminals and transportation facilities	1 per 500	1 per 500	1 per 750	—	1 per 1,000	1 service sink
			Places of worship and other religious services	1 per 150	1 per 75	1 per 200	—	1 per 1,000	1 service sink

- a. The fixtures shown are based on one fixture being the minimum required for the number of persons indicated or any fraction of the number of persons indicated. The number of occupants shall be determined by the *International Building Code*.
- b. Toilet facilities for employees shall be separate from facilities for inmates or care recipients.
- c. A single-occupant toilet room with one water closet and one lavatory serving not more than two adjacent patient sleeping units shall be permitted provided that each patient sleeping unit has direct access to the toilet room and provision for privacy for the toilet room user is provided.
- d. The occupant load for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of facilities required.
- e. For business and mercantile occupancies with an occupant load of 15 or fewer, service sinks shall not be required.

**Commenter's Reason:** A fixture count for a casino gaming area is not currently defined in the code. This proposal was added to provide a fixture count for this specific use. With the current proposal, the term "Casino" was modified to "Casino Gaming Areas" to provide more clarity to the proposed intent. The term "Gaming Area" was approved by the IBC – Egress Committee in code proposal E167-15. The Plumbing Committee disapproved the original proposal because the term "Casino" was inclusive of the gaming area and the other uses in a "Casino" (including: nightclubs, theaters, restaurants, convention areas, and retail establishments). The gaming areas is the primary use of a "Casino" and yet this use is not defined in Table 29-A. Currently, casino gaming is allowed in 48 of the 50 United States and the code user is not provided adequate direction with respect to the fixture count for this use. Clark County, including the Las Vegas strip, has locally amended the fixture count table, and this proposal is very similar to the Southern Nevada amendment which has been successful in the region for more than 20 years.

**P31-15**

**Table 403.1 (IBC Table 2902.1)**

**Proposed Change as Submitted**

**Proponent :** Stephen DiGiovanni, Clark County Building Department, representing Southern Nevada Chapter of ICC (sdigiovanni@clarkcountynv.gov)

**2015 International Plumbing Code**

Revise as follows:

TABLE 403.1  
**MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES<sup>a</sup>(See Sections 403.1.1 and 403.2)**

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS: SEE SECTION 419.2)		LAVATORIES		BATHTUBS/ SHOWERS	DRINKING FOUNTAIN (SEE SECTION 410)	OTHER	
				MALE	FEMALE	MALE	FEMALE				
1	Assembly	A-1 <sup>d</sup>	Theaters and other buildings for the performing arts and motion pictures							1 service sink <sup>e</sup>	
			A-2 <sup>d</sup>	Nightclubs, bars, taverns, dance halls and buildings for similar purposes							1 service sink <sup>e</sup>
				Restaurants, banquet halls and food courts							1 service sink <sup>e</sup>
			A-3 <sup>d</sup>	Auditoriums without permanent seating, art galleries, exhibition halls, museums, lecture halls, libraries, arcades and gymnasiums							1 service sink <sup>e</sup>
				Passenger terminals and transportation facilities							1 service sink <sup>e</sup>
			Places of worship and other religious						1 service sink <sup>e</sup>		

			services						
--	--	--	----------	--	--	--	--	--	--

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS: SEE SECTION 419.2)		LAVATORIES		BATHTUBS/ SHOWERS	DRINKING FOUNTAIN (SEE SECTION 410)	OTHER
				MALE	FEMALE	MALE	FEMALE			
1 (cont.)	Assembly	A-4	Coliseums, arenas, skating rinks, pools and tennis courts for indoor sporting events and activities							1 service sink <sup>e</sup>
		A-5	Stadiums, amusement parks, bleachers and grandstands for outdoor sporting events and activities							1 service sink <sup>e</sup>
2	Business	B	Buildings for the transaction of business, professional services, other services involving merchandise, office buildings, banks, light industrial and similar uses							1 service sinke
3	Educational	E	Educational facilities							1 service sink <sup>e</sup>
4	Factory and industrial	F-1 and F-2	Structures in which occupants are engaged in work fabricating, assembly or processing of products or materials							1 service sink <sup>e</sup>

5	Institutional	I-1	Residential care						1 service sink <sup>e</sup>
		I-2	Hospitals, ambulatory nursing home care recipient						1 service sink per floor <sup>e</sup>
			Employees, other than residential care <sup>b</sup>						—
			Visitors, other than residential care						—
		I-3	Prisons <sup>b</sup>						1 service sink <sup>e</sup>
			Reformatories, detention centers, and correctional centers <sup>b</sup>						1 service sink <sup>e</sup>
			Employees <sup>b</sup>						—
		I-4	Adult day care and child day care						1 service sink <sup>e</sup>

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS: SEE SECTION 419.2)		LAVATORIES		BATHTUBS/ SHOWERS	DRINKING FOUNTAIN (SEE SECTION 410)	OTHER
				MALE	FEMALE	MALE	FEMALE			
6	Mercantile	M	Retail stores, service stations, shops, salesrooms, markets and shopping centers							1 service sink <sup>e</sup>
7	Residential	R-1	Hotels, motels, boarding houses (transient)							1 service sink <sup>e</sup>
		R-2	Dormitories, fraternities,							1 service

			sororities and boarding houses (not transient)					sink <sup>e</sup>
		R-2	Apartment house					1 kitchen sink per dwelling unit; 1 automatic clothes washer connection per 20 dwelling units
		R-3	Congregate living facilities with 16 or fewer persons					1 service sink <sup>e</sup>
		R-3	One- and two-family dwellings and lodging houses with five or fewer guestrooms					1 kitchen sink per dwelling unit; 1 automatic clothes washer connection per dwelling unit
		R-4	Congregate living facilities with 16 or fewer persons					1 service sink <sup>e</sup>
8	Storage	S-1 S-2	Structures for the storage of goods, warehouses, store-house and freight depots. Low and Moderate Hazard.					1 service sink <sup>e</sup>

(Portions of table not shown remain unchanged)

- a. The fixtures shown are based on one fixture being the minimum required for the number of persons indicated or any fraction of the number

of persons indicated. The number of occupants shall be determined by the *International Building Code*.

- b. Toilet facilities for employees shall be separate from facilities for inmates or care recipients.
- c. A single-occupant toilet room with one water closet and one lavatory serving not more than two adjacent patient sleeping units shall be permitted provided that each patient sleeping unit has direct access to the toilet room and provision for privacy for the toilet room user is provided.
- d. The occupant load for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of facilities required.
- e.—~~For business and mercantile occupancies with an occupant load of 15 or fewer,~~Service sinks shall not be required: where the occupant load is 30 or fewer.

**Reason:** This proposal revises note e and applies note "e" to each of the service sink entries in the table, so that it addresses all occupancies required to have service sinks, not just B and M occupancies. Note "e" is revised to trigger the service sink at an occupant load of over 30, rather than the current trigger of 15 found in the note.

**Cost Impact:** Will not increase the cost of construction  
This proposal provides a more lenient approach for fixture requirements, so the cost of construction is not increased.

P31-15 : T403.1-DIGIOVANNI3856

**Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** Raising the number of occupants threshold and applying the note to all service sink applications would result in some occupancies that really need these sinks, such as small healthcare offices and small restaurants not to have service sinks (but need them to meet other regulations).

**Assembly Action :**

None

**Individual Consideration Agenda**

*Public Comment 1:*

Proponent : **Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com)**  
**requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

**2015 International Plumbing Code**

TABLE 403.1  
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES<sup>a</sup>(See Sections 403.1.1 and 403.2)

				MALE	FEMALE	MALE	FEMALE			
6	Mercantile	M	Retail stores, service stations, shops, salesrooms, markets and shopping centers	1 per 500		1 per 750		—	1 per 1,000	1 service sink <sup>e</sup>
7	Residential	R-1	Hotels, motels, boarding houses (transient)	1 per sleeping unit		1 per sleeping unit		1 per sleeping unit	—	1 service sink <sup>e</sup>

		R-2	Dormitories, fraternities, sororities and boarding houses (not transient)	1 per 10	1 per 10	1 per 8	1 per 100	1 service sink <sup>e</sup>
		R-2	Apartment house	1 per dwelling unit	1 per dwelling unit	1 per dwelling unit	—	1 kitchen sink per dwelling unit; 1 automatic clothes washer connection per 20 dwelling units
		R-3	Congregate living facilities with 16 or fewer persons	1 per 10	1 per 10	1 per 8	1 per 100	4 service sink <sup>e</sup>
		R-3	One- and two-family dwellings and lodging houses with five or fewer guestrooms	1 per dwelling unit	1 per dwelling unit	1 per dwelling unit	—	1 kitchen sink per dwelling unit; 1 automatic clothes washer connection per dwelling unit
		R-4	Congregate living facilities with 16 or fewer persons	1 per 10	1 per 10	1 per 8	1 per 100	4 service sink <sup>e</sup>
8	Storage	S-1 S-2	Structures for the storage of goods, warehouses, store-house and freight depots. Low and Moderate Hazard.	1 per 100	1 per 100	See Section 411	1 per 1,000	1 service sink <sup>e</sup>

a. The fixtures shown are based on one fixture being the minimum required for the number of persons indicated or any fraction of the number

of persons indicated. The number of occupants shall be determined by the *International Building Code*.

- b. Toilet facilities for employees shall be separate from facilities for inmates or care recipients.
- c. A single-occupant toilet room with one water closet and one lavatory serving not more than two adjacent patient sleeping units shall be permitted provided that each patient sleeping unit has direct access to the toilet room and provision for privacy for the toilet room user is provided.
- d. The occupant load for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of facilities required.
- e. ~~For business and mercantile occupancies with an occupant load of 15 or fewer, Service sinks shall not be required for occupant loads of where the occupant load is 30 or fewer.~~

**Commenter's Reason:** The proposed modification is editorial in nature. The proposed change would only require a service sink when there is an occupancy of more than 30. These two facilities always have an occupant load of less than 30. Therefore, there is no need to reference a service sink.

The proponent has a valid reason for reducing the requirements for service sink. This is a plumbing fixture that architects and engineers are constantly requesting be not required, especially for smaller buildings. The code should allow the building owner to determine if a service sink is necessary for smaller buildings.

Most smaller building do not use their service sink. Often times, the trap dries out from lack of use allowing sewer gas to enter the building. One has to weight the perceived health issues of not having a service sink versus providing one that allows sewer gas into the building. It is more appropriate to remove the requirement for a service sink when the occupant load is 30 or less.

8	Storage	S-1-S-2	Structures for the storage of goods, warehouses, store- house and freight depots. Low and Moderate Hazard.					

(Portions of table not shown remain unchanged)

- The fixtures shown are based on one fixture being the minimum required for the number of persons indicated or any fraction of the number of persons indicated. The number of occupants shall be determined by the *International Building Code*.
- Toilet facilities for employees shall be separate from facilities for inmates or care recipients.
- A single-occupant toilet room with one water closet and one lavatory serving not more than two adjacent patient sleeping units shall be permitted provided that each patient sleeping unit has direct access to the toilet room and provision for privacy for the toilet room user is provided.
- The occupant load for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of facilities required.
- For business and mercantile occupancies classifications with an occupant load of 15 or fewer, service sinks shall not be required.

**Reason:** Section 403.1 was revised for the 2015 IPC to direct the reader to the use of a building rather than its IBC occupancy classification (Group) for determining the number of plumbing fixtures. The occupancy column in Table 403.1 is now really confusing as Section 403.1 says to use the Description column but this Occupancy column implies that the IBC classification is to be used. This proposal removes the occupancy column for clarity and coordination with what Section 403.1 states.

Table 403.1 will still retain the classification column, although that column doesn't seem to add any clarification to the table as the IPC doesn't speak of "classifications" for various uses. However, as Table 403.1 is reprinted in the IBC (as Table [P] 2902.1), the classification column might incorrectly lead IBC readers to assume that the IBC occupancy classification (Group) has something to do with selection of an appropriate row for plumbing fixture requirements. IBC Section [P] 2902.1 is identical to Section 403.1 in the IPC but if the reader neglects reading the IBC section and jumps directly to the table, the existence of classification column could cause a misunderstanding.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 191.

**Cost Impact:** Will not increase the cost of construction

**Public Hearing Results**

**Committee Action:**

**Approved as Submitted**

**Committee Reason:** Based on changes made to Section 403.1 for the 2012 IPC, the occupancy classification of a building space no longer impacts the selection of the row in Table 403.1 for determining the number of plumbing fixtures. The use description does, therefore, the occupancy classification column needs removed from the table to avoid confusion about how the table is to be used.

**Assembly Action :**

None

**Individual Consideration Agenda**

*Public Comment 1:*

Proponent : **Carl Baldassarra, P.E., FSFPA, representing Code Technologies Committee (CTC@iccsafe.org); John Williams, CBO, representing Adhoc Healthcare Committee (AHC@iccsafe.org)** requests **Approve as Modified by this Public Comment.**

Modify as Follows:

**2015 International Plumbing Code**

**TABLE 403.1

## Proposed Change as Submitted

**Proponent :** Cornelia M Orzescu, Town of Parker, representing Colorado Chapter of the ICC, Code Change Committee, representing Town of Parker (corzescu@parkeronline.org)

### 2015 International Plumbing Code

Add new text as follows:

**403.1.1 Outdoor public swimming pool fixtures** Outdoor public swimming pools used for aquatic recreation and having a water area of less than 7500 ft<sup>2</sup> (697 m<sup>2</sup>) shall have not less than one water closet, one urinal, one lavatory and one shower for males and not less than two water closets, one lavatory and one shower for females.

Outdoor public swimming pools used for aquatic recreation having a water area of 7500 ft<sup>2</sup> (697 m<sup>2</sup>) or more shall have, for every 7500 ft<sup>2</sup> (697 m<sup>2</sup>) or portion thereof, not less than 0.7 water closets, one urinal, 0.85 lavatory and one shower for males and not less than two water closets, one lavatory and one shower for females. Where the result of a fixture calculation is a portion of a whole number, the result shall be rounded up to the nearest whole number.

Section 403.1.1 (Fixture calculations) shall not apply where complying with this section.

Add new definition as follows:

### SECTION 202 DEFINITIONS

**PUBLIC SWIMMING POOL** A pool, other than a residential pool, that is intended to be used for swimming or bathing and is operated by an owner, lessee, operator, licensee or concessionaire, regardless of whether a fee is charged for use.

Revise as follows:

**TABLE 403.1**  
**MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES<sup>a</sup> (See Sections 403.1.1 and 403.2)**

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS (URINALS: SEE SECTION 419.2)		LAVATORIES		BATHTUBS/ SHOWERS	DRINKING FOUNTAIN (SEE SECTION 410)	OTHER
				MALE	FEMALE	MALE	FEMALE			
1 (cont.)	Assembly	A-4	Coliseums, arenas, skating rinks, pools and tennis courts for indoor sporting events and activities	1 per 75 for the first 1,500 and 1 per 120 for the remainder exceeding 1,500	1 per 40 for the first 1,520 and 1 per 60 for the remainder exceeding 1,520	1 per 200	1 per 150	—	1 per 1,000	1 service sink
		A-5	Stadiums, amusement parks, bleachers and grandstands for outdoor sporting events and activities <sup>f</sup>	1 per 75 for the first 1,500 and 1 per 120 for the remainder exceeding 1,500	1 per 40 for the first 1,520 and 1 per 60 for the remainder exceeding 1,520	1 per 200	1 per 150	—	1 per 1,000	1 service sink

(Portions of table not shown remain unchanged)

- a. The fixtures shown are based on one fixture being the minimum required for the number of persons indicated or any fraction of the number of persons indicated. The number of occupants shall be determined by the *International Building Code*.
- b. Toilet facilities for employees shall be separate from facilities for inmates or care recipients.
- c. A single-occupant toilet room with one water closet and one lavatory serving not more than two adjacent patient sleeping units shall be permitted provided that each patient sleeping unit has direct access to the toilet room and provision for privacy for the toilet room user is provided.
- d. The occupant load for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of facilities required.
- e. For business and mercantile occupancies with an occupant load of 15 or fewer, service sinks shall not be required.
- f. For outdoor public swimming pools used for aquatic recreation, see Section 403.1.1

**Reason:** Trying to figure out a plumbing fixture count associated with outdoor public swimming pools when there is not a "building occupant load" is a daunting task. The proposed fixture count is based on the 2015 International Swimming Pool and Spa Code provisions Section 609 for Toilet rooms and bathrooms. Note f is added to Table 403.1 to point the code user to this new section and to not attempt to use "building occupant load" numbers, Table 403.1 fixture ratios for A-5 and the calculation method of existing 403.1.1. That will result in far too many fixtures for an outdoor public swimming pool application.

This new section would not apply to buildings that might be associated with a public pool such as a club house.

Instead of just referencing the 2015 ISPSC for the number of required plumbing fixtures, the verbiage is included in the IPC for jurisdictions that otherwise will not adopt or have not adopted the 2015 ISPSC.

This proposed language for the IPC will hopefully be approved to be carried into Chapter 29 the 2018 IBC as it is integral to the information that is normally in IBC Chapter 29.

**Bibliography:** Title of book- 2015 International Swimming Pool and Spa Code  
 Year published-2014  
 Page #35

**Cost Impact:** Will not increase the cost of construction  
 Because this proposal is not based on an occupant load, this will result in a cost decrease as compared to the cost of the number of required fixtures based on IPC Table 403.1.

P36-15 Part I : 403.1.1 (New)-ORZESCU6014

### Public Hearing Results

#### Part I

#### Committee Action:

**Disapproved**

**Committee Reason:** There is a terminology issue as "aquatic recreation" seems to be pointing to pools only in aquatic recreational facilities. The ISPSC already covers those requirements so this proposal isn't needed-the requirements are already covered.

#### Assembly Action :

None

### Individual Consideration Agenda

#### Public Comment 1:

Proponent : **Cornelia M Orzescu, representing Colorado Chapter of the ICC, Code Development/Change Committee (corzescu@parkeronline.org) requests Approve as Modified by this Public Comment.**

#### Modify as Follows:

#### 2015 International Plumbing Code

**TABLE 403.1**

**MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES<sup>a</sup> (See Sections 403.1.1 and 403.2)**

- a. The fixtures shown are based on one fixture being the minimum required for the number of persons indicated or any fraction of the number of persons indicated. The number of occupants shall be determined by the *International Building Code*.
- b. Toilet facilities for employees shall be separate from facilities for inmates or care recipients.
- c. A single-occupant toilet room with one water closet and one lavatory serving not more than two adjacent patient sleeping units shall be permitted provided that each patient sleeping unit has direct access to the toilet room and provision for privacy for the toilet room user is provided.
- d. The occupant load for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of facilities required.
- e. For business and mercantile occupancies with an occupant load of 15 or fewer, service sinks shall not be required.
- f. For outdoor public swimming pools used for aquatic recreation, see Section 403.1.1. The required number and type of plumbing fixtures for outdoor public swimming pools shall be in accordance with Section 609 of the *International Swimming Pool and Spa Code*.

**403.1.1 Outdoor public swimming pool fixtures** Outdoor public swimming pools used for aquatic recreation and having a water area of less than 7500 ft<sup>2</sup> (697 m<sup>2</sup>) shall be provided with not less than one water closet, one urinal, one lavatory and one shower for males and not less than two water closets, one lavatory and one shower for females.

Outdoor public swimming pools used for aquatic recreation having a water area of 7500 ft<sup>2</sup> (697 m<sup>2</sup>) or more shall provided with, for every

7500 ft<sup>2</sup> (697 m<sup>2</sup>) or portion thereof, not less than 0.7 water closets, one urinal, 0.85 lavatory and one shower for males and not less than two water closets, one lavatory and one shower for females. Where the result of a fixture calculation is a portion of a whole number, the result shall be rounded up to the nearest whole number.

~~Section 403.1.1 (Fixture calculations) shall not apply where complying with this section.~~

**Commenter's Reason:** The Committee did not agree with the term recreational aquatic facilities and felt that the fixture count is already addressed by the International Swimming Pool and Spa Code (ISPSC). Footnote f will direct the user to determine the fixture count as defined by the ISPSC based on the water area not pool occupant and deck occupant combined.

Outdoor public swimming pool fixtures Outdoor public swimming pools used for aquatic recreation and having a water area of less than 7500 ft<sup>2</sup> (697 m<sup>2</sup>) shall have not less than one water closet, one urinal, one lavatory and one shower for males and not less than two water closets, one lavatory and one shower for females.

Outdoor public swimming pools used for aquatic recreation having a water area of 7500 ft<sup>2</sup> (697 m<sup>2</sup>) or more shall have, for every 7500ft<sup>2</sup> (697 m<sup>2</sup>) or portion thereof, not less than 0.7 water closets, one urinal, 0.85 lavatory and one shower for males and not less than two water closets, one lavatory and one shower for females. Where the result of a fixture calculation is a portion of a whole number, the result shall be rounded up to the nearest whole number.

The code references other codes all the time. For example IRC refers to the International Swimming Pool and Spa code in Section R326. A new section 101.4.8 referencing the pool code will be submitted in Group B changes.

P36-15 Part I

## **P36-15 Part II**

### **IBC 2902.1.1 (New), IBC Table 2902.1**

#### **Proposed Change as Submitted**

**Proponent :** Cornelia M Orzescu, Town of Parker, representing Colorado Chapter of the ICC, Code Change Committee, representing Town of Parker (corzescu@parkeronline.org)

### **2015 International Building Code**

#### **Add new text as follows:**

**2902.1.1 Outdoor public swimming pool fixtures** Outdoor public swimming pools used for aquatic recreation and having a water area of less than 7500 ft<sup>2</sup> (697 m<sup>2</sup>) shall be provided with not less than one water closet, one urinal, one lavatory and one shower for males and not less than two water closets, one lavatory and one shower for females.

Outdoor public swimming pools used for aquatic recreation having a water area of 7500 ft<sup>2</sup> (697 m<sup>2</sup>) or more shall be provided with, for every 7500 ft<sup>2</sup> (697 m<sup>2</sup>) or portion thereof, not less than 0.7 water closets, one urinal, 0.85 lavatory and one shower for males and not less than two water closets, one lavatory and one shower for females. Where the result of a fixture calculation is a portion of a whole number, the result shall be rounded up to the nearest whole number.

Section 2902.1.1 (Fixture calculations) shall not apply where complying with this section.

**Cost Impact:** Will not increase the cost of construction  
Because this proposal is not based on an occupant load, this will result in a cost decrease as compared to the cost of the number of required fixtures based on IPC Table 403.1.

**Analysis:** Changes to IPC Table 403.1 made by PART I will automatically change IBC Table 2902.1.

**P36-15 Part II : 2902.1.1  
(New)-ORZESCU6015**

---

### **Public Hearing Results**

## **Part II**

# P37-15

## 403.1.2 (New) (IBC 2902.1.2 (New))

### Proposed Change as Submitted

**Proponent :** Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com)

## 2015 International Plumbing Code

**Add new text as follows:**

**403.1.2 Excess number of elimination fixtures for males.** Where the combined number of water closets and urinals for males exceeds the number of male water closets required by Section 403.1, the total number of water closets for females shall be increased by the number of combined fixtures for males that exceeds the required number of water closets for males, adjusted as necessary by the statistical requirements of Section 403.1.1.

**Reason:** Potty parity was a part of the Plumbing Code from its inception. The goal of the code requirements on number of fixtures between the sexes is to provide the same waiting time for men and women using the facilities.

Because of space differentials, the combined number of water closets and urinals in the men's room often exceeds the number required by code. However, the women's room may have the required number of water closets. This results in an unequal waiting time for use of the plumbing fixtures. As a result, potty parity is not achieved.

This code requirement will mandate that the number of water closets in the women's room must be increased by the same percentage as the number of water closets and urinals in the men's room. The result will be potty parity with the same waiting time between the men and women.

**Cost Impact:** Will increase the cost of construction

This will add cost when additional water closets are required to be installed in the women's room.

P37-15 : 403.1.2 (New)-  
BALLANCO3813

---

### Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** This proposal would require fixtures in excess of the minimum requirements of the code.

**Assembly Action :**

**None**

---

### Individual Consideration Agenda

*Public Comment 1:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com) requests Approve as Submitted.**

**Commenter's Reason:** This change is important for maintaining potty parity. Currently, an owner can offset the number of fixture in the men's room without any consequences other than that the female population will have to wait longer to use the fixtures than the male population. Potty parity is considered a constitutional right to provide equal waiting time for the use of plumbing fixtures. While this change may require additional fixtures beyond the code minimum that is only to provide balance in fixture use between the sexes. The owner always has the option to provide the code minimum number of fixtures for each sex, then there are no additional fixtures required.

---

**P37-15**

# P39-15

## 403.1.2 (New) (IBC 2902.1.2 (New))

### Proposed Change as Submitted

**Proponent :** Billy Smith, American Society of Plumbing Engineers Legislative Committee, representing American Society of Plumbing Engineers Legislative Committee (bsmith@aspe.org)

## 2015 International Plumbing Code

**Add new text as follows:**

**403.1.2 Excess number of male fixtures.** Where the sum of the numbers of installed water closets and urinals for males will be in excess of the required number of male water closets, and the sum is greater than the required number of female water closets, the number of installed female water closets shall be the total of the number of required female water closets and the excess number of male fixtures.

**Reason:** ASPE has long been a proponent of potty parity. The original values found in the International Plumbing Code were based on a paper published by ASPE. The goal of the code is to provide the same waiting time for men and women using the facilities.

Because of space differentials, the combined number of water closets and urinals in the men's room exceeds the number required by code. However, the women's room has the required number of water closets. This results in an unequal waiting time for use of the plumbing fixtures. As a result, potty parity is not achieved.

This code requirement will mandate that the number of water closets in the women's room must be increased by the same percentage as the number of water closets and urinals in the men's room. The result will be potty parity with the same waiting time between the men and women.

**Cost Impact:** Will not increase the cost of construction

This does not increase the cost since the change merely provides options for the installer or designer.

P39-15 : 403.1.2 (New)-  
SMITH5374

---

### Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** Consistency with the action on P39-15.

**Assembly Action :**

**None**

---

### Individual Consideration Agenda

*Public Comment 1:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com) requests Approve as Submitted.**

**Commenter's Reason:** This change is similar to P37. There is slightly different wording. This change is important for maintaining potty parity. Currently, an owner can offset the number of fixture in the men's room without any consequences other than that the female population will have to wait longer to use the fixtures than the male population. Potty parity is considered a constitutional right to provide equal waiting time for the use of plumbing fixtures. While this change may require additional fixtures beyond the code minimum that is only to provide balance in fixture use between the sexes. The owner always has the option

**P39-15**

# P40-15

## 403.1.2 (IBC 2902.1.2)

### Proposed Change as Submitted

**Proponent :** David Collins, representing The American Institute of Architects (dcollins@preview-group.com)

## 2015 International Plumbing Code

Revise as follows:

### **403.1.2 ~~Family or assisted-use~~ Single-user toilet facility and bath bathing room fixtures.** ~~Fixtures~~

The plumbing fixtures located within in single-user toilet facilities and bathing rooms, including family or assisted-use toilet and bathing rooms that are required by Section 1109.2.1 of the *International Building Code* are permitted to be included in , shall contribute towards the total number of required plumbing fixtures for either the male a building or female occupants in assembly tenant space. Single-user toilet facilities and mercantile occupancies. bathing rooms, and family or assisted-use toilet and bathing rooms shall not be required to be identified for exclusive use by either sex.

**Reason:** The use of single-user toilets has become increasingly beneficial system of providing not only better facilities, but more user friendly facilities. A higher level of privacy is achieved, the facilities are typically better maintained by the users, and the efficiencies of having unisex facilities where the users are of a dominate sex are significantly increased.

Similarly, this code change removes the limitation of use for family or assisted-use facilities to mercantile and assembly occupancies. Families or persons requiring assisted-use can be found in various occupancies and should be allowed as providing required toilets. Currently, when there are multiple single-user toilets 50% of them are required to be accessible. If this is compared with the standard ganged toilet rooms where there are multiple toilet fixtures, the number of accessible toilets and thus a greater number of useful toilets by everyone will be increased by this change.

**Cost Impact:** Will not increase the cost of construction

The single-user toilet room will reduce the cost of construction. Based on the minimum number of toilets, the larger general area required for circulation for multi-fixture toilet rooms can be eliminated in large part because areas such as sight-blocking and the multiplier for urinals for credit will be eliminated in multiple single-user toilet designs.

P40-15 : 403.1.2-  
COLLINS4506

---

## Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** The proposed language results in not knowing how to calculate the number of males and females. If these new requirements result in a greater minimum number of plumbing fixtures, that will result in additional cost. More cost would conflict with the cost impact statement on the proposal.

---

**Individual Consideration Agenda*****Public Comment 1:***

**Proponent : Bruce Pitts, representing BHP (bhpbhp@yahoo.com) requests Approve as Submitted.**

**Commenter's Reason:** 1. The American Restroom Association has designed and built clustered single user toilet rooms with up to 50% square footage savings instead of having designed gang restrooms. They also strongly support single-user toilet facilities not be required to be identified for exclusive use by either sex for maximum function, safety, availability, ease of maintenance and changing social needs. They can discuss this in Long Beach.

2. The National Organization for Women (NOW) has lobbied Congress in the past for more single-user toilet rooms not be required to be identified for exclusive use by either sex. Regarding any sanitary concerns, NOW simply asks for disposable seat cover dispensers and soap dispensers at the lavatory in each single user restroom.

***Public Comment 2:***

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

**2015 International Plumbing Code**

**403.1.2 Single-user toilet facility and bathing room fixtures.** The plumbing fixtures located in single-user toilet facilities and bathing rooms, including family or assisted-use toilet and bathing rooms that are required by Section 1109.2.1 of the International Building Code, shall contribute towards the total number of required plumbing fixtures for a building or tenant space. Single-user toilet facilities and bathing rooms, and family or assisted-use toilet and bathing rooms shall ~~not be required to be identified for exclusive use by either sex.~~

**Commenter's Reason:** This is a good change and addresses many issues by allowing single occupant toilet rooms rather than grouped toilet rooms. This should be allowed as a designer option. The same number of fixtures are provided and waiting can be reduced by allowing either sex to use the toilet room. This will also address the concerns regarding transgender individuals as identified in Code Change P43.

***Public Comment 3:***

**Proponent : David Collins, representing The American Institute of Architects (dcollins@preview-group.com) requests Approve as Modified by this Public Comment.**

**Replace Proposal as Follows:**

## **2015 International Plumbing Code**

**Delete and substitute as follows:**

~~**403.1.2 Family or assisted-use toilet and bath fixtures.** Fixtures located within family or assisted-use toilet and bathing rooms required by Section 1109.2.1 of the *International Building Code* are permitted to be included in the number of required fixtures for either the male or female occupants in assembly and mercantile occupancies.~~

**403.1.2 Single user toilet facility and bathing room fixtures.** The plumbing fixtures located in single-user toilet facilities and bathing rooms, including family or assisted-use toilet and bathing rooms that are required by Section 1109.2.1 of the *International Building Code*, shall contribute towards the total number of required plumbing fixtures for a building or tenant space. The total number of fixtures provided, including those in single-user toilet facilities and bathing rooms and family or assisted-use toilet rooms, shall meet or exceed the aggregate number of fixtures required by Section 403.1. Single-user toilet facilities and bathing rooms, and family or assisted-use toilet and bathing rooms shall not be required to be identified for exclusive use by either sex.

**Commenter's Reason:** This modification to the original proposal is in response to the committees comment:

*The proposed language results in not knowing how to calculate the number of males and females. If these new requirements result in a greater minimum number of plumbing fixtures, that will result in additional cost. More cost would conflict with the cost impact statement on the proposal.*

With the additional text It should be clear that the number of fixtures required for females and males must be met whether they are located in separated toilet rooms of in unisex or family or assisted-use toilet rooms.

---

# P41-15

## 403.2 (IBC 2902.2)

### Proposed Change as Submitted

**Proponent :** Stephen DiGiovanni, Clark County Building Department, representing Southern Nevada Chapter of ICC (sdigiovanni@clarkcountynv.gov)

## 2015 International Plumbing Code

**Revise as follows:**

**403.2 Separate facilities.** Where plumbing fixtures are required, separate facilities shall be provided for each sex.

### **Exceptions:**

1. Separate facilities shall not be required for dwelling units and sleeping units.
2. Separate facilities shall not be required in structures or tenant spaces with a total occupant load, including both employees and customers, of ~~15~~ 30 or fewer.
3. Separate facilities shall not be required in mercantile *occupancies* in which the maximum occupant load is 100 or fewer less.
4. Separate facilities shall not be required in Group B occupancies in which the maximum occupany load is 50 or less provided a single toilet facility is designed for use by no more than one person at a time.

**Reason:** Section 403.2 (IBC Section 2902.2) requires that separate facilities be provided for males and females when plumbing fixtures are required by Table 403.1 (IBC Table 2902.1). Exception No. 2 to Section 403.2 (IBC Section 2902.2) allows shared facilities for spaces with a maximum occupant load of 15, while Exception No. 3 allows shared facilities for mercantile (Group M) occupancies with a maximum occupant load of 100. The proposed amendment is to modify Exception No. 2 to raise the minimum occupant load that requires separate facilities for males and females from 15 to 30.

With respect to the proposal for Exception #2, the following table identifies the occupant load factors for various occupancies based on IBC Table 1004.1.2 and shows the maximum area that would be allowed for each occupancy in order to avoid providing separate facilities. The table also shows the maximum area that the proposed amendment would allow for each occupancy in order to avoid providing separate facilities.

<b>Occupancy</b>	<b>Occupant Load Factor (OLF) (ft<sup>2</sup>/person)</b>	<b>2015 IBC Max. Area Permitted without Separate Facilities (OLF x 15) (ft<sup>2</sup>)</b>	<b>Proposed Amended Max. Area Permitted without Separate Facilities (OLF x 30) (ft<sup>2</sup>)</b>
Assembly (unconcentrated)	15	225	450

use)			
Educational	20	300	600
Factory/Industrial	100	1500	3000
Institutional areas:			
Inpatient treatment areas	240	3600	7200
Outpatient areas	100	1500	3000
Sleeping areas	120	1800	3600
Residential	200	3000	6000
Storage	300	4500	9000

An additional modification in this proposal is to use terminology and the occupancy description used throughout the code in exception #3 to be consistent with typical code language.

Further, this proposal adds an exception to address Group B occupancies. This proposal is to allow Group B (business) occupancies, with a total occupant load of 50 or less, including customers and employees, to have a single toilet facility provided that it is designed for use by no more than one person at a time. This appears to be a reasonable standard for small business spaces of 5,000 square feet or less. Current code requires separate facilities for business occupancies that exceed 1,500 square feet.

A single accessible toilet facility occupies approximately 50 ft<sup>2</sup>. Therefore, requiring separate facilities for males and females in small businesses requires the loss of approximately an additional 50 ft<sup>2</sup> of floor area along with the cost of the additional plumbing fixtures and enclosure. Fifty square feet represents a significant percentage of the floor area for the minimum size of spaces that require separate facilities per the base IPC Section 403.2 (IBC Section 2902.2). This change is intended to benefit storefront/strip mall business tenants that individually provide facilities within their space. This proposal will have little impact to standard office buildings that typically share restroom facilities.

**Cost Impact:** Will not increase the cost of construction  
This proposal will provide a more lenient approach for facilities in Group B occupancies, so construction costs are not increased with this proposal.

P41-15 : 403.2-  
DIGIOVANNI3855

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** One committee member's single-person survey indicated that women would not use a single-user toilet facility that was also used by men. Proposal P42-15 is a superior proposal to this proposal.

**Assembly Action :**

**None**

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com) requests Approve as Submitted.**

**Commenter's Reason:** The denial of this change was based on an unscientific one person survey that a certain female would not use the same bathroom as a man. This should never be the reason for denying the change. The other reason given was that P42 was considered the better change. However, P42 was also recommended for denial. Hence, there is no valid reason provided for denying this change. The supporting statement justifies the approval of this change.

## **Proposed Change as Submitted**

**Proponent :** Shawn Meerkamper, Transgender Law Center, representing Transgender Law Center

## **2015 International Plumbing Code**

**Revise as follows:**

**403.2 Separate facilities.** Where plumbing fixtures are required, separate facilities shall be provided for each sex.

### **Exceptions:**

1. Separate facilities shall not be required for dwelling units and sleeping units.
2. Separate facilities shall not be required in structures or tenant spaces with a total occupant load, including both employees and customers, of 15 or fewer.
3. Separate facilities shall not be required in mercantile *occupancies* in which the maximum occupant load is 100 or fewer.
4. Toilet facilities that have only one water closet shall not be identified for exclusive use by either sex, as provided in Sections 403.2.1 and 403.2.2 and shall be deemed to meet the requirements of this section.

**403.2.1 Family or assisted-use toilet facilities serving as separate facilities.** Where a building or tenant space requires a separate toilet facility for each sex and each toilet facility is required to have only one water closet, two family or assisted-use toilet facilities shall be permitted to serve as the required separate facilities. Family or ~~assisted-use~~ assisted-use toilet facilities shall ~~not be required to be~~ identified for exclusive use by either sex as required by Section 403.4.

**Add new text as follows:**

**403.2.2 Single-stall facilities** Where toilet facilities have only one water closet, those facilities shall not be identified for exclusive use by either sex.

**Revise as follows:**

**403.4 Signage.** Required *public* facilities shall be provided with signs that ~~designate~~ indicate the sex or designated use, as required by ~~Section~~ Sections 403.2, 403.2.1, and 403.2.2. Signs shall be readily visible and located near the entrance to each toilet facility. Signs for accessible toilet facilities shall comply with Section 1111 of the *International Building Code*.

**Reason:** This proposal is jointly submitted by Transgender Law Center, National Center for Lesbian Rights, and National Center for Transgender Equality. Many people have been in the frustrating position of waiting in line for a single-stall restroom while the restroom designated for the other gender sits empty. This proposal simply provides that single-stall restrooms must be available to people of

all genders, and clarifies that such single-user facilities do not violate existing laws requiring equal facilities to be available for men and for women. Amending the Plumbing Code as set forth above would increase the number of restrooms available to all people while especially benefitting parents with children of a different gender; senior citizens or people with disabilities who may require an attendant; people with bladder conditions; and people who don't fit narrow gender stereotypes, including some lesbian, gay, bisexual, and transgender people, for whom public restrooms can be sources of anxiety and sites of harassment or even violence. The consequences for public health can be serious: individuals who are unable to safely access public restrooms can develop medical problems from delaying or avoiding restroom usage.

This proposal mirrors policies already in effect in a number of major U.S. cities, including New York City, Philadelphia, San Francisco, Washington, D.C., West Hollywood, and Austin, Texas. Designating single-stall restrooms for use by all genders is also a growing trend at universities (including the University of California, which recently adopted this policy system-wide) and private businesses. Unfortunately, some institutions and government bodies find their options limited by codes such as the IPC that require single-stall restrooms to be limited to one gender. Adopting these amendments to the Plumbing Code would give guidance to local and state policymakers seeking to ensure that public restrooms are accessible and inclusive.

West Hollywood Municipal Code Section 9.28.090, 2014,

[http://weho.granicus.com/MetaViewer.php?view\\_id=22&clip\\_id=2505&meta\\_id=86373](http://weho.granicus.com/MetaViewer.php?view_id=22&clip_id=2505&meta_id=86373).

**Cost Impact:** Will not increase the cost of construction

Costs associated with our proposed amendments are limited to signage and would have no effect on construction costs. Restroom signs that do not specify gender are available for comparable costs to those that do specify gender. To the extent that there are price reductions for buying in bulk, some establishments will actually save money if they only need to purchase many of one sign.

P43-15 : 403.2-  
MEERKAMPER5718

---

## ***Public Hearing Results***

**Committee Action:**

**Disapproved**

**Committee Reason:** The code identifies male and female facilities and there isn't

any need for anything other to be in the code. "Single stall" seems to indicate a compartment but a single user toilet room doesn't have a compartment.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Jo Michael, Equality California, representing Equality California requests Approve as Submitted.**

**Commenter's Reason:** Submitted on behalf of Equality California:

Most people don't realize under the International Code Council's current building codes, public and commercial spaces are actually required to restrict single-user restrooms to only one gender. This doesn't make sense.

The International Code Council should adopt P 43-15, following the examples set by Austin, TX; Santa Fe, NM, Washington, DC; and a number of other cities that now require single-user restrooms to be inclusive of all genders. Taking this important step will reduce wait times for everyone. Many people have been in the frustrating position of waiting in line for a single-stall restroom while the restroom designated for the other gender sits empty. In establishments that have two single-user restrooms, making those restrooms inclusive of all genders will double the options for everyone. This proposal will also make single-user restrooms more accessible to parents with a young child of a different gender as well as people with disabilities who have an attendant of another gender.

This proposal will also make single-user restrooms safer and more welcoming for many gay, lesbian, bisexual, and transgender people. People who do not fit traditional ideas of gender are often harassed or even assaulted simply for being in what other people incorrectly assume is the "wrong" restroom. Many gender nonconforming people are seen as both too feminine for the men's room and too masculine for the women's room. Adopting this proposal would help many people avoid that kind of harassment by increasing access to gender neutral restrooms for those who need them.

Additionally, as more and more local governments around the country enact policies like this one, the International Code Council risks being unresponsive to the public welfare, which could undermine the ICC's broader purpose of providing a model code for state governments that reflects the current best practices in construction and public accommodations. There is simply no reason that single-user restrooms should be labeled by sex. Please vote yes on P 43-15.

### *Public Comment 2:*

**Proponent : Susan Surface, Design in Public, representing Design In Public (comment text authored with Transgender Law Center) (info@designinpublic.org) requests Approve as Submitted.**

**Commenter's Reason:** We put forth this comment in support of P 43-15, the Transgender Law Center's proposed revision to International Building Code.

Most people don't realize under the International Code Council's current building codes, public and commercial spaces are actually required to restrict single-user restrooms to only one gender. This doesn't make sense.

The International Code Council should adopt P 43-15, following the examples set by

Austin, TX; Santa Fe, NM, Washington, DC; Seattle, WA; and a number of other cities that now require single-user restrooms to be inclusive of all genders.

Taking this important step will reduce wait times for everyone. Many people have been in the frustrating position of waiting in line for a single-stall restroom while the restroom designated for the other gender sits empty. In establishments that have two single-user restrooms, making those restrooms inclusive of all genders will double the options for everyone.

This proposal will also make single-user restrooms more accessible to parents with a young child of a different gender as well as people with disabilities who have an attendant of another gender.

This proposal will also make single-user restrooms safer and more welcoming for many gay, lesbian, bisexual, and transgender people. People who do not fit traditional ideas of gender are often harassed or even assaulted simply for being in what other people incorrectly assume is the "wrong" restroom. Many gender nonconforming people are seen as both too feminine for the men's room and too masculine for the women's room. Adopting this proposal would help many people avoid that kind of harassment by increasing access to gender neutral restrooms for those who need them.

Additionally, as more and more local governments around the country enact policies like this one, the International Code Council risks being unresponsive to the public welfare, which could undermine the ICC's broader purpose of providing a model code for state governments that reflects the current best practices in construction and public accommodations. There is simply no reason that single-user restrooms should be labeled by sex. Please implement P43-15.

### *Public Comment 3:*

**Proponent : Harper Jean Tobin, National Center for Transgender Equality, representing National Center for Transgender Equality (hjtobin@transequality.org) requests Approve as Submitted.**

**Commenter's Reason:** These comments are submitted on behalf of the National Center for Transgender Equality (NCTE). Founded in 2003, NCTE is a national nonprofit organization in the United States dedicated to improving the lives of transgender people through education and advocacy. NCTE regularly works with federal, state, and local government agencies and other institutions to develop policies and practices that increase accessibility and equity for all people. Recently, NCTE formed an alliance with the US Occupational Safety and Health Administration (OSHA) and helped inform a national best practice guide from OSHA on workplace restroom access. NCTE strongly supports P 43-15, which reflects an approach already recommended for workplaces by US OSHA and other US government agencies such as the US Office of Personnel Management. The International Code Council should adopt P 43-15, following the examples set by Austin, TX; Santa Fe, NM, Washington, DC; and a number of other cities that now require single-user restrooms to be inclusive of all genders. Taking this important step will reduce wait times for everyone. Many people have been in the frustrating position of waiting in line for a single-stall restroom while the restroom designated for the other gender sits empty. In establishments that have two single-user restrooms, making those restrooms inclusive of all genders will double the options for everyone. This proposal will also make single-user restrooms more accessible to parents with a young child of a different gender as well as people with disabilities who have an attendant of another gender.

This proposal will also make single-user restrooms safer and more welcoming for many gay, lesbian, bisexual, and transgender people. People who do not fit traditional ideas of gender are often harassed or even assaulted simply for being in what other people incorrectly assume is the "wrong" restroom. Many gender nonconforming people are seen as both too feminine for the men's room and too

masculine for the women's room. Adopting this proposal would help many people avoid that kind of harassment by increasing access to gender neutral restrooms for those who need them.

Additionally, as more and more local governments around the country enact policies like this one, the International Code Council risks being unresponsive to the public welfare, which could undermine the ICC's broader purpose of providing a model code for state governments that reflects the current best practices in construction and public accommodations. There is simply no reason that single-user restrooms should be labeled by sex. Please vote yes on P 43-15.

*Public Comment 4:*

**Proponent : Amanda Goad, representing self (amandacgoad@gmail.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

**2015 International Plumbing Code**

**403.2.2 ~~Single-stall~~ Single-user toilet facilities** *No change to text.*

**Commenter's Reason:** This proposal seeks to improve timely access to restroom facilities for all members of the public, including but not limited to those whose gender does not match the traditional restroom signage. It is important for the Code to stop dictating the designation of single-user toilet facilities as exclusively "male" or "female," as this unnecessarily creates awkwardness for children and adults requiring the assistance of a caregiver in the restroom, as well as for people whose gender does not neatly fit either "male" or "female." Various localities and institutions have already, successfully adopted analogous codes and policies. Adopting the core of this proposal (403.2(4)) would have substantial benefits for the public.

Based on the Committee's response to the initial proposal, it appears that the wording of the proposal at section 403.2.2 should be changed to clarify that it refers to "single user toilet rooms," which typically do not contain separate "stalls" or compartments.

Amanda Goad, Esq.  
Los Angeles, CA, USA

# P44-15

## 403.2 (IBC 2902.2)

### **Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

## **2015 International Plumbing Code**

**Revise as follows:**

**403.2 Separate facilities.** Where plumbing fixtures are required, separate facilities shall be provided for each sex.

### **Exceptions:**

1. Separate facilities shall not be required for dwelling units and sleeping units.
2. Separate facilities shall not be required in structures or tenant spaces with a total occupant load, including both employees and customers, of 15 or fewer.
3. Separate facilities shall not be required in mercantile and business occupancies in which the maximum occupant load is ~~100~~ 50 or fewer.

**Reason:** It has been long standing practice in the codes to group business and mercantile occupancies in regards to plumbing fixtures. It was not clear why the number was changed from 50 to 100 in the 2012 IPC for mercantile with the IBC occupant load remaining the same. These revisions are made to allow for small business occupancies to provide a single toilet facility for up to 50 occupants and reduce the number to the previous value of 50 for mercantile occupancies.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 98.

**Cost Impact:** Will increase the cost of construction

This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. Specifically, for mercantile occupancies having an occupant load of greater than 50 and less than 101, separate toilet facilities (for male and female) will be required whereas in the current code that range does not require separate facilities. Extra space and duplicate fixtures, piping and associated materials and labor will increase the cost of construction for those mercantile establishments in that range.

**P44-15 : 403.2-  
SNYDER3937**

---

## **Public Hearing Results**

**Committee Action:****Disapproved**

**Committee Reason:** There is no real technical justification to change mercantile back to 50 when it was just changed to 100 in the 2012 edition. A 100 person occupant load is a 6000 square foot tenant space which is still fairly small as far as typical mercantile tenant spaces are today. Requiring separate male/female toilet rooms for those spaces would be a undue hardship.

**Assembly Motion:****As Submitted****Online Vote Results:****Failed**

Support: 47.4% (73) Oppose: 52.6% (81)

**Assembly Action :****None****Individual Consideration Agenda***Public Comment 1:*

**Proponent : Janine Snyder, representing Plumbing, Mechanical and Fuel Gas Code Committee (PMGCAC@iccsafe.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:****2015 International Plumbing Code**

**403.2 Separate facilities.** Where plumbing fixtures are required, separate facilities shall be provided for each sex.

**Exceptions:**

1. Separate facilities shall not be required for dwelling units and sleeping units.
2. Separate facilities shall not be required in structures or tenant spaces with a total occupant load, including both employees and customers, of 15 or fewer.
3. Separate facilities shall not be required in mercantile ~~and business occupancies~~ in which the maximum occupant load is ~~50~~ 100 or fewer.
4. Separate facilities shall not be required in business occupancies in which the maximum occupant load is 25 or fewer.

**Commenter's Reason:** The main intent of the original proposal was to address business occupancies. Therefore, this public comment returns Item 3 to what is currently in the code and adds a new Item 4 to cover business occupancies only. The toilet facility arrangements in some small business tenant spaces have male and female toilet rooms on opposite ends of the tenant space, typically creating unnecessary travel from the employee work area for one of the sexes. Labeling the toilet facilities (for each sex) is unnecessary in this type of small business environment.

**P44-15**

# P47-15

## 404.1.1 (New)

### Proposed Change as Submitted

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

## 2015 International Plumbing Code

**Add new text as follows:**

**404.1.1 Clustered family-or-assisted-use toilet facilities.** Where multiple family-or-assisted-use toilet facilities are clustered at a single location, not less than 50 percent of the cluster of toilet facilities shall be required to be accessible.

**Reason:** IBC Section 1109.2 Exception 2 allow for single occupant toilet rooms that are clustered and of the same type to only have 50% constructed accessible. Since the family or assisted-use toilet room requirements basically describe an accessible single occupant bathroom, the intent of the exception is to allow for the same exception to be applicable when someone uses the allowance in IPC Section 404.2.2. This would be consistent with the 2010 ADA Standard for Accessible Design. This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is CTC/PMG Proposal Item 1.

In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled Accessibility. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the [CTC website](#).

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P47-15 : 404.1.1 (New)-  
SNYDER3938

---

### Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** Assisted accessible bathrooms do not include assistance. If you have assistance, it falls outside of accessibility.

**Assembly Action :**

**None**

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Janine Snyder, representing Plumbing, Mechanical and Fuel Gas Code Committee (PMGCAC@iccsafe.org) requests Approve as Submitted.**

**Commenter's Reason:** The original proposal reason statement is still valid. The following example illustrates the advantages of having this new language in the code: A building (or tenant space) requires (according to Table 403.1) two water closets for males and two water closets for females. The building designer decides that the best use of space is to do this with 4 single user toilet rooms, two labeled MALE and two labeled FEMALE, all in the same location (clustered). The basic understanding of many plans examiners and code officials is to require that the fixtures in each one of these single user toilet facilities be designed for accessibility because of their basic knowledge that "not less less than one fixture of each type in each toilet facility must be of accessible design". However, the IBC (Section 1109.2) and beginning with the 2010 ADA, recognize that where multiple single user toilet facilities are in a cluster (as this example illustrates), only 50% of those clustered toilet facilities are required to be of accessible design. This allowance results in a space and cost savings for two single user toilet facilities (one each per sex) to be of "standard" design because of less square footage, use of standard plumbing fixtures and grab bars not needed. The plumbing code does not need to be requiring toilet facilities of accessible design where the accessible design community does not require such facilities to be provided.

## 405.8, 1002.2

### **Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

**NOTE:** PART II DID NOT RECEIVE A PUBLIC COMMENT AND IS ON THE CONSENT AGENDA. PART II IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY FOLLOWING ALL OF PART I.

## **2015 International Plumbing Code**

### **Revise as follows:**

**405.8 Slip joint connections.** Slip joints connections shall be installed only for tubular waste piping and only between the outlet of a fixture and the connection to the drainage piping. Slip joint connections shall be made with an *approved* elastomeric sealing gasket and shall only be installed on the trap outlet, trap inlet and within the trap seal. Fixtures with concealed slip-joint Slip joint connections shall be provided with access. Such access shall provide an access panel or utility space opening that is not less than 12 inches (305 mm 305mm) in its smallest dimension or other approved arrangement so as to provide access to the slip joint connections for inspection and repair.

**1002.2 Design of traps.** Fixture traps shall be self-scouring. Fixture traps shall not have interior partitions, except where such traps are integral with the fixture or where such traps are constructed of an *approved* material that is resistant to corrosion and degradation. Slip joints Traps having slip joint connections shall be made comply with an approved elastomeric gasket and shall be installed only on the trap inlet, trap outlet and within the trap seal. Section 405.8.

**Reason:** From the existing wording of this section, some inspectors have the misconception that the code doesn't allow slip joints to be installed upstream of a trap inlet nor at the connection of the trap "arm" to the drainage piping. For example, consider a typical lavatory where the drainage piping in the wall was roughed in at a fairly low elevation and the tailpiece from the fixture outlet is not very long. Normally, a slip joint end, tubular waste extension piece is installed to make the connection to the end of the fixture tailpiece to the inlet of the trap. However, if the existing wording is read literally, the code doesn't allow a slip joint above the trap inlet: *only at the trap inlet, outlet and within the trap seal.* Although it would be ideal to have the rough-in elevation of the drain in the wall "coordinate" with the elevation of the fixture outlet tailpiece piece, it is not realistic to make this happen every time. Sometimes the rough-in installer doesn't know the height of the cabinetry for the lavatory or the model of the drain assembly because neither have been chosen yet by the builder designer.

The revised wording allows for what is a common practice for fixture installation in the plumbing industry.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls

to discuss and debate the proposed changes. This is PMGCAC Item 1.

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

---

## **Public Hearing Results**

### **Part I**

**Committee Action:**

**Disapproved**

**Committee Reason:** Approving this proposal would prohibit some types of bathtub waste assemblies as they use slip joints on other than tubular waste.

**Assembly Motion:**

**As Submitted**

**Online Vote Results:**

**Failed**

Support: 47.26% (69) Oppose: 52.74% (77)

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### ***Public Comment 1:***

**Proponent : Janine Snyder, representing Plumbing, Mechanical and Fuel Gas Code Committee (PMGCAC@iccsafe.org) requests Approve as Submitted.**

**Commenter's Reason:** The Committee was swayed by inaccurate information given by opposition testimony. The revised wording does not change anything with regards to where *tubular waste* assemblies with slip joint connections have been commonly installed in all types of buildings for the past 50 years. Everyone in the plumbing industry should be well acquainted with the phrase "tubular waste" (see explanation at the bottom of this reason statement)

Tubular waste assemblies are commonly used for bathtub waste assemblies, whirlpool tub waste assemblies, bidet waste assemblies, lavatory waste assemblies and sink waste assemblies. This proposal does not limit where *tubular waste* assemblies can be installed, whether the connections are solid (solvent cemented or soldered) or slip-joint.

The PMGCAC believes that the inaccurate information is based on misreading and misunderstanding of the first sentence of Section 405.8:

**405.8 Slip joint connections.** Slip joint connections shall be installed only for tubular waste piping and only between the outlet of a fixture and the connection to the drainage piping. ....

The first part of the sentence says slip joint connections are only appropriate for use on tubular waste piping. It does **not** say that slip-joint connections are the only type of connection that can be used for connecting tubular waste assemblies. The section

is about where slip joint connections can be used and the limitations for using those connections. This section is **not** about where tubular waste assemblies are allowed to be used. The code doesn't need a section on where tubular waste assemblies are allowed to be used because those locations are automatically driven by the design of the fixture outlet fittings (tub shoes, lav pop up assemblies, KS basket strainer assemblies, bidet drain assemblies.)

And while it should not be necessary to state the last half of the proposed sentence, there are some inspectors who believe that there cannot be a slip joint connection above the inlet of a trap. That *is* what the current code section literally says !

However, in a typical two-bowl kitchen sink with a combination tubular waste assembly, there are several slip joints "above the trap". The PMGCAC added the last half of the sentence to make it clear to everyone that slip joints are allowed at any point from the outlet of the fixture to where the tubular waste assembly connects to the *drain piping*, that being the piping that complies with one of the standards in Tables 702.1 (and the piping-appropriate fittings in Table 702.4)

Part II of this proposal for the IRC was approved by that committee. This proposal needs approval for consistency between the two plumbing codes.

What is meant by "tubular waste":

These components are made of either plastic or brass, with the tubing of these waste assemblies having an outside diameter of 1-1/4 or 1-1/2 inches. Although some tubular waste is solvent cemented (PVC or ABS plastic) or soldered (copper or brass) joints, the vast majority of *tubular waste* is installed with slip-joint connections.

---

P53-15 Part I

## **P53-15 Part II**

### **P2704, P2704.1, P3201.1**

#### **Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

## **2015 International Residential Code**

**Revise as follows:**

### **SECTION P2704 ~~ACCESS TO~~ SLIP JOINT CONNECTIONS**

**P2704.1 General Slip joints.** ~~Slip joints connections shall be installed only for tubular waste piping and only between the trap outlet of a fixture and the connection to the drainage piping. Slip joint connections shall be made with an approved elastomeric sealing gasket and shall be installed only on the trap outlet, trap inlet and within the trap seal. Fixtures with concealed slip joint Slip joint connections shall be provided with accessible. Such access shall provide an access panel or utility space opening that is not less than 12 inches (305 mm 305mm) in its smallest dimension or other approved arrangement so as to provide access to the slip connections for inspection and repair.~~

**P3201.1 Design of traps.** Traps shall be of standard design, shall have smooth uniform internal waterways, shall be self-cleaning and shall not have interior partitions except where integral with the fixture. Traps shall be constructed of lead, cast iron, copper or copper alloy or *approved* plastic. Copper or copper alloy traps shall be not less than No. 20 gage (0.8 mm) thickness. Solid connections, slip joints and couplings shall be permitted to be used on the trap inlet, trap outlet, or within the trap seal. ~~Slip joints~~ Trap having slip joint connections shall be accessible. comply with Section P2704.1.

**Reason:** From the existing wording of this section, some inspectors have the misconception that the code doesn't allow slip joints to be installed upstream of a trap inlet nor at the connection of the trap "arm" to the drainage piping. For example, consider a typical lavatory where the drainage piping in the wall was roughed in at a fairly low elevation and the tailpiece from the fixture outlet is not very long. Normally, a slip joint end, tubular waste extension piece is installed to make the connection to the end of the fixture tailpiece to the inlet of the trap. However, if the existing wording is read literally, the code doesn't allow a slip joint above the trap inlet: *only at the trap inlet, outlet and within the trap seal*. Although it would be ideal to have the rough-in elevation of the drain in the wall "coordinate" with the elevation of the fixture outlet tailpiece piece, it is not realistic to make this happen every time. Sometimes the rough-in installer doesn't know the height of the cabinetry for the lavatory or the model of the drain assembly because neither have been chosen yet by the builder designer.

The revised wording allows for what is a common practice for fixture installation in the plumbing industry.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International

Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 1.

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

**Committee Reason:** The committee agreed with the proponent's published reason statement.

**Assembly Action :**

**None**

---

# P55-15 Part I

407.2

## Proposed Change as Submitted

**Proponent :** Julius Ballanco, representing Self  
(JBENGINEER@aol.com)

**NOTE:** PART II DID NOT RECEIVE A PUBLIC COMMENT AND IS ON THE CONSENT AGENDA. PART II IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY FOLLOWING ALL OF PART I.

## 2015 International Plumbing Code

**Revise as follows:**

**407.2 Bathtub waste outlets and overflows.** Bathtubs shall be equipped with a waste outlet ~~and an overflow outlet. The outlets shall be connected to waste tubing or piping~~ not less than 1<sup>1</sup>/<sub>2</sub> inches (38 mm) in diameter. The waste outlet shall be equipped with a water-tight stopper. Where an overflow is installed on a bathtub, the overflow shall be not less than 1-1/2 inches (38 mm) in diameter.

**Reason:** The Code is currently not coordinated with the referenced standards. The standards listed in Table 2701.1 do not require an overflow. An overflow is an optional connection for a bathtub. The reason the standard removed the mandate for overflows is because they cannot be properly cleaned. Furthermore, they are rarely if ever used, which is the only way to clean the overflow. Without proper cleaning, there is a build-up of contaminants in the overflow.

As the code currently reads, it prohibits certain tubs because they do not have an overflow. However, Table 2701.1 allows these tubs.

The national consensus product standard should be the document that regulates the construction requirements of a bathtub.

**Cost Impact:** Will not increase the cost of construction

This will decrease the cost of construction by not requiring an overflow for every bathtub.

P55-15 Part I : 407.2-  
BALLANCO6056

---

## Public Hearing Results

### Part I

**Committee Action:**

**Disapproved**

**Committee Reason:** The standard for bathtubs is in the process of the being revised to be more clear on this issue. Until the revision is complete, the code should not be revised.

**Assembly Action :**

**None**

---

## Individual Consideration Agenda

## *Public Comment 1:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com) requests Approve as Submitted.**

**Commenter's Reason:** Part 2 of this change was recommended for approval. For consistency, Part 1 should also be approved. The reason given for denial is not valid. The comment during testimony was that the standard is in the process of being clarified to require overflows. That is incorrect. The standard may have a change proposed to mandate overflows for bathtubs, but at the current time such a mandate is not found in the standard. Furthermore, any change would have to go through the consensus process. There is no determining how such a change would fair during the consensus review.

Manufacturers are producing high end bathtubs without an overflow. The worse thing to happen would be to drill a hole in the field on these high end fixtures to install an overflow.

If the standard ever is changed, a change can be proposed to mandate overflows. However, until such change is proposed, the code should not mandate overflows.

---

**P55-15 Part I**

## **P55-15 Part II**

### **P2713.1**

#### **Proposed Change as Submitted**

**Proponent :** Julius Ballanco, representing Self  
(JBENGINEER@aol.com)

### **2015 International Residential Code**

#### **Revise as follows:**

**P2713.1 Bathtub waste outlets and overflows.** Bathtubs shall be equipped with a waste outlet ~~and an overflow outlet. The outlets shall be connected to waste tubing or piping that is~~ not less than  $1\frac{1}{2}$  inches (38 mm) in diameter. The waste outlet shall be equipped with a water-tight stopper. Where an overflow is installed, the overflow shall be not less than  $1\frac{1}{2}$  inches (38 mm) in diameter.

**Reason:** The Code is currently not coordinated with the referenced standards. The standards listed in Table 2701.1 do not require an overflow. An overflow is an optional connection for a bathtub. The reason the standard removed the mandate for overflows is because they cannot be properly cleaned. Furthermore, they are rarely if ever used, which is the only way to clean the overflow. Without proper cleaning, there is a build-up of contaminants in the overflow.

As the code currently reads, it prohibits certain tubs because they do not have an overflow. However, Table 2701.1 allows these tubs.

The national consensus product standard should be the document that regulates the construction requirements of a bathtub.

**Cost Impact:** Will not increase the cost of construction  
This will decrease the cost of construction by not requiring an overflow for every bathtub.

**P55-15 Part II : P2713.1-  
BALLANCO6057**

---

### **Public Hearing Results**

## **Part II**

### **Committee Action:**

**Approved as Submitted**

**Committee Reason:** Tubs are being sold without overflow openings. The code should not be requiring plumbers to be drilling holes in tubs in the field in order to comply with the code.

### **Assembly Action :**

**None**

---

# P59-15

## 410.2 (IBC 2902.6)

### Proposed Change as Submitted

**Proponent :** Stephen DiGiovanni, representing Southern Nevada Chapter of ICC (sdigiovanni@clarkcountynv.gov)

## 2015 International Plumbing Code

### Revise as follows:

**410.2 Small occupancies.** Drinking fountains shall not be required for an occupant load of ~~15~~ 30 or fewer.

**Reason:** IPC Section 410.2 (IBC Section 2902.6) is revised to increase the occupant load up to 30 for those small occupancies where drinking fountains are not required. The increase in the occupant load for both drinking fountains and service sinks would provide a favorable code limitation to very small occupancies and a decrease in cost to small business owners. Real occupancy of spaces and the calculated occupant loads may differ to the point where the requirements of the current code may be too stringent.

**Cost Impact:** Will not increase the cost of construction  
This proposal will result in a less stringent code requirement, and therefore would presumably lower the cost of construction.

P59-15 : 410.2-  
DIGIOVANNI4738

---

### Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** The requested increase to thirty is arbitrary. The current threshold of 15 is not overly conservative.

**Assembly Action :**

**None**

---

### Individual Consideration Agenda

#### *Public Comment 1:*

**Proponent :** Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com) requests Approve as Submitted.

**Commenter's Reason:** It is interesting that the Committee denied this change because the value for fixture requirements is arbitrary. Actually every value for minimum number of fixtures is arbitrary. They move up and down based on field experience. The proponent has a valid reason for the change in the number of fixtures required.

#### *Public Comment 2:*

**Proponent : Kevin McOsker, representing Southern Nevada Chapter of ICC (ktm@ClarkCountyNV.gov) requests Approve as Submitted.**

**Commenter's Reason:** The small occupancy trigger established in 410.2 with respect to drinking fountains is based on the egress requirements in Chapter 10. The occupant load factors, are, and should be, relatively conservative to ensure safe egress requirements. This conservative approach for the egress requirements results in very small building areas where drinking fountains are required. The chart below addresses various occupancy types, occupant load factors and comparison of areas where drinking fountains are required in the current code and based on this code change proposal. This code change allows larger building areas to be exempt from the requirement of a drinking fountain. It should be noted, the actual occupant load of building area is often less than the stated occupant load, resulting in the requirement for a drinking fountain for relatively few people.

Occupancy	Occupant Load Factor (OLF) (ft <sup>2</sup> /
Assembly (unconcentrated)	15
Day Care	30
Mercantile	60
Industrial/Business	100
Residential	200
Storage	300

---

P59-15

# P60-15

## 410.2 (IBC 2902.6)

### Proposed Change as Submitted

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

## 2015 International Plumbing Code

**Revise as follows:**

**410.2 Small occupancies.** Drinking fountains shall not be required for an occupant load of ~~15~~ 50 or fewer.

**Reason:** The following is provided as support that drinking fountains for smaller occupancies are just not needed as evidenced by the experience (two code cycles) in one of the hottest and driest areas of the country.

As many should know, the climate in Phoenix, Arizona is HOT and DRY. The following Wikipedia quote sums up the general facts:

Phoenix has a subtropical desert climate, typical of the Sonoran Desert in which it lies. Phoenix has extremely hot summers and warm winters. The average summer high temperatures are some of the hottest of any major city in the United States, and approach those of cities such as Riyadh and Baghdad.<sup>[60]</sup> On average (1981-2010), there are 107 days annually with a high of at least 100 °F (38 °C),<sup>[61]</sup> including most days from late May through early October. Highs top 110 °F (43 °C) an average of 18 days during the year.<sup>[62]</sup> Every day from June 10 through August 24, 1993, the temperature in Phoenix reached 100 °F or more, the longest continuous number of days (76) in the city's history. Officially, the number of days with a high of at least 100 °F has historically ranged from 48 in 1913 to 143 in 1989. For comparison, since 1870, New York City has seen a temperature of 100 degrees or more a total of only 59 days.<sup>[63]</sup> On June 26, 1990, the temperature reached an all-time recorded high of 122 °F (50 °C).<sup>[64]</sup>

60. "Collier Center". Collier Center of Phoenix. Retrieved September 12, 2012.

61. "NowData - NOAA Online Weather Data". National Oceanic and Atmospheric Administration.

Retrieved 2011-12-18.

62. "Climatology of heat in the southwest". National Weather Service. Retrieved January 6, 2009.

63. NWS Upton, NY. Retrieved 2014-05-24

64. Dorish, Joe. "10 All-Time Hottest Weather Temperature Days in Phoenix". Knoji. Retrieved February 5, 2014.

Another source indicates the average relative humidity is second to the lowest in the nation with Las Vegas having the lowest. Here's a typical year for Morning (M) and Afternoon (A) Relative Humidities in Phoenix:

JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC											
M	A	M	A	M	A	M	A	M	A	M	A											
M	A	M	A	M	A	M	A	M	A	M	A											
67	33	60	27	57	24	43	16	35	13	31	12	44	20	51	23	49	23	50	22	57	27	67
34																						

Our mouths are parched just thinking about those afternoon conditions!

The City of Phoenix has always believed that the threshold of 15 occupants for not requiring drinking fountains was far too low such that it created a significant waste of building space for smaller buildings and tenant spaces. Phoenix made the decision two code cycles ago to raise the threshold to 50. In the 8 plus years of this

new threshold in place for new and renovated buildings in Phoenix, there have not been any complaints about not having drinking fountains in smaller establishments. Not one.

It is believed that the low threshold is unwarranted for the remainder of the United States as those areas are not nearly as hot or dry as Phoenix.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This PMGCAC Item 97.

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P60-15 : 410.2-  
SNYDER3947

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** A threshold of 50 seems to be an arbitrary number. People need free access to water. Allowing 15 people not have access to water is one thing but 50 seems to be excessive number of people to have to go without water.

**Assembly Motion:**

**As Submitted**

**Online Vote Results:**

**Failed**

Support: 40.38% (63) Oppose: 59.62% (93)

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Janine Snyder, representing Plumbing, Mechanical and Fuel Gas Code Code Action Committee (PMGCAC@iccsafe.org) requests Approve as Submitted.**

**Commenter's Reason:** The reason statement in the proposal provides more than enough evidence that not installing of drinking fountains in small occupancies is not a problem in one of the hottest and driest climates in this country.

History on where the 15 person threshold came from:

The 15 person threshold was introduced into the 2009 IPC through proposal P17-07/08. That proposal originally requested a threshold of 50, based simply on the requirement for where separate (male/female) toilet facilities were needed for mercantile occupancies (at that time, the separate facilities requirement for mercantile was at 50 persons.) The Committee disapproved the proposal saying that they *wanted* all buildings and spaces to have free water (but provided no

technical reason as to why that was necessary for every building and tenant space, no matter how small). The proponent submitted a public comment asking the Voters for a reduced threshold of 15 or fewer persons, that number based on "matching" the threshold for where separate toilet facilities were not required for any building or space. The proposal, as modified by that public comment, was successful.

Note that proposal P17-07/08 was submitted by the Utah ICC Chapter (based in Salt Lake City). Salt Lake City is dry and hot (nearly 100F some days) during the summer months. Yet those Utah code officials felt, at that time, that 50 persons was a reasonable and appropriate threshold to propose.

In this code cycle, the Committee first acted on an As-Submitted motion which was defeated by only 8 to 6. An Assembly Motion for putting As-Submitted on the Public Comment agenda was acted upon by Online Voters and was defeated 93 to 63.

Clearly, there is a significant portion of people who believe that the 50 person threshold is not too high.

Change is difficult. However, to stay with a current code requirement that was not based on *any* data is difficult to swallow when data now exists and many code officials are being challenged about the increase in construction costs, especially for smaller spaces, that newer code editions often create. This is a reasonable opportunity to offset those increased costs that are much more important in the the bigger picture.

Consider the following:

The landscape of drinking water sources has been evolving and significantly so in the last 5 years. Many of today's projects are focused on turning large existing buildings into usable tenant spaces of "small" areas.

Major renovation of any building or tenant space is costing more than ever these days. This is especially true for spaces having an occupant load of less than 50. "One" drinking fountain in and of itself, doesn't appear to take up much space but the requirement for one drinking fountain requires, for accessibility compliance, that two drinking fountains be installed: one for standing persons and one for wheelchair-seated persons. As these drinking fountains are accessible fixtures, an accessible route is required. ICC/ANSI A117.1 (currently at the 2009 edition), no longer allows "parallel access" to a drinking fountain and does not allow drinking fountains located in an alcove. Thus, the presence of drinking fountains requires a significant amount of space that could be used for more beneficial purposes in these small tenant spaces and buildings. In most cases, these fixtures will not ever be used (the following paragraph explains further). It has also been found that after final inspection, some small business offices simply remove the drinking fountain(s) and locate the copy machine in its place. There is anecdotal stories of plumbing contractors "renting" the same drinking fountains for final inspection compliance and removing them later at the owners request. That is just how *not* valuable these fixtures are for small occupancies.

As unfortunate as it may be, much of the public currently has some distrust of tap water. That coupled with many frequently found undesirable aspects of using drinking fountains such as water streams not high enough off the bubbler, the potential for slobber and spit on a bubbler and generally unclean conditions most of the time, cause people to avoid drinking fountains. They would much rather buy water or bring water with them. Thus, drinking fountains are not being used at the frequency that they once were decades ago. This is not to say that people are not drinking less water than they used to. They are just being much more selective in how they obtain drinking water. And drinking fountains are low on the list of sources.

When this code is published in 2018, many jurisdictions will not be adopting that edition until many years afterwards. The time is now to once again, consider a change in the code that makes a bold step, similar to what the Final Action voters did in 2008, against what the Committee said they *wanted* (no threshold at all). The 15

person threshold had no real basis. Now there is hard evidence that the 50-person threshold is satisfactory in the hottest of climates. The code body has changed other plumbing fixture requirement ratios based on hard data presented. The hard data for drinking fountains has now been provided.

The PMGCAC urges approval of this proposal.

---

**P60-15**

# **P63-15**

## **411.3 (New), Chapter 14**

### **Proposed Change as Submitted**

**Proponent :** Billy Smith, American Society of Plumbing Engineers Legislative Committee, representing American Society of Plumbing Engineers Legislative Committee (bsmith@aspe.org)

## **2015 International Plumbing Code**

### **Add new text as follows:**

**411.3 Water supply.** The temperature of the water supply to an emergency shower or eyewash station shall only be controlled by a temperature actuated mixing valve complying with ASSE 1071.

### **Add new standard(s) as follows:**

**ASSE 1071 - 2012 Performance Requirements for Temperature Actuated Mixing Valves for Plumbed Emergency Equipment**

**Reason:** The temperature of the water to emergency fixtures is regulated by ASSE 1071 devices. These devices raise the temperature of the cold water by the introduction of hot water. The cold water flows freely through the device. This feature is imperative to prevent the water supply to an emergency fixture from shutting off. The most important requirement of an emergency fixture is the constant flow of high volumes of water.

Without this code requirement, the water supply could be regulated with an ASSE 1070 device. This would be dangerous in that such a device could shut off the flow of water if there is a loss of either hot or cold water. By listing that the "only" means of protection is an ASSE 1071 device, no other mixing valve can be used.

The use of these devices is also consistent with the OSHA requirements for emergency fixtures.

**Cost Impact:** Will not increase the cost of construction

This merely adds the proper reference to the thermostatic mixing valve required for an emergency shower.

This is already a requirement of OSHA.

**Analysis:** A review of the standard proposed for inclusion in the code, ASSE 1071, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

**P63-15 : 411.3 (New)-  
SMITH5398**

---

## **Public Hearing Results**

**Committee Action:**

**Approved as Modified**

**Modification:**

**411.3 Water supply.** ~~The temperature of the~~ Where hot and cold water supply is supplied to an emergency shower or eyewash station the temperature of the water supply shall only be controlled by a temperature actuated mixing valve complying with ASSE 1071.

**Committee Reason:**

For the Modification only:

The correct water temperature to a safety shower can be supplied by mixed hot and cold water supply, storage tanks or tankless water heaters. Only where hot and cold water supplies are mixed is there a need for a mixing valve.

For the proposal As Modified:

The committee agreed with the proponent's published reason statement.

**Assembly Motion:**

**Disapprove**

**Online Vote Results:**

**Successful**

Support: 52.94% (81) Oppose: 47.06% (72)

**Assembly Action :**

**Disapproved**

**Analysis.** For staff analysis of the content of ASSE 1071 - 2012 with regard to the ICC criteria for referenced standards (Section 3.6 of CP #28), please visit: <http://www.iccsafe.org/wp-content/uploads/2015-Proposed-Standards-Group-A-Final.pdf>

**Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com) requests Approve as Modified by Committee.**

**Commenter's Reason:** The reason presented for the floor motion was that the opponents to the change were unsure as to whether their concerns were addressed by the modification. In fact, the modification did address their concerns. An ASSE 1071 device is only required when hot and cold water are supplied to the emergency fixture. There are many emergency fixtures that have a single source of water supply, that being water that is tempered (by some controlled heating source) to meet the requirements of the emergency fixture. Since the modification allows the single pipe installations without an ASSE 1071 device, this change must be approved.

Without this change, it is possible that someone could install an ASSE 1017 or ASSE 1070 device for tempering the water. These are the wrong types of valve since they do not allow the uninterrupted flow of water. Both devices could close of the flow of water if tempering is not possible. An ASSE 1071 device allows the free flow of cold water adding hot water to temper the cold water.

*Public Comment 2:*

**Proponent : Ronald George, representing Self (Ron@Plumb-TechLLC.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

## **2015 International Plumbing Code**

**411.3 Water supply.** The temperature of the water ~~supply~~ supplied to an emergency shower or eyewash station shall ~~only~~ not exceed 100 °F (37.8 °C) and shall be controlled by a temperature actuated mixing valve complying with ASSE 1071.

**Commenter's Reason:** The maximum tempoerature supplied to emergency fixtures that can be used for flushing the eyes shaoud be limited to 100 Degrees Fahrenheit. Temperatures in excess of 100 degees fahrenheit for the require fluid flushing time period in the ISEA/ANSI Z358.1 standard can cause eye damage if the temperatures exceed 100 degrees Fahrenheit. This temperature is a recommendation in the appendix of the standard, but it is not enforceable there. This languge allows the inspector to verify that the mixing valve is set to limit the temperature to less than 100 F.

### *Public Comment 3:*

**Proponent : Assembly Action requests Disapprove.**

**Commenter's Reason:** This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. The assembly action for Disapprove was successful by a vote of 52.94% (81) to 47.06% (72) by eligible members online during the period of May 14 - May 28, 2015.

### *Public Comment 4:*

**Proponent : Misty Guard, Bradley Corporation, representing Bradley Corporation requests Disapprove.**

**Commenter's Reason:**

- 1) The code language will make it hard to enforce by code officials. "Only" and the phrase "thermostatic mixing valve" are too prescriptive for the code and not reflective of current technologies and design options available on the market, which will slow down innovation, prevent a competitive market for alternative technologies, and application of new technologies.
  - a) There are other technologies, such as electronic mixing valves and steam mixing valves, that can be used to achieve tepid water where hot and cold water is supplied for emergency eyewash and shower equipment.
  - b) Recirculation Loop Systems do not require a TMV at every emergency shower and eyewash station. A water

heater (storage tank or instantaneous) feeds a single TMV and distributes the blended water out to the entire system, often comprised of 3 or more emergency shower(s) or eyewash station(s).

- 2) The code language may be misinterpreted by building owners and architectural firms, which will lead to limited design options used in buildings/facilities.
  - a) "Where hot and cold water is supplied" implies that plumbed hot and cold water is required to be provided to emergency shower(s) or eyewash station(s), which prevents the use of the following technologies:
    - i) Tankless instantaneous water heaters, that use only a cold plumbed line
    - ii) Self-contained immersion heater systems and self-contained gravity-fed systems that do not use plumbed lines
    - iii) Recirculation loop systems that do not use a TMV at every emergency shower or eyewash station fixture.
  
- 3) Other industry technologies safely perform and meet the intent of ASSE 1071, Sections 1.2.3 to 1.2.7. In fact, certain industry technologies contain higher levels of protections than ASSE 1071 valves.
  - a) Instantaneous tankless water heaters prevent scalding with three separate thermostatic safety controls. In addition to outlet temperature monitoring, inlet temperature is monitored, which is not performed by ASSE 1071 valves.
  
- 4) The code language deviates from the referenced standard ISEA Z358.1, which will make it hard to enforce by code officials.
  - a) ISEA Z358.1 focuses on the performance of emergency eyewash and shower equipment to provide tepid water (60 to 100°F). The ISEA Z358.1 standard is intentionally silent on the mechanisms by which tepid water is achieved to allow for design innovations and to ensure freedom of choice based on individual building/project needs.
  - b) Z358.1 Sections 4.5.6, 5.4.6, 6.4.6, 7.4.5, and 8.2.3.4 state: "Deliver tepid flushing fluid. In circumstances where

chemical reaction is accelerated by flushing fluid temperature, a facilities safety/health advisor should be consulted for the optimum temperature for each application."

- c) IPC § 411.1 Approval states: Emergency showers and eyewash stations shall conform to ISEA Z358.1.
  - The addition of § 411.3 prohibits the use of other means to achieve tepid water. Therefore, alternative technologies and design options that comply with ISEA Z358.1 may not be allowed in jurisdictions utilizing the IPC.
  
- 5) The focus of the ISEA Z358.1 standard is for emergency shower and eyewash equipment be made available to all employees at risk for exposure to injurious materials and chemicals. Limiting design options may have unintended consequences.
  - a) Customizable solutions that are able to fit the constraints of any building/facility is core to the industry and reflective in the multitude of design options available. Limiting the choice of customizable solutions for different infrastructure needs may drive building owners/employers away from providing emergency eyewash and shower equipment, which puts employees at risk if adequate/flushing facilities are not available.
  
- 6) OSHA does not require the use of a temperature actuated mixing valve, nor an ASSE 1071 valve. Emergency Fixtures are classified according to OSHA 1910.151(c) – Medical and First Aid, which states: "Where the eyes or body of any person may be exposed to injurious corrosive materials, suitable facilities for quick drenching or flushing of the eyes and body shall be provided within the work area for immediate emergency use."

### *Public Comment 5:*

**Proponent : Gary Klein, Gary Klein and Associates, representing Self (gary@garykleinassociates.com) requests Disapprove.**

**Commenter's Reason:** While the Committee Modification is an improvement on the original proposal, neither is needed at this time in the IPC. I urge disapproval this cycle and ask that the proponents work with the emergency shower and eyewash station industry to come up with more complete wording for the next cycle.

### *Public Comment 6:*

**Proponent : Matt Sigler, Plumbing Manufacturers International, representing Plumbing Manufacturers International requests Disapprove.**

**Commenter's Reason:** This proposal does not reflect other technologies and design options that are available and used throughout the industry (i.e. electronic mixing valves, steam mixing valves, instantaneous tankless water heaters, etc.). Furthermore, this proposal is not consistent with ISEA Z358.1, which is referenced in Section 411.1 of the IPC, which does not prescribe specific equipment or devices to be used to provide tepid water, but instead focuses on the performance of emergency eyewash and shower equipment which allows for various options based on project needs.

202 (New), 418.4 (New)

## Proposed Change as Submitted

**Proponent :** Ronald George, Self; Plumb-Tech Design & Consulting Services LLC; www.Plumb-TechLLC.com;

www.ScaldPrevention.org, representing Self; Plumb-Tech Design & Consulting Services LLC (Ron@Plumb-TechLLC.com)

## 2015 International Plumbing Code

Add new definition as follows:

### SECTION 202 DEFINITIONS

**SCALD HAZARD** A condition where the discharge of high temperature hot water from a plumbing fixture can cause serious burn injuries.

Add new text as follows:

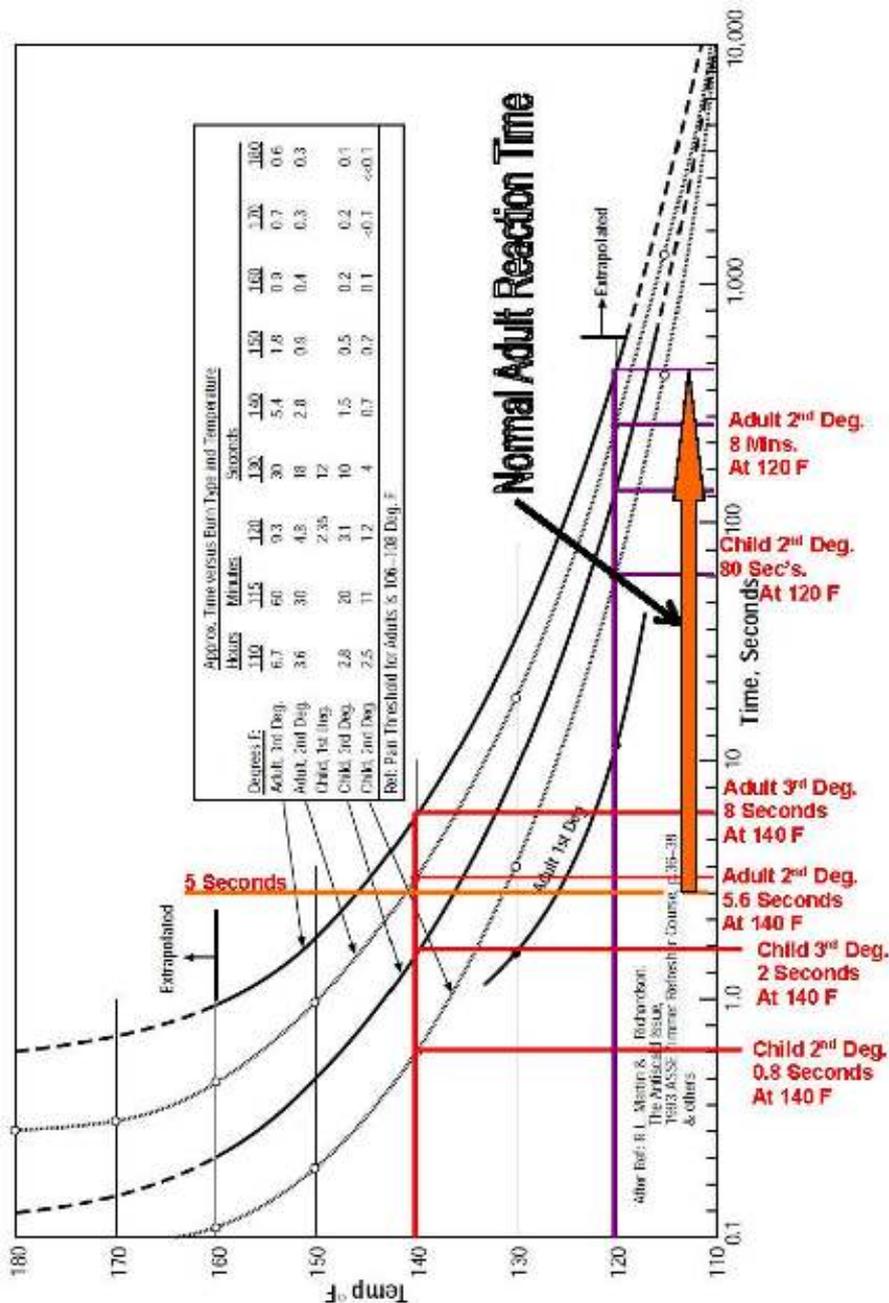

**418.4 Hot water temperature limits at sinks.** To provide for the reduction of scald hazards for people, including the elderly, persons with physical disabilities and children, using public or private sinks where hot water is supplied to sink faucets, the water discharged to the sink shall flow through one or more of the following:

1. A device conforming to ASSE 1017.
2. A device conforming to ASSE 1070.
3. A device conforming to ASSE 1062.
4. A faucet having an integral, field-adjustable limit-stop that can be adjusted from 110°F (43.3°C) to 135°F (57.2°C).

Adjustable devices and limit-stop-equipped faucets shall be set at a faucet discharge water temperature, as determined by the building owner, that protects the intended users provided that the setting does not result in a water temperature exceeding 135°F (57.2°C). Non-adjustable devices complying with ASSE 1062 shall significantly reduce flow from the faucet when discharge water temperatures exceed 115°F (46.1°C).

**Reason:** This code change is intended to provide scald protection at sinks and it offers several options for controls. The code change is intended to allow limitation and adjustment of the hot water temperature to prevent scald injuries to children, elderly or handicapped persons when they are present in a facility.

hot water scald burns, time-temperature relationships, adults & children

A Seminar and Technical Paper for the 25-28 Oct. 88 Annual ASPE Meeting at the Indianapolis Convention Center in Indianapolis, Indiana. Reprinted by Watts Regulator Company with permission of Dr. D. Bynum Jr.  
**Figure 1 – Hot Water Scald Burns – Time vs Temperature Relationship for Second and Third Degree Burns for Adults and Children.**  
 (Notes By: Ron George, CPD, See: [www.ScaldPrevention.org](http://www.ScaldPrevention.org))

**Bibliography:** [www.ScaldPrevention.org](http://www.ScaldPrevention.org)

**Cost Impact:** Will increase the cost of construction  
 The cost for a faucet with a limit stop or an ASSE 1062 device (TAFR) is minimal for the ability to limit the hot water in a home, apartment or hotel room where children, the elderly or handicapped persons may be injured using the fixture. This code change gives several options to comply without spending too much for safety.

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The proposed language applies to all sinks but that is not the intent of the proponent's published reason statement.

**Assembly Action :**

**None**

## **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Ronald George, representing Self requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Plumbing Code**

**418.4 Hot water temperature limits at sinks.** ~~To provide for the reduction of scald hazards for people, including the elderly, persons with physical disabilities and children, using public or private sinks where~~ Where hot water is supplied to sink faucets, the water discharged to the sink shall flow through one or more of the following:

1. A device conforming to ASSE 1017.
2. A device conforming to ASSE 1070.
3. A device conforming to ASSE 1062.
4. ~~A faucet having an integral, field adjustable limit stop that can be adjusted from 110°F (43.3°C) to 135°F (57.2°C).~~

~~Adjustable devices and limit stop equipped faucets shall be set at a faucet discharge water temperature, as determined by the building owner, that protects the intended users provided that the setting does not result in a water temperature exceeding 135°F (57.2°C). Non adjustable devices complying with ASSE 1062 shall significantly reduce flow from the faucet when discharge water temperatures exceed 115°F (46.1°C).~~

**Commenter's Reason:** This modification provides the ability to limit temperatures at sinks and eliminates the confusion about children and the elderly.

# P77-15

## 424.3

### **Proposed Change as Submitted**

**Proponent :** Julius Ballanco, representing Self  
(JBENGINEER@aol.com)

## **2015 International Plumbing Code**

### **Revise as follows:**

**424.3 Individual shower valves.** Individual shower and ~~tub~~ tub-  
shower combination valves shall be balanced-pressure, thermostatic or  
combination balanced-pressure/thermostatic valves that conform to the  
requirements of ASSE 1016/ ASME A112.1016/CSA B125.16 or ASME  
A112.18.1/CSA B125.1 and shall be installed at the point of use. ~~Shower and~~  
The maximum temperature of water discharging from an individual shower  
or tub-shower combination valves required by this section valve shall be  
equipped with a means to limit the maximum setting of the valve to 120°F  
(49°C), which . The maximum discharge water temperature shall be field  
adjusted in accordance with limited by a temperature-actuated mixing valve  
conforming to ASSE 1017, ASSE 1070, or CSA B125.3, by a temperature-  
actuated, flow reduction device conforming to ASSE 1062 that is installed at  
every discharge outlet, or by the manufacturer's instructions. In line  
thermostatic valves shall not be utilized for compliance with this section.  
field adjustment and setting of the hot water temperature limit stop within  
the individual shower or tub-shower combination valve.

**Reason:** The plumbing engineering community has found it to be safer for large installations, such as hotels and motels, to limit the temperature of the hot water to shower valves and tub-shower combination valves. This avoids the need to adjust every shower valve.

The maximum temperature requirement is based on someone inadvertently turning the water to full hot. This was typically assumed to be a child. Hence, this limitation is not related to thermal shock. As such a thermostatic mixing valve can be used to accomplish this level of protection, including an ASSE 1017, ASSE 1070, or CSA B125.3 valve.

This change still permits the handle limit stop on the individual valve to be used to limit the temperature of the hot water.

The last sentence regarding in-line thermostatic mixing valves predates the change to ASME A112.18.1/CSA B125.1. It no longer has any meaning. Furthermore, with the allowance of a central thermostatic mixing valve to limit the temperature of the hot water, this sentence would only add confusion to the requirements.

Temperature actuated flow reduction devices are extremely effective in protecting users from high temperatures in a shower. The devices reduce the flow of water to a trickle, thus preventing water in excess of 120°F from hitting the bather. These devices meet the intent of the code requirement for limiting the maximum temperature of hot water.

**Cost Impact:** Will not increase the cost of construction  
The change allows an option. Hence, there is no cost impact for options.

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The ASSE 1017 and ASSE 1070 valves are being misapplied for this point-of-use outlet.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com) requests Approve as Submitted.**

**Commenter's Reason:** The Committee clearly did not understand the wording of this change. They concluded that an ASSE 1017 or ASSE 1070 was misapplied for controlling the maximum temperature of the hot water. This is not correct. Currently, engineers often add an ASSE 1017 device at the water heater to provide a level of safety with the temperature of the hot water. When these valves are set for a temperature below 120 degrees F, the handle limit stop does not have to be adjusted. That is what is being done today. If a measurement is made at the shower and the maximum temperature is below 120 degrees F, then it meets the code. Hence, this is merely clarifying what is already taking place.

Similarly, an ASSE 1070 device can be set up to control the flow of water to a maximum of 120 degrees F (or lower). Thus, the valve prevents the discharge of water above 120 degrees F. There is no reason for prohibiting an installer from using an ASSE 1070 device to control the maximum temperature.

The difference between this change and the change proposed by ASPE is that this change also allows the use of an ASSE 1062 device, which prevents the showerhead from flowing a stream of water when the temperature exceed 115 degrees F. These are effective valves for limiting the temperature of the hot water discharging from a shower. The Committee had no issue with this use of an ASSE 1062 device.

---

P77-15

# P80-15

## 424.3

### **Proposed Change as Submitted**

**Proponent :** Billy Smith, American Society of Plumbing Engineering Legislative Committee, representing American Society of Plumbing Engineers Legislative Committee (bsmith@aspe.org)

## **2015 International Plumbing Code**

### **Revise as follows:**

**424.3 Individual shower valves.** ~~Individual~~ Point-of-use-controlled shower and ~~tub-shower~~ tub-shower combination valves shall be balanced-pressure, thermostatic or combination balanced-pressure/thermostatic valves that conform to the requirements of ASSE 1016/ASME A112.1016/CSA B125.16 or ASME A112.18.1/CSA B125.1 ~~and .~~ The temperature of water discharging from such valves shall be installed at the point of use. Shower and tub-shower combination valves required by this section shall be equipped with a means to limit the maximum setting of the valve to not exceed 120°F (49°C), which . The temperature shall be field adjusted in accordance with limited either by a temperature-actuated master mixing valve conforming to ASSE 1017, ASSE 1070, or CSA B125.3, or by the manufacturer's instructions limit stop integral to each point-of-use-controlled shower or tub-shower combination valve. In-line thermostatic Master mixing valves or integral limit stops, whichever serves as the temperature limiting means, shall not be utilized for compliance with this section. field-adjusted and set after the hot water distribution system is operational.

**Reason:** This change will recognize a common means of limiting the maximum temperature from a shower valve, which is a central thermostatic mixing valve. Plumbing engineers have used this method of design in many large installations, including high rise residential buildings, hotels, and motels. It is an effective means of preventing the temperature from rising above of 120°F. This also removes the possible problem with improperly adjusted individual shower valves. Since the maximum temperature requirement is not a means of protecting against thermal shock, any thermostatic mixing valve can be used. There is no need for end point protection of shutting off the flow of water. This is still accomplished by the shower valve. Therefore, a thermostatic mixing valve can conform to ASSE 1017, ASSE 1070, or CSA B125.3 valve.

The individual valve handle limit stop can still be used to limit the maximum temperature of hot water. This is the common means of providing this level of protection in individual dwelling units.

The existing last sentence has been deleted since it adds confusion regarding the use of central thermostatic mixing valves for limiting the temperature of the hot water. The code requirements are complete without having this confusing last sentence.

**Cost Impact:** Will not increase the cost of construction

This does not increase the cost since the change merely provides options for the installer or designer.

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** Consistency with committee's action on P77-15.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com) requests Approve as Submitted.**

**Commenter's Reason:** The Committee clearly did not understand the wording of this change. They concluded that an ASSE 1017 or ASSE 1070 was misapplied for controlling the maximum temperature of the hot water. This is not correct. Currently, engineers often add an ASSE 1017 device at the water heater to provide a level of safety with the temperature of the hot water. When these valves are set for a temperature below 120 degrees F, the handle limit stop does not have to be adjusted. That is what is being done today. If a measurement is made at the shower and the maximum temperature is below 120 degrees F, then it meets the code. Hence, this is merely clarifying what is already taking place.

Similarly, an ASSE 1070 device can be set up to control the flow of water to a maximum of 120 degrees F (or lower). Thus, the valve prevents the discharge of water above 120 degrees F. There is no reason for prohibiting an installer from using an ASSE 1070 device to control the maximum temperature.

**P80-15**

# P82-15 Part I

424.5

## **Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

### **2015 International Plumbing Code**

**Revise as follows:**

**424.5 Bathtub and whirlpool bathtub valves.** The *hot water* supplied to bathtubs and whirlpool bathtubs shall be limited to a maximum temperature of 120°F (49°C) by a water-temperature limiting device that conforms to ASSE 1070 or CSA B125.3, except where such protection is otherwise provided by a combination tub/shower valve in accordance with Section 424.3. Access shall be provided to the ASSE 1070 or CSA B125.3 devices. Such access shall be large enough to enable removal of the device for replacement and for temperature adjustments.

**Reason:** Designers and installers don't think about these devices needing periodic adjustment, cleaning or replacement. Although it should be obvious that these devices should not be covered up without any way to get to them, this happens frequently, because, "the code doesn't make me do otherwise". This is loophole that needs to be eliminated so that these safety devices can be accessed. This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 51.

**Cost Impact:** Will increase the cost of construction  
This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. Specifically, these valves might have to be located elsewhere where access can be made to the valve. This might involve a little more piping and labor. Or, at a minimum, an access panel might have to be installed in a wall or ceiling. As access wasn't required before, this extra work to provide access might increase the cost of construction in some situations.

P82-15 Part I : 424.5-  
SNYDER5919

---

## **Public Hearing Results**

### **Part I**

**Committee Action:**

**Disapproved**

**Committee Reason:** The requirement for access is already required by the standard. The phrase "large enough" is too vague as to what is needed.

**Assembly Motion:**  
**Online Vote Results:**

**As Submitted**  
**Failed**

Support: 49.4% (83) Oppose: 50.6% (85)

**Assembly Action :**

**None**

---

**Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Janine Snyder, representing Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org) requests Approve as Submitted.**

**Commenter's Reason:** The variation in size and installation arrangement of these tempering valves makes it difficult to be more specific. The PMGCAC believes that the code official should be able to judge whether the access opening is sufficient for the purposes of maintenance and replacement. Without the code stating anything about access, many of these valves are covered over with permanent wall coverings. When problems with hot water supply to the tub occur, the service technician will not know the valve exists. And if he suspects one does exist, he will have no clue as to its location.

---

**P82-15 Part I**

# P82-15 Part II

## P2713.3

### **Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

## **2015 International Residential Code**

**Revise as follows:**

**P2713.3 Bathtub and whirlpool bathtub valves.** Hot water supplied to bathtubs and whirlpool bathtubs shall be limited to a temperature of not greater than 120°F (49°C) by a water-temperature limiting device that conforms to ASSE 1070 or CSA B125.3, except where such protection is otherwise provided by a combination tub/shower valve in accordance with Section P2708.4. These ASSE 1070 or CSA B125.3 devices shall be accessible. Such access shall be large enough to enable removal of the device for replacement and for temperature adjustments.

**Reason:** Designers and installers don't think about these devices needing periodic adjustment, cleaning or replacement. Although it should be obvious that these devices should not be covered up without any way to get to them, this happens frequently, because, "the code doesn't make me do otherwise". This is loophole that needs to be eliminated so that these safety devices can be accessed.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 51.

**Cost Impact:** Will increase the cost of construction

This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. Specifically, these valves might have to be located elsewhere where access can be made to the valve. This might involve a little more piping and labor. Or, at a minimum, an access panel might have to be installed in a wall or ceiling. As access wasn't required before, this extra work to provide access might increase the cost of construction in some situations.

**P82-15 Part II**

# P93-15 Part I

## 504.6

### **Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

**NOTE:** PART II DID NOT RECEIVE A PUBLIC COMMENT AND IS ON THE CONSENT AGENDA. PART II IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY FOLLOWING ALL OF PART I.

## **2015 International Plumbing Code**

### **Revise as follows:**

**504.6 Requirements for discharge piping.** The discharge piping serving a pressure relief valve, temperature relief valve or combination thereof shall:

1. Not be directly connected to the drainage system.
2. Discharge through an *air gap* located in the same room as the water heater.
3. Not be smaller than the diameter of the outlet of the valve served and shall discharge full size to the *air gap*.
4. Serve a single relief device and shall not connect to piping serving any other relief device or equipment.
5. Discharge to the floor, to the pan serving the water heater or storage tank, to a waste receptor or to the outdoors.
6. Discharge in a manner that does not cause personal injury or structural damage.
7. Discharge to a termination point that is readily observable by the building occupants.
8. Not be trapped.
9. Be installed so as to flow by gravity.
10. Terminate not more than 6 inches (152 mm) above and not less than two times the discharge pipe diameter above the floor or *flood level rim* of the waste receptor.
11. Not have a threaded connection at the end of such piping.
12. Not have valves or tee fittings.
13. Be constructed of those materials listed in Section 605.4 or materials tested, rated and *approved* for such use in accordance with ASME A112.4.1.
14. Be one nominal size larger than the size of the relief valve outlet, where the relief valve discharge piping is constructed of PEX or PE-RT tubing installed with insert fittings. The outlet end of such tubing shall be fastened in place.

**Reason:** This revision was accepted to the IRC in the last cycle. The issue is simply this: In some cases (perhaps the majority of cases), PEX and PE-RT tubing is connected using insert fittings. Where an insert fitting is used to connect to a relief valve, the ID of the insert fitting is significantly smaller than the ID of PEX or PE-RT tubing of the same nominal size of the relief valve outlet. This smaller opening might create excessive restriction where the relief valve had a full trip event. Therefore, increasing the size of the tubing increases the size of the insert fitting to allow for less restriction.

Fastening the end of the tubing is a safety measure to keep the discharge of water at the intended location. PEX and PE-RT tubing can be "springy" and could easily dislodge from the intended discharge point.

**Cost Impact:** Will not increase the cost of construction  
This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P93-15 Part I : 504.6-  
SNYDER5921

---

## **Public Hearing Results**

### **Part I**

**Committee Action:** **Approved as Submitted**

**Committee Reason:** Same size PEX pipe connected with insert fittings is not large enough inside diameter for proper T & P valve relief flow.

**Assembly Action :** **None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Michael Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservices.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Plumbing Code**

**504.6 Requirements for discharge piping.** The discharge piping serving a pressure relief valve, temperature relief valve or combination thereof shall:

1. Not be directly connected to the drainage system.
2. Discharge through an *air gap* located in the same room as the water heater.
3. Not be smaller than the diameter of the outlet of the valve served and shall discharge full size to the *air gap*.
4. Serve a single relief device and shall not connect to piping serving any other relief device or equipment.
5. Discharge to the floor, to the pan serving the water heater or storage tank, to a waste receptor or to the outdoors.
6. Discharge in a manner that does not cause personal injury or structural damage.
7. Discharge to a termination point that is readily observable by the building occupants.
8. Not be trapped.
9. Be installed so as to flow by gravity.
10. Terminate not more than 6 inches (152 mm) above and not less

- than two times the discharge pipe diameter above the floor or *flood level rim* of the waste receptor.
11. Not have a threaded connection at the end of such piping.
  12. Not have valves or tee fittings.
  13. Be constructed of those materials listed in Section 605.4 or materials tested, rated and *approved* for such use in accordance with ASME A112.4.1.
  14. Be one nominal size larger than the size of the relief valve outlet, where the relief valve discharge piping is ~~constructed of PEX or PE-RT tubing~~ installed with insert fittings.
  15. The outlet end of ~~such~~ flexible tubing shall be fastened in place.

**Commenter's Reason:** We suggest this modification, as calling out two types of material isn't optimal language for the code, as other materials could be an issue, also the securing of the flexible tubing end should be a new number, because it is a specific requirement, separate from the insert fitting issue.

## *Public Comment 2:*

**Proponent : Janine Snyder, representing Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

## **2015 International Plumbing Code**

**504.6 Requirements for discharge piping.** The discharge piping serving a pressure relief valve, temperature relief valve or combination thereof shall:

1. Not be directly connected to the drainage system.
2. Discharge through an *air gap* located in the same room as the water heater.
3. Not be smaller than the diameter of the outlet of the valve served and shall discharge full size to the *air gap*.
4. Serve a single relief device and shall not connect to piping serving any other relief device or equipment.
5. Discharge to the floor, to the pan serving the water heater or storage tank, to a waste receptor or to the outdoors.
6. Discharge in a manner that does not cause personal injury or structural damage.
7. Discharge to a termination point that is readily observable by the building occupants.
8. Not be trapped.
9. Be installed so as to flow by gravity.
10. Terminate not more than 6 inches (152 mm) above and not less than two times the discharge pipe diameter above the floor or *flood level rim* of the waste receptor.
11. Not have a threaded connection at the end of such piping.
12. Not have valves or tee fittings.
13. Be constructed of those materials listed in Section 605.4 or materials tested, rated and *approved* for such use in accordance with ASME A112.4.1.
14. Be one nominal size larger than the size of the relief valve outlet,

where the relief valve discharge piping is ~~constructed of PEX or PE-RT tubing~~ installed with insert fittings. The outlet end of such tubing shall be fastened in place.

**Commenter's Reason:** PEX and PE-RT tubing might not be the only types of T&P discharge piping that can be installed with insert fittings. There is no need to be this specific. Part II for the IRC was Approved as Modified by the IRC Committee. This proposal for the IPC needs to be AMPC for consistency between the two plumbing codes.

---

**P93-15 Part I**

## **P93-15 Part II**

### **P2804.6.1**

#### **Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

### **2015 International Residential Code**

#### **Revise as follows:**

**P2804.6.1 Requirements for discharge pipe.** The discharge piping serving a pressure-relief valve, temperature-relief valve or combination valve shall:

1. Not be directly connected to the drainage system.
2. Discharge through an air gap located in the same room as the water heater.
3. Not be smaller than the diameter of the outlet of the valve served and shall discharge full size to the air gap.
4. Serve a single relief device and shall not connect to piping serving any other relief device or equipment.
5. Discharge to the floor, to the pan serving the water heater or storage tank, to a waste receptor or to the outdoors.
6. Discharge in a manner that does not cause personal injury or structural damage.
7. Discharge to a termination point that is readily observable by the building occupants.
8. Not be trapped.
9. Be installed to flow by gravity.
10. Terminate not more than 6 inches (152 mm) and not less than two times the discharge pipe diameter above the floor or waste receptor flood level rim.
11. Not have a threaded connection at the end of the piping.
12. Not have valves or tee fittings.
13. Be constructed of those materials indicated in Section P2906.5 or materials tested, rated and *approved* for such use in accordance with ASME A112.4.1.
14. Be one nominal size larger than the size of the relief-valve outlet, where the relief-valve discharge piping is ~~constructed of PEX or PE-RT tubing~~ installed with insert fittings. The outlet end of such tubing shall be fastened in place.

**Reason:** Item 14 was added to this section in the last cycle. The issue is simply this: In some cases (perhaps the majority of cases), PEX and PE-RT tubing is connected using insert fittings. Where an insert fitting is used to connect to a relief valve, the ID of the insert fitting is significantly smaller than the ID of PEX or PE-RT tubing of the same nominal size of the relief valve outlet. This smaller opening might create excessive restriction where the relief valve had a full trip event. Therefore, increasing the size of the tubing increases the size of the insert fitting to allow for less restriction. What was forgotten is that there are fittings that fit on the outside diameter of this type of tubing such that the inside area would not be restricted. This

added phrase allows for same size (as the relief valve outlet) tubing to be used where these "outside connect fittings" are used.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC 147.

**Cost Impact:** Will not increase the cost of construction

This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

**P93-15 Part II :  
P2804.6.1-SNYDER5922**

---

## **Public Hearing Results**

### **Part II**

**Committee Action:**

**Approved as Modified**

**Modification:**

**P2804.6.1 Requirements for discharge pipe.** The discharge piping serving a pressure-relief valve, temperature-relief valve or combination valve shall:

1. through 13. *Remain unchanged.*

14. Be one nominal size larger than the size of the relief valve outlet, where the relief valve discharge piping is ~~constructed of PEX or PE-RT tubing~~ installed with insert fittings.

**Committee Reason:** For the Modification only:

There is no need to be specific about PEX and PE-RT; any type of piping that is connected using an insert fitting needs to be upsized.

For the proposal As Modified:

Insert fittings into "same size as the valve outlet" piping will cause a restriction in flow from the relief valve which could affect the safety of the equipment.

**Assembly Action :**

**None**

# P94-15

## 504.6.1 (New)

### Proposed Change as Submitted

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

## 2015 International Plumbing Code

**Add new text as follows:**

**504.6.1 Relief valve indirect waste piping.** Indirect waste piping that receives the discharge from not more than two ¾ inch (19 mm) relief valves shall be not less than ¾ inch (19 mm) nominal pipe size. Where indirect waste piping receives the discharge from more than two ¾ inch (19 mm) relief valves, the piping shall be not less than 1 ½ inch (38.1 mm) nominal pipe size. Indirect waste piping receiving only the discharge from relief valves shall not require liquid-seal traps.

**Reason:** Multi-story buildings having water heaters on each floor (water heaters "stacked") sometimes have an indirect waste pipe "stack" to catch each of the T&P discharge pipes. There is currently no sizing criteria in the code. The proposed language is what the State of New York has used successfully for many years. The 3+ relief valve indirect waste pipe size doesn't have to be any bigger for more water heaters as all of the T&P valves would never be leaking all at once. The 1 ½ inch pipe size is easy to work with in walls, is resistant to accidental damage during rough-in and is economical.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 29.

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P94-15 : 504.6.1 (New)-  
SNYDER3955

---

### Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** This would be a direct conflict with Item 4 of Section 504.6.

**Assembly Action :**

**None**

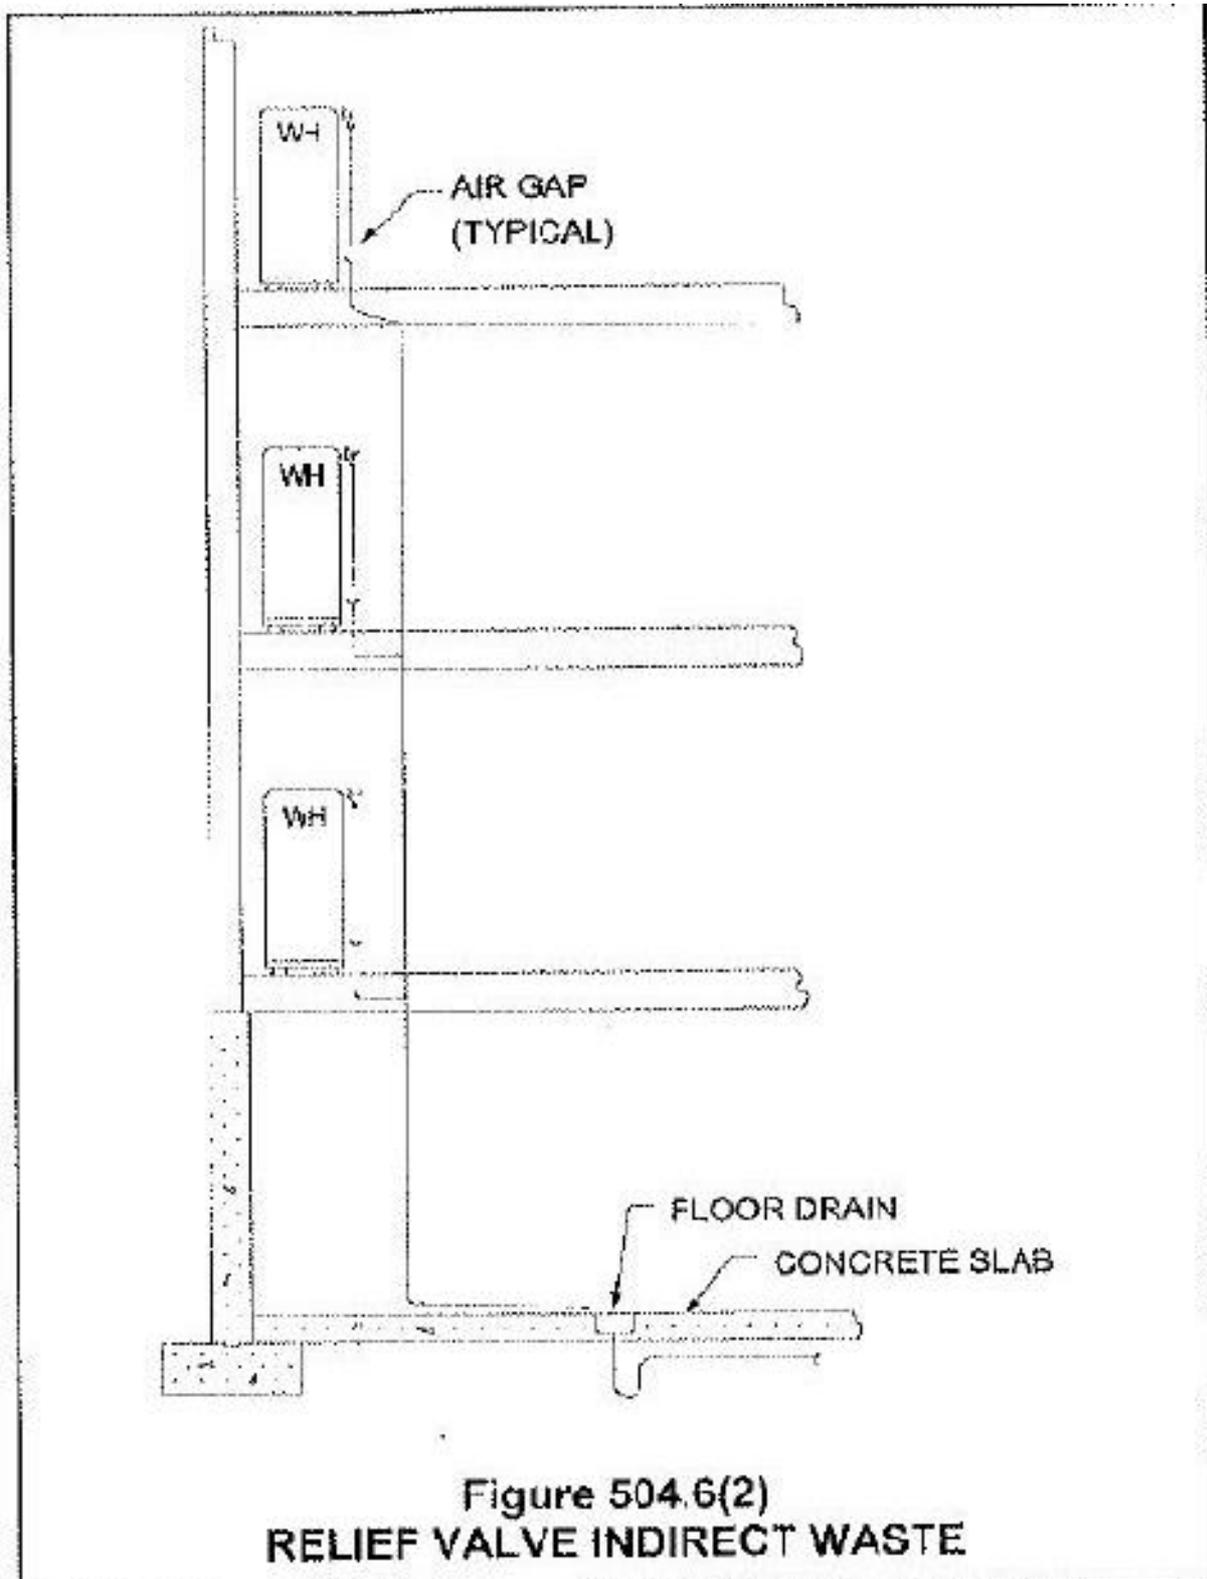

---

### Individual Consideration Agenda

*Public Comment 1:*

**Proponent : Janine Snyder, representing Plumbing, Mechanical and Fuel Gas Code Committee (PMGCAC@iccsafe.org) requests Approve as Submitted.**

**Commenter's Reason:** The PMGCAC doesn't believe that the Committee understood the proposal. The IPC Commentary has discussed this common arrangement for relief valve discharge piping for many code editions. However, frequent questions arise as to the sizing of this waste piping that "collects" the potential relief valve discharges. The figure below (from the 2015 IPC Commentary) illustrates the typical arrangement.

Note that there is an air gap from the end of each T&P relief valve discharge pipe above the waste receptor in the room with the water heater (satisfying Item 2 of Section 504.6). As such, Item 4 of Section 504.6 is *not* violated because all of the items of Section 504.6 are concerning the discharge piping of the relief valve, *not* the waste piping that collects water discharged from the T&P relief valve discharge pipe(s).

---

**P94-15**

# P101-15 Part II

## P2903.7

### Proposed Change as Submitted

**Proponent :** Julius Ballanco, representing Self  
(JBENGINEER@aol.com)

**NOTE:** PART I DID NOT RECEIVE A PUBLIC COMMENT AND IS ON THE CONSENT AGENDA. PART I IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY FOLLOWING ALL OF PART II.

## 2015 International Residential Code

### Revise as follows:

**P2903.7 Size of water-service mains, branch mains and risers.** The size of the water service pipe shall be not less than  $\frac{3}{4}$  inch (19 mm) diameter. The size of water service mains, branch mains and risers shall be determined from the water supply demand [gpm (L/m)], available water pressure [psi (kPa)] and friction loss caused by the water meter and *developed length* of pipe [feet (m)], including *equivalent length* of fittings. The size of each water distribution system shall be determined according to design methods conforming to acceptable engineering practice, such as those methods in Appendix P and shall be *approved* by the code official.

**Reason:** The minimum pipe size of  $\frac{3}{4}$  inch dates back to the Hoover Code days, whereby it was understood that the minimum pipe size for a single family dwelling could be  $\frac{1}{2}$  inch galvanized steel pipe. This sizing was based on one bathroom and a kitchen sink. That was the original indoor plumbing required for a single family dwelling. The code predated the use of copper tube or plastic pipe. However, in case additional fixtures were added to the home, it was mandated that the water service be a minimum of  $\frac{3}{4}$  inch. Most water services during this period of time were lead pipe. The inside diameter of  $\frac{3}{4}$  inch lead pipe was  $\frac{3}{4}$  inch.

Today's modern home has minimum plumbing requirements that dictate a pipe size of at least  $\frac{3}{4}$  inch. Following the concept of the earlier codes, this would result in upsizing the water service to a minimum of 1 inch pipe. Additionally, both the International Building Code and International Plumbing Code require residential sprinklers for all single family dwellings. With a typical demand of two residential sprinklers, the minimum flow rate for the system becomes 16 gpm. The residential sprinkler flow rate can be as high as 40 gpm or more. This would result in the need for a 1 inch water service.

The most popular pipe used today for residential water service is polyethylene. It has been estimated that 90 percent of the water services for single family dwellings in the United States is polyethylene.

A  $\frac{3}{4}$  inch polyethylene tube has an inside diameter that range from 0.625 inches to 0.715 inches depending on the SDR. A 1 inch polyethylene tube would be more in line with the older  $\frac{3}{4}$  inch lead water service regarding size. Furthermore, the inside diameter of 1 inch polyethylene is very similar to  $\frac{3}{4}$  inch galvanized steel pipe. The inside diameter of  $\frac{3}{4}$  inch galvanized steel pipe is 0.824 inches. The inside diameter of 1 inch polyethylene pipe, SDR 9 is 0.875 inches.

Based on the additional fixtures required for a single family dwelling and the requirement for residential sprinklers, the minimum water service must be increased to 1 inch.

**Cost Impact:** Will increase the cost of construction

## **Public Hearing Results**

### **Part II**

#### **Committee Action:**

**Disapproved**

**Committee Reason:** This will increase the cost of the tap fee and water meter and is a large cost to the homeowner forever.

#### **Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : Julius Ballanco, representing IRC Fire Sprinkler Coalition (JBENGINEER@aol.com) requests Approve as Submitted.**

**Commenter's Reason:** The claim by the Committee is that this will increase the tap fees. That is not accurate. The size of the water service does not dictate the size of the tap nor the size of the meter. It is common practice to have a 3/4 inch tap with a 5/8 inch meter, yet the water service is 1". This is a common installation practice already used across the county. There are even water services that are 1-1/4 inch in size, with a 3/4 inch tap and 5/8 inch meter. The reason for this larger size is the length of the water service from the public main to the dwelling unit. Contrary to the statement by the Committee, there is no continuous annual fee because a larger size water service is installed.

The tap and the meter size are not the issue with this proposed change. The issue is the pressure loss in the water service pipe. A 3/4 inch water service cannot provide the flow and pressure that is needed for homes with the greater number of plumbing fixtures and a residential sprinkler system. Furthermore, homeowners often add plumbing fixtures after moving into the home. This places even a greater burden on the water service.

There is minimal cost for increasing the size of the water service. The difference in price between a 3/4 inch polyethylene water service and a 1 inch polyethylene water service is pennies a foot. The labor to install a 3/4 inch water service is the same as a 1 inch water service. Hence, there is minimal cost for a significant gain in performance of the plumbing system. One only has to review Table P2904.6.2(1) to see how poorly a 3/4 inch water service is in providing water to a dwelling unit.

To allow a 3/4 inch water service would place a burden on the homeowner. Any future changes would require a significant expenditure to replace the water service with a larger size water service.

## **P101-15 Part I**

### **603.1**

#### **Proposed Change as Submitted**

**Proponent :** Julius Ballanco, representing Self  
(JBENGINEER@aol.com)

### **2015 International Plumbing Code**

#### **Revise as follows:**

**603.1 Size of water service pipe.** The water service pipe shall be sized to supply water to the structure in the quantities and at the pressures required in this code. The water service pipe shall be not less than  ~~$\frac{3}{4}$~~  1 inch (~~19.1~~ 25.4 mm) in diameter.

**Reason:** The minimum pipe size of  $\frac{3}{4}$  inch dates back to the Hoover Code days, whereby it was understood that the minimum pipe size for a single family dwelling could be  $\frac{1}{2}$  inch galvanized steel pipe. This sizing was based on one bathroom and a kitchen sink. That was the original indoor plumbing required for a single family dwelling. The code predated the use of copper tube or plastic pipe. However, in case additional fixtures were added to the home, it was mandated that the water service be a minimum of  $\frac{3}{4}$  inch. Most water services during this period of time were lead pipe. The inside diameter of  $\frac{3}{4}$  inch lead pipe was  $\frac{3}{4}$  inch.

Today's modern home has minimum plumbing requirements that dictate a pipe size of at least  $\frac{3}{4}$  inch. Following the concept of the earlier codes, this would result in upsizing the water service to a minimum of 1 inch pipe. Additionally, both the International Building Code and International Plumbing Code require residential sprinklers for all single family dwellings. With a typical demand of two residential sprinklers, the minimum flow rate for the system becomes 16 gpm. The residential sprinkler flow rate can be as high as 40 gpm or more. This would result in the need for a 1 inch water service.

The most popular pipe used today for residential water service is polyethylene. It has been estimated that 90 percent of the water services for single family dwellings in the United States is polyethylene.

A  $\frac{3}{4}$  inch polyethylene tube has an inside diameter that range from 0.625 inches to 0.715 inches depending on the SDR. A 1 inch polyethylene tube would be more in line with the older  $\frac{3}{4}$  inch lead water service regarding size. Furthermore, the inside diameter of 1 inch polyethylene is very similar to  $\frac{3}{4}$  inch galvanized steel pipe. The inside diameter of  $\frac{3}{4}$  inch galvanized steel pipe is 0.824 inches. The inside diameter of 1 inch polyethylene pipe, SDR 9 is 0.875 inches.

Based on the additional fixtures required for a single family dwelling and the requirement for residential sprinklers, the minimum water service must be increased to 1 inch.

**Cost Impact:** Will increase the cost of construction  
The increase in cost is minimal based on the cost of the piping material. The labor and installation costs remain the same.

# Part I

**Committee Action:**

**Disapproved**

**Committee Reason:** A 3/4 inch minimum size for a water service line is a good starting point. Fixture flow rates are being reduced so the 3/4 inch size becomes even more appropriate. Increasing the minimum size will significantly increase the cost of construction because of increased tap fee and larger meter size fee.

**Assembly Action :**

**None**

# P102-15

604.2

## **Proposed Change as Submitted**

**Proponent :** Ronald George, Self; Plumb-Tech Design & Consulting Services LLC, representing Self; Plumb-Tech Design & Consulting Services LLC (Ron@Plumb-TechLLC.com)

## **2015 International Plumbing Code**

**Revise as follows:**

**604.2 System interconnection.** At the points of interconnection between the hot and cold water supply piping systems and the individual fixtures, appliances or devices, provisions shall be made to prevent flow between such piping systems. Hot water circulation systems shall not utilize cold water distribution piping for the return of water to the water heater.

**Reason:** This is a health hazard routing hot water return through the cold water distribution system. Routing hot water return through the cold water supply pipes creates a condition where it will not be possible to get cold water in some cases. It also creates a condition where Legionell bacteria can grow.

**Cost Impact:** Will not increase the cost of construction  
Cross connections are already prohibited. Returning hot water through the cold water pipe is a cross-connection where hot water can be routed to other fixtures.

## **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Ronald George, Plumb-Tech Design & Consulting Services LLC, representing Self requests Approve as Submitted.**

**Commenter's Reason:** The plumbing code has recently Accepted "Cross Connections" as an "Acceptable Practice" The last code development cycle for the International Codes brought about a code change that was submitted to the model

codes by a manufacturer of a unique product that has filled an aftermarket niche. An entrepreneur decided to address the problem of dumping water down the drain while waiting for hot water to arrive at a fixture. Since this code change went into the code, just about every pump manufacturer has jumped on the band wagon to sell these small pumps at significant prices. Instead of requiring a dedicated hot water return piping system, the proponents solution to the problem was simply to add a small circulating pump under the lavatory or sink and connect it to both the hot and cold water lines to the fixture and pull hot water to the fixture through the hot water pipe and utilize the cold water pipes as a hot water return path back to the water heater. (This only works where there are no check valves in the hot water system)

When I first heard of the concept of circulating hot water back through the cold water piping, I was slightly amused and I was well aware of the fact that it was an obvious cross connection along with a health and safety issues. The hot water in the cold water piping can create a scalding hazard and if it is hot or warm water it can lead to accelerated water treatment chemical dissipation and there will be an increase in the growth of bacteria and other organic pathogens in the water which creates a biological and potentially a Legionella hazard. When I first saw the proposal, I was pretty sure that the plumbing industry was not going to accept circulating hot water in the cold water piping because that is a direct cross-connection and the code prohibits cross-connections. I thought the backflow prevention folks would surely see this and step up to address the issue at the code hearings.

Unfortunately, during the code hearing testimony, there was little or no opposing testimony from the backflow industry on this issue and the proposed code change was promoted as a "water saving" and "energy saving" measure to reduce the waste of water poured down the drain and to reduce the energy used to heat that water. It seems like green marketing hype had an effect on code development. They bought it and the code change passed. It seems you can call something green and people seem to think green is good so they blindly support it. Anyone can propose a code change and sometimes they don't understand all of the consequences of their proposals. This sometimes leads to code change proposals that are well intentioned, yet unsanitary and unsafe. If a presentation is done well, it is possible to convince enough code committee members to support a code change that is in conflict with other sections of the code because it sounded good at the time.

The code change to recirculate hot water through the cold water pipes was presented in the name of energy and water conservation. I'm the number one advocate for energy conservation and water conservation, but only if it does not create a health and safety issue. It appears the code change for circulating hot water back to the water heater passed because many of the code committee members were thinking of their personal experiences of waiting for hot water in their home and they were not presented with facts about the potential health and safety consequences to the public in larger buildings. I think this system is great for an individual homeowner who knowingly chooses to install this system in a private home and live with the health and safety consequences of such a decision. It would be appropriate for the International Residential Code (IRC), but not the IPC.

I do not believe we should allow this as a design option for commercial buildings and multi-family buildings. We already have a way for hot water to be maintained at the fixture by installing a dedicated hot water return piping system. The codes have accepted cross-connections as an acceptable design practice.

With this code language, we have gone back in time about 50 years to the days of two handle faucets with crossover flow. I submitted code change (P-139-15) to undue the code change from the last cycle. I'm hoping there will be some comments and some common sense employed to correct this terrible mistake by well-intentioned individuals that have created a serious health and safety issue. The following are reasons why we should not circulate hot or tempered water through the cold water distribution pipes:

1. Circulating hot water in the cold water pipes can scald someone who will not expect to find hot water in the cold water pipes. This is a form of cross connection that backflow protection language in the codes was specifically intended to prevent. The proponent has indicated there can be a thermostat that shuts-off the circulator when the water temperature gets to a given temperature, but that is a manufacturing option in their catalog and there is no language in the code change

that mandates thermostats or even a maximum or minimum temperature. As the code change is written, there is no temperature limit for hot water that can be circulated through the cold water piping.

2. If someone in a high rise apartment building has a bathroom located a considerable distance from the circulated main they decide to install one of these circulator pumps under a lavatory or sink, the code will allow them and then everyone else in the building will have hot water return water flowing through their cold water piping. In some of these high rise buildings there are different pressure zones that flow through pressure reducing valves or through booster pumps. Now with this code change the circulator pump will be pushing hot water back against a booster pump on the cold water system. This is why we have code language prohibiting cross-connections between plumbing systems. These systems should be limited to single family homes only. They should not be allowed in the International Plumbing Code, they should be relegated to the international residential code. If circulating hot water through the cold water pipes is allowed people in all other floors or areas of large buildings will be drinking and brushing their teeth with hot or warm water that has metals from dissolved anode rods and elevated bacteria levels.

3. Recirculating hot or warm water in the cold water piping will increase bacteria growth and biofilm formation in the cold water piping.

4. Hot water in the cold water piping system will promote accelerated dissipation of water treatment chemicals - The act of recirculating the hot water back into the cold water system is actually holding the water and circulating it in the piping system longer than it normally would have been. With the increase in low-flow and ultralow-flow fixtures associated with water conservation measure, the water treatment chemicals will dissipate at the same rate while the flow rate goes down.

5. Reducing the water flowing out of and into the water system promotes stagnation. Lack of flushing water flow causes the water to remain in the piping system for longer periods of time. This contributes to water treatment dissipation and will lead to an increase in bacteria levels in the domestic water system and will contribute to legionella bacteria and other organic pathogen growth in the domestic water systems.

6. This allows the water treatment chemicals to dissipate over time and when the water is circulated through the water heater, the heat accelerates the dissipation rate of the water treatment chemicals. The water is held in the plumbing system for longer periods of time contributing to stagnation and loss of water treatment chemicals and less water in the drain to contribute to drain line transport.

7. If someone in any commercial building installs one of these circulating pumps that circulate through the cold water pipes, the people in other areas of the building that want or expect cold water will be receiving hot or warm water when the draw water from a tap for drinking or cooking. I would not be happy if the electric water cooler or drinking fountain in my office was receiving hot or warm water that is injected into the cold water pipes from a circulation pump under a sink in a tenant space down the hall. I will be drinking hot or warm water from the drinking fountain and if I have an electric water cooler, my electric bill is going to go up because now the refrigeration unit on my electric water cooler will be cooling hot or warm water instead of cold water.

8. The hot water in the cold water pipes will have dissolved metals in the hot water. This is because all tank type water heaters have magnesium or aluminum sacrificial anode rods in the tank that corrode and dissolve metals into the water to protect the tank from corrosion. These dissolved metals are present in hot water tanks, but typically not in the cold water piping. This is why all cooking shows recommend you fill your cooking kettles with cold water. It is for this same reason I don't want the tenant on another floor in a condo building being allowed to circulate hot water with dissolved metals into my cold water piping on another floor for drinking and cooking water.

# P105-15

## Table 604.4

### Proposed Change as Submitted

**Proponent :** John Addario, New York State Department of State - Building Standards and Codes, representing New York State Department of State - Building Standards and Codes (john.addario@dos.state.ny.us)

## 2015 International Plumbing Code

Revise as follows:

**TABLE 604.4  
MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES  
AND FIXTURE FITTINGS**

<b>PLUMBING FIXTURE OR FIXTURE FITTING</b>	<b>MAXIMUM FLOW RATE OR QUANTITY <sup>b</sup></b>
Water closet - <u>public and private</u>	<del>1.6</del> <u>1.28</u> gallons per flushing cycle <sup>c</sup>
<u>Water closet—public and remote<sup>d</sup></u>	<u>1.6</u> gpf

*(Portions of table not shown remain unchanged)*

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

- a. A hand-held shower spray is a shower head.
- b. Consumption tolerances shall be determined from referenced standard.
- c. The effective flush volume for dual-flush water closet is defined as the composite, average flush volume of two reduced flushes and one full flush. In public settings, the maximum water use of a dual flush water closet is based solely on its full flush operation; not an average of full and reduced volume flushes.
- d. A water closet is remote where its discharge is combined with less than 1.5 DFU discharge from other fixtures and such discharge must flow horizontally for 30 feet or more.

**Reason:** This proposal reflects the current requirements in the IGCC for high efficiency water closets. The last cycle the committee was concerned that there was a need for further study in the use of high efficiency water closets. The proposed

change addresses these concerns by exempting them in a public setting when they are installed in a remote location. This proposal is in line with the IGCC and addresses the concerns from the committee from the last cycle.

**Cost Impact:** Will not increase the cost of construction  
 The price of plumbing fixtures and fittings vary due to style, trim, and material. The attached documents demonstrate that essentially there will be no cost impact in response to adopting these requirements. The attached only reflects the bare cost comparison of the fixtures and does not include the cost saving realized from water conservation.

P105-15 : T604.4 -  
 ADDARIO4773

## Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** The next phase of the PERC study needs to be completed before water closet water consumption (per full flush) is reduced further as there are concerns about not enough water to move solids along long runs of horizontal piping.

**Assembly Motion:**

**As Modified**

**Online Vote Results:**

**Failed**

Support: 11.43% (20) Oppose: 88.57% (155)

**Assembly Action :**

**None**

**Online Floor Modification:**

### TABLE 604.4

### MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY <sup>b</sup>
Lavatory, private	2.2 gpm at 60 psi
Lavatory, public (metering)	0.25 gallon per metering cycle
Lavatory, public (other than metering)	0.5 gpm at 60 psi
Shower head <sup>a</sup>	2.5 gpm at 80 psi
Sink faucet	2.2 gpm at 60 psi
Urinal	1.0 gallon per flushing cycle
Water closet <del>private and non-remote public</del> <sup>d</sup>	1.28 gallons per flushing cycle <sup>c,d,e</sup>
<del>Water closet remote public</del> <sup>d</sup>	<del>1.6 gpf</del>

---

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

- a. A hand-held shower spray is a shower head.
- b. Consumption tolerances shall be determined from referenced standard.
- c. The effective flush volume for a dual-flush water closet is defined as the composite, average flush volume of two reduced flushes and one full flush. ~~In public settings, the maximum water use of a dual flush water closet is based solely on its full flush operation; not an average of full and reduced volume flushes.~~
- d. ~~A water closet is remote where its discharge is combined with less than 1.5 DFU discharge from other fixtures and such discharge flows horizontally for 30 feet or more.~~ 1.6 gallons per flushing cycle is permitted at a location where no other fixtures discharge upstream of the drain line connection to the water closet.
- e. 1.6 gallons per flushing cycle for a water closet connected to a building's existing sanitary drainage piping.

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : Karen Hobbs, Natural Resources Defense Council, representing Natural Resources Defense Council (khobbs@nrdc.org); Ed Osann, representing National Resources Defense Council (eosann@nrdc.org); Anthony Floyd, representing City of Scottsdale (afloyd@scottsdaleaz.gov); John Addario, Department of State, Division of Building Standards and Codes , representing NYS Dept of State (john.addario@dos.ny.gov) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

#### **2015 International Plumbing Code**

**TABLE 604.4  
MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES  
AND FIXTURE FITTINGS**

<b>PLUMBING FIXTURE</b>	<b>MAXIMUM FLOW RATE</b>
-------------------------	--------------------------

OR FIXTURE FITTING	OR QUANTITY <sup>b</sup>
<del>Water closet public and private</del>	<del>1.6</del> <u>1.28</u> gallons per flushing cycle <sup>c,d,e</sup>
<del>Water closet public and remote<sup>d</sup></del>	<del>1.6 gpf</del>

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

- a. A hand-held shower spray is a shower head.
- b. Consumption tolerances shall be determined from referenced standard.
- c. The effective flush volume for dual-flush water closet is defined as the composite, average flush volume of two reduced flushes and one full flush.~~In public settings, the maximum water use of a dual flush water closet is based solely on its full flush operation; not an average of full and reduced volume flushes.~~
- d. ~~A water closet is remote where its discharge is combined with less than 1.5 DFU discharge from other fixtures and such discharge must flow horizontally for 30 feet or more.~~ 1.6 gallons per flushing cycle where no other fixtures discharge upstream of the drain piping connection to the water closet.
- e. 1.6 gallons per flushing cycle for a water closet connected to a building's existing sanitary drainage piping.

**Commenter's Reason:** The Technical Committee stated this reason for disapproval: "The next phase of the PERC study needs to be completed before water closet water consumption (per full flush) is reduced further as there are concerns about not enough water to move solids along long runs of horizontal piping." The Committee's statement is at odds with the results of the study it references, "The Drainline Transport of Solid Waste in Buildings" (see link below), published in 2012 by the Plumbing Efficiency Research Coalition (PERC). On p. 7, the PERC study found that, "The 1.28 gallon (4.8 L) and 1.6 gallon (6.0 L) test runs resulted in an orderly and predictable movement in the Test Apparatus." Based on these findings, the study went on to recommend "that the U.S. EPA WaterSense Program expand their specification on toilets to include commercial flushometer-valve operated HETs." On p. 45, another reported finding was "Toilet hydraulics (percent trailing water and flush rate) were found to be non-significant variables. As such, the effect that toilet fixture designs have on drain line transport in long building drains has been found to be minimal."

The PERC Phase 2 Test Plan Proposal, "Phase 2: Test Plan Proposal to Investigate Drainline Transport in Buildings" (attached), clearly focuses on 0.8 and 1.0 gpf toilets, neither of which is the object of this proposed change. According to the Phase 2 Test Plan Proposal, a 3-inch diameter drainline will be used to mirror the 4-inch diameter line employed in Phase 1. However, it is noted that most plumbing engineers recognize that reduced pipe diameter size enhances the transporting of waste down the drainline due to higher flood levels. Also, the "Phase I test variables associated with toilet discharge characteristics, flush rate and percent trailing water, were shown to be non-significant at both the 1% and 2% slope settings."

Thus, it should be clear that concerns about 1.28 gpf water closets creating or exacerbating drain line transport issues are unfounded. This is a view shared by

plumbing manufacturers as well --

Since the introduction of the low-flow 1.6 gpf and 1.28 gpf toilets, questions have been raised about whether water-saving toilets flush with a sufficient volume of water to move solid wastes through the building drainlines and the municipal sewer system. Industry research through the Plumbing Efficiency Research Coalition (PERC) presents no evidence that waste transport problems are due to low-flow toilets. -- Barbara C. Higgins, CEO/Executive Director, Plumbing Manufacturers International, March 13, 2014.

Nevertheless, out of abundance of caution, the proposal as modified by this comment will allow 1.6 gpf toilets to be installed at any location where there is no other fixture discharge upstream, and whenever a water closet is being installed (or reinstalled) on an existing building drainage system.

Given that the Committee's stated reason for disapproval overlooked the most relevant results of the initial PERC study and deferred to the next phase of research that will investigate the performance of lower flush volumes than proposed here, we respectfully request approval as modified.

## Table 604.4

### Proposed Change as Submitted

**Proponent :** Karen Hobbs, Natural Resources Defense Council, representing Natural Resources Defense Council (khobbs@nrdc.org)

## 2015 International Plumbing Code

**Revise as follows:**

**TABLE 604.4  
MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES  
AND FIXTURE FITTINGS**

<b>PLUMBING FIXTURE OR FIXTURE FITTING</b>	<b>MAXIMUM FLOW RATE OR QUANTITY <sup>b</sup></b>
Urinal	<del>1.0</del> <u>0.5</u> gallon per flushing cycle
Water closet <sup>c,d,e</sup>	<del>1.6</del> <u>1.28</u> gallons per flushing cycle

*(Portions of table not shown remain unchanged)*

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

- a. A hand-held shower spray is a shower head.
- b. Consumption tolerances shall be determined from referenced standards.
- c. 1.6 gallons per flushing cycle for a water closet connected to the sanitary drainage system of an existing building.
- d. The effective flush volume for a dual-flush water closet is defined as the composite, average flush volume of two reduced flushes and one full flush.
- e. In public settings, the maximum water use of a dual flush water closet is based solely on its full flush operation; not the average of full and reduced volume flushes.

**Reason:** Recent advancements have allowed toilets to use 1.28 gallons per flush or less while providing equal or superior performance. This is 20 percent less water than the current federal standard of 1.6 gallons per flush. Toilets are by far the main source of water use in the home, accounting for nearly 30 percent of an average home's indoor water consumption. Water-efficient toilets can reduce water use in the home and help preserve the nation's water resources. Unlike some first-generation, "low-flow" toilets, high-efficiency toilets combine efficiency with high performance. Design advances enable high-efficiency toilets to save water with no

trade-off in flushing performance or drainline function. In fact, many perform better than standard toilets in consumer testing (Source: EPA

*WaterSense*:<http://www.epa.gov/WaterSense/products/toilets.html>).

*WaterSense* criteria for tank-type water closets were established in 2007. Based on the most recent reports by *WaterSense* partners, more than 2,305 models of tank-type toilets from more than 115 brands currently meet the *WaterSense* specification, showing the widespread availability and commercial viability of these more efficient water closets.

Like toilets, urinals operating at 0.5 gpf or better are commonly available today and perform as well as those with higher flush volume. *WaterSense* criteria for flushing urinals were established in 2009. Manufacturers have responded by bringing large numbers of models to market that meet or exceed *WaterSense* specifications.

Based on the most recent reports by *WaterSense* partners, 151 models of urinal fixtures from 15 brands and 91 models of urinal valves from 7 brands currently meet the *WaterSense* specification of 0.5 gpf, demonstrating the widespread availability and commercial viability of more efficient urinals. With the pace of introduction of new models that meet *WaterSense* specifications, it is reasonable to expect that these figures will be even larger by 2018.

The Natural Resources Defense Council (NRDC) estimates that significant water savings could be realized if these standards were applied nationwide effective in 2018:

- **For toilets**, approximately 36 million gallons of water per day could be saved in the residential sector by 2030 (this value represents savings from residential toilets; it does not exclude flushometer valve toilets in the residential sector and tank-type toilets in the Commercial and Industrial sectors). NRDC estimates savings in the commercial sector of 8 million gallons of water per day by 2030.
- **For urinals**, water savings would reach 2 million gallons per day by 2030.

Reducing water use is an integral part of the stated purpose of the International Plumbing Code. As noted in Chapter 1 of the 2015 edition: "**101.3 Intent.** The purpose of the code is to establish minimum standards to provide a reasonable level of safety, health, property protection and public welfare by regulating the controlling the design, construction, installation, quality of materials, location, operation and maintenance or use of plumbing equipment and systems."

Nothing is more fundamental to public "health, safety, property protection and public welfare" than the maintenance of adequate water supplies. Water-saving technologies, such as high-efficiency toilets and urinals, reduce water use, helping to ensure that water supplies are maintained at safe and reliable levels, maintaining human health and firefighting capability, as well as environmental resources.

### Maximum Performance (MaP) of Toilet Fixtures

December 3, 2014

The following list of toilet fixtures was screened from the current MaP database of 3,084 tank-type models. All models on this list include these characteristics: WaterSense compliant; single-flush, 1.28 gallons per flush maximum; gravity-fed, elongated ADA height bowl, floor-mounted, 12-inch rough-in, minimum 3-inch flush valve, and a MaP score of 1,000 grams. Except for the 3 models highlighted below, all feature a trapway in excess of 2 inches. Current retail prices for the models were obtained where possible from retailer websites.

MaP Report No.	Brand Name	Model Name	Model Number	Map Flush Performance Score (grams of waste removed in a single flush)	Flush Valve-Flapper size 1- or 2-piece	Round (R) or Elongated (E) (in.) www.map-testing.com

© 2014 Koeller and Company, All rights reserved

December 3, 2014

models of urinal fixtures from 15 brands and 91 models of urinal valves from 7 brands currently meet the *WaterSense* specification of 0.5 gpf (Source: MaP Testing: <http://www.map-testing.com/high-efficiency-toilets.html>). *Consumer Reports* identifies top-performing toilets at 1.28 gpf, ranging in cost from \$100 to \$380 (Source: *Consumer Reports*, "Water-saving toilets from Consumer Reports' tests: Stop flushing water and money down the drain," July 14, 2014: <http://www.consumerreports.org/cro/news/2014/07/water-saving-toilets-from-consumer-reports-tests/index.htm>).

In addition, attached is a list of toilet fixtures that was screened from the current MaP database; all models on the list are 1.28 gpf. Current retail prices for the models were obtained where possible from retailer websites (file name: "Single-flush toilet matrix-2014-12-03.pdf."

According to EPA's *WaterSense*, "Our product research has found that high-efficiency urinal fixtures and flushing devices are no more expensive than their standard (1.0 gpf) counterparts. The average price of a new high-efficiency or standard urinal fixture is about \$350 and the average cost for a high-efficiency or standard pressurized flushing device (flushometer valve) is approximately \$200. Because there is very little to no cost difference between high-efficiency flushing urinals and standard flushing urinals, installing high-efficiency models in new construction or as part of the natural replacement process is cost-effective with immediate payback in water cost savings" (Source: EPA *WaterSense*: [http://www.epa.gov/WaterSense/pubs/faq\\_lfu.html](http://www.epa.gov/WaterSense/pubs/faq_lfu.html)).

The City of Tucson has found that "Prices [for urinals] are comparable to those for regular urinals and toilets" (Source: City of Tucson, "Commercial-Industrial High Efficiency Urinal Rebate Program," [http://water.tucsonaz.gov/files/water/docs/Urinal\\_Brochure\\_2-13.pdf](http://water.tucsonaz.gov/files/water/docs/Urinal_Brochure_2-13.pdf)).

P108-15 : T604.4-  
HOBBS5110

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** There are unknown problems with lowering water flow rates. Consistent with committee's action on P110-15.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Karen Hobbs, Natural Resources Defense Council, representing Natural Resources Defense Council (khobbs@nrdc.org); Ed Osann, representing Natural Resources Defense Council (eosann@nrdc.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

**2015 International Plumbing Code**

**TABLE 604.4  
MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES  
AND FIXTURE FITTINGS**

<b>PLUMBING FIXTURE OR FIXTURE FITTING</b>	<b>MAXIMUM FLOW RATE OR QUANTITY <sup>b</sup></b>
Urinal	0.5 gallon per flushing cycle
Water closet <sup>c,d,e</sup>	<del>1.28</del> 1.6 gallons per flushing cycle

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

- a. A hand-held shower spray is a shower head.
- b. Consumption tolerances shall be determined from referenced standards.
- ~~c. 1.6 gallons per flushing cycle for a water closet connected to the sanitary drainage system of an existing building.~~
- ~~d. The effective flush volume for a dual flush water closet is defined as the composite, average flush volume of two reduced flushes and one full flush.~~
- ~~e. In public settings, the maximum water use of a dual flush water closet is based solely on its full flush operation; not the average of full and reduced volume flushes.~~

**Commenter's Reason:** As modified by this comment, this proposal ONLY pertains to urinals, changing the maximum flush volume from 1 gallon per flush in the current code to 0.5 gallon per flush.

The Technical Committee's reason statement for disapproval, "There are unknown problems with lowering water flow rates," clearly does not apply to WaterSense-labeled 0.5 gpf urinals. There are no known problems with 0.5 gpf urinals; indeed, as noted by the Plumbing Manufacturers International (PMI) in a December 19, 2014 letter to the California Energy Commission regarding PMI's support for a 0.5 gpf standard for urinals, "...EPA WaterSense Specifications that have been vetted through a consensus process to ensure that such fixtures function safely and effectively" (that letter is attached).

WaterSense established the 0.5 gpf standard in 2009. According to the most recent reports from WaterSense partners, 151 models of urinal fixtures from 15 brands and 91 models of urinal valves from 7 brands currently meet the specification.

As noted in the original reason statement, there is little to no cost difference between high-efficiency flushing urinals (0.5 gpf) and standard urinals (1.0 gpf). By lowering water and sewer costs, 0.5 gpf urinals save money for building owners and occupants.

<http://media.iccsafe.org/cdpACCESS/docs/P108.pdf>

# P109-15 Part I

## Table 604.4

### Proposed Change as Submitted

**Proponent :** Karen Hobbs, Natural Resources Defense Council, representing Natural Resources Defense Council (khobbs@nrdc.org)

## 2015 International Plumbing Code

**Revise as follows:**

**TABLE 604.4  
MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES  
AND FIXTURE FITTINGS**

<b>PLUMBING FIXTURE OR FIXTURE FITTING</b>	<b>MAXIMUM FLOW RATE OR QUANTITY <sup>b</sup></b>
Lavatory, private	<del>2.2</del> <u>1.5</u> gpm at 60 psi
Shower head <sup>a</sup>	<del>2.5</del> <u>2.0</u> gpm at 80 psi

*(Portions of table not shown remain unchanged)*

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

- a. A hand-held shower spray is a shower head.
- b. Consumption tolerances shall be determined from referenced standards.

**Reason:** Showerheads operating at 2.0 gpm at 80 psi are commonly available and perform as well as showerheads operating at 2.5 gpm. The *WaterSense* specification for showerheads was adopted in 2010, including a maximum flow rate of 2.0 gpm at 80 psi. Based on the most recent reports by *WaterSense* partners, more than 800 models from 45 brands currently meet the proposed standard, demonstrating the widespread availability and commercial viability of these types of showerheads (Source: MaP Testing: <http://www.map-testing.com/>). Residential lavatory faucets rated at 1.5 gpm or less are also commonly available and perform as well as those with higher flow rates. *WaterSense* established criteria for residential lavatory faucets and faucet accessories such as aerators in 2007. Based on the most recent reports by *WaterSense* partners, over 5,200 models from 134 brands currently meet the *WaterSense* specification, showing the widespread availability and commercial viability of more efficient lavatory faucets (Source: MaP Testing: <http://www.map-testing.com/>).

The Natural Resources Defense Council (NRDC) estimates that significant water and energy savings could accrue nationwide if these revised flow rates for showerheads and faucets became effective in 2018 (savings estimates apply only to the residential sector):

- **Water and energy savings potential for showerheads:**
  - 86 million gallons of water per day by 2030;
  - 1,553 MWh (Megawatt hours) of electricity per year by 2030; and;
  - 112 million therms of natural gas per year by 2030.
- **Water and energy savings potential for faucets:**
  - 122 million gallons of water per day by 2030;
  - 2,199 MWh (Megawatt hours) of electricity per year by 2030; and
  - 158 million therms of natural gas per year by 2030.

Reducing water use is an integral part of the stated purpose of the International Plumbing Code. As noted in Chapter 1 of the 2015 edition: "**101.3 Intent.** The purpose of the code is to establish minimum standards to provide a reasonable level of safety, health, property protection and public welfare by regulating the controlling the design, construction, installation, quality of materials, location, operation and maintenance or use of plumbing equipment and systems."

Nothing is more fundamental to public "health, safety, property protection and public welfare" than the maintenance of adequate water supplies. Water-saving technologies, such as high-efficiency faucets and showerheads, reduce water use, helping to ensure that water supplies are maintained at safe and reliable levels, protecting human health and firefighting capability, as well as environmental resources.

**Cost Impact:** Will not increase the cost of construction

As noted above, both showerheads and faucets operating at the flow rates proposed are commonly available and perform as well as less efficient fixtures. For showerheads, more than 800 models from 45 brands currently meet the proposed standard; for faucets, over 5,200 models from 134 brands currently meet the proposed standard (Source: MaP Testing; <http://www.map-testing.com/>). According to EPA WaterSense, "Showerheads are available at a variety of price points and ranges in cost may be due to a number of factors including style or functional design" (Source: EPA WaterSense:

[http://www.epa.gov/WaterSense/pubs/faq\\_showerheads.html](http://www.epa.gov/WaterSense/pubs/faq_showerheads.html)).

*Consumer Reports* found that, "If you think you have to spend top dollar to get a strong performer, think again. Our top-rated multisetting showerhead costs a quarter of the price of the model that finished second" (Source: *Consumer Reports*: <http://www.consumerreports.org/cro/showerheads/buying-guide.htm>).

Regarding faucets, EPA WaterSense also found that, "Most high-efficiency faucet accessories that restrict flow are no more expensive than their conventional counterparts. However, pressure compensating faucet accessories that are designed to provide and maintain a constant flow rate despite fluctuations in water pressure typically cost a few dollars

more." <http://www.epa.gov/WaterSense/faucets.html>. Lowe's Home Improvement Store features more than 1,759 residential bathroom faucets that meet the proposed standard of 1.5 gpm from 19 brands, ranging in cost from \$15 to \$2000 (Source: Lowe's Home Improvement Store website:

[http://www.lowes.com/Bathroom/Bathroom-Faucets/Bathroom-Sink-Faucets/\\_/N-1z0wz0vZ1z0z4i4/pl#!](http://www.lowes.com/Bathroom/Bathroom-Faucets/Bathroom-Sink-Faucets/_/N-1z0wz0vZ1z0z4i4/pl#!)). For showerheads, Lowe's lists 185 products from 15 brands, ranging in cost from \$5 to \$400 (Source: Lowe's Home Improvement Store website: [http://www.lowes.com/Bathroom/Showers-Shower-Accessories/Showerheads/\\_/N-1z0wz0vZ1z0z4gq/pl#!](http://www.lowes.com/Bathroom/Showers-Shower-Accessories/Showerheads/_/N-1z0wz0vZ1z0z4gq/pl#!)).

## **Public Hearing Results**

### **Part I**

**Committee Action:**

**Disapproved**

**Committee Reason:** Consistency with committee's action on P108-15.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Karen Hobbs, Natural Resources Defense Council, representing Natural Resources Defense Council (khobbs@nrdc.org); Ed Osann, representing National Resources Defense Council (eosann@nrdc.org); Anthony Floyd, representing City of Scottsdale (afloyd@scottsdaleaz.gov) requests Approve as Submitted.**

**Commenter's Reason:** Part 1 of this proposal is solely about revisions to maximum flow rates for private lavatory faucets and showerheads.

The Technical Committee's stated reason for disapproval references committee action on two other proposals, P108-15 and P110-15. The committee's reason statements for those disapprovals cited "unknown problems with lowering water flow rates," and, for P110-15, "The IgCC provides the guidance for the lower flow fixtures. The PERC study needs to be finished before the IPC moves towards lower flow rates for water closets."

We would like to address each of the Committee's statements:

1. "Unknown problems with lowering flow rates" -- There is no evidence of problems associated with lower flow rates for showerheads and lavatory faucets. The Phase 1 PERC test finding (see below for link) and Phase 2 test plan (attached) are based on toilet hydraulics and drain line transport in long building drains. The identified issue is with 0.8 and 1.0 gpf toilets. The reduced flow rates of showerheads and lavatory faucets have not been identified as a contributing issue for drain line transport.
2. "The IgCC provides the guidance for the lower flow fixtures" - Reducing water use is an integral part of the stated purpose of the International Plumbing Code. As noted in Chapter 1 of the 2015 edition, "The purpose of the code is to establish minimum standards to provide a reasonable level of safety, health, property protection and public welfare by regulating the controlling the design, construction, installation quality of materials, location, operation and maintenance or use of plumbing equipment and systems." Nothing is more fundamental to public "health, safety, property protection and public welfare" than the maintenance of adequate water supplies. Water-saving technologies, such as high-efficiency toilets and urinals, reduce water use, helping to ensure that water supplies are maintained at safe and reliable levels, maintaining human health and firefighting capability as well as environmental resources.
3. "The PERC study needs to be finished before the IPC moves towards lower flow rates for water closets" - The referenced Phase 2 PERC Test Plan proposal (attached), is for water closets and not relevant to this proposal. This proposal is

about reducing flow rates for lavatory faucets and showerheads, not water closets. It is possible the Committee members were confused by the opponent's testimony.

**P109-15 Part I**

# P109-15 Part II

## Table P2903.2

### Proposed Change as Submitted

**Proponent :** Karen Hobbs, Natural Resources Defense Council, representing Natural Resources Defense Council (khobbs@nrdc.org)

## 2015 International Residential Code

### Revise as follows:

**TABLE P2903.2  
MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES  
AND FIXTURE FITTINGS**

<b>PLUMBING FIXTURE OR FIXTURE FITTING</b>	<b>MAXIMUM FLOW RATE OR QUANTITY<sup>b</sup></b>
Lavatory faucet	<del>2.2</del> <u>1.5</u> gpm at 60 psi
Water closet <sup>c</sup>	<del>1.6</del> <u>1.28</u> gallons per flushing cycle

*(Portions of table not shown remain unchanged)*

For SI: 1 gallon per minute = 3.785 L/m,

1 pound per square inch = 6.895 kPa.

- a. A handheld shower spray shall be considered a shower head.
- b. Consumption tolerances shall be determined from referenced standards.

c. 1.6 gallons per flushing cycle for a water closet connected to the sanitary drainage system of an existing building.

**Reason:** Recent advancements have allowed toilets to use 1.28 gallons per flush or less while providing equal or superior performance. This is 20 percent less water than the current federal standard of 1.6 gallons per flush. Toilets are by far the main source of water use in the home, accounting for nearly 30 percent of an average home's indoor water consumption. Water-efficient toilets can reduce water use in the home and help preserve the nation's water resources. Unlike some first-generation, water-saving toilets twenty years ago, high-efficiency toilets today combine efficiency with high performance. Design advances enable high-efficiency toilets to save water with no trade-off in flushing performance or drainline function. In fact, many perform better than standard toilets in consumer testing (source: EPA *WaterSense*; <http://www.epa.gov/WaterSense/products/toilets.html>).

*WaterSense* criteria for tank-type water closets were established in 2007. Based on the most recent reports by *WaterSense* partners, more than 2,305 models of tank-type toilets from more than 115 brands currently meet the *WaterSense* specification, showing the widespread availability and commercial viability of these more efficient water closets (Source: MaP Testing; <http://www.map-testing.com/high-efficiency-toilets.html>).

Faucets account for more than 15 percent of indoor household water use -- more than 1 trillion gallons of water across the United States each year. High efficiency bathroom sink faucets that use a maximum of 1.5 gallons per minute can reduce a sink's water flow by 30 percent or more from the standard flow of 2.2 gallons per minute without sacrificing performance (Source: EPA WaterSense; [http://www.epa.gov/watersense/products/bathroom\\_sink\\_faucets.html](http://www.epa.gov/watersense/products/bathroom_sink_faucets.html)). Residential lavatory faucets rated at 1.5 gpm or less are commonly available and perform as well as those with higher flows. EPA's WaterSense established criteria for residential lavatory faucets and faucet accessories such as aerators in 2007. Based on the most recent reports by WaterSense partners, over 5,200 models from 134 brands currently meet the WaterSense specification, showing the widespread availability and commercial viability of more efficient lavatory faucets.

The Natural Resources Defense Council (NRDC) estimates that significant water and energy savings could be realized if these standards were applied nationwide effective in 2018:

- **For toilets**, approximately 36 million gallons of water per day could be saved by 2030 (this value represents savings from residential toilets; it does not exclude flushometer valve toilets in the residential sector and tank-type toilets in the Commercial and Industrial sectors).
- **For faucets**, both water and energy savings could be realized:
  - 122 million gallons of water per day by 2030;
  - 2,199 MWh (Megawatt hours) of electricity per year by 2030; and
  - 158 million therms of natural gas per year by 2030.

Finally, reducing energy and water use is an integrall part of the stated purpose of the IRC:

The purpose of this code is to establish minimum requirements to safeguard the public safety, health and general welfare through affordability, structural strength, means of egress facilities, stability, sanitation, light and ventilation, energy conservation and safety to life and property from fire and other hazards attributed to the built environment and to provide safety to fire fighters and emergy responders during emergency operations (Source: International Residential Code, R101.3 Intent).

This proposal, by reducing demands on energy and water systems from new homes, clearly advances "public safety, health and general welfare" through affordable practices and energy conservation. Water-saving technologies, such as high-efficiency toilets, reduce water use, helping to ensure that water supplies are maintained at safe and reliable levels, protecting human health and firefighting capability as well as environmental resources; these technologies also reduce consumers' water and sewer bills. High efficiency faucets provide substantial energy savings as noted above, as well as water savings. The American Council for an Energy-Efficient Economy finds that "Utility energy efficiency programs have yielded significant energy and economic benefits to the utility system and to ratepayers. Energy efficiency programs have also led to job growth in many fields, including the building trades" (Source: American Council for an Energy-Efficient Economy: [www.aceee.org/topics/energy-efficiency-programs](http://www.aceee.org/topics/energy-efficiency-programs)).

### Maximum Performance (MaP) of Toilet Fixtures

December 3, 2014

The following list of toilet fixtures was screened from the current MaP database of 3,084 tank-type models. All models on this list include these characteristics: WaterSense compliant; single-flush, 1.28 gallons per flush maximum; gravity-fed, elongated ADA height bowl, floor-mounted, 12-inch rough-in, minimum 3-inch flush valve, and a MaP score of 1,000 grams. Except for the 3 models highlighted below, all feature a trapway in excess of 2 inches. Current retail prices for the models were obtained where possible from retailer websites.

MaP Report No.	Brand Name	Model Name	Model Number	MaP Flush Performance Score (grams of waste removed in a single flush)	Flush Valve-Flapper size 1- or 2-piece	Round (R) or Elongated (E) (in.) December 3, 2014

<http://www.consumerreports.org/cro/news/2014/07/water-saving-toilets-from-consumer-reports-tests/index.htm>).

In addition, attached is a list of toilet fixtures screened from the current MaP database; all models on the list are 1.28 gpf. Current retail prices for the models were obtained where possible from retailer websites (file name: "Single-flush toilet matrix-2014-12-03.pdf").

*Consumer Reports* tested 16 brands of faucets ranging in price from \$80 to \$600 and found little difference in performance or durability (Source: "Water Conservation with Shower and Faucet Tips", <http://www.scgh.com/go-green/water-fixtures-and-plumbing/water-wise-showers-and-faucets/>).

Regarding faucets, EPA WaterSense also found that, "Most high-efficiency faucet accessories that restrict flow are no more expensive than their conventional counterparts. However, pressure compensating faucet accessories that are designed to provide and maintain a constant flow rate despite fluctuations in water pressure typically cost a few dollars more" (Source: EPA WaterSense:

<http://www.epa.gov/WaterSense/faucets.html>). Lowe's Home Improvement Store features more than 1,759 residential bathroom faucets that meet the proposed standard of 1.5 gpm from 19 brands, ranging in cost from \$15 to \$2000 (Source: Lowe's Home Improvement Store website:

[http://www.lowes.com/Bathroom/Bathroom-Faucets/Bathroom-Sink-Faucets/\\_/N-1z0wz0vZ1z0z4i4/pl#!](http://www.lowes.com/Bathroom/Bathroom-Faucets/Bathroom-Sink-Faucets/_/N-1z0wz0vZ1z0z4i4/pl#!)).

P109-15 Part II : Table  
P2903.2-HOBBS5070

---

## **Public Hearing Results**

### **Part II**

#### **Committee Action:**

**Disapproved**

**Committee Reason:** There is a concern that in older homes, the slope of some piping is very steep and it is known that it takes more water to move solids in piping with greater slope. This code affects older homes where water closets are replaced. Some jurisdictions are allowing greater water closet flows in some applications in order to make the drainage system work.

#### **Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### ***Public Comment 1:***

**Proponent :** Karen Hobbs, Natural Resources Defense Council, representing Natural Resources Defense Council ([khobbs@nrdc.org](mailto:khobbs@nrdc.org)); Ed Osann, representing National Resources Defense Council ([eosann@nrdc.org](mailto:eosann@nrdc.org)); Anthony Floyd, representing City of Scottsdale ([afloyd@scottsdaleaz.gov](mailto:afloyd@scottsdaleaz.gov)) requests **Approve as Submitted.**

**Commenter's Reason:** The Technical Committee's stated reason for disapproval was, "There is a concern that in older homes, the slope of some piping is very steep and it is known that it takes more water to move solids in piping with greater slope. This code affects older homes where water closets are replaced. Some jurisdictions are allowing greater water closet flows in some applications in order to make the drainage system work."

We would respectfully note that this code change proposal allows a water closet with 1.6 gallons per flush to be installed on an existing building drainage system, which addresses the Committee's concern that "This code affects older homes where water closets are replaced."

To address the Committee's other concerns, we would note that "The Drainline Transport of Solid Waste in Buildings" (see below for link) found that, "The 1.28 gallon (4.8 L) and 1.6 gallon (6.0 L) test runs resulted in an orderly and predictable movement in the Test Apparatus." On p. 45, another reported finding was "Toilet hydraulics (percent trailing water and flush rate) were found to be non-significant variables. As such, the effect that toilet fixture designs have on drainline transport in long building drains has been found to be minimal."

While the next phase of this study, "Phase 2: Test Plan Proposal to Investigate Drainline Transport in Buildings" (attached), clearly focuses on 0.8 and 1.0 gpf toilets, it does note that the "Phase I test variables associated with toilet discharge characteristics, flush rate and percent trailing water, were shown to be non-significant at both the 1% and 2% slope settings."

Thus, it should be clear that concerns about 1.28 gpf water closets creating or exacerbating drain line transport issues are unfounded. This is a view shared by plumbing manufacturers as well --

Since the introduction of the low-flow 1.6 gpf and 1.28 gpf toilets, questions have been raised about whether water-saving toilets flush with a sufficient volume of water to move solid wastes through the building drainlines and the municipal sewer system. Industry research through the Plumbing Efficiency Research Coalition (PERC) presents no evidence that waste transport problems are due to low-flow toilets. -- Barbara C. Higgins, CEO/Executive Director, Plumbing Manufacturers International, March 13, 2014.

**Bibliography:** The Drainline Transport of Solid Waste in Buildings, Plumbing Efficiency Research Coalition, November, 2012,  
<http://www.plumbingefficiencyresearchcoalition.org/projects/drainline-transport-of-solid-waste-in-buildings>.

# P110-15

## Table 604.4

### Proposed Change as Submitted

**Proponent :** Billy Smith, American Society of Plumbing Engineers Legislative Committee, representing American Society of Plumbing Engineers Legislative Committee (bsmith@aspe.org)

## 2015 International Plumbing Code

Revise as follows:

**TABLE 604.4  
MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES  
AND FIXTURE FITTINGS**

<b>PLUMBING FIXTURE OR FIXTURE FITTING</b>	<b>MAXIMUM FLOW RATE OR QUANTITY <sup>b</sup></b>
<u>Water closet, private use application</u>	1.6 gallons per flushing cycle
<u>Water closet, public use application</u>	<u>1.28 gallons per full flushing cycle or, where equipped with dual flush device, 1.6 gallons per full flush cycle</u>

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

- a. A hand-held shower spray is a shower head.
- b. Consumption tolerances shall be determined from referenced standards.

**Reason:** This will increase the water conservation requirements for public use water closets. Every manufacturer of water closets has a 1.28 gallon per flush public water closet. Similarly, every manufacturer of water closets has a bowl for public use that can be equipped with a dual flush device.

If you consider a standard commercial building with 100 water closets. The water savings amounts to more than 33,000 gallons per year. This savings is accomplished without any loss in performance of the plumbing system.

**Cost Impact:** Will increase the cost of construction

This may increase the cost depending on which fixture is selected to install. The cost of the fixture may be higher. The installation is the same cost.

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The IgCC provides the guidance for the lower flow fixtures. The PERC study needs to be finished before the IPC moves towards lower flow rates for water closets.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com) requests Approve as Submitted.**

**Commenter's Reason:** This change is different from the other changes in that it is not in violation of the Federal mandate. Concern was expressed that the preemption from the Federal mandate only applies to states, not local jurisdictions. This change would still allow a 1.6 gpf water closet. It would simply have to be a dual flush. There is no need for any study since liquids are flushed with more water than the current urinals. However, it is a saving from the 1.6 gallons for a full flush. The other option would be to install a 1.28 gpf water closet. These are already prevalent and working very well. Again, this would be an option, not a mandate.

---

P110-15

# P115-15 Part I

605.4

## Proposed Change as Submitted

**Proponent :** Gary Morgan, Viega LLC, representing Viega LLC  
(gary.morgan@viega.us)

## 2015 International Plumbing Code

**Revise as follows:**

**605.4 Water distribution pipe.** Water distribution pipe shall conform to NSF 61 and shall conform to one of the standards listed in Table 605.4. ~~Hot~~ Water distribution pipe and tubing shall have a pressure rating of not less than 100 psi (690 kPa) at 180°F (82°C).

**Reason:** This code proposal is really only an attempt to address a subtle technicality that has existed for a very long time. The addition of "and cold" to this sentence makes it 100% clear that even cold water distribution piping needs to be temperature/pressure rated at 180F. Another possible way to address the issue is to simply remove "hot" from the same sentence. All of the piping standards listed in Table 605.4 for water distribution piping already meet this mandatory elevated temperature/pressure rating. The existing code language stating specifically "hot water distribution pipe and tubing" implies that pipes used for cold water distribution piping may not need to carry elevated temperature/pressure rating. Your support of this proposal would be most appreciated!

**Cost Impact:** Will not increase the cost of construction  
This proposal has absolutely no impact on the cost of construction and only attempts to address a technicality which has existed for many years.

P115-15 Part I : 605.4-  
MORGAN5960

---

## Public Hearing Results

### Part I

**Committee Action:**

**Approved as Modified**

**Modification:**

**605.4 Water distribution pipe.** Water distribution pipe shall conform to NSF 61 and shall conform to one of the standards listed in Table 605.4. ~~Hot and cold~~ Water distribution pipe and tubing shall have a pressure rating of not less than 100 psi (690 kPa) at 180°F (82°C).

**Committee Reason:** For the Modification only:

The terms "hot" and "cold" are unnecessary as the intent is that all water distribution piping must comply.

For the proposal As Modified:

The committee agreed with the proponent's reason statement.

**Assembly Action :**

**None**

---

**Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com) requests Disapprove.**

**Commenter's Reason:** This is a hidden attempt to restrict competitive piping materials. There is no reason for having cold water piping rated for hot water. Currently, polyethylene and PVC water pipe cannot meet the hot water temperature and pressure requirements. However, both are excellent materials for cold water piping. The proponent has not given any valid reason for removing the acceptance of these materials.

## **2015 International Plumbing Code**

**Revise as follows:**

**605.17 PEX plastic.** Joints between cross-linked polyethylene plastic tubing and fittings shall comply with Sections 605.17.1 and 605.17.2. PEX tubing shall comply with Section 605.17.3.

**Add new text as follows:**

**605.17.3 PEX tubing.** The manufacturer of PEX tubing shall have marked the outside of the tubing with the thermoplastic material designation code in accordance with ASTM F876. The designation code shall consist of the abbreviation "PEX" followed by four digits. The first digit shall represent a chlorine resistance rating as established by testing in accordance with ASTM F876.

**605.17.3.1 Chlorine resistance rating digits.** The first digit of the designation code shall have the following meanings:

1. Digit "0" indicates that the tubing has not been tested for chlorine resistance or that tubing does not comply with the minimum requirements for chlorine resistance.
2. Digit "1" indicates that the tubing complies with the minimum requirements for chlorine resistance for the conditions of 25% of the time at 140°F (60°C) and 75% of the time at 73°F (23°C).
3. Digit "3" indicates that the tubing complies with the minimum requirements for chlorine resistance for the conditions of 50% of the time at 140°F (60°C) and 50% of the time at 73°F (23°C).
4. Digit "5" indicates that the tubing complies with the minimum requirements for chlorine resistance for the conditions of 100% of the time at 140°F (60°C).

**Reason:** Disinfection of potable water using free chlorine as a disinfectant is the most common practice used today and has been over the last many decades. Not all plastic pipes have equal long-term performance when operating in a hot-chlorinated water environment therefore it is important for the user of this code to understand how plastic pipes are rated so pipes can be properly specified for their expected end use operating conditions. The PEX standard ASTM F876 includes mandatory chlorine resistance designation code information needed by field personnel so that the PEX selected meets

the expected end use conditions of the installation. This information is normally included on the print line of the tubing in accordance with the listing of that specific tubing. Building inspectors not having ready access to the ASTM standard need code guidance so they will know if the tubing is correctly applied for the end use and environmental conditions of the installation. If the tubing will be used for a hot water recirculation system, the inspector needs to know how to determine if properly rated PEX has been used. Also, if the tubing will be installed in an environment that normally exceeds 73°F (23°C) (such as an attic in very warm climates), the inspector needs to know what designation code is required.

This proposal would require that all PEX tubing be marked with its material designation code according to ASTM F876. Currently the other PEX standard listed in the table of water distribution pipe, CSA B137.5, does not currently mandate a PEX material designation code marking requirement therefore it would be impossible for the specifier, installer, or code inspector to know if the tubing is suitable for the expected end use conditions.

Chlorine testing of all ASTM F876 and CSA B137.5 PEX tubing materials are required today for certification and listing which attempts to replicate the end-use conditions (time at elevated temperature) under which the tubing can operate and still reach an extrapolated test lifetime of 50 years.

**Cost Impact:** Will not increase the cost of construction

This proposal has absolutely no impact on the cost of construction and only seeks to clarify requirements within the code.

MORGAN5433

---

## **Public Hearing Results**

### **Part I**

**Committee Action:**

**Disapproved**

**Committee Reason:** All of the proposed information is already in the standard for the product.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Pennie L Feehan, representing Self (penniefeehan@me.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Plumbing Code**

**605.17.3 PEX tubing, temperature limitations** ~~The manufacturer of PEX tubings shall have marked the outside of the tubing with the thermoplastic material designation code in accordance~~ For PEX tubing complying with ASTM F876, the designation code, the first digit following "PEX" as marked on the tubing exterior shall consist be an indicator of the abbreviation "PEX" followed by four digits maximum service

temperatures for which the PEX tubing can be used. The first digit maximum service temperatures shall be represent a chlorine resistance ratings established by testing in accordance with ASTM F876. as follows:

1. Digit "0": 73°F (23°C).
2. Digit "1": For not more than 25% of the time, greater than 73°F (23°C) and not exceeding 140°F (60°C). For the remainder of the time, not greater than 73°F (23°C).
3. Digit "3": For not more than 50% of the time, greater than 73°F (23°C) and not exceeding 140°F (60°C). For the remainder of the time, not greater than 73°F (23°C).
4. Digit "5": 140°F (60°C).

~~**605.17.3.1 Chlorine resistance rating digits.** The first digit of the designation code shall have the following meanings:~~

~~1. Digit "0" indicates that the tubing has not been tested for chlorine resistance or that tubing does not comply with the minimum requirements for chlorine resistance.~~

~~2. Digit "1" indicates that the tubing complies with the minimum requirements for chlorine resistance for the conditions of 25% of the time at 140°F (60°C) and 75% of the time at 73°F (23°C).~~

~~3. Digit "3" indicates that the tubing complies with the minimum requirements for chlorine resistance for the conditions of 50% of the time at 140°F (60°C) and 50% of the time at 73°F (23°C).~~

~~4. Digit "5" indicates that the tubing complies with the minimum requirements for chlorine resistance for the conditions of 100% of the time at 140°F (60°C).~~

**Commenter's Reason:**

This information is necessary for inspectors and installers to ensure that the tubing is installed using the proper material and in the correct locations for a successful installation.

For more than 100 years, municipal water purveyors have used chlorine to protect drinking water from disease-causing organisms. In 1997 Life Magazine declared "the filtration of drinking water plus the use of chlorine is probably the most significant public health advancement of the millennium". Chlorine has a residual effect throughout the entire water distribution system that may also have a negative influence on some plastic piping materials.

ASTM F876 contains chlorine designation codes and requirements that must be strictly adhered to when installing PEX tubing that may be expose to temperatures in excess of 73°F for extended periods of time, such as in unconditioned building spaces (attics) and hot water recirculation loops.

If all PEX tubing available had the first digit designation of 5, there would not be any concern, but this is not the case. This information is necessary for the proper installation of PEX.

## **P117-15 Part II**

### **P2906.9.1.5, P2906.9.1.5.3 (New), P2906.9.1.5.3.1 (New)**

#### **Proposed Change as Submitted**

**Proponent :** Gary Morgan, Viega LLC, representing Viega LLC  
(gary.morgan@viega.us)

### **2015 International Residential Code**

#### **Revise as follows:**

**P2906.9.1.5 Cross-linked polyethylene plastic (PEX).** Joints between cross-linked polyethylene plastic tubing or fittings shall comply with Section P2906.9.1.5.1 or Section P2906.9.1.5.2. PEX tubing shall comply with Section P2906.9.1.5.3.

#### **Add new text as follows:**

**P2906.9.1.5.3 PEX tubing.** The manufacturer of PEX tubing shall have marked the outside of the tubing with the thermoplastic material designation code in accordance with ASTM F876. The designation code shall consist of the abbreviation "PEX" followed by four digits. The first digit shall represent a chlorine resistance rating as established by testing in accordance with ASTM F876.

**P2906.9.1.5.3.1 Chlorine resistance rating digits.** The first digit of the designation code shall have the following meanings:

1. Digit "0" indicates that the tubing has not been tested for chlorine resistance or that tubing does not comply with the minimum requirements for chlorine resistance.
2. Digit "1" indicates that the tubing complies with the minimum requirements for chlorine resistance for the conditions of 25% of the time at 140°F (60°C) and 75% of the time at 73°F (23°C).
3. Digit "3" indicates that the tubing complies with the minimum requirements for chlorine resistance for the conditions of 50% of the time at 140°F (60°C) and 50% of the time at 73°F (23°C).
4. Digit "5" indicates that the tubing complies with the minimum requirements for chlorine resistance for the conditions of 100% of the time at 140°F (60°C).

**Reason:** Note: This same proposal has also been made for the IPC. Disinfection of potable water using free chlorine as a disinfectant is the most common practice used today and has been over the last many decades. Not all plastic pipes have equal long-term performance when operating in a hot-chlorinated water environment therefore it is important for the user of this code to understand how plastic pipes are rated so pipes can be properly specified for their expected end use operating conditions.

The PEX standard ASTM F876 includes mandatory chlorine resistance designation code information needed by field personnel so that the PEX selected meets the expected end use conditions of the installation. This information is normally included on the print line of the tubing in accordance with the listing of that specific tubing. Building inspectors not having ready access to the ASTM standard need code guidance so they will know if the tubing is correctly applied for the end use and environmental conditions of the installation. If the tubing will be used for a hot water recirculation system, the inspector needs to know how to determine if properly rated PEX has been used. Also, if the tubing will be installed in an environment that normally exceeds 73°F (23°C) (such as an attic in very warm climates), the inspector needs to know what designation code is required.

This proposal would require that all PEX tubing be marked with its material designation code according to ASTM F876. Currently the other PEX standard listed in the table of water distribution pipe, CSA B137.5, does not currently mandate a PEX material designation code marking requirement therefore it would be impossible for the specifier, installer, or code inspector to know if the tubing is suitable for the expected end use conditions.

Chlorine testing of all ASTM F876 and CSA B137.5 PEX tubing materials are required today for certification and listing which attempts to replicate the end-use conditions (% time at elevated temperature in chlorinated environment) under which the tubing can operate and still reach an extrapolated test lifetime of 50 years.

**Cost Impact:** Will not increase the cost of construction

This proposal has absolutely no impact on the cost of construction and only seeks to clarify requirements within the code.

**Disapproved**

**Committee Reason:** An excessive amount of text is being added to the code but doesn't does add any useful information.

**Assembly Action :**

**None**

---

# P122-15

605.6, 605.9

## Proposed Change as Submitted

**Proponent :** Ronald George, self, representing self (Ron@Plumb-TechLLC.com)

### 2015 International Plumbing Code

**Revise as follows:**

**605.6 Flexible water connectors.** Flexible water connectors exposed to continuous pressure shall conform to ASME A112.18.6/CSA B125.6. Access shall be provided to all flexible water connectors. Compression couplings shall not be used for flexible water connector joints.

**605.9 Prohibited joints and connections.** The following types of joints and connections shall be prohibited:

1. Cement or concrete joints.
2. Joints made with fittings not *approved* for the specific installation.
3. Solvent-cement joints between different types of plastic pipe.
4. Saddle-type fittings.
5. Compression joints on plastic water distribution piping or flexible connectors.

**Reason:** Plastic piping with compression couplings have failed on many occasions when there is a seasonal change in the water temperature or domestic hot water application that allows the plastic pipe to soften. During water hammer events from booster pumps cycling on, valves closing or well pumps cycling, the plastic piping can work loose and cause a flood. Plastic pipe and compressin couplings do not make a safe pipe joint.

**Cost Impact:** Will not increase the cost of construction  
This is not a cost issue it is a material issue. Flexible water connectors and plastic piping should not be joined with compression couplings. I have served as an expert witness recently for a signficnt number of compression joint failures especially on hot water piping systems.

P122-15 : 605.6-  
GEORGE5606

---

## Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** Section 605.6 and 605.9 are duplicated. This would be too stringent for the distribution piping for the balance of the code. The proponent indicated that he failed to put in the proposal "without metal insert stiffeners" to qualify where compression fittings cannot be used.

**Assembly Action :**

**None**

---

## Individual Consideration Agenda

## Public Comment 1:

**Proponent : Ronald George, Plumb-Tech Design & Consulting Services, representing Self (Ron@Plumb-TechLLC.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Plumbing Code**

**605.6 Flexible water connectors.** Flexible water connectors exposed to continuous pressure shall conform to ASME A112.18.6/CSA B125.6. Access shall be provided to all flexible water connectors. ~~Compression couplings shall not be~~ Where a compression fitting is used for to connect the end of a plastic flexible water connector joints , a stiffener insert shall be installed in the tube end.

**605.9 Prohibited joints and connections.** The following types of joints and connections shall be prohibited:

1. Cement or concrete joints.
2. Joints made with fittings not *approved* for the specific installation.
3. Solvent-cement joints between different types of plastic pipe.
4. Saddle-type fittings.
5. Compression joints on plastic water distribution piping or flexible connectors where a stiffener insert has not been installed in the tube end.

**Commenter's Reason:** The Committee is correct that prohibiting compression joints for plastic flexible tubing is overly restrictive. Compression joints for plastic water connectors is very common (such as the connector tubes from the stop valves to faucets and water closets).

The problem is that there have been numerous water damage claims from plastic flexible water connectors that slip out of a compression joint because they were not assembled with an insert stiffener fitting in the end of the tube. The insert stiffener holds the outside of the tubing tight against the compression ferrule on the outside of the tubing. Without the insert stiffener in place, the tubing can collapse or flex inward allowing the joint to separate/slip under water hammer conditions, hot water flow or with heat from external heat sources. (adjacent bathroom heaters)

Some water connector manufacturers require the inserts, supplying the inserts with the connector. However, not all manufacturers supply the inserts or mention anything about inserts and, unfortunately, those are the compression joint connections that are failing. Adding this requirement to the code will prevent these water damage events, where in many cases, the insurance companies deny the claims saying the homeowner left the stiffener out intentionally or that the homeowner intentionally loosened the joint and they deny the claim, This causes the homeowner to go to great expenses to try and prove what happened and fight the insurance companies.

---

P122-15

# P130-15

605.14.3, 605.18.3, 605.22.2, 605.23.3

## Proposed Change as Submitted

**Proponent :** John Stempo, Victaulic Company, representing Victaulic Company

### 2015 International Plumbing Code

**Add new text as follows:**

**605.14.3 Grooved and shouldered mechanical joints.** Grooved and shouldered mechanical joints shall comply with ASTM F 1476, shall be made with an *approved* elastomeric seal and other internal components, if applicable, and shall be installed in accordance with the manufacturer's instructions. Such joints shall be exposed or concealed.

**605.18.3 Grooved and shouldered mechanical joints.** Grooved and shouldered mechanical joints shall comply with ASTM F 1476, shall be made with an *approved* elastomeric seal and other internal components, if applicable, and shall be installed in accordance with the manufacturer's instructions. Such joints shall be exposed or concealed.

**605.22.2 Grooved and shouldered mechanical joints.** Grooved and shouldered mechanical joints shall comply with ASTM F 1476, shall be made with an *approved* elastomeric seal and other internal components, if applicable, and shall be installed in accordance with the manufacturer's instructions. Such joints shall be exposed or concealed.

**605.23.3 Grooved and shouldered mechanical joints.** Grooved and shouldered mechanical joints shall comply with ASTM F 1476, shall be made with an *approved* elastomeric seal and other internal components, if applicable, and shall be installed in accordance with the manufacturer's instructions. Such joints shall be exposed or concealed.

**Reason:** There are some types of grooved mechanical joints that utilize internal components other than elastomeric seals. These proposed changes are intended to clarify language in the code to specifically address the use and acceptance of these additional components within a grooved mechanical joint design, if they are *approved*.

**Cost Impact:** Will not increase the cost of construction  
A clarification of what components could be used for sealing in this type of joint will not increase the cost of construction.

P130-15 : 605.14.3-  
STEMPO3966

---

## Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** "Other components" seems vague. The elastomeric seal needs approval but these other components don't which seems to allow anything to be installed the joint (without approval).

**Assembly Motion:**  
**Online Vote Results:**

**As Submitted**  
**Failed**

Support: 23.49% (35) Oppose: 76.51% (114)

**Assembly Action :**

**None**

---

**Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : John Stempo, Victaulic Company, representing Victaulic Company requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

**2015 International Plumbing Code**

**605.14.3 Grooved and shouldered mechanical joints.** Grooved and shouldered mechanical joints shall comply with ASTM F 1476, shall be made with an approved elastomeric seal and where applicable, other internal components, ~~if applicable, and as provided by the manufacturer.~~ The joints shall be installed in accordance with the manufacturer's instructions. Such joints shall be exposed or concealed.

-

**605.18.3 Grooved and shouldered mechanical joints.** Grooved and shouldered mechanical joints shall comply with ASTM F 1476, shall be made with an approved elastomeric seal and where applicable, other internal components, ~~if applicable, and as provided by the manufacturer.~~ The joints shall be installed in accordance with the manufacturer's instructions. Such joints shall be exposed or concealed.

-

**605.22.2 Grooved and shouldered mechanical joints.** Grooved and shouldered mechanical joints shall comply with ASTM F 1476, shall be made with an approved elastomeric seal and where applicable, other internal components, ~~if applicable, and as provided by the manufacturer.~~ The joints shall be installed in accordance with the manufacturer's instructions. Such joints shall be exposed or concealed.

-

**605.23.3 Grooved and shouldered mechanical joints.** Grooved and shouldered mechanical joints shall comply with ASTM F 1476, shall be made with an approved elastomeric seal and where applicable, other internal components, ~~if applicable, and as provided by the manufacturer.~~ The joints shall be installed in accordance with the manufacturer's instructions. Such joints shall be exposed or concealed.

-

**Commenter's Reason:** The addition of the words after "other internal components" directly addresses the committee's concern in regard to vague language and thus, will ensure that the "other internal components" are the components provided by the manufacturer and not just any components that an installer might try to include in the joint..

# P135-15 Part I

605.24.3 (New), 605.9

## Proposed Change as Submitted

**Proponent :** Michael Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservices.com)

**NOTE:** PART II DID NOT RECEIVE A PUBLIC COMMENT AND IS ON THE CONSENT AGENDA. PART II IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY FOLLOWING ALL OF PART I.

## 2015 International Plumbing Code

**Add new text as follows:**

**605.24.3 Joint between PVC water service and CPVC water distribution.** Where a PVC water service pipe connects to a CPVC pipe at the beginning of a water distribution system, the transition shall be by a mechanical fitting, an approved adapter fitting, a transition fitting or by a single solvent-cemented transition joint. A single, solvent cement transition joint shall be in compliance with ASTM F493 and the pipe, fitting, and solvent cement manufacturers' instructions. Solvent cement joint surfaces shall be clean, free from moisture and prepared with an approved primer. Solvent cement conforming to ASTM F493 shall be applied to the joint surfaces and the joint assembled while the cement is wet.

**Revise as follows:**

**605.9 Prohibited joints and connections.** The following types of joints and connections shall be prohibited:

1. Cement or concrete joints.
2. Joints made with fittings not *approved* for the specific installation.
3. Solvent-cement joints between different types of plastic pipe except as provided for in Section 605.24.3.
4. Saddle-type fittings.

**Reason:** Transitions being made from PVC service to CPVC water distribution systems is common, and solvent cementing for this single transition application should be an option.

**Cost Impact:** Will not increase the cost of construction  
None.

P135-15 Part I : 605.24.3  
(New)-CUDAHY5893

---

## Public Hearing Results

### Part I

**Committee Action:**

**Disapproved**

**Committee Reason:** The committee is not certain that the solvent cement standard covers joining two different types of piping.

**Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Michael Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservices.com) requests Approve as Submitted.**

**Commenter's Reason:** We stand on the original proposal statement. Transitions being made from PVC service to CPVC water distribution systems is common, and solvent cementing for this single transition application should be an option.

---

**P135-15 Part I**

## **P135-15 Part II**

### **P2906.17.2 (New)**

#### **Proposed Change as Submitted**

**Proponent :** Michael Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservices.com)

### **2015 International Residential Code**

**Add new text as follows:**

**P2906.17.2 Joint between PVC water service and CPVC water distribution** Where a PVC water service pipe connects to a CPVC pipe at the beginning of a water distribution system, the transition shall be by a mechanical fitting, an *approved* adapter fitting, a transition fitting or by a single solvent-cemented transition joint. A single, solvent cement transition joint shall be in compliance with ASTM F493 and the pipe, fitting, and solvent cement manufacturers' instructions. Solvent cement joint surfaces shall be clean, free from moisture and prepared with an approved primer. Solvent cement conforming to ASTM F493 shall be applied to the joint surfaces and the joint assembled while the cement is wet.

**Reason:** Transitions being made from a building's PVC service to CPVC water distribution systems is a fairly common occurrence, and using solvent cementing for this single transition application should be an option.

**Cost Impact:** Will not increase the cost of construction  
This proposal allows for an optional method of joining not in this code. The option is not requiring that this method be chosen. Thus the code with this proposal added will not cause the cost of construction to increase.

**P135-15 Part II :  
P2906.17.2 (New)-  
CUDAHY4670**

---

### **Public Hearing Results**

## **Part II**

**Committee Action:**

**Approved as Submitted**

**Committee Reason:** The committee agreed with the proponent's published reason statement.

**Assembly Action :**

**None**

---

# P136-15

## 604.1, Chapter 14

### **Proposed Change as Submitted**

**Proponent :** Ronald George, Self; Plumb-Tech Design & Consulting Service LLC; [www.Plumb-TechLLC.com](http://www.Plumb-TechLLC.com);  
[www.LegionellaPrevention.org](http://www.LegionellaPrevention.org), representing Self; Plumb-Tech Design & consulting Services LLC (Ron@Plumb-TechLLC.com)

## **2015 International Plumbing Code**

### **Revise as follows:**

**604.1 General.** The design of the water distribution system shall be in accordance with ASHRAE 188 and shall conform to *accepted engineering practice*. Methods utilized to determine pipe sizes shall be *approved*.

### **Add new standard(s) as follows:**

ASHRAE 188 - DRAFT\_4th Public Review\_09262014 Legionellosis: Risk Management for Building Water Systems

**Reason:** There are many design considerations in the ASHRAE standard that will help minimize Legionella bacteria growth in building water systems which can lead to Legionnaires Disease when water droplets are aerosolized from shower heads, and other building water systems and fixtures that aerosolize water droplets. Following the ASHRAE Standard will minimize the risk of a Person contracting Legionnaires' disease.

**Bibliography:** [www.LegionellaPrevention.org](http://www.LegionellaPrevention.org)  
[www.Plumb-TechLLC.com](http://www.Plumb-TechLLC.com)

**Cost Impact:** Will increase the cost of construction

The cost of construction of the plumbing system to eliminate dead legs and provide other design concepts to address temperature and stagnation is estimated to be about 10 - 15 percent more to comply with this standard, however it will provide for hygienic system designs that will minimize legionella bacteria growth and help prevent Legionnaires Disease. See [www.LegionellaPrevention.org](http://www.LegionellaPrevention.org).

**Analysis:** A review of the standard proposed for inclusion in the code, ASHRAE 188, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

P136-15 : 606.8 (New)-  
GEORGE5211

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The standard is in draft form and cannot be approved for inclusion into the code at this point in the code development process. This draft standard appears to be mostly an operational standard and not a construction

standard.

**Assembly Action :**

**None**

**Analysis.** For staff analysis of the content of ASHRAE 188 (SPC 188) with regard to the ICC criteria for referenced standards (Section 3.6 of CP #28), please visit: <http://www.iccsafe.org/wp-content/uploads/2015-Proposed-Standards-Group-A-Final.pdf>

---

**Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Ronald George, representing Plumb-Tech Design & Consulting Services LLC (Ron@Plumb-TechLLC.com) requests Approve as Submitted.**

**Commenter's Reason:** The reason this code change was turned down was stated that "The standard is in draft form and cannot be approved for inclusion into the code at this point in the code development process." The standard has now been published.

*Public Comment 2:*

**Proponent : Steven Ferguson, representing American Society of Heating Refrigerating and Air-Conditioning Engineers (sferguson@ashrae.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

**2015 International Plumbing Code**

**604.1 General.** The design of the water distribution system shall be in accordance with ASHRAE 188 and shall conform to *accepted engineering practice*. Methods utilized to determine pipe sizes shall be *approved*.

**Modify standard(s) as follows:**

**Commenter's Reason:** The reason for disapproval of this proposal at the committee hearings was "The proposed standard is in draft form and not likely to be completed by the Public Comment Hearings. The content could change before the draft is finalized."

The Staff analysis on this standard was "Appears to be written in enforceable language. No proprietary references were noted. Consensus process stated."

In addition to the original proponent's reason statement. ASHRAE Standard 188 was developed with the intent of providing code officials and building operators information on how to manage the risk of legionellosis. ASHRAE Standard 188 was published on June 26, 2015, and is now publicly available as a final, published ANSI Standard. No substantive changes were made from the version previously provided to ICC for review.

For more information on the standard, go here: <http://www.techstreet.com/ashrae/products/1897561>

# P139-15

## 607.2.1.2

### **Proposed Change as Submitted**

**Proponent :** Ronald George, Self; Plumb-Tech Design & Consulting Services LLC, representing Self; Plumb-Tech Design & Consulting Services LLC. (Ron@Plumb-TechLLC.com)

## **2015 International Plumbing Code**

**Delete without substitution:**

### ~~**607.2.1.2 Demand recirculation controls for distribution**~~

~~**systems.** A water distribution system having one or more recirculation pumps that pump water from a heated water supply pipe back to the heated water source through a cold water supply pipe shall be a demand recirculation water system. Pumps shall have controls that comply with both of the following:~~

- ~~1. The control shall start the pump upon receiving a signal from the action of a user of a fixture or appliance, sensing the presence of a user of a fixture, or sensing the flow of hot or tempered water to a fixture fitting or appliance.~~
- ~~2. The control shall limit the temperature of the water entering the cold water piping to 104°F (40°C).~~

**Reason:** Demand recirculation systems create a cross nonnection between hot water and cold water systems.

**Cost Impact:** Will not increase the cost of construction

If you do not have to install demand recirculation controls proximity sensors, electrical wiring, transformers, control wiring, circulating pumps, etc. it will save money. This will not increase the cost of construction when the cost of previously heated warm water is dumped down the drain every time someone needs cold water. Th hot water will also promote bacteria growth in the piping system which will lead to medical expenses and illness, doctors fees, lawyers fees, and the cost of labor, materials to make repairs to the plumbing system when it is discovered this system does not provide cold water to the fixture for brushing teeth, drinking or any other uses for cold water The cost to make corrections in order to get cold water from the fixture should be factored in.

P139-15 : 607.2.1.2-  
GEORGE5210

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** This is more of a health and safety issue versus energy savings. The committee prefers the langauge currently in the code.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

## *Public Comment 1:*

**Proponent : Ronald George, representing Self (Ron@Plumb-TechLLC.com) requests Approve as Submitted.**

**Commenter's Reason:** The plumbing code has recently Accepted "Cross Connections" as an "Acceptable Practice" The last code development cycle for the International Codes brought about a code change that was submitted to the model codes by a manufacturer of a unique product that has filled an aftermarket niche. An entrepreneur decided to address the problem of dumping water down the drain while waiting for hot water to arrive at a fixture. Since this code change went into the code, just about every pump manufacturer has jumped on the band wagon to sell these small pumps at significant prices. Instead of requiring a dedicated hot water return piping system, the proponents solution to the problem was simply to add a small circulating pump under the lavatory or sink and connect it to both the hot and cold water lines to the fixture and pull hot water to the fixture through the hot water pipe and utilize the cold water pipes as a hot water return path back to the water heater. (This only works where there are no check valves in the hot water system) When I first heard of the concept of circulating hot water back through the cold water piping, I was slightly amused and I was well aware of the fact that it was an obvious cross connection along with a health and safety issues. The hot water in the cold water piping can create a scalding hazard and if it is hot or warm water it can lead to accelerated water treatment chemical dissipation and there will be an increase in the growth of bacteria and other organic pathogens in the water which creates a biological and potentially a Legionella hazard. When I first saw the proposal, I was pretty sure that the plumbing industry was not going to accept circulating hot water in the cold water piping because that is a direct cross-connection and the code prohibits cross-connections. I thought the backflow prevention folks would surely see this and step up to address the issue at the code hearings.

Unfortunately, during the code hearing testimony, there was little or no opposing testimony from the backflow industry on this issue and the proposed code change was promoted as a "water saving" and "energy saving" measure to reduce the waste of water poured down the drain and to reduce the energy used to heat that water. It seems like green marketing hype had an effect on code development. They bought it and the code change passed. It seems you can call something green and people seem to think green is good so they blindly support it. Anyone can propose a code change and sometimes they don't understand all of the consequences of their proposals. This sometimes leads to code change proposals that are well intentioned, yet unsanitary and unsafe. If a presentation is done well, it is possible to convince enough code committee members to support a code change that is in conflict with other sections of the code because it sounded good at the time.

The code change to recirculate hot water through the cold water pipes was presented in the name of energy and water conservation. I'm the number one advocate for energy conservation and water conservation, but only if it does not create a health and safety issue. It appears the code change for circulating hot water back to the water heater passed because many of the code committee members were thinking of their personal experiences of waiting for hot water in their home and they were not presented with facts about the potential health and safety consequences to the public in larger buildings. I think this system is great for an individual homeowner who knowingly chooses to install this system in a private home and live with the health and safety consequences of such a decision. It would be appropriate for the International Residential Code (IRC), but not the IPC.

I do not believe we should allow this as a design option for commercial buildings and multi-family buildings. We already have a way for hot water to be maintained at the fixture by installing a dedicated hot water return piping system or providing temperatur maintenance cables. The codes have accepted this cross-connections as an acceptable design practice.

I submitted code changes (P102-15 & P-139-15) to undue the code change from the last cycle. I'm hoping there will be some comments from the backflow prevention

industry, Engineers and some common sense employed to correct this terrible mistake by well-intentioned individuals that have created a serious health and safety issue with the code change last cycle. The following are reasons why we should not circulate hot or tempered water through the cold water distribution pipes:

1. Circulating hot water in the cold water pipes can scald someone if the temperature sensor fails or is disconnected or not installed. People will not expect to find hot water in the cold water pipes. This is a form of cross connection that backflow protection language in the codes was specifically intended to prevent. The proponent has indicated there can be a thermostat that shuts-off the circulator when the water temperature gets to a given temperature, but that is a manufacturing option in many catalogs and not mandatory on all devices that are sold for this purpose. There is no language in the code change that mandates a maximum or minimum temperature. As the code change is written, there is no temperature limit for hot water that can be circulated through the cold water piping. One manufacturer states his device has a temperature limit, but not all manufacturers have a maximum temperature limit.

2. If someone in a high rise apartment building has a bathroom located a considerable distance from the circulated main they decide to install one of these circulator pumps under a lavatory or sink, the code will allow them and then everyone else in the building will have hot water return water flowing through their cold water piping. In some of these high rise buildings there are different pressure zones that flow through pressure reducing valves or through booster pumps. Now with this code change the circulator pump will be pushing hot water back against a pressure reducing valve or a booster pump on the cold water system. These systems should be limited to single family homes only. They should not be allowed in the International Plumbing Code, they should be relegated to the international residential code where the homeowner will have to deal with the consequences of their choice. I don't want someone in a building deciding I have to have hot water in my cold water pipes. If circulating hot water through the cold water pipes is allowed people in all other floors or areas of large buildings will be drinking and brushing their teeth with hot or warm water that has metals from dissolved anode rods and elevated bacteria levels.

3. Recirculating hot or warm water in the cold water piping will increase bacteria growth and biofilm formation in the cold water piping.

4. Hot water in the cold water piping system will promote accelerated dissipation of water treatment chemicals - The act of recirculating the hot water back into the cold water system is actually holding the water and circulating it in the piping system longer than it normally would have been. With the increase in low-flow and ultralow-flow fixtures associated with water conservation measures, the water treatment chemicals will dissipate at the same rate while the flow rate goes down.

5. Reducing the water flowing out of and into the water system promotes stagnation. Lack of flushing water flow causes the water to remain in the piping system for longer periods of time. This contributes to water treatment dissipation and will lead to an increase in bacteria levels in the domestic water system and will contribute to legionella bacteria and other organic pathogen growth in the domestic water systems.

6. This allows the water treatment chemicals to dissipate over time and when the water is circulated through the water heater, the heat accelerates the dissipation rate of the water treatment chemicals. The water is held in the plumbing system for longer periods of time contributing to stagnation and loss of water treatment chemicals and less water in the drain to contribute to drain line transport.

7. If someone in any commercial building installs one of these circulating pumps that circulate through the cold water pipes, the people in other areas of the building that want or expect cold water will be receiving hot or warm water when the draw water from a tap for drinking or cooking. I would not be happy if the electric water cooler or drinking fountain in my office was receiving hot or warm water that is injected into the cold water pipes from a circulation pump under a sink in a tenant space down the hall. I will be drinking hot or warm water from the drinking fountain and if I have an electric water cooler, my electric bill is going to go up because now the refrigeration unit on my electric water cooler will be cooling hot or warm water

instead of cold water.

8. The hot water in the cold water pipes will have dissolved metals in the hot water. This is because all tank type water heaters have magnesium or aluminum sacrificial anode rods in the tank that corrode and dissolve metals into the water to protect the tank from corrosion. These dissolved metals are present in hot water tanks, but typically not in the cold water piping. This is why all cooking shows recommend you fill your cooking kettles with cold water. It is for this same reason I don't want the tenant on another floor in a condo building being allowed to circulate hot water with dissolved metals into my cold water piping on another floor for drinking and cooking water.

## **607.6 (New)**

### **Proposed Change as Submitted**

**Proponent :** Ronald George, Self; [www.ScaldPrevention.org](http://www.ScaldPrevention.org);  
[www.LegionellaPrevention.org](http://www.LegionellaPrevention.org), representing Self (Ron@Plumb-TechLLC.com)

## **2015 International Plumbing Code**

### **Add new text as follows:**

**607.6 Master Temperature Actuated Mixing Valve.** All commercial water heaters shall have the ability to heat water to a temperature of not less than 180°F ( 82.2°C). The water heaters shall be designed to be operated to provide for a stored water temperature of not less than 140°F (60°C) to minimize Legionella bacteria growth. A master temperature actuated mixing valve conforming to ASSE 1017 shall be installed on the hot water discharge pipe of a water heater to stabilize the hot water distribution system delivery temperature at the temperature required for hot water return temperature of not less than 124°F ( 51.1°C) to minimize Legionella bacteria growth.

**Reason:** This code change is to provide hot water system controls to minimize scalding and control Legionella bacteria growth.

## **A Hot Water System Balancing Act – Scald Prevention vs Legionella Prevention**

By: Ron George, CPD, President, Plumb-Tech Design & Cons. Services LLC.

Web site: [www.Plumb-TechLLC.com](http://www.Plumb-TechLLC.com)

*Plumbing Engineer Magazine, Mar. 2013*

Plumbing design professionals and contractors are faced with many challenges when designing, installing or maintaining domestic hot water systems. Two of the more important challenges of a domestic hot water system are providing hot water for bathing and washing that will not cause scald injuries and hot water that is at a temperature high enough to prevent Legionella bacteria growth. I call it the *hot water system balancing act*. Scalding and Legionella account for a significant percentage of the litigation cases associated with plumbing systems.

Many plumbing industry groups have addressed the scalding issue and it is documented in the plumbing codes that the maximum hot water temperature to prevent scalding is 120 degrees Fahrenheit (F). The minimum temperature to prevent Legionella bacteria growth at any point in the domestic hot water supply or return piping system should be 124 degrees F according to ASHRAE. The 124 degree temperature comes from the new ASHRAE Guideline 12 which is nearing completion for publication. (See Figure 2) These two temperatures seem conflict with each other, but they can actually work together. The plumbing system can be designed to store and distribute hot water at higher temperatures and deliver the hot water from the showers and bathtub/shower fixtures at safe temperatures of 120 F or less by simply adjusting the limit stops on the tub/shower valves to limit the hot water to 120 F or less. Many design professionals, contractors, maintenance personnel, tenants and building owners may not be aware of the temperature limit stop feature on all code compliant shower valves. The manufacturers publish information on how to set the limit stop for shower valves. If the shower valve is an older shower valve without limit stops, it should be replaced or a thermostatic mixing valve conforming to ASSE 1070 should be installed on the hot water supply branch to temper the water to a maximum of 120 F or an ASSE 1062 device could be used to prevent scalding. Code compliant shower valves conform to ASSE 1016 or CSA B125.1 which were recently harmonized with ASME in the standard titled: *ASSE 1016/ASME A112.1016/CSA B125.16, Performance requirements for automatic compensating valves for individual showers and tub/shower combinations*. The temperature flowing to the shower valves can be as high as 140 degrees F and the shower valves should have the maximum temperature limit stops adjusted to limit the temperature leaving the shower valve to a maximum of 120 F. In addition the valves must be seasonally adjusted to account for the changes in the incoming cold water temperature which can affect the mixed water temperature.

### **Maximum Hot Water Temperature to Prevent Scalding**

I have served on many industry committees dealing with hot water system code requirements, hot water system design standards and product standards related to domestic hot water systems devices for temperature control and scald prevention. There has been consensus in all of these committees that the maximum safe hot water delivery temperature for a shower or bathtub is 120 degrees Fahrenheit to prevent scalding with a few exceptions for lower temperatures for bidets and emergency eye wash fixtures. (See Figure 1 - Hot Water Scald Burns – Time vs Temperature Relationship for Second and Third Degree Burns for Adults and Children)

There were discussions in a plumbing code ad-hoc committee on temperature limits for the hot water system where everyone agreed the maximum safe temperature was 120 F. The ASPE Hot water committee dealing with a proposed standard for temperature limits in hot water systems also agreed the maximum safe hot water temperature to prevent scalding is

120 Fahrenheit. Several ASSE working groups that I have served on dealing with hot water temperature controls have all have discussed the reaction time of bathers and they have taken into consideration that children, the elderly and people with disabilities usually take longer to get out of harm's way if the water suddenly gets hot and they agreed 120 Fahrenheit is the maximum safe hot water temperature that a valve should deliver. At 120 F it takes about 80 seconds to develop a second degree burn in a child and it takes about 8 minutes to develop a second degree burn in an adult. (See Figure 1) The 120 Degree F temperature limit gives bathers or users an adequate amount of time to get out of harm's way before an irreversible scald burn injury can occur. Each of these committees looked back to the data that was the result of burn studies done by Dr. Moritz and Dr. Henrique's at Harvard Medical College in the 1940s. The burn studies were done using baby pigs that had skin thicknesses similar to that of adult males. The studies exposed the pig's skin to various temperatures of hot water for various periods of time and the severity of the burns were studied and recorded. These were the studies used to develop the time and temperature exposure charts. There have been numerous white papers, seminars, and reports since then discussing the fact that burns can occur quicker than those recorded in the Moritz & Henrique's studies for adult males. The skin is thinner for children and the elderly and the amount of time to receive an irreversible 2<sup>nd</sup> degree burn injury is less because their skin is thinner. Many of the white papers use the Moritz and Dr. Henrique's original burn studies and they use a ratio of the skin thickness to come up with burn times for thinner skin of children and the elderly. Children, the elderly and handicapped are also slower to react because it takes them more time to realize what is happening and try to react to get out of harm's way. Someone once told me an apartment complex was not intended for children or the elderly. I said everyone grows old and children often come visit so we need to consider prevention of scalds to children, the elderly and people with disabilities more so than burns to adults because burns can occur quicker for those groups.

#### **The PIEV Theory for Reaction Time**

There is a PIEV theory relates to reaction time. The PIEV theory is most commonly used to address braking distance in automobile accidents. It addresses the amount of time it takes a driver to sense a problem and decide to react, then the reaction time is added to the braking time for the total distance that a car travels before stopping. The PIEV theory can also apply to reaction times for a bather with respect to hot water scalds.

PIEV relates to the amount of time it takes a person to react to a hazard. **PIEV** means - **Perception, Intellection, Emotion** and **Volition**. It is usually referred to as the PIEV theory. Before we recognize and react to a hazard, four specific areas of activity need to be processed by the brain for the muscles to react. Those processes are:

1. **Perception** - We need to perceive or gain a *Perception* of a hazard. There can be delays in the perception with limitation in sight, sound, feeling, or any other of our senses.

2. **Intellection** - We go through a period called, *Intellection* or the act or process of using the intellect by thinking or reasoning. The bather must determine if the hazard is legitimate and deciding either move out of the way of the hazard or eliminate the hazard by adjusting the controls or in some cases where the bather may be sitting out of the reach of the controls the bather may choose to pull the shower curtain in front of them. If the adjustment of the controls is the choice one must decide which control to turn and try to remember which way to turn each control to adjust the temperature or turn the water off in order to eliminate the hazard. If a wrong choice is made during this process it could compound the situation by making the water even hotter. I travel a lot and I often find that shower controls can be very confusing with respect to how to adjust the controls. I still find two handle shower controls that do not meet code requirements. This is critically important when there is no temperature

limit on the shower controls. For example if the shower has a two-handle shower valve and 160 degree hot water is supplied to the system, then turning of the cold water first could lead to instant scalding injuries. Turning down the hot water to 120 F or below creates a system where it could incubate Legionella Bacteria to very high levels.

3. **Emotion** - There is an *Emotion* or evaluation factor which is defined as a conscious mental reaction (as anger or fear) subjectively experienced as strong feeling usually directed toward a specific object and typically accompanied by physiological and behavioral changes in the body with respect to deciding or assessing how we want to react. A person with reduced mental capacity or someone that is just very old will take longer to process this information and ultimately decide to react.

4. **Volition** - There is the physical *Volition* or deciding/choosing to act and acting. In the case of braking distance it is when the choice is made to move the foot from the gas pedal to the brake pedal and pressing on the brake pedal. This can be related to the time the bather chooses to adjust the control, and they move their hand to the shower control valve, plus the time to rotate or re-adjust the shower valve plus the time from the adjustment until the water temperature changes coming out of the shower head. Often it can take as much as 3-5 seconds to re-adjust the shower head and another few seconds until the water temperature changes coming out of the shower head. For ultra-low-flow (ULF) showers the delay from the time of the adjustment of the shower valve until the water temperature changes coming out of the shower head can be even longer. So burns can become more severe with ULF shower heads. This is one more area where water conservations measures can unintentionally make plumbing systems less safe.

As the temperature of the water increases this PIEV reaction time becomes more important. Using a bathtub/shower controller with a single handle would reduce the mental processing time and reduce the possibility of making an error when turning off the water. As Figure 1 shows the higher the temperatures get, the quicker the burns can occur. within seconds or less and the degree and severity of the burn can be affected by this reaction time.

As you can see by the chart in Figure 1, if the water is at 140 F it will take about 0.8 seconds for a child to receive a 2<sup>nd</sup> degree irreversible burn injury and it will take about 5.6 seconds for an adult male to receive an irreversible burn injury at 140 degrees F. Everyone else will fall somewhere in between. An adult will often find it very difficult to react to a sudden change in temperature within five (5) seconds. If the shower head is an Ultra-Low-Flow (ULF) shower head the delay can be several seconds longer before the water temperature is reduced because the mixed water temperature must evacuate or flush out the hot water in the pipe riser from the shower valve to the shower head. There is basically very little or no time to react at higher temperatures. For a typical adult that is alert and aware the PIEV theory shows it can take well over five (5) seconds to react to a sudden burst of hot water in a shower. For an elderly person or a small child that is confused it could take several minutes or more before they are able to react and adjust the controls or get out of harm's way. There has been a lot of information that suggests reducing the domestic hot water temperature to 120 F or less as it flows from the fixtures will minimize scalding and allow most people to react or get out of harm's way before a scald injury occurs.

Reducing the water temperature flowing from the fixture can be done in several ways by:

1. Reducing the hot water temperature at the fixture by adjusting the maximum temperature limit-stop on the shower valve. (The best way)

2. Using local mixing valves conforming to ASSE 1070 to reduce the hot water temperature flowing from a faucet.
3. Reducing the temperature at the source (Water Heater) with the use of a master mixing valve or temperature actuated mixing valve conforming to ASSE 1017.
4. For existing non code compliant shower or tub/shower installations, Two handle tub/shower valves without a maximum temperature limit adjustment) an ASSE 1062 valve could be used. An ASSE 1062 valve is a Temperature Actuated Flow Reduction (TAFR) valve. It looks like a chrome pipe coupling and it screws on between the shower head and the shower arm. Other models screw into a tub spout or onto a sink faucet in place of the aerator. If the water flowing from fixture exceeds about 117-120 degrees Fahrenheit the TAFR valve will shut the flow of water down to just a trickle so that scalding hot water does not spray onto the bather. It can be reset by adjusting the fixture control valve to a cold water setting and when the cold water reaches the valve it will reset and begin flowing again. This can be a bit of a nuisance in buildings where the hot water temperature is erratic, but it is an inexpensive way to provide protection against scald injuries in older buildings without code compliant shower valves.

#### **Minimum Water Temperature to Prevent Legionella Bacteria Growth**

Recently the members of the ASHRAE committee for *ASHRAE Guideline 12 - Prevention of Legionellosis Associated with Building Water Systems* recommended a change to the next edition of the guideline to require a minimum hot water temperature of 124 degrees Fahrenheit in the Hot Water Return (HWR) piping and a minimum hot water storage temperature of 130 F in circulated water heaters and a minimum of 140 F in uncirculated water heaters. This is because they have realized hot water temperatures in the ideal growth range have a lot to do with the Legionella bacteria levels on hot water systems. The new ASHRAE Guideline 12 will bring hot water system designs into alignment with what the ASPE Research Foundation's recommendations were in a white paper published in 1988. Many plumbing engineers have been following those recommendations for years. The ASPE research paper called for storing hot water at 135 to 140 degrees Fahrenheit and delivering it from the fixtures at no more than 120 degrees Fahrenheit. In the near future the ASHRAE standard titled *ASHRAE 188 - Prevention of Legionellosis Associated with Building Water Systems* which references the ASHRAE Guideline 12 will be published as an industry standard and it may even be adopted in the codes. In either case it set the industry standard for hot water system design and it will change how some hot water systems have been designed over the years. Hot water systems will now require storage temperatures high enough to prevent Legionella Bacteria Growth. So simply setting the thermostat to 120 F to prevent scalding will not be possible. (See: Figure 2 - Effects of Water Temperature on Legionella Bacteria and see: Legionella articles in December 2012 and Jan 2013 issues of Plumbing Engineer Magazine for more information and facts about Legionnaires Disease)

If you follow the new ASHRAE Standard 188 and the soon to be published guideline 12, you will find you should not use the thermostat on a water heater to simply adjust it to 120 degrees Fahrenheit to prevent scalding. This is already not allowed in the two model plumbing codes, however there are some local codes such as the State of North Carolina plumbing code that, as this writing, allow this dangerous practice. The minimum storage temperature required in a water heater will soon be 130 F for circulated heaters and 140 F for uncirculated heaters.

#### **Water Heater Thermostats**

The water temperature flowing from the fixtures should not be reduced to 120 degrees Fahrenheit by adjusting the water heater thermostat for scald prevention. The water heater thermostat should never be used to try and control the hot water system delivery temperature. The thermostat is located in the bottom of the water heater and is intended to only sense the incoming cold water and anticipate the need for hot water by turning the burner "ON" and "OFF". There are too many variables that can allow the hot water to exceed the water heater thermostat setting. Intermittent, short usage of hot water can cause the water heater burner to cycle on even when the hot water at the top of the water heater is hotter than the thermostat setting. This causes the water heater to overheat the hot water at the top of the water heater. In some cases the hot water can be as much as 30 degrees or more, higher than the thermostat setting on the water heater. This is why the thermostat on the water heater should not be used as a system temperature controller for scald prevention.

#### **Energy Conservation and Bacteria Growth on Hot Water Systems.**

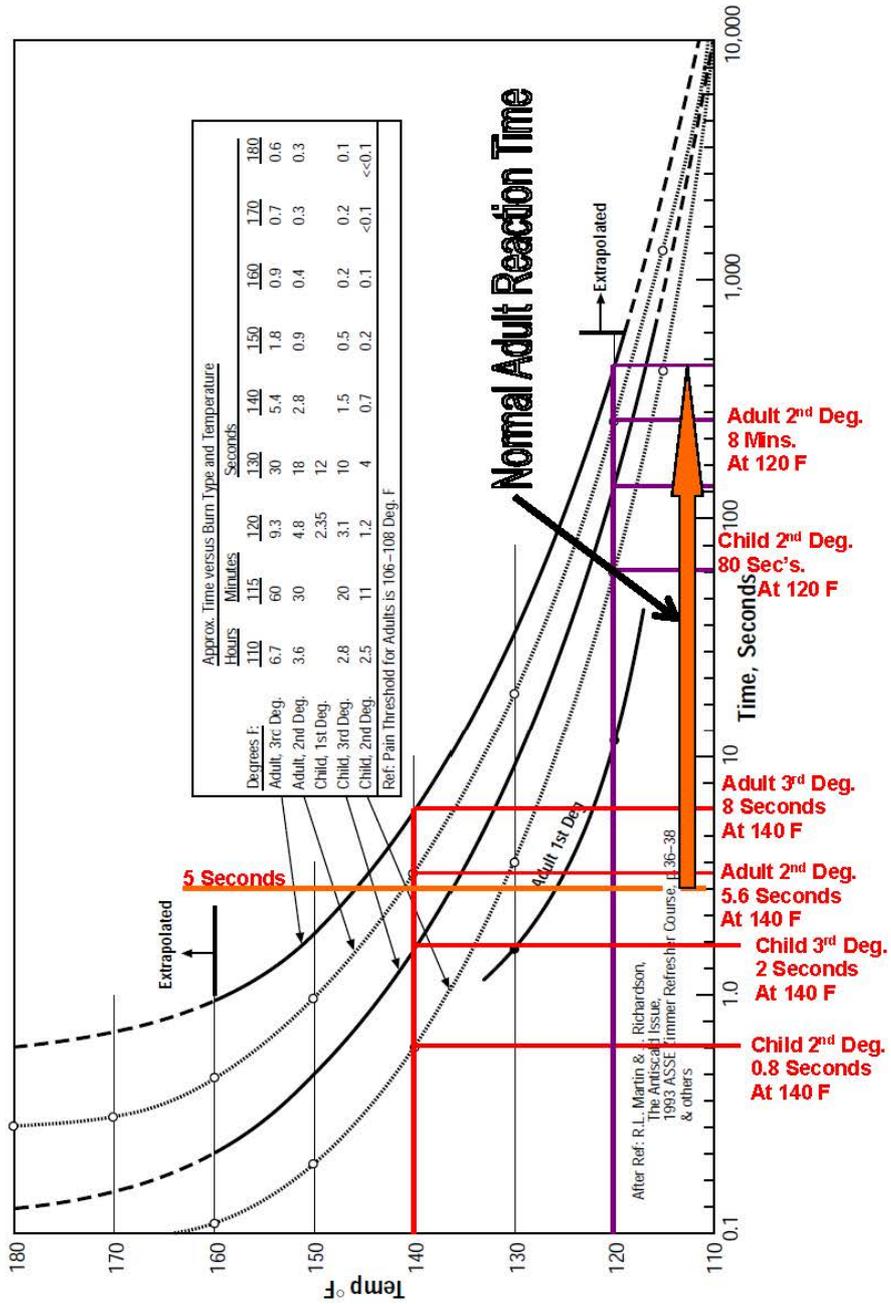

There have been numerous web sites, radio spots, print materials and other well intentioned people that suggest turning the water heater down to 120 degrees Fahrenheit to save energy and they usually discuss the added side effect of minimizing scalding. These suggestions are wrong for many reasons because the thermostat on the water heater cannot accurately control the outlet temperature of the water heater, Low storage temperatures also create a shortage of hot water, low storage temperatures can allow condensing conditions in heaters that are not designed for condensing which can lead to heat exchanger corrosion and it creates storage temperatures that are ideal for legionella bacteria growth. This is another example of energy conservation practices making a hot water system less safe. Safety should trump efficiency! There are other ways to prevent scalding without turning down the water heater thermostat. I have also heard of many healthcare facilities eliminating hot water tanks and installing instantaneous water heaters in a misguided effort to minimize Legionella bacteria growth in hot water tanks. It's not the tank it's the storage temperature. This is reaction to a problem that often creates other problems. (See Figure 2)

#### **Master Thermostatic Mixing Valves**

The ASHRAE Guideline 12 recommendations do not mandate a master thermostatic mixing valve for a hot water system. Although one could be installed to allow water temperatures to be stored at slightly higher temperatures and the hot water could be distributed at a stable temperature that assures a minimum of 124 degrees F on the hot water return prior to the hot water tank connection. These new temperature requirements will undoubtedly mean we need to have a temperature gauge on the hot water return piping, the hot water supply piping leaving the water heater and on the piping leaving a mixing valve if one is installed. By providing the temperature gauges the maintenance personnel can monitor the entire hot water distribution system so that it can be hot enough to prevent legionella bacteria growth.

It's a balancing act to try and keep from scalding someone or giving them Legionellosis. If the hot water system temperatures are maintained at a minimum of 124 F in the hot water return, no less than 130 F in a circulated storage tank and no less than 140 F in an uncirculated storage tank Legionella growth will be minimized. If temperature limit stops are utilized to keep shower and tub/shower water from exceeding 120 F the system will not present a scald hazard. Make sure your plumbing designs include the *hot water system balancing act*.

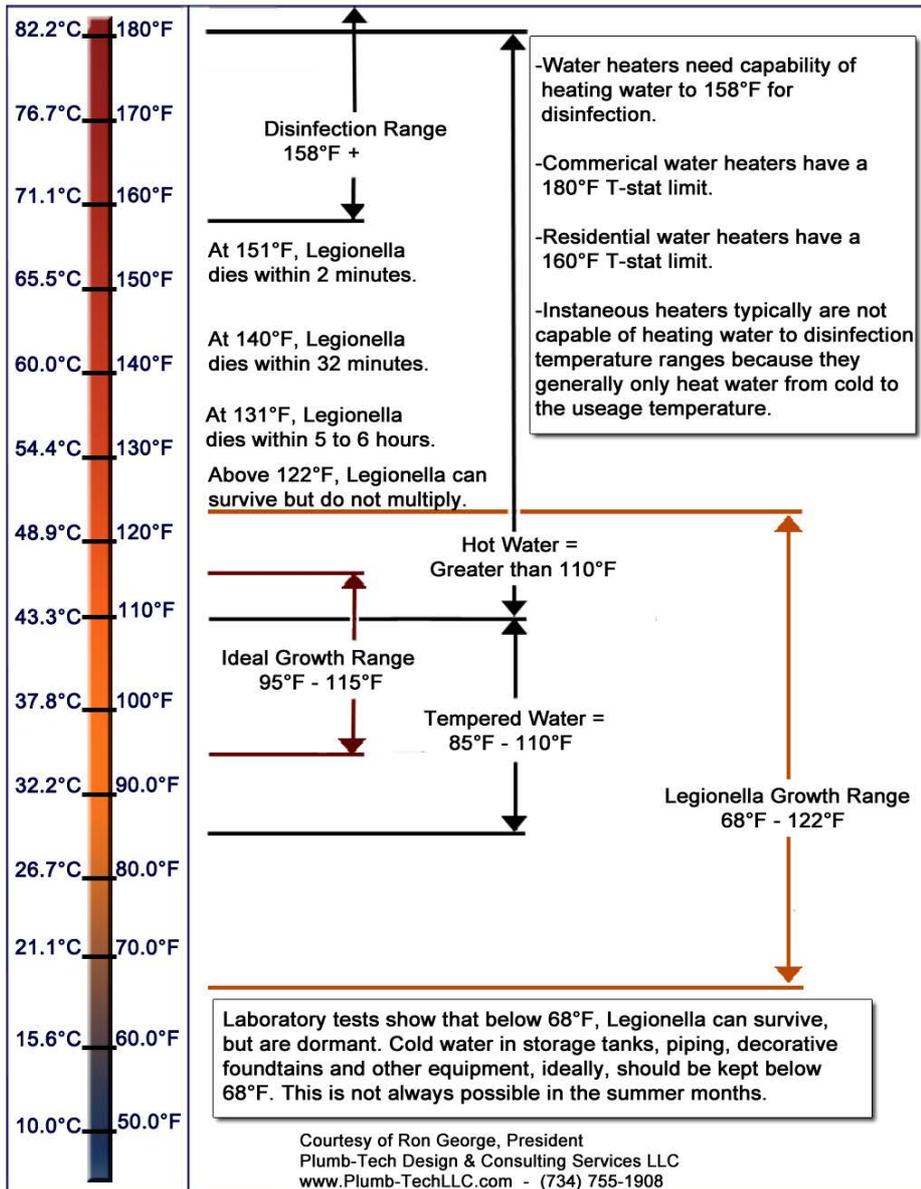

# hot water scald burns, time-temperature relations, adults & children

A Seminar and Technical Paper for the 25-28 Oct. 98 Annual ASPE Meeting at the Indianapolis Convention Center in Indianapolis, Indiana. Reprinted by Watts Regulator Company with permission of Dr. D. Bynum Jr.

**Figure 1 – Hot Water Scald Burns – Time vs Temperature Relationship for Second and Third Degree Burns for Adults and Children.**

(Notes By: Ron George, CPD, See: [www.ScaldPrevention.org](http://www.ScaldPrevention.org))

**Figure 2 – Effects of Water Temperature on Legionella Bacteria**  
(Source: www.LegionellaPrevention.org)

**Bibliography:** www.ScaldPrevention.org  
www.LegionellaPrevention.org

**Cost Impact:** Will increase the cost of construction  
This will slightly increase the cost of construction, but it will provide significant health and safety benefits of controlling Legionella and minimizing scalding by stabilizing system temperatures with a mixing valve.

**Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Ronald George, representing Self (Ron@Plumb-TechLLC.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

**2015 International Plumbing Code**

**607.6 Master Temperature Actuated Mixing Valve.** ~~All commercial water heaters shall have the ability to heat water to a temperature of not less than 180°F ( 82.2°C). The water heaters shall be designed to be operated to provide for a stored water temperature of not less than 140°F (60°C) to minimize Legionella bacteria growth. A master temperature actuated mixing valve conforming to ASSE 1017 shall be installed on the hot water discharge pipe of a- storage type water heater to stabilize the hot or steam fired instantaneous water distribution system delivery temperature at the temperature required for hot water return temperature of not less than 124°F ( 51.1°C) heater. to minimize Legionella bacteria growth.~~

**Commenter's Reason:** The language with requirements from the standard was removed. This modification is clear and easily enforceable. This code language will help provide scald protections and system temperature stability.

---

**P144-15**

# P145-15

607.6 (New), 607.7 (New)

## Proposed Change as Submitted

**Proponent :** Ronald George, Self, [www.scaldprevention.org](http://www.scaldprevention.org);  
[www.Plumb-TechLLC.com](http://www.Plumb-TechLLC.com), representing Self (Ron@Plumb-TechLLC.com)

## 2015 International Plumbing Code

**Add new text as follows:**

### **607.6 Balancing of multi-branch hot water circulating**

**systems** Where there is more than one hot water return branch in a hot water circulating system having one circulating pump, the circulating pump shall be sized to deliver the required flow and head for all branches. The required flow in gallons per minute (liters per second) to maintain the desired hot water temperature for each branch shall be calculated. Each branch shall have a balancing valve that is field-adjusted and set to the required calculated flow. A check valve shall be located downstream of each balancing valve to prevent crossflow between branches.

**607.7 Maximum velocities for hot water return piping** The water velocity in hot water return piping systems shall be limited to prevent water hammer and erosion of piping. Where the water temperature is 140°F (60°C) or less, the water velocity shall not exceed 5 feet per second (3 meters per second). Where the water temperature exceeds 140°F (60°C), the water velocity shall not exceed 2.5 feet per second (1.5 meters per second).

**Reason:** No balancing requirement is in the plumbing code. Many larger buildings are experiencing problems because balancing is not required. When balancing is not done properly the velocity in some sections of pipe can become excessive. Balancing valves have a flow adjustment that allows you to read or set the flow at each balancing valve. If the flow in GPM is known based on the balancing valve setting or the flow rate of the circulating pump can be used in smaller systems. Where the flow in GPM is known and the pipe size is known, the velocity in feet per second can easily be determined by looking at any pipe sizing chart or table.

### **Bibliography:**

[http://www.copper.org/publications/pub\\_list/pdf/copper\\_tube\\_handbook.pdf](http://www.copper.org/publications/pub_list/pdf/copper_tube_handbook.pdf)

See Page 11 of the Copper Tube Handbook for velocity limitations. These velocity limitations should apply to PEX piping systems with brass fittings also.

<http://www.pdionline.org/storage/publications/PDI-WH-201.pdf>

See the water pipe sizing chart on page 31 of the PDI WH 201 standard that is free to download. It lists the Pipe size, flow in GPM and flow Velocity in Feet Per Second.

**Cost Impact:** Will increase the cost of construction balancing has always been required for the system to operate properly, but it has never been required in the code. There will be a slight cost to balance the HW system, but now they will perform better because there never has been a requirement for balancing.

P145-15 : 607.6 (New)-  
GEORGE5595

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** Limiting the velocities in the piping to the velocity limit for copper piping is restrictive for other piping materials. Section 607.6 limits designer flexibility in system design.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Ronald George, representing Self (Ron@Plumb-TechLLC.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

#### **2015 International Plumbing Code**

##### **607.6 Balancing of multi-branch hot water circulating**

**systems** Where there is more than one hot water return branch in a hot water circulating system having one circulating pump, the circulating pump and piping shall be sized to deliver the required flow and head for all branches in accordance with ASPE, ASHRAE or other engineered recirculation system sizing methods. The required flow in gallons per minute (liters per second) to maintain the desired hot water temperature for each branch shall be calculated. Each branch shall have a balancing valve that is field-adjusted and set to the required calculated flow. A check valve shall be located downstream of each balancing valve to prevent crossflow between branches.

**Commenter's Reason:** This revision eliminates the velocity issues and it add a source for determining the proper flow rates for each branch and corresponding size based on friction losses for hot water return piping systems.

P145-15

---

# P147-15

## 608.1.1 (New)

### Proposed Change as Submitted

**Proponent :** Michael Moss, American Backflow Prevention Association, representing American Backflow Prevention Association (msmoss@utah.gov)

## 2015 International Plumbing Code

### Add new text as follows:

**608.1.1 Equipment location and installation planning.** Backflow prevention assemblies in accordance with Sections 608.13.2, 608.13.3, 608.13.5, 608.13.7 and 608.13.8 shall be located with the center of the assembly not greater than 5 feet (1524 mm) above a floor or a permanent equipment platform. Where an assembly or portions of an assembly must be located at a greater dimension above a floor or platform, a permanent equipment platform shall be provided to access the assembly, or portion thereof, that is greater than 5 feet (1524 mm) above the floor or platform. The structural design of equipment platforms shall comply with Chapter 16 of the International Building Code.

**Reason:** To ensure safe access to backflow prevention assemblies for testing, repair and maintenance, an equipment platform is required where the assembly is located higher than 5 feet off the floor. It is very difficult to work off of a ladder when attempt to test or repair a backflow prevention assembly. Having to work off a ladder is just an another obstacle that might cause someone to not do the required testing

Where access is readily and safely provided, assemblies will be tested as they need to be.

This new section is placed at the beginning of Section 608 to alert mechanical systems designers to put some thought into where to locate these backflow prevention assemblies in the first place, rather than to have their location be an after thought such that equipment platformss are needed. No one wants to work off platform so prior planning to avoid platforms is smart design.

**Cost Impact:** Will not increase the cost of construction  
Proper planned installation will not increase costs and will enhance safety.

P147-15 : 608.1.1 (New)-  
MOSS5765

---

## Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** Manufacturer's instructions for these devices already cover these requirements. Why can't a ladder be used to do some testing? Contrary to what is claimed in the cost impact statement, this proposal will increase the cost of construction.

**Assembly Action :**

**None**

## **Individual Consideration Agenda**

### ***Public Comment 1:***

**Proponent : Michael Moss, representing American Backflow Prevention Association (msmoss@utah.gov) requests Approve as Submitted.**

#### **Commenter's Reason:**

PUBLIC COMMENT to P 147-15 A backflow prevention assembly is installed because a cross connection was identified which could affect water quality. The assembly must be installed and maintained properly. Manufacturer's installation comments refer to proper piping concerns such as backpressure or continuous pressure, but only briefly mention adequate space for maintenance. Installation comments emphasize flushing of dirt and debris from the pipeline or freeze protection when used for irrigation. Most comments about adequate space are vague. This proposal provides specific installation criteria to assure the assembly can be easily reached to perform necessary annual field testing with room and proper footing to disassemble, repair or perform maintenance for the assembly. An assembly that is not easy to reach tends to have maintenance delayed or ignored which could create water quality problems. The use of a temporary ladder is conditional on its availability, sturdiness and adequate height. However, a ladder can only access one point on a vertical plane. An assembly may be several feet in a horizontal length requiring continual movement of the ladder. A ladder is not a stable work platform and is not conducive to carrying and holding various tools. It is also not an ideal location for applying torque to remove nuts, bolts and access covers and internal parts, especially if elevated. Falls from ladders are a significant concern for Workman's Compensation claims and OSHA violations. A proper location on the ground would be significantly advantageous for proper repair and maintenance. If an assembly must be installed in an elevated position, a permanent sturdy platform will ensure proper maintenance and optimal protection in the workplace.

---

**P147-15**

# P148-15

**608.1.2 (New), 608.1.2.1 (New), 608.1.2.2 (New), 608.1.2.3 (New)**

## **Proposed Change as Submitted**

**Proponent :** Michael Moss, representing American Backflow Prevention Association (msmoss@utah.gov)

### **2015 International Plumbing Code**

**Add new text as follows:**

**608.1.2 Specific installation criteria.** Backflow prevention assemblies shall be installed in accordance with Sections 608.1.2.1 through 608.1.2.3, as applicable.

**608.1.2.1 Reduced pressure principle backflow prevention assembly** The reduced pressure principle backflow prevention assembly shall be installed as follows:

1. Assemblies shall not be installed in a pit.
2. The relief valve shall not be directly connected to any waste disposal line, including sanitary sewer, storm drains or vents.
3. Assemblies shall be in a horizontal position only unless listed or approved for vertical installation in accordance with Section 303.4.
4. The bottom of each assembly shall be installed not less than 12 inches above the floor or ground.
5. The body of each assembly shall be not less than 12 inches from any walls, ceiling, or obstacle and shall be provided with access for testing, repair and maintenance.

**608.1.2.2 Double check backflow prevention assembly.** Double check backflow prevention assembly shall be installed as follows:

1. Assemblies shall be in the horizontal position except where listed or approved for vertical installation in accordance with Section 303.4.
2. The bottom of the assembly shall be not less than 12 inches above the floor or ground.
3. The body of each assembly shall be not less than 12 inches from any walls, ceilings or obstacle and shall be accessible for testing, repair and maintenance.
4. Where installed in a pit or vault, the body shall be not less than 12 inches from all sides, including the floor, roof or ceiling and shall be provided with access for testing, repair and maintenance.

**608.1.2.3 Pressure and spill-resistant vacuum breaker assemblies.** Pressure and spill-resistant vacuum breaker assemblies shall be installed as follows:

1. Not subject to a backpressure condition from downstream piping.
2. Not less than 12 inches above all downstream piping and outlets.

3. Not less than 12 inches from any wall, ceiling or obstacle and shall be provided with access for testing, repair and maintenance.
4. Not below ground, in a vault or pit.
5. In a vertical position only.

**Reason:** There is no adequate minimum installation criteria for the assemblies in Table 608.1 and inadequate guidance within the individual sections for the specific assemblies. For clarity and consistency this information is provided in these sections to assist in proper installation and inspection.

**Cost Impact:** Will not increase the cost of construction  
There is no cost impact with the added criteria of proper installation.

**P148-15 : 608.1.2 (New)-  
MOSS5671**

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** This information is already in the product standards however, there is useful information in what is presented. Use of "shall not be" is not acceptable code language. The committee prefers use of "shall be" in code language.

**Assembly Action :**

**None**

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Michael Moss, representing American Backflow Prevention Association (msmoss@utah.gov) requests Approve as Submitted.**

**Commenter's Reason:**

PUBLIC COMMENT to P 148-15 A backflow prevention assembly is installed because a cross connection was identified which could affect water quality and must be installed and maintained properly. Manufacturer's installation comments refer to proper piping concerns such as backpressure or continuous pressure but only briefly mention providing adequate space for maintenance. They emphasize flushing of dirt and debris in the pipeline or freeze protection for irrigation. Most comments about adequate space are vague. This proposal provides specific installation criteria to assure the assembly can be easily reached to perform necessary annual field testing with room provided for proper disassembly, repair or perform maintenance required. An assembly that is not easy to reach or adequate room for tools around the assembly tends to have maintenance delayed or ignored which could lead to water quality problems. Specifying a minimum space around the assembly will make it more conducive for easy use of needed tools and an easier job requiring less labor. I feel that the language of "shall not be" in the context of this requirement for section **608.1.2.1(1)** is precise and sound. However, alternate language might be "Assembly shall be installed above level ground surface to ensure there is no ponding or accumulation of liquids below it". Also, other manufacturer information would require that the proposed language for **608.1.2.3 (5)** be replaced with "The assembly shall be installed in the orientation as evaluated and approved by the third party approval agency".

### *Public Comment 2:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com) requests Approve**

as Modified by this Public Comment.

Modify as Follows:

## 2015 International Plumbing Code

**608.14 Location of backflow preventers.** Access shall be provided to backflow preventers as specified by the manufacturer's instructions and as required by this section.

**608.14.1 Outdoor enclosures for backflow prevention devices.** Outdoor enclosures for backflow prevention devices shall comply with ASSE 1060.

**608.14.2 Testable backflow preventer installation requirements.** Testable backflow preventers shall be provided with access for testing, maintenance and repair. The installation of a reduced pressure principle backflow prevention assembly shall comply with Section 608.14.2.1. The installation of a double check backflow prevention assembly shall comply with Section 608.14.2.2. The installation of pressure and spill-resistant vacuum breaker assemblies shall comply Section 608.14.2.3.

**608.14.2.1 Reduced pressure principle backflow prevention assembly.** The installation of a reduced pressure principle backflow prevention assembly shall comply with all of the following:

1. The assembly shall be located above a finished floor or above adjacent grade. The assembly shall not be located in a pit.
2. The relief port discharge of the assembly shall be indirectly connected to the sanitary drainage system or to an opening on the exterior of the building.
3. The assembly shall be oriented in a horizontal position except where the assembly is listed for use in an vertical orientation, the installed orientation shall be horizontal or vertical.
4. The lowest point of the assembly shall be not less than 12 inches (305 mm) above the finished floor or adjacent grade.
5. The assembly shall have clear space of not less than 12 inches (305 mm) to any wall, ceiling or other component.

~~**608.14.2.1 Relief port piping.** The termination of the piping from the relief port or *air gap* fitting of a backflow preventer shall discharge to an *approved* indirect waste receptor or to the outdoors where it will not cause damage or create a nuisance.~~

**608.14.2.2 Double check backflow prevention assembly** The installation of a double check backflow prevention assembly shall be in accordance with all of the following:

1. The assembly shall be oriented in a horizontal position except where the assembly is listed for use in an vertical orientation, the installed orientation shall be horizontal or vertical.
2. The lowest point of the assembly shall be not less than 12 inches (305 mm) above the finished floor or adjacent grade.
3. The assembly shall have clear space of not less than 12 inches (305 mm) to any wall, ceiling or other component.

**608.14.2.3 Pressure and spill-resistant vacuum breaker assemblies.** The installation of pressure and spill-resistant vacuum

breaker assemblies shall be in accordance with all of the following:

1. The assembly shall be in the vertical to horizontal orientation.
2. The critical level of the assembly shall be not less than the height, as specified by the assembly manufacturer, above the flood level rim. The assembly shall not be installed in a pit.
3. Piping downstream of the assembly shall be installed not higher than the outlet of the assembly.
4. The assembly shall have clear space of not less than 12 inches (305 mm) to any wall, ceiling or other obstruction.

**608.14.2 608.14.3 Protection of backflow preventers.** *No change to text.*

**~~608.1.2.1 Reduced pressure principle backflow prevention assembly~~** ~~The reduced pressure principle backflow prevention assembly shall be installed as follows:~~

- ~~1. Assemblies shall not be installed in a pit.~~
- ~~2. The relief valve shall not be directly connected to any waste disposal line, including sanitary sewer, storm drains or vents.~~
- ~~3. Assemblies shall be in a horizontal position only unless listed or approved for vertical installation in accordance with Section 303.4.~~
- ~~4. The bottom of each assembly shall be installed not less than 12 inches above the floor or ground.~~
- ~~5. The body of each assembly shall be not less than 12 inches from any walls, ceiling, or obstacle and shall be provided with access for testing, repair and maintenance.~~

**~~608.1.2.2 Double check backflow prevention assembly.~~** ~~Double check backflow prevention assembly shall be installed as follows:~~

- ~~1. Assemblies shall be in the horizontal position except where listed or approved for vertical installation in accordance with Section 303.4.~~
- ~~2. The bottom of the assembly shall be not less than 12 inches above the floor or ground.~~
- ~~3. The body of each assembly shall be not less than 12 inches from any walls, ceilings or obstacle and shall be accessible for testing, repair and maintenance.~~
- ~~4. Where installed in a pit or vault, the body shall be not less than 12 inches from all sides, including the floor, roof or ceiling and shall be provided with access for testing, repair and maintenance.~~

**~~608.1.2.3 Pressure and spill-resistant vacuum breaker assemblies.~~** ~~Pressure and spill resistant vacuum breaker assemblies shall be installed as follows:~~

- ~~1. Not subject to a backpressure condition from downstream piping.~~
- ~~2. Not less than 12 inches above all downstream piping and outlets.~~
- ~~3. Not less than 12 inches from any wall, ceiling or obstacle and shall be provided with access for testing, repair and maintenance.~~
- ~~4. Not below ground, in a vault or pit.~~
- ~~5. In a vertical position only.~~

~~**608.1.2 Specific installation criteria.** Backflow prevention assemblies shall be installed in accordance with Sections 608.1.2.1 through 608.1.2.3, as applicable.~~

**Commenter's Reason:** This change contained a lot of useful information. However, it was located in the incorrect section and the wording needed to be modified. The correct location is Section 608.14. The language has been modified to be consistent with the language in the IPC. The requirements have also been coordinated with the current requirements. Section 608.14 needs to reference the provision in this modified section. Section 608.14.2.1 needs to be deleted since the requirements are addressed in the new text.

---

**P148-15**

# P150-15 Part II

## P2903.9.5

### **Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

**NOTE:** PART I DID NOT RECEIVE A PUBLIC COMMENT AND IS ON THE CONSENT AGENDA. PART I IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY FOLLOWING ALL OF PART II.

## **2015 International Residential Code**

**Revise as follows:**

**P2903.9.5 Valves and outlets prohibited below grade.** Potable water outlets and combination stop-and-waste valves shall not be installed underground or below grade. ~~Freezeproof~~ A freezeproof yard hydrants hydrant that drain drains the riser into the ground ~~are shall be~~ considered ~~to be~~ as having a stop-and-waste valves valve below grade.

~~**Exception:** Installation of freezeproof~~ Freezeproof yard hydrants that drain the riser into the ground shall be permitted if to be installed provided that the potable water supply to such hydrants is protected upstream of in accordance with Section P2902.3.5 or P2902.3.4 and the hydrants and the piping from the backflow preventer to the hydrants are identified in accordance with Section P2902 and the hydrants are permanently identified as nonpotable outlets by approved signage that reads as follows: "Caution, Nonpotable Water P2901.2. Do Not Drink."

**Reason:** There is no way to know what type of health hazard the stop and waste opening of a yard hydrant will be exposed to. The contaminants could include lawn fertilizer, animal wastes, garden fertilizer or septic tank effluent. This application is not any different than an irrigation system having at/below grade sprinkler heads. See Section P2902.5.3. The code requires either a pressure vacuum breaker assembly or a backflow prevention assembly for that application. (For a valve downstream of the backflow preventer, an atmospheric vacuum breaker will not work). But the code currently lacks coverage for what type of backflow protection is necessary for yard hydrant applications. For the code officials who do give this yard hydrant application some thought, many simply choose a dual check valve which is only suitable for low hazard conditions. And there is no way to field verify that this type of backflow device is operational. This is a high hazard application just like an irrigation system and the potable water supply of the building should be protected accordingly. Improper backflow protection for connection of these frost proof yard hydrants to the building water distribution system is an accident waiting to happen.

Keep in mind that where a yard hydrant is needed, a sanitary type yard hydrant (one that does not drain the riser into the ground) can be provided, probably at a lower cost than requiring a backflow prevention assembly for the more inexpensive, riser drain-to-the-ground type yard hydrant. Where only one yard hydrant is installed, a sanitary yard hydrant will probably be an easier selection. Where multiple yard hydrants are on a lot, a dedicated yard hydrant line for all yard hydrants with one backflow prevention assembly to serve all hydrant might be easier.

The signage and marking requirements were removed as the indicated section was updated in the last code cycle to more adequately cover the topic. There is no need

to duplicate requirements in the code.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 148.

**Cost Impact:** Will increase the cost of construction

This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. Specifically, where code officials were not requiring the correct backflow preventer for these applications, there will be a higher cost for the correct backflow preventer plus added labor and materials for either placing the required backflow prevention assembly in a place where leakage (when failure of the device occurs) or for providing a drain for the assembly for when leakage happens (when failure of the device occurs).

**P150-15 Part II :  
P2903.9.5-SNYDER5930**

---

## **Public Hearing Results**

### **Part II**

**Committee Action:**

**Disapproved**

**Committee Reason:** Yard hydrants can have a vacuum breaker on the outlet or a backflow preventer supplying the hydrant. These requirements are already covered by Section P2902.

**Assembly Motion:**

**As Submitted**

**Online Vote Results:**

**Successful**

Support: 52.35% (78) Oppose: 47.65% (71)

**Assembly Action :**

**Approved as Submitted**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Assembly Action**

**requests Approve as Submitted.**

**Commenter's Reason:** This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. The assembly action for Approve as Submitted was successful by a vote of 52.35% (78) to 47.65% (71) by eligible members online during the period of May 14 - May 28, 2015.

**P150-15 Part II**

## **P150-15 Part I**

### **608.7**

#### **Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

### **2015 International Plumbing Code**

#### **Revise as follows:**

**608.7 Valves and outlets prohibited below grade.** Potable water outlets and combination stop-and-waste valves shall not be installed underground or below grade. ~~Freezeproof~~ A freezeproof yard hydrants hydrant that drain drains the riser into the ground ~~are~~ shall be considered ~~to be~~ as having a stop-and-waste valves valve below grade.

**Exception:** Freezeproof yard hydrants that drain the riser into the ground shall be permitted to be installed, provided that the potable water supply to such hydrants is protected ~~upstream of~~ in accordance with Section 608.13.2 or 608.13.5 and the hydrants and the piping from the backflow preventer to the hydrant are identified in accordance with Section ~~608 and the hydrants are permanently identified as nonpotable outlets by approved signage that reads as follows: "Caution, Nonpotable Water 608.8. Do Not Drink."~~

**Reason:** There is no way to know what type of health hazard the stop and waste opening of a yard hydrant will be exposed to. The contaminants could include lawn fertilizer, animal wastes, garden fertilizer or septic tank effluent. This application is not any different than an irrigation system having at/below grade sprinkler heads. See Section 608.16.5. The code requires either a pressure vacuum breaker assembly or a backflow prevention assembly for that application. (For a valve downstream of the backflow preventer, an atmospheric vacuum breaker will not work). But the code currently lacks coverage for what type of backflow protection is necessary for yard hydrant applications. For the code officials who do give this yard hydrant application some thought, many simply choose a dual check valve which is only suitable for low hazard conditions. And there is no way to field verify that this type of backflow device is operational. This is a high hazard application just like an irrigation system and the potable water supply of the building should be protected accordingly. Improper backflow protection for connection of these frost proof yard hydrants to the building water distribution system is an accident waiting to happen.

Keep in mind that where a yard hydrant is needed, a sanitary type yard hydrant (one that does not drain the riser into the ground) can be provided, probably at a lower cost than requiring a backflow prevention assembly for the more inexpensive, riser drain-to-the-ground type yard hydrant. Where only one yard hydrant is installed, a sanitary yard hydrant will probably be an easier selection. Where multiple yard hydrants are on a lot, a dedicated yard hydrant line for all yard hydrants with one backflow prevention assembly to serve all hydrant might be easier.

The signage and marking requirements were removed as the indicated section was updated in the last code cycle to more adequately cover the topic. There is no need to duplicate requirements in the code.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 148.

**Cost Impact:** Will increase the cost of construction

This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. Specifically, where code officials were not requiring the correct backflow preventer for these applications, there will be a higher cost for the correct backflow preventer plus added labor and materials for either placing the required backflow prevention assembly in a place where leakage (when failure of the device occurs) or for providing a drain for the assembly for when leakage happens (when failure of the device occurs).

## **Public Hearing Results**

### **Part I**

**Committee Action:**

**Approved as Submitted**

**Committee Reason:** The current text was unclear about sanitary yard hydrants so this text is better.

**Assembly Action :**

**None**

---

# P156-15

**608.13.6, 608.13.6.1 (New), 608.13.6.2 (New),  
608.13.6.3 (New)**

## **Proposed Change as Submitted**

**Proponent :** Michael Moss, American Backflow Prevention Association, representing American Backflow Prevention Association (msmoss@utah.gov)

## **2015 International Plumbing Code**

**Revise as follows:**

**608.13.6 Atmospheric-type vacuum breakers.** ~~Pipe applied atmospheric-type vacuum~~ Vacuum breakers shall conform to ~~ASSE 1001 or CSA B64.1.1~~ be in accordance with Sections 608.13.6.1 and 608.13.6.2. ~~Hose connection vacuum breakers~~ Laboratory faucet backflow preventers shall conform to ~~ASME A112.21.3, ASSE 1011, ASSE 1019, ASSE 1035, ASSE 1052, CSA B64.2, CSA B64.2.1, CSA B64.2.1.1, CSA B64.2.2 or CSA B64.7.~~ These devices shall operate under normal atmospheric pressure when the critical level is installed at the required height. be in accordance with Section 608.13.6.3.

**Add new text as follows:**

**608.13.6.1 Pipe-applied vacuum breakers** Pipe-applied atmospheric-type vacuum breakers shall conform to ASSE 1001 or CSA B64.1.1. These vacuum breakers shall be considered capable of functioning only where the downstream piping is open to the atmosphere and is located not less than 6 inches above all downstream piping and outlets.

**608.13.6.2 Hose-connection vacuum breakers.** Hose connection vacuum breakers shall conform to ASME A112.21.3, ASSE 1011, ASSE 1019, ASSE 1035, ASSE 1052, CSA B64.2, CSA B64.2.1, CSA B64.2.2 or CSA B64.7. These vacuum breakers shall be considered capable of functioning only where the downstream hose is open to the atmosphere and the open end of the hose is not greater than 10 feet (3048 mm) above the elevation of the vacuum breaker.

**608.13.6.3 Laboratory faucet backflow preventers** Laboratory faucet backflow preventers shall conform to ASSE 1035 or CSA B64.7. These backflow preventers shall be considered capable of functioning only where the downstream hose is open to the atmosphere and the open end of the hose is not greater than 10 feet (3048 mm) above the elevation of the backflow preventer.

**Reason:** Existing Section 608.13.6 has requirements for three (3) different vacuum breakers with multiple standards. The statement "These devices shall operate under normal atmospheric pressure when the critical level is installed at the required height." does not provide adequate and necessary guidance for installation and inspection. The section was divided to ensure proper and clear installation and inspection conditions for each device.

**Cost Impact:** Will not increase the cost of construction  
Proper installation and identification will not increase cost.

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** One standard CSA B64.2.1.1 was left out of the list of standards. A public comment to fix this problem should be made to fix the error.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Michael Moss, representing American Backflow Prevention Association (msmoss@utah.gov) requests Approve as Submitted.**

**Commenter's Reason:**

PUBLIC COMMENT to P 156-15 The intent of this proposal is to provide specific direction to those who use the code for the installation of these devices. In the process, there may have been inadvertent errors and omissions for specific standard references. The proposed language for 608.13.2 should include CSA B64.2.1.1.

---

**P156-15**

# P157-15

608.13.7, 608.13.10

## Proposed Change as Submitted

**Proponent :** Michael Moss, American Backflow Prevention Association, representing American Backflow Prevention Association (msmoss@utah.gov)

### 2015 International Plumbing Code

**Revise as follows:**

**608.13.7 Double check backflow prevention assemblies.** Double check backflow prevention assemblies shall conform to ASSE 1015, CSA B64.5, CSA B64.5.1 or AWWA C510. Double check detector fire protection backflow prevention assemblies shall conform to ASSE 1048. These assemblies shall be considered to be capable of operating functioning under continuous any downstream pressure conditions condition whether continuous or intermittent.

**608.13.10 Dual check valve type backflow preventer.** Dual check valve-type backflow preventers shall conform to ASSE 1024 or CSA B64.6. These backflow preventers shall be considered to be capable of functioning under any downstream pressure condition whether continuous or intermittent.

**Reason:** In Section 608.13.7 the deleted language is more of a device design statement than a required condition of service for proper operation of the device. The added language conveys permissible downstream operating conditions. This is much clearer language for installation and inspection. Section 608.13.10 has been modified to properly identify this device in accordance with the ASSE naming convention and Table 608.1. The added language conveys the permissible downstream operating conditions. This is much clearer language for installation and inspection.

**Cost Impact:** Will not increase the cost of construction  
There is not any cost involved with the clarification of this section.

P157-15 : 608.13.7-  
MOSS5774

---

## Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** There is a concern that these backflow preventer will not work in conjunction with fire pumps.

**Assembly Action :**

**None**

---

## Individual Consideration Agenda

*Public Comment 1:*

**Proponent : Michael Moss, representing American Backflow Prevention Association (msmoss@utah.gov) requests Approve as Submitted.**

**Commenter's Reason:**

PUBLIC COMMENT to P 157-15 The intent of this proposal for 608.13.7 is to clarify that these assemblies are presently installed and function in fire sprinkler systems. Pressures are limited by the testing of the approval agency. Therefore the installation, specifically that with pumps to boost pressure, require the attention of the design professionals to ensure safety of operation. Proposed language of section 608.13.10 is intended to provide clear language for installation and inspection.

## Proposed Change as Submitted

**Proponent :** Michael Moss, American Backflow Prevention Association, representing American Backflow Prevention Association (msmoss@utah.gov)

### 2015 International Plumbing Code

**Delete without substitution:**

~~**608.13.9 Chemical dispenser backflow devices.** Backflow devices for chemical dispensers shall comply with ASSE 1055 or shall be equipped with an air gap fitting.~~

**Revise as follows:**

**608.16.7 Chemical dispensers.** Where chemical dispensers connect to the potable water distribution system, the water supply system shall be protected against backflow in accordance with Section 608.13.1, 608.13.2, 608.13.5, 608.13.6, ~~608.13.8 or 608.13.9~~ 608.13.8. The chemical dispenser unit shall connect to a dedicated water supply connection separate from any sink faucet outlet.

**Exception:** For chemical dispenser units listed to act as an air gap fitting because backflow protection is installed within the unit, an external means of protection shall not be required.

**Reason:** Section 608.13.9 is incorrectly located and confused with the various types of backflow preventers of Section 608.13 which is specific to the types of backflow preventers, their standards and suitability to certain conditions. Table 608.1 aligns with those. Chemical dispensers already specify the backflow requirements in Section 608.16.7

**Cost Impact:** Will not increase the cost of construction  
There is no addition cost for the proper use and installation

P158-15 : 608.13.9-  
MOSS5775

---

## Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** Why was ASSE 1055 removed from this section? No one could answer this question.

**Assembly Action :**

**None**

---

## Individual Consideration Agenda

*Public Comment 1:*

**Proponent : Michael Moss, representing American Backflow Prevention Association (msmoss@utah.gov) requests Approve as**

## **Submitted.**

### **Commenter's Reason:**

PUBLIC COMMENT to P 158-15 The language for this proposal is to clarify backflow protection requirements for chemical dispenser equipment. It does not remove standard ASSE 1055, it specifies when additional protection is required. This language also ensures a proper installation by specifying a separate dedicated connection. This installation does not compromise existing approved installed equipment. Where chemical dispenser equipment meets the existing standard of code protection there is no additional protection required.

---

**P158-15**

# P162-15 Part I

608.16.11 (New), 801.1, 801.2, 802.1

## Proposed Change as Submitted

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

### 2015 International Plumbing Code

**Add new text as follows:**

**608.16.11 Humidifiers.** The water supply connection to humidifiers shall be protected against backflow by a backflow preventer conforming to ASSE 1012 or by an *air gap*.

**Revise as follows:**

**801.1 Scope.** This chapter shall govern matters concerning indirect waste piping and special wastes. This chapter shall further control matters concerning food-handling establishments, sterilizers, humidifiers, clear-water waste, swimming pools, methods of providing *air breaks* or *air gaps*, and neutralizing devices for corrosive wastes.

**801.2 Protection.** Devices, appurtenances, appliances and apparatus intended to serve some special function, such as sterilization, humidification, distillation, processing, cooling, or storage of ice or foods, and that discharge to the drainage system, shall be provided with protection against backflow, flooding, fouling, contamination and stoppage of the drain.

**802.1 Where required.** Food-handling equipment, in other than dwelling units, clear-water waste, humidifiers, dishwashing machines and utensils, pots, pans and dishwashing sinks shall discharge through an indirect waste pipe as specified in Sections 802.1.1 through 802.1.8. Health-care related fixtures, devices and equipment shall discharge to the drainage system through an indirect waste pipe by means of an *air gap* in accordance with this chapter and Section 713.3. Fixtures not required by this section to be indirectly connected shall be directly connected to the plumbing system in accordance with Chapter 7.

**Reason:** Most humidifier manufacturer installation instructions only say to make potable water connections in accordance with local codes. The codes are silent on the protection of the water supply connection to humidifiers. Humidifiers, if not regularly serviced, can be a source of contamination to the connected water supply. The inspector has no way of knowing whether such pieces of equipment have internal backflow protection. This simple addition to the codes will clarify the humidifiers need to have a backflow device just like other similar pieces of equipment in the list of items.

Humidifiers have overflows that drain excess water. Improper (direct) connection of the overflow tube could cause a contamination to occur inside of the humidifier which could result in contamination being carried into the airstream of the equipment that the humidifier is attached to. The requirement for an air gap connection at the termination of this discharge tube will prevent this possible contamination from occurring.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International

Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 177.

**Cost Impact:** Will increase the cost of construction

This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. Specifically, there will be the added cost of a backflow preventer and the installation labor.

# P162-15 Part II

P2725 (New), P2726.1 (New), P2902.6 (New)

## Proposed Change as Submitted

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

2015 International Residential Code

**Add new text as follows:**

### **SECTION P2725** **HUMIDIFIER DISCHARGE**

**P2726.1 Overflow pipe from humidifier.** The overflow pipe from a humidifier shall terminate at an air gap before discharging water to the point of disposal.

**P2902.6 Humidifiers.** The water supply connection to humidifiers shall be protected against backflow by a backflow preventer conforming to ASSE 1012 or by an air gap.

**Reason:** Most humidifier manufacturer installation instructions only say to make potable water connections in accordance with local codes. The codes are silent on the protection of the water supply connection to humidifiers. Humidifiers, if not regularly serviced, can be a source of contamination to the connected water supply. The inspector has no way of knowing whether such pieces of equipment have internal backflow protection. This simple addition to the codes will clarify the humidifiers need to have a backflow device just like other similar pieces of equipment in the list of items.

Humidifiers have overflows that drain excess water. Improper (direct) connection of the overflow tube could cause a contamination to occur inside of the humidifier which could result in contamination being carried into the airstream of the equipment that the humidifier is attached to. The requirement for an air gap connection at the termination of this discharge tube will prevent this possible contamination from occurring.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 177.

**Cost Impact:** Will increase the cost of construction

This proposal will increase the cost of construction because additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code. Specifically, there will be the added cost of a backflow preventer and the installation labor.

P162-15 Part II : P2725 (New)-  
SNYDER5926

---

## **Public Hearing Results**

### **Part II**

**Committee Action:**

**Disapproved**

**Committee Reason:** The language needs a little work. In the first section, "at an air gap" should be "through an air gap". Is it the overflow in the humidifier that needs the air gap or is an air gap needed for the water supply to the humidifier?

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

**Public Comment 1:**

Proponent : **Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com)** requests Approve as Modified by this Public Comment.

**Modify as Follows:**

2015 International Residential Code

**P2902.6 Humidifiers.** The water supply connection to humidifiers that do not have internal backflow protection shall be protected against backflow by a backflow preventer conforming to ASSE 1012 or CSA B64.3, or by an air gap.

**P2726.1 Overflow pipe from humidifier.** The overflow pipe from a humidifier shall terminate at an air gap break before discharging water to the point of disposal.

**Commenter's Reason:** These modification are consistent with the modifications proposed to Part 1. Additionally, the discharge from a humidifier is through an air break, not an air gap. The water supply is protected against backflow, hence, the discharge is non-potable water. The code allows non-potable water to discharge through an air break.

*Public Comment 2:*

Proponent : **Janine Snyder, representing Plumbing, Mechanical and Fuel Gas Code Committee (PMGCAC@iccsafe.org)** requests Approve as Modified by this Public Comment.

**Modify as Follows:**

2015 International Residential Code

**P2726.1 Overflow pipe from humidifier.** The overflow pipe from a humidifier shall ~~terminate at~~ discharge through an air break or an air gap ~~before discharging water to the point of disposal.~~

**Commenter's Reason:** The Committee's confusion was understood and the requested modification resolves that confusion. "Air break" was added because the small humidifiers installed for residential HVAC systems are commonly installed in this manner. Typically, the tubing is inserted into a standpipe or a hole is cut in a floor drain cover with the tube inserted into the hole to keep it in the drain. Both arrangements would be considered an air break. There have not been any problems with this practice. Requiring only an air gap at a drain termination point is often difficult to accomplish because of the problems for making sure that the tube stays in place and does not get knocked out of place to end up causing water damage. There is no need to complicate these installations.

Leaving the option for air gap in this section is necessary for where the discharge goes to the outdoors. Some rewording was necessary to make the intent clear. In an outdoor discharge arrangement, the term "air break" makes no sense so the text was revised to make this section read correctly.

P162-15 Part II

# P167-15

701.8

## **Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

### **2015 International Plumbing Code**

**Delete without substitution:**

~~**701.8 Drainage piping in food service areas.** Exposed soil or waste piping shall not be installed above any working, storage or eating surfaces in food service establishments.~~

**Reason:** Questions about this section have been coming up more frequently concerning the necessity of this requirement and the intent of the section. Does this section mean that soil and waste piping cannot be above the indicated areas regardless of whether a "ceiling" is between the piping and those areas? Or is this section requiring that a ceiling be installed and if so, what type of ceiling (lay-panel/grid work or gypsum board on framing)? Or is this section requiring custom-made "drip pans" under all soil and waste piping (whether there is a ceiling between the piping and the surfaces below or not)?

This section is vague and should be removed from the code. Here's why:

There seems to be the implication that soil and waste piping joints will always leak even though the piping is installed in accordance with the code and is pressure tested in the presence of a code official. If there really is a significant problem with joints failing, then that is an issue to be solved elsewhere. What about ductwork, sprinkler piping and even penetrations through a floor above that can leak "contaminated water" that can drop down to the surfaces below? What about condensation on the outside of cool surfaces that carry years of dirt off of surfaces. Why is there not a similar restriction against the installation of ductwork, sprinkler piping and penetrations above these areas?

If the assumption is made that a ceiling below the piping is what is required, why does a ceiling make the situation any more acceptable? Lay-in panel/grid ceiling systems can "leak" water without ever showing any damage to ceiling panels (think of the lighting troffers). Would we not be just as concerned about leakage in a space above a ceiling that served as an air plenum for a HVAC system?

A recent popular building design practice for restaurants is to not have a "ceiling" over the eating surfaces such as tables or bars. The "ceiling" in these areas is the bottom of the roof deck or the floor above. All the support structure, ductwork, sprinkler piping, other piping and associated hardware is exposed; typically all painted a uniform dark color.

Where the floor above the eating surfaces has plumbing fixtures, there will necessarily be soil and waste piping below the floor and in the open ceiling area just described. If the code intends for "drip pans" to be installed under the piping, then what should the drip pans be made of? Should those pans slope to a drain point? If so, where should the discharge of the drip pans be routed to? Is it acceptable to have the drip pans catching leaks for years and, unbeknownst to the owner, allowing a build-up of a festering mess of bacteria that is open to the moving ventilation air in the space?

A reading of the latest Food Code by the FDA, did not reveal any prohibitions for soil and waste piping above the surfaces indicated in this section. However, the Food

Code does make a big deal about the "clean ability" of surfaces above food prep areas (but not above eating surfaces). Obviously, pipes and pipe hangers as well as most structural and ductwork surfaces would be difficult to clean. The local health departments enforcing their version of the Food Code will most likely demand ceilings in the food prep area even though the code (the IBC) does not have such a requirement.

Perhaps what needs to happen is that a proposal to the IBC be made to indicate that ceilings (and what type) are required above food preparation areas with the justification that the Food Code has concerns about "clean ability" of items that would be exposed if the ceiling was not there. That seems more logical than possibly what IPC Section 701.8 is trying to imply.

The PMGCAC did not feel that it was within their scope to make or suggest an IBC proposal for ceilings in restaurants. However, if such a proposal was made and was successful, it would be appropriate to make a proposal to the IPC that would prohibit the installation of any type of piping below a ceiling required by IBC Section 123.4 (whatever the IBC section number would end up being). Until then, this IPC Section 701.8 should simply be removed.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 137.

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P167-15 : 701.8-  
SNYDER4019

---

## **Public Hearing Results**

**Committee Action:**

**Approved as Submitted**

**Committee Reason:** The committee agreed with the proponent's published reason statement. Ceilings for these areas should be addressed in the IBC.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Michael Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservices.com) requests Disapprove.**

**Commenter's Reason:** Why would you want pipes over food areas? Even with perfect joints, condensation is still possible.

# P169-15

## Table 702.1, Table 702.2, Table 702.3, 705.12 (New)

### Proposed Change as Submitted

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

## 2015 International Plumbing Code

**Revise as follows:**

**TABLE 702.1  
ABOVE-GROUND DRAINAGE AND VENT PIPE**

<b>MATERIAL</b>	<b>STANDARD</b>
<u>Ductile iron</u>	<u>AWWA C115/A21.15,</u> <u>AWWA C151/A21.51</u>

(Portions of table not shown remain unchanged)

**TABLE 702.2  
UNDERGROUND BUILDING DRAINAGE AND VENT PIPE**

<b>MATERIAL</b>	<b>STANDARD</b>
<u>Ductile iron</u>	<u>AWWA C115/A21.15,</u> <u>AWWA C151/A21.51</u>

(Portions of table not shown remain unchanged)

**TABLE 702.3  
BUILDING SEWER PIPE**

<b>MATERIAL</b>	<b>STANDARD</b>
<u>Ductile iron</u>	<u>AWWA C115/A21.15,</u> <u>AWWA C151/A21.51</u>

(Portions of table not shown remain unchanged)

Add new text as follows:

**705.12 Ductile iron.** Joints between ductile iron pipe sections, or between ductile iron pipe and ductile or gray iron fittings shall be mechanical joints

installed in accordance with the manufacturer's instructions.

**Reason:** Tables 702.1, 702.2, 702.3 are each missing a ductile iron pipe material entry even though the pipe fitting Table 702.4 includes ductile iron fittings. That in itself is a coordination problem. Why would the pipe fittings be included in the code but not the pipe? Over the years, there have been a few designers asking about what this is because they want to use ductile iron for sanitary drainage service. Although more costly than most other drainage pipe materials, there are good reasons for that material choice for special circumstances both inside and outside of a building. This material might be used where support spacing is desired to be much wider than the code allows (Table 308.5). Or burial in expansive soils creates significant stresses for the piping that other pipe materials don't have the strength to withstand.

Ductile iron piping is frequently used by utilities for wastewater service. The standards for ductile iron piping are already in the code because the same standards apply to ductile iron water piping. However, for water service, the piping is required (by this code) to have cement mortar lining to reduce rust coloring of potable water. Ductile iron for wastewater service does not need a lining.

The new section simply covers how the joints are to be made between fittings and the piping.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC). The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 52.

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P169-15 : T702.1-  
SNYDER4020

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** Sanitary drainage pattern fittings are not available for this product except for wyes. Typically, flanged fittings are used above ground and mechanical fittings are used below ground.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

**Public Comment 1:**

**Proponent : Janine Snyder, representing Plumbing, Mechanical and Fuel Gas Code Committee (PMGCAC@iccsafe.org) requests Approve as Submitted.**

**Commenter's Reason:** The Committee's reason is true statement about ductile iron *fittings* and where certain types should and shouldn't be used. It is also true a true statement that ductile iron fittings are not available in a wide selection of drainage patterns.

But this proposal has nothing to do with putting ductile iron fittings in the code. Gray iron/ ductile iron fittings have been in the fittings table of the code (Table 702.4) for many, many editions. *This proposal* is only about adding ductile iron pipe standards to the sanitary drainage pipe tables of the code to "match" those fittings. What purpose is served by having the ductile (and gray iron) fittings in the fittings table if the pipe tables do not have the corresponding ductile iron pipe that is used with those fittings?

There are applications where ductile iron pipe is used in sanitary drainage piping systems to avoid potential problems in some applications. There is not a question about whether ductile iron piping is suitable for waste water service. Millions of miles of ductile iron piping are installed in municipal (utility) sewer systems because of its durability and strength. This proposal does not attempt to provide justification for use of this type of piping for wastewater service....that is wide-spread general knowledge and well-documented by many studies and white papers in the utility services industry. *And ductile iron fittings are already in the IPC!*

There have been instances where "hard line" inspectors refuse to consider accepting ductile iron pipe as an alternative material under Section 105.2. "If it is not written in the code, then I can't accept it." This has created quite a stir on more than one project and makes no sense that this material would not be acceptable given that the *fittings for this pipe are already in the IPC!*

This proposal needs approval to resolve a long-standing "disconnect" in the code.

---

**P169-15**

# P175-15

702.5

## Proposed Change as Submitted

**Proponent :** Michael Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservices.com)

### 2015 International Plumbing Code

**Revise as follows:**

**702.5 Temperature rating.** Where the waste water temperature will be greater than 140°F (60°C), the sanitary drainage piping material shall be ~~rated~~ recommended for such service by the pipe and fitting manufacturers for the highest temperature of the waste water.

**Reason:** Non-pressure DWV piping materials are not "rated" as pressure piping is - rating is a combination temperature and pressure issue.

**Cost Impact:** Will not increase the cost of construction  
This proposal is only modifying and correcting language and does not impact costs. Thus the code with this proposal added will not cause the cost of construction to increase.

P175-15 : 702.5-  
CUDAHY4926

---

## Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** The term "recommended" is weak code language. The use of pipe and fittings for higher temperature service should be approved by the manufacturer,

**Assembly Action :**

**None**

---

## Individual Consideration Agenda

*Public Comment 1:*

**Proponent :** Michael Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservices.com) requests **Approve as Submitted.**

**Commenter's Reason:** "Approved" is a term reserved for the code official, not the manufacturer. We recommend our original language, "recommended". Non-pressure pipe is not rated.

P175-15

# P178-15 Part I

## 704.2

### **Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

## **2015 International Plumbing Code**

**Revise as follows:**

**704.2 Change No reduction in size in the direction of flow.** The size of the drainage piping shall not be reduced in size in the direction of the flow. The following shall not be considered a reduction in size in the direction of flow.

1. A 4-inch by 3-inch (102 mm by 76 mm) water closet ~~connection~~ shall flange.
2. A water closet bend fitting having a 4-inch (102 mm) inlet and a 3-inch (76 mm) outlet provided that the 4 inch leg of the fitting is upright and below, but not be considered as a reduction in size. necessarily directly connected to, the water closet flange.
3. An approved offset closet flange.

**Reason:** This section begs for clarification especially since 4 x 3 closet bends (elbows) and offset closet flanges are frequently being used in current day construction. Item 1 is not any change to what was stated before.

Item 2- Four x 3 closet bends were commonly used many decades ago when these bends were made of lead. The item is carefully worded to make the intent clear that the bend is to be installed in the upright orientation (and not horizontally). Also, the wording indicates that the bend is not required to be directly connected to closet flange - there can be a vertical section of pipe between the upright bend and the closet flange.

Item 3-Offset closet flanges have been used for decades. Some jurisdictions are reluctant to allow any offset closet flanges because the code doesn't outright discuss the use offset flanges (nor does it prohibit them). Because some offset closet flanges are especially "restrictive looking", code officials didn't want to start allowing some types and not other types. This section is often cited as the basis for disapproving the use of all offset flanges. However, that doesn't seem completely appropriate as some offset closet flanges comply with the standards indicated for pipe fittings in Table 702.4. For example, the standard ASTM D2665 (for PVC fittings) references the standard ASTM D3311 for the patterns and dimensions of DWW fittings. Table 44 in ASTM D3311 shows two types of offset closet flanges. Thus, a code official denying the use of that particular offset closet flange might not be supported by what the code is allowing by Table 702.4. Therefore, Item 3 is being added to open the door for fittings that are already approved by inclusion in a referenced standard and any other offset closet flange that the code official thinks is acceptable.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included

members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 201.

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P178-15 Part I : 704.2-  
SNYDER5939

---

## **Public Hearing Results**

### **Part I**

**Committee Action:**

**Disapproved**

**Committee Reason:** Requiring offset closet flanges be approved (by the code official) puts the responsibility onto the code official without providing him any guidance as to how to decide what is acceptable.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Janine Snyder, representing Plumbing, Mechanical and Fuel Gas Code Committee (PMGCAC@iccsafe.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Plumbing Code**

**704.2 No reduction in size in the direction of flow.** The size of the drainage piping shall not be reduced in the direction of the flow. The following shall not be considered as a reduction in size in the direction of flow:

1. A 4-inch by 3-inch (102 mm by 76 mm) water closet flange.
2. A water closet bend fitting having a 4-inch (102 mm) inlet and a 3-inch (76 mm) outlet provided that the 4 inch leg of the fitting is upright and below, but not necessarily directly connected to, the water closet flange.
3. An ~~approved~~ offset closet flange.

**Commenter's Reason:** The Committee's point about offset closet flange is well-taken. The PMGCAC is removing "approved". This does not necessarily mean that any design of offset closet flange is acceptable. Closet flanges are pipe fittings and should comply with the standards indicated for pipe fittings in Table 702.4.

For example, PVC pipe standards ASTM D2665 and F1866 include a reference to ASTM D3311 which covers the patterns and dimensions for drainage fittings. ASTM D3311 includes the pattern and dimensions for an offset closet flange. Therefore, where the offset closet flange is marked with the standard for the pipe, that fitting is acceptable. Any pipe fitting, such as a closet flange, that is not marked with the pipe

or fitting standard that includes a reference to fitting patterns for offset closet flanges, would need to be approved under Section 105.2 Alternative design, materials and methods.

# P178-15 Part II

## P3005.1.6

### Proposed Change as Submitted

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

## 2015 International Residential Code

**Revise as follows:**

### **P3005.1.6 Change No reduction in size in the direction of flow.**

The size of the drainage piping shall not be reduced in ~~size in the~~ direction of the flow. The following shall not be considered a reduction in size in the direction of flow.

1. A 4-inch by 3-inch (102 mm by 76 mm) water closet ~~connection~~ shall flange.
2. A water closet bend fitting having a 4-inch (102 mm) inlet and a 3-inch (76 mm) outlet provided that the 4 inch leg of the fitting is upright and below, but not be considered as a reduction in size. necessarily directly connected to, the water closet flange.
3. An approved offset closet flange.

**Reason:** This section begs for clarification especially since 4 x 3 closet bends (elbows) and offset closet flanges are frequently being used in current day construction. Item 1 is not any change to what was stated before.

Item 2- Four x 3 closet bends were commonly used many decades ago when these bends were made of lead. The item is carefully worded to make the intent clear that the bend is to be installed in the upright orientation (and not horizontally). Also, the wording indicates that the bend is not required to be directly connected to closet flange - there can be a vertical section of pipe between the upright bend and the closet flange.

Item 3-Offset closet flanges have been used for decades. Some jurisdictions are reluctant to allow any offset closet flanges because the code doesn't outright discuss the use offset flanges (nor does it prohibit them). Because some offset closet flanges are especially "restrictive looking", code officials didn't want to start allowing some types and not other types. This section is often cited as the basis for disapproving the use of all offset flanges. However, that doesn't seem completely appropriate as some offset closet flanges comply with the standards indicated for pipe fittings in Table P3002.3. For example, the standard ASTM D2665 (for PVC fittings) references the standard ASTM D3311 for the patterns and dimensions of DWV fittings. Table 44 in ASTM D3311 shows two types of offset closet flanges. Thus, a code official denying the use of that particular offset closet flange might not be supported by what the code is allowing by Table P3002.3. Therefore, Item 3 is being added to open the door for fittings that are already approved by inclusion in a referenced standard and any other offset closet flange that the code official thinks is acceptable.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included

members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 201.

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P178-15 Part II :  
P3005.1.6-SNYDER5940

---

## **Public Hearing Results**

### **Part II**

**Committee Action:**

**Disapproved**

**Committee Reason:** Item 3 requires offset closet flanges to be approved by the code official but there is not any criteria for the code official to use for making that approval. There are many different types of offset closet flanges that would not be appropriate.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Janine Snyder, representing Plumbing, Mechanical and Fuel Gas Code Committee (PMGCAC@iccsafe.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Residential Code**

**P3005.1.6 No reduction in size in the direction of flow.** The size of the drainage piping shall not be reduced in the direction of the flow. The following shall not be considered a reduction in size in the direction of flow:

1. A 4-inch by 3-inch (102 mm by 76 mm) water closet flange.
2. A water closet bend fitting having a 4-inch (102 mm) inlet and a 3-inch (76 mm) outlet provided that the 4 inch leg of the fitting is upright and below, but not necessarily directly connected to, the water closet flange.
3. An ~~approved~~ offset closet flange.

**Commenter's Reason:** The Committee's point about offset closet flange is well-taken. The PMGCAC is removing "approved". This does not necessarily mean that any design of offset closet flange is acceptable. Closet flanges are pipe fittings and should comply with the standards indicated for pipe fittings in Table P3002.3.

For example, PVC pipe standards ASTM D2665 and F1866 include a reference to

ASTM D3311 which covers the patterns and dimensions for drainage fittings. ASTM D3311 includes a pattern and dimensions for an offset closet flange. Therefore, where the offset closet flange is marked with the standard for the pipe that references ASTM D3311, that fitting is acceptable. Any fitting that is not marked with the pipe standard (that references ASTM D3311) would need to be approved under Section 105.2 Alternative design, materials and methods.

**P178-15 Part II**

# P199-15

## 713 (New), 713.1 (New), 713.1.1 (New), 713.1.2 (New) Proposed Change as Submitted

**Proponent :** Julius Ballanco, JB Engineering and Code Consulting, P.C., representing InSinkErator (JBENGINEER@aol.com)

### 2015 International Plumbing Code

Add new text as follows:

#### SECTION 713

#### FOOD WASTE IN COMMERCIAL FOOD HANDLING ESTABLISHMENTS

**713.1 Food waste.** In commercial food handling establishments, the disposal of food waste shall be in accordance with Section 713.1.1 or Section 713.1.2.

**713.1.1 Food waste disposer.** Food waste shall discharge to the sanitary drainage system through a commercial food waste disposer.

**713.1.2 Separation of food waste.** Food waste shall be separated from sanitary drainage flow. Such food waste shall be put into a trash receptacle, a composting bin, a beneficial reuse bin or a pulper for disposal. Sink strainers and mechanical strainers shall be an *approved* means for separating food waste from drainage flow.

**Reason:** While this may appear to be an obvious requirement, there are still plumbing systems that have food waste discharged down the drain. The only time food waste should discharge down the drain in a food handling establishment is after it has been first ground up through a commercial food waste disposer. If a commercial food waste disposer is not provided, the food waste must be disposed of in another manner. The most common method of disposing of food waste is to a trash receptacle. Other options are to compost the food waste, have it sent for beneficial reuse, or dispose of it to a pulper.

This code requirement will help prevent stoppages in the drainage system resulting for large food waste items that do not belong in the piping. Only pulverized food particle are intended to be discharged to the sanitary drainage system.

**Cost Impact:** Will not increase the cost of construction  
The intent of the code is currently to prevent uncontrolled food waste from discharging down the drain. This section merely identifies the options for doing this.

P199-15 : 713 (New)-  
BALLANCO3806

---

### Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** The food separation section is unenforceable. This proposal seems to force the installation of a food waste disposer.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing InSinkErator (JBENGINEER@aol.com) requests Approve as Submitted.**

**Commenter's Reason:** The reason the committee rejected this change is because they claim it is unenforceable. That is not correct. There are means that must be provided during inspection to assure that untreated food waste does not discharge down the drainage system. All of these means are enforceable. If the claim is made that this is unenforceable, the same could be made for the statement in the Plumbing Code that reads, "Corrosive liquids, spent acids or other harmful chemicals that destroy or injure a drain, sewer, soil or waste pipe, or create noxious or toxic fumes or interfere with sewage treatment processes shall not be discharged into the plumbing system." However, this section has been a mainstay of the code since the code's inception.

The Committee's second statement that the proposal seems to force the installation of a food waste disposer is completely unprofessional. There is no mandate of food waste disposers in this section. As anyone in the plumbing profession knows, the only way to allow food waste down the drainage system is through a food waste disposer. Otherwise, the food waste must be removed.

This section provides the necessary code language to for addressing food waste in a commercial food handling establishment.

---

**P199-15**

# P202-15 Part I

## 715.1, 715.2 (New)

### Proposed Change as Submitted

**Proponent :** Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Mainline Backflow Products (JBENGINEER@aol.com)

**NOTE:** PART II DID NOT RECEIVE A PUBLIC COMMENT AND IS ON THE CONSENT AGENDA. PART II IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY FOLLOWING ALL OF PART I.

## 2015 International Plumbing Code

### Revise as follows:

**715.1 Sewage backflow. Where required.** Where plumbing fixtures are installed on a floor with a finished floor elevation below the elevation of the manhole cover of the next upstream manhole in the public sewer, such fixtures shall be protected by a backwater valve installed in the *building drain*, or horizontal *branch* serving such fixtures. ~~Plumbing fixtures installed on a floor with a finished floor elevation above the elevation of the manhole cover of the next upstream manhole in the public sewer shall not discharge through a backwater valve.~~

~~**Exception:** In existing buildings, fixtures above the elevation of the manhole cover of the next upstream manhole in the public sewer shall not be prohibited from discharging through a backwater valve.~~

### Add new text as follows:

**715.2 Allowable installation.** Where plumbing fixtures are installed on a floor with a finished floor elevation above the elevation of the manhole cover of the next upstream manhole in the public sewer, and a backwater valve is installed in the building drain or horizontal branch serving such fixtures, the backwater valve shall be of the normally-open type.

**Exception:** Normally-closed backwater valve installations for existing buildings shall not be prohibited.

**Reason:** This section was originally developed based on the use of what is now classified as "normally closed backwater valve." ASME A112.14.1 has two categories of backwater valves, normally closed backwater valves and normally open backwater valves. A normally open backwater valve allows the free movement of air throughout the drainage system. The connection to the public sewer is based on having a free movement of air from the public sewer through the vent terminal on the roof. When a normally closed backwater valve is installed for the entire plumbing system, this is not accomplished. However, with a normally open backwater valve, the free movement of air occurs in the sanitary drainage and vent system.

This change merely adds a distinction between the use of a normally closed backwater valve and a normally open backwater valve. The requirements for normally closed backwater valve remain the same. The only change is to revise the title of the section to read, "Where required." Since this is the section that requires backwater valves to be installed, it is most appropriate to entitle the section, "Where required."

The second half of the original section has been split into a new section entitled,

"Allowable installation." This is the part of the original code section that placed limitations on using backwater valves for fixtures that are located above the elevation of the manhole cover. The change is to allow the discharge of fixtures located above the elevation of the manhole cover provided that a normally open backwater valve is installed. This is consistent with the intended use of each style of backwater valve.

The wording of the exception was been changed to reflect the revised wording to Section 915.2. However, the requirements of the exception do not change. It still will allow a normally closed backwater valve for an existing building.

**Cost Impact:** Will increase the cost of construction  
This change provides options for the code user. There is no additional language mandating the use of backwater valves.

P202-15 Part I : 715.1-  
BALLANCO5901

---

## **Public Hearing Results**

### **Part I**

#### **Committee Action:**

**Disapproved**

**Committee Reason:** The plumbing industry has used normally closed backwater valves for decades where protection against backwater events was necessary. This proposal no requires that normally open tpye have to be used in some applications but again, normally closed valves have worked fine before this. This requirement seems overly restrictive and possibly requiring proprietary products.

#### **Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Mainline Backflow Products (JBENGINEER@aol.com) requests Approve as Submitted.**

**Commenter's Reason:** It is strange that the Committee considered this code change overly restrictive. In fact, it is the opposite. The Committee's concern for normally closed backwater valves is misplaced. The proposed code change allows normally closed backwater valves in the same locations they have always been permitted. The modification would allow normally open backwater valves to be used in new construction whereas the current code prohibits all backwater valves. The reason given for prohibiting backwater valves for these installations was that the backwater valve closes off the free flow of air in the drainage and vent system. While this is true for normally closed backwater valves, it is not true for normally open valves. That is why the standard makes a distinction between the two types of valves.

Part 2 of this change was recommended for approval.

P202-15 Part I

---

## **P202-15 Part II**

### **P3008.1, P3008.2 (New)**

#### **Proposed Change as Submitted**

**Proponent :** Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Mainline Backflow Products (JBENGINEER@aol.com)

## **2015 International Residential Code**

### **Revise as follows:**

**~~P3008.1 Sewage backflow. Where required.~~** Where the flood level rims of plumbing fixtures are below the elevation of the manhole cover of the next upstream manhole in the public sewer, the fixtures shall be protected by a backwater valve installed in the *building drain*, branch of the *building drain* or horizontal branch serving such fixtures. ~~Plumbing fixtures having flood level rims above the elevation of the manhole cover of the next upstream manhole in the public sewer shall not discharge through a backwater valve.~~

~~**Exception:** In existing buildings, fixtures above the elevation of the manhole cover of the next upstream manhole in the *public sewer* shall not be prohibited from discharging through a backwater valve.~~

### **Add new text as follows:**

**P3008.2 Allowable installation.** Where plumbing fixtures are installed on a floor with a finished floor elevation above the elevation of the manhole cover of the next upstream manhole in the public sewer, and a backwater valve is installed in the building drain or horizontal branch serving such fixtures, the backwater valve shall be of the normally-open type.

**Exception:** Normally-closed backwater valve installations for existing buildings shall not be prohibited.

**Reason:** This section was originally developed based on the use of what is now classified as "normally closed backwater valve." ASME A112.14.1 has two categories of backwater valves, normally closed backwater valves and normally open backwater valves. A normally open backwater valve allows the free movement of air throughout the drainage system. The connection to the public sewer is based on having a free movement of air from the public sewer through the vent terminal on the roof.

When a normally closed backwater valve is installed for the entire plumbing system, this is not accomplished. However, with a normally open backwater valve, the free movement of air occurs in the sanitary drainage and vent system.

This change merely adds a distinction between the use of a normally closed backwater valve and a normally open backwater valve. The requirements for normally closed backwater valve remain the same. The only change is to revise the title of the section to read, "Where required." Since this is the section that requires backwater valves to be installed, it is most appropriate to entitle the section, "Where required."

The second half of the original section has been split into a new section entitled, "Allowable installation." This is the part of the original code section that placed limitations on using backwater valves for fixtures that are located above the elevation of the manhole cover. The change is to allow the discharge of fixtures located above the elevation of the manhole cover provided that a normally open backwater valve is installed. This is consistent with the intended use of each style of backwater valve.

The wording of the exception was been changed to reflect the revised wording of Section P3008.2. However, the requirements of the exception do not change. It still will allow a normally closed backwater valve for an existing building.

**Cost Impact:** Will not increase the cost of construction  
This change provides options for the code user. There is no additional language mandating the use of backwater valves.

## **Public Hearing Results**

### **Part II**

**Committee Action:**

**Approved as Submitted**

**Committee Reason:** The committee agreed with the proponent's published reason statement.

**Assembly Action :**

**None**

---

# **P205-15 Part I**

## **718 (New), Chapter 14**

### **Proposed Change as Submitted**

**Proponent :** Larry Gill, representing IPEX USA LLC  
(larry.gill@ipexna.com)

**NOTE:** PART II DID NOT RECEIVE A PUBLIC COMMENT AND IS ON THE CONSENT AGENDA. PART II IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY FOLLOWING ALL OF PART I.

## **2015 International Plumbing Code**

**Add new text as follows:**

### **SECTION 718** **REPLACEMENT OF UNDERGROUND SEWERS BY PVC FOLD AND FORM METHODS**

**718.1 General** This section shall govern the replacement of existing building sewer piping by PVC fold and form methods.

**718.2 Applicability** The replacement of building sewer piping by PVC fold and form methods shall be limited to gravity drainage piping of sizes 6 inches (152mm) and smaller. The replacement piping shall be of the same nominal size as the existing piping.

**718.3 Pre-installation inspection** The existing piping sections to be replaced shall be inspected internally by a recorded video camera survey. The survey shall include notations of the position of cleanouts and the depth of connections to the existing piping.

**718.4 Pipe** The replacement piping shall be manufactured in compliance with ASTM F1871 or ASTM F1504.

**718.5 Installation** Pipe complying with ASTM F1504 shall be installed in accordance with ASTM F1947. Pipe complying with ASTM F1871 shall be installed in accordance with ASTM F1867.

**718.6 Cleanouts** Where the existing building sewer did not have cleanouts meeting the requirements of this code, cleanout fittings shall be installed as required by this code.

**718.7 Post-installation inspection** The completed replacement piping shall be inspected internally by a recorded video camera survey. The video survey shall be reviewed and approved by the code official prior to pressure testing of the replacement piping system.

**718.8 Pressure testing** The replacement piping system and the connections to the replacement piping shall be tested in accordance with Section 312.

**Add new standard(s) as follows:**

ASTM F1871-2011 Standard Specification for Folded/Formed Poly (Vinyl Chloride) Pipe Type A for Existing Sewer and Conduit Rehabilitation

ASTM F1504-2014 Standard Specification for Folded Poly(Vinyl Chloride)

(PVC) Pipe for Existing Sewer and Conduit Rehabilitation

ASTM F1947-2010 Standard Practice for Installation of Folded Poly (Vinyl Chloride) (PVC) Pipe into Existing Sewers and Conduits

ASTM F1867-2012 Standard Practice for Installation of Folded/Formed Poly (Vinyl Chloride) (PVC) Pipe Type A for Existing Sewer and Conduit Rehabilitation

**Reason:** The current IPC includes provisions for replacement of underground sewers by pipe bursting or the installation of new pipe in an open cut trench. This proposal introduces a different method for sewer rehabilitation which is similar to pipe bursting. Fold and form is a method where a PVC pipe is manufactured in a plant to either ASTM F1504 or ASTM F1871. The pipe is heated and collapsed to form a roll for transport to the worksite. Once on site the pipe is heated and pulled into an existing sewer pipe which is in need of rehabilitation. The new pipe is then expanded and installed per ASTM F1947 or ASTM F1867. This proposal also includes sections similar to Section 717 to put the sewer line back in service. This proposal will provide for an alternative to open cut and pipe bursting methods and give owners and municipalities additional means to repair a deteriorating system.

**Cost Impact:** Will not increase the cost of construction  
This proposal provides another option for sewer rehabilitation/replacement. It is estimated that pipe bursting and fold and form methods are approximately 60% of the cost of open cut installation. These methods offer significant savings as well as less impact on the surrounding area.

P205-15 Part I : 718  
(NEW)-GILL5952

---

**Public Hearing Results**

**Part I**

**Committee Action:**

**Disapproved**

**Committee Reason:** The size of 4 to 6 inches should be corrected to what the standard indicates as the capability. Installation of the products need to be better addressed.

**Assembly Action :**

**None**

**Analysis.** For staff analysis of the content of ASTM F1871-2011, ASTM F1504-2014, ASTM F1947-2010 and ASTM F1867-2012 with regard to the ICC criteria for referenced standards (Section 3.6 of CP #28), please visit:  
<http://www.iccsafe.org/wp-content/uploads/2015-Proposed-Standards-Group-A-Final.pdf>

---

**Individual Consideration Agenda**

***Public Comment 1:***

**Proponent : Larry Gill, representing IPEX USA LLC requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

## 2015 International Plumbing Code

**718.2 Applicability** The replacement of building sewer piping by PVC fold and form methods shall be limited to gravity drainage piping of sizes ~~6~~ 4 inches (102mm) to 18 inches (152mm ~~457mm~~) and smaller. The replacement piping shall be of the same nominal size as the existing piping.

**718.5 Installation** ~~Pipe complying with ASTM F1504~~ The piping sections to be replaced shall be cleaned and flushed. Remediation shall be installed in accordance with ASTM F1947. Pipe complying with ASTM F1871 shall be installed in accordance with ASTM F1867 performed where there is groundwater infiltration, roots, collapsed pipe, dropped joints, offsets more than 12 percent of the inside pipe diameter or other obstructions.

**Modify standard(s) as follows:**

~~ASTM F1871-2011 Standard Specification for Folded/Formed Poly (Vinyl Chloride) Pipe Type A for Existing Sewer and Conduit Rehabilitation~~

~~ASTM F1504-2014 Standard Specification for Folded Poly(Vinyl Chloride) (PVC) Pipe for Existing Sewer and Conduit Rehabilitation~~

ASTM F1947-2010 Standard Practice for Installation of Folded Poly (Vinyl Chloride) (PVC) Pipe into Existing Sewers and Conduits

ASTM F1867-2012 Standard Practice for Installation of Folded/Formed Poly (Vinyl Chloride) (PVC) Pipe Type A for Existing Sewer and Conduit Rehabilitation

**Commenter's Reason:** Identical changes to the IPC and the IRC were proposed for Fold and Form PVC. The IPC disapproved the proposal due to an error related to sizing and concerns that the installation needed to be better addressed. These comments were used to floor modify the IRC proposal and the modified proposal was approved by the IRC. This public comment repeats the proposal which was approved by the IRC. The sizes have been corrected and the installation requirements have been written directly into the Code section 718.5. The installation standards that were in the original submittal have been deleted as they are no longer needed.

---

P205-15 Part I

## **P205-15 Part II**

### **3011 (New), Chapter 44**

#### **Proposed Change as Submitted**

**Proponent :** Larry Gill, representing IPEX USA LLC  
(larry.gill@ipexna.com)

### **2015 International Residential Code**

**Add new text as follows:**

#### **SECTION 3011** **REPLACEMENT OF UNDERGROUND SEWERS BY PVC FOLD AND** **FORM METHODS**

**3011.1 General** This section shall govern the replacement of existing building sewer piping by PVC Fold and Form methods.

**3011.2 Applicability** The replacement of building sewer piping by PVC Fold and Form methods shall be limited to gravity drainage piping 4 inches (152MM) to 18 inches (457mm). The replacement piping shall be of the same nominal size as the existing piping.

**3011.3 Pre-installation inspection** The existing piping sections to be replaced shall be inspected internally by a recorded video camera survey. The survey shall include notations of the position of cleanouts and the depth of connections to the existing piping.

**3011.4 Pipe** The replacement piping shall be manufactured in compliance with ASTM F1871 or ASTM F1504.

**3011.5 Installation** The piping sections to be replaced shall be cleaned and flushed. Remediation shall be performed where there is groundwater infiltration, roots, collapsed pipe, dropped joints, offsets more than 12% of the inside pipe diameter or other obstructions.

**3011.6 Cleanouts** Where the existing building sewer did not have cleanouts meeting the requirements of this code, cleanout fittings shall be installed as required by this code.

**3011.7 Post-installation inspection** The completed replacement piping shall be inspected internally by a recorded video camera survey. The video survey shall be reviewed and approved by the code official prior to pressure testing of the replacement piping system.

**3011.8 Pressure testing** The replacement piping system as well as the connections to the replacement piping shall be tested in accordance with Section P2503.4.

**Add new standard(s) as follows:**

ASTM F1871 - 2011 Standard Specification for Folded/Formed Poly (Vinyl Chloride) Pipe Type A for Existing Sewer and Conduit Rehabilitation

ASTM F1504 - 2014 Standard Specification for Folded Poly(Vinyl Chloride)

(PVC) Pipe for Existing Sewer and Conduit Rehabilitation

ASTM F1947 - 2010 Standard Practice for Installation of Folded Poly (Vinyl Chloride) (PVC) Pipe into Existing Sewers and Conduits

ASTM F1867 - 2012 Standard Practice for Installation of Folded/Formed Poly (Vinyl Chloride) (PVC) Pipe Type A for Existing Sewer and Conduit Rehabilitation

**Reason:** The current IPC includes provisions for replacement of underground sewers by pipe bursting. This proposal introduces a different method for sewer rehabilitation. Fold and form is a method where a PVC pipe is manufactured in a plant to either ASTM F1504 or ASTM F1871. The pipe is heated and collapsed to form a roll for transport to the worksite. Once on site the pipe is heated and pulled into an existing sewer pipe which is in need of rehabilitation. The new pipe is then expanded and installed per ASTM F1947 or ASTM F1867. This proposal also includes sections similar to Section P3010 to put the sewer line back in service. This proposal will provide an alternative to open cut and pipe bursting methods and give owners and municipalities additional means to repair a deteriorating system.

**Cost Impact:** Will not increase the cost of construction  
No cost impact. It is estimated that pipe bursting and fold and form methods are approximately 60% of the cost of open cut installations. These methods offer significant savings as well as less impact on the surrounding area.

**Analysis:** A review of the standard proposed for inclusion in the code, ASTM F1871-2011, ASTM F1504-2014, ASTM F1947-2010 and ASTM F1867-2012, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

P205-15 Part II : P3011  
(New)-GILL4924

---

**Public Hearing Results**

**Part II**

**Committee Action:**

**Approved as Modified**

**Modification:**

**P3011.2 Applicability.** The replacement of building sewer piping by PVC Fold and Form methods shall be limited to gravity drainage piping in sizes ~~6~~4 inches ( ~~152~~102 mm ) and smaller to 18 inches (457 mm). The replacement piping shall be of the same nominal size as the existing piping.

**P3011.5 Installation.** ~~Piping complying with ASTM F1504~~The piping sections to be replaced shall be installed in accordance with ~~ASTM F1947~~cleaned and flushed. Piping complying with ~~ASTM F1871~~ASTM F1871 Remediation shall be installed in accordance with ~~ASTM F1867~~performed where there is

groundwater infiltration, roots, collapsed pipe, dropped joints, offsets more than 12 percent of the inside pipe diameter or other obstructions.

**Reference Standards:**

ASTM F1871 - 2011 Standard Specification for Folded/Formed Poly (Vinyl Chloride) Pipe Type A for Existing Sewer and Conduit Rehabilitation

ASTM F1504 - 2014 Standard Specification for Folded Poly(Vinyl Chloride) (PVC) Pipe for Existing Sewer and Conduit Rehabilitation

~~ASTM F1947—2010 Standard Practice for Installation of Folded Poly (Vinyl Chloride) (PVC) Pipe into Existing Sewers and Conduits~~

~~ASTM F1867—2012 Standard Practice for Installation of Folded/Formed Poly (Vinyl Chloride) (PVC) Pipe Type A for Existing Sewer and Conduit Rehabilitation~~

**Committee Reason:** For the Modification only:

The size of piping that this process can be used on was corrected to allow its use for larger piping systems that could exist for IRC buildings.

For the proposal As Modified:

The committee agreed with the proponent's reason statement.

**Assembly Action :**

**None**

**Analysis.** For staff analysis of the content of ASTM F1871-2011, ASTM F1504-2014, ASTM F1947-2010 and ASTM F1867-2012 with regard to the ICC criteria for referenced standards (Section 3.6 of CP #28), please visit:

# P214-15

804.1, 804.2 (New)

## Proposed Change as Submitted

**Proponent :** Brian Conner, Charlotte Pipe and Foundry, representing Charlotte Pipe and Foundry (bconner@charlottepipe.com)

### 2015 International Plumbing Code

**Revise as follows:**

**804.1 General.** ~~The materials and~~ methods utilized for the construction and installation of indirect waste pipes and systems shall comply with the applicable provisions of Chapter 7.

**Add new text as follows:**

**804.2 Special waste pipe, fittings and components.** Pipes ,fittings and components receiving or intended to receive the discharge of any fixture into which acid or corrosive chemicals are placed shall be constructed of CPVC, high silicon iron, PP, PVDF, chemical resistant glass, or glazed ceramic materials.

**Reason:** Sanitary and chemical drainage are inherently different applications. The purpose of this proposed change is to clarify the allowable materials which are specifically listed for chemical drainage applications.

**Cost Impact:** Will not increase the cost of construction  
This change will not increase the cost of construction as special wastes have always required special piping of one of those types..

P214-15 : 804.1-  
CONNER5388

---

## Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** Not all of these piping materials are suitable for any type of chemical waste. This section needs to indicate that the manufacturer of the piping materials needs to provide guidance on what type of material should be chosen for each application.

**Assembly Action :**

**None**

---

## Individual Consideration Agenda

*Public Comment 1:*

**Proponent :** Brian Conner, representing CPF (bconner@charlottepipe.com) requests Approve as Modified by this Public Comment.

**Modify as Follows:**

## 2015 International Plumbing Code

**804.2 803.3 Special waste pipe, fittings and components.** Pipes, fittings and components receiving or intended to receive the discharge of any fixture into which acid or corrosive chemicals are placed shall be constructed of CPVC, high silicon iron, PP, PVDF, chemical resistant glass, or glazed ceramic materials.

**Commenter's Reason:** The code does not provide any direction as to what materials are approved for chemical waste drainage. The addition of this section was merely to clarify what materials are approved to be used in chemical drainage systems. It would still be up to the installer or specifying engineer to decide what piping system is appropriate to use with the chemicals that will be conveyed. All manufacturers of chemical waste piping systems offer guidance in this area. I would like the ICC Governmental Voters to approve this proposal as modified.

---

P214-15

# P215-15 Part I

**903.1, 903.1.1 (New), 903.1.2 (New), 903.1.3 (New), 903.1.4 (New), 903.6**

## **Proposed Change as Submitted**

**Proponent :** Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Solar City (JBENGINEER@aol.com)

## **2015 International Plumbing Code**

**Revise as follows:**

**903.1 Roof extension. Vent pipes terminating outdoors.** ~~Open vent~~ ~~Vent pipes that extend through a roof terminating outdoors shall be~~ ~~terminated not less than [NUMBER] inches (mm) above~~ ~~extended to the~~ ~~outdoors through the roof. Where~~ ~~or a roof is to be used for assembly or as~~ ~~a promenade, observation deck, sunbathing deck or similar purposes, open~~ ~~vent pipes shall terminate not less than 7 feet (2134 mm) above~~ ~~side wall of~~ ~~the roof building in accordance with one of the methods identified in~~ ~~Sections 903.1.1 through 903.1.4.~~

**Add new text as follows:**

**903.1.1 Roof extension.** Open vent pipes that extend through a roof and that do not meet the conditions of Section 902.1.2 or Section 903.1.3 shall terminate not less than [NUMBER] inches (mm) above the roof.

**903.1.2 Roof used for recreational uses.** Where a roof is to be used for assembly or as a promenade, observation deck, sunbathing deck or similar purposes, open vent pipes shall terminate not less than 7 feet (2134 mm) above the roof.

**903.1.3 Roof extension covered.** Where an open vent pipe terminates above a sloped roof and is covered by either a roof-mounted panel such as a solar collector or photovoltaic panel mounted over the vent opening, or by a roof element such as an architectural feature or a decorative shroud, the vent pipe shall terminate not less than 2 inches (51 mm) above the roof surface. Such roof elements shall be designed to prevent the adverse effects of snow accumulation and wind on the function of the vent. The placement of a panel over a vent pipe and the design of a roof element covering the vent pipe shall provide for an open area for the vent pipe to the outdoors that is not less than the area of the pipe, as calculated from the inside diameter of the pipe. Such vent terminals shall be protected by a method that prevents birds and rodents from entering or blocking the vent pipe opening.

**903.1.4 Side wall vent terminal.** Vent terminals extending through the wall shall terminate not closer than 10 feet (3048 mm) from a lot line and not less than 10 feet (3048 mm) above the highest grade elevation within 10 feet (3048 mm) in any direction horizontally of the vent terminal. Vent pipes shall not terminate under the overhang of a structure where the overhang includes soffit vents. Such vent terminals shall be protected by a method that prevents birds and rodents from entering or blocking the vent pipe opening and that does not reduce the open area of the vent pipe.

## Delete without substitution:

~~**903.6 Extension through the wall.** Vent terminals extending through the wall shall terminate at a point not less than 10 feet (3048 mm) from a lot line and not less than 10 feet (3048 mm) above average ground level. Vent terminals shall not terminate under the overhang of a structure with soffit vents. Side wall vent terminals shall be protected to prevent birds or rodents from entering or blocking the vent opening.~~

**Reason:** This proposed change reorganizes the section regarding the vent terminal. There are currently three options for a vent terminal, extending the vent (number) inches or more above the roof, extending the vent more than 7 feet above the roof when the roof is used for entertainment, or extending the vent through the side wall. However, the three requirements are separated between multiple sections. This makes the requirement readily identifiable in a section that presents all the options in one main section.

A fourth option for terminating the vent has been included. The fourth option would allow the vent to terminate 2 inches above a sloped roof when protected by a covering. This would allow photovoltaic solar collectors to be installed over vent terminals. It would also allow other protected vent terminals, such as architectural features that hide the vent for aesthetic purposes.

The size, length, and location of vent terminals has been a subject matter that has been greatly discussed over the last century. There are many myths, innuendoes, theories, and hypothesis regarding vent terminals. One of the most complete papers on vent terminals was published by the National Bureau of Standards (NBS) in 1954, entitled, "Frost Closure of Roof Vents in Plumbing Systems," authored by Nerbert Eaton and Robert Wyly. Most of the current code requirements originate from the recommendations of this paper.

The NBS paper investigated plumbing roof vents and their termination throughout North America. Identified as a major concern is the frost closure of the vent terminal. Other concerns included snow blockage, shearing off of the vent terminal, and rainwater entrance.

Prior to this paper, it was largely alluded that the reason for a minimum size of 1-1/4 inch and a termination above the roof surface was to prevent a bird from building a nest and laying an egg to block off the vent. To this day, birds building nests in vents is a concern. However, that concern is more related to side wall venting that provides an easy opening for a bird to build a nest.

When a vent terminates lower to the roof, measures must be taken to prevent a bird from building a nest around the vent pipe and blocking it off. Increasing the size of the vent is one means used to avoid a bird's nest. Screening and vent covers also are used to prevent birds from building a nest.

The more pressing issue is how far above the roof a vent should terminate. Two issues of importance are water tightness of the flashing and preventing rainwater entrance into the plumbing vent. Modern day flashings can make the roof penetration water tight at much lower heights, including a termination 2 inches above the roof.

The NBS report suggested a minimum of 2 inch penetration above the roof to prevent rainwater from entering the plumbing vent. It is recognized that a flat roof can have a greater accumulation of water hence the need for the vent to be at a higher elevation. Typically secondary roof drains are located between 2 and 4 inches above the roof. Thus, the vent terminal would have to be located at a higher height which is the reason for maintaining a minimum of inserting the appropriate number of inches above the roof for a flat roof.

The NBS report identified a vent terminal used in Saskatoon, Canada that terminates at the sloped roof. There was no extension above the roof. This was found to be extremely effective in preventing frost closure. As the NBS report states, the closer the vent terminates to the roof, the lower the possibility of frost closure. The report also found that by making the vent a minimum of 3 inch in diameter, frost closure that impacts the performance of the venting system was avoided.

Snow accumulation has been a subject of more recent discussions regarding vent

terminals. However, snow accumulation was addressed in the NBS report. The NBS report found that while snow may completely cover the vent terminal, the snow eventually melts from the heated vapors emanating out of the vent. Prior to the snow melting, the NBS report found that the snow cover did not impact the performance of the vent. This makes sense since the purpose of the vent is to balance the pressure in the drainage system with atmospheric pressure. The snow cover is not dense enough to prevent the balancing of pressure in the piping system.

The current code requires the vent to terminate at a height specified by the jurisdiction. The Residential Code requires the termination to be 6 inches above the anticipated snow cover. The requirement add the local value remains intact. However, when the vent is covered, such as by a solar panel or architectural feature, it cannot be covered by snow such that the vent doesn't perform properly. Thus, the vent could terminate at a 2 inch height above a sloped roof.

In the mountain west, shearing of the roof vent is a problem when the snow and ice melt and slide off of sloped roofs. By extending the vent higher through the roof, there is a greater force applied on the vent that can result in the pipe being sheared off. If the vent is lowered, the force on the vent during snow and ice slides is also lowered. This may reduce the shearing incidents of vent pipes. However, that is not part of the reason for lowering the vent terminal height. The vent would be protected if installed at a lower height. Hence, the snow and ice slides would have little to no impact on the vent since it is covered.

Plumbing contractors in the mountain west with heavy snow and ice accumulations have found that the more practical solution is to extend the vent through the roof closer to the peak of the roof. Thus, the force from sliding snow and ice is lowered. This has not been addressed in this code change and is more of a regional issue addressed by knowledgeable local contractors.

The remaining issue that is not often addressed for vent terminals is the impact of wind. During windy conditions, the vent terminal can create a reduced pressure zone that siphons the trap seal. This is often called a Venturi effect. The other concern is downdrafts that can increase the pressure in the drainage system. However, downdrafts have not had a major impact on the drainage system based on the termination height above the roof. While the possibility exists that a lower vent termination height could result in higher wind downdrafts, this has not proven to be the case. However, the code requirement addresses downdrafts by requiring the covering to prevent any adverse impact from wind.

What the plumbing profession must acknowledge is that solar is a viable source of energy for a building. As such, accommodations must be made to allow for the maximum area of roof coverage with solar panels. This may require the adjustment in the height of the vent terminal.

While accommodations must be made, there cannot be a sacrifice of public health. The lowering of the vent terminal to 2 inches on a sloped roof will not impact public health. This was proven by the NBS study published in 1954. Furthermore, modern building practices will result in a water tight vent terminal that will perform as intended.

**Bibliography:** "*Frost Closure of roof Vents in Plumbing Systems*," Herbert N. Eaton and Robert S. Wylie, BMS Report 142, published 1954, United States Department of Commerce, National Bureau of Standards.

National Plumbing Code Handbook, Standards and Design Information, Vincent T. Manas, P.E., copyright 1957, McGraw-Hill Book Company

**Cost Impact:** Will not increase the cost of construction  
This change provides options to the code user. There are no cost implications.

## Public Hearing Results

### Part I

**Committee Action:**

**Disapproved**

**Committee Reason:** There is concern about airflow over a covered vent pipe. Too short of vent pipe above the roof could invite entry by rodents. Vent piping is sometimes used for drain clearing so have covered vents would be a big problem for that type of operation. too short of vent might cause problems with roof flashing replacement.

**Assembly Action :**

**None**

---

### Individual Consideration Agenda

#### *Public Comment 1:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Solar City (JBENGINEER@aol.com) requests Approve as Submitted.**

**Commenter's Reason:** The Committee's reasons for denial of this change were addressed in the supporting statement. However, the technical substantiation appears to have been ignored. There is no problem reducing the height of the vent with regard to air movement. Hence, the first statement by the committee is incorrect and merely conjecture.

The Committee's statement regarding rodents is bizarre since the proposed language states, "Such vent terminals shall be protected by a method that prevents birds and rodents from entering or blocking the vent pipe opening." Apparently, this requirement was missed by the Committee.

Another statement by the Committee that the vent terminal may be used as a cleanout is also inappropriate. Cleanouts are required by the code. A vent terminal is NOT a cleanout.

The final statement that it may be difficult to flash a lower vent terminal is also preposterous. There are many flashings available for vents that only penetrate the roof 2 inches. The flashing provide an acceptable seal to prevent leakage.

Part 2 of this change was recommended for approval. This requirement is very important for advancing the use of photovoltaic solar panels. There is no technical justification for not allowing a modification to the vent through the roof.

---

### **P3103.1, P3103.1.1 (New), P3101.1.2 (New), P3103.1.3 (New), P3103.1.4 (New), P3103.6 Proposed Change as Submitted**

**Proponent :** Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Solar City (JBENGINEER@aol.com)

## **2015 International Residential Code**

### **Revise as follows:**

**P3103.1 Roof extension. Vent pipes terminating outdoors.** ~~Open vent Vent pipes that extend through a roof terminating outdoors shall be terminated not less than 6 inches (152 mm) above extended to the outdoors through the roof or 6 inches (152 mm) above a side wall of the anticipated snow accumulation, whichever is greater. Where a roof is to be used for assembly, as a promenade, observation deck or sunbathing deck or for similar purposes, open vent pipes shall terminate not less than 7 feet (2134 mm) above building in accordance with one of the roof methods identified in Sections P3103.1.1 through P3103.1.4.~~

### **Add new text as follows:**

**P3103.1.1 Roof extension.** Open vent pipes that extend through a roof and that do not meet the conditions of Section P3101.1.2 or Section P3101.1.3 shall terminate not less than 6 inches (150 mm) above the roof or 6 inches (150 mm) above the anticipated snow accumulation, which ever is greater.

**P3101.1.2 Roof used for recreational puposes.** Where a roof is to be used for assembly or as a promenade, observation deck, sunbathing deck or similar purposes, open vent pipes shall terminate not less than 7 feet (2134 mm) above the roof.

**P3103.1.3 Roof extension covered.** Where an open vent pipe terminates above a sloped roof and is covered by either a roof-mounted panel such as a solar collector or photovoltaic panel mounted over the vent opening, or by a roof element such as an architectural feature or a decorative shroud, the vent pipe shall terminate not less than 2 inches (51 mm) above the roof surface. Such roof elements shall be designed to prevent the adverse effects of snow accumulation and wind on the function of the vent. The placement of a panel over a vent pipe and the design of a roof element covering the vent pipe shall provide for an open area for the vent pipe to the outdoors that is not less than the area of the pipe, as calculated from the inside diameter of the pipe. Such vent terminals shall be protected by a method that prevents birds and rodents from entering or blocking the vent pipe opening.

**P3103.1.4 Side wall vent terminal.** Vent terminals extending through the wall shall terminate not closer than 10 feet (3048 mm) from a lot line and not less than 10 feet (3048 mm) above the highest grade elevation within 10 feet (3048 mm) in any direction horizontally of the vent terminal.

Vent pipes shall not terminate under the overhang of a structure where the overhang includes soffit vents. Such vent terminals shall be protected by a method that prevents birds and rodents from entering or blocking the vent pipe opening and that does not reduce the open area of the vent pipe.

**Delete without substitution:**

~~**P3103.6 Extension through the wall.** Vent terminals extending through the wall shall terminate not less than 10 feet (3048 mm) from the *lot line* and 10 feet (3048 mm) above the highest adjacent *grade* within 10 feet (3048 mm) horizontally of the vent terminal. Vent terminals shall not terminate under the overhang of a structure with soffit vents. Side wall vent terminals shall be protected to prevent birds or rodents from entering or blocking the vent opening.~~

**Reason:** This proposed change reorganizes the section regarding the vent terminal. There are currently three options for a vent terminal, extending the vent 6 inches or more above the roof, extending the vent more than 7 feet above the roof when the roof is used for entertainment, or extending the vent through the side wall. However, the three requirements are separated between multiple sections. This makes the requirement readily identifiable in a section that presents all the options in one main section.

A fourth option for terminating the vent has been included. The fourth option would allow the vent to terminate 2 inches above a sloped roof when protected by a covering. This would allow photovoltaic solar collectors to be installed over vent terminals. It would also allow other protected vent terminals, such as architectural features that hide the vent for aesthetic purposes.

The size, length, and location of vent terminals has been a subject matter that has been greatly discussed over the last century. There are many myths, innuendoes, theories, and hypotheses regarding vent terminals. One of the most complete papers on vent terminals was published by the National Bureau of Standards (NBS) in 1954, entitled, "Frost Closure of Roof Vents in Plumbing Systems," authored by Nerbert Eaton and Robert Wily. Most of the current code requirements originate from the recommendations of this paper.

The NBS paper investigated plumbing roof vents and their termination throughout North America. Identified as a major concern is the frost closure of the vent terminal. Other concerns included snow blockage, shearing off of the vent terminal, and rainwater entrance.

Prior to this paper, it was largely alluded that the reason for a minimum size of 1-1/4 inch and a termination above the roof surface was to prevent a bird from building a nest and laying an egg to block off the vent. To this day, birds building nests in vents is a concern. However, that concern is more related to side wall venting that provides an easy opening for a bird to build a nest.

When a vent terminates lower to the roof, measures must be taken to prevent a bird from building a nest around the vent pipe and blocking it off. Increasing the size of the vent is one means used to avoid a bird's nest. Screening and vent covers also are used to prevent birds from building a nest.

The more pressing issue is how far above the roof a vent should terminate. Two issues of importance are water tightness of the flashing and preventing rainwater entrance into the plumbing vent. Modern day flashings can make the roof penetration water tight at much lower heights, including a termination 2 inches above the roof.

The NBS report suggested a minimum of 2 inch penetration above the roof to prevent rainwater from entering the plumbing vent. It is recognized that a flat roof can have a greater accumulation of water hence the need for the vent to be at a higher elevation. Typically secondary roof drains are located between 2 and 4 inches above the roof. Thus, the vent terminal would have to be located at a higher height which is the reason for maintaining a minimum of 6 inches above the roof for a flat roof.

The NBS report identified a vent terminal used in Saskatoon, Canada that terminates

at the sloped roof. There was no extension above the roof. This was found to be extremely effective in preventing frost closure. As the NBS report states, the closer the vent terminates to the roof, the lower the possibility of frost closure. The report also found that by making the vent a minimum of 3 inch in diameter, frost closure that impacts the performance of the venting system was avoided.

Snow accumulation has been a subject of more recent discussions regarding vent terminals. However, snow accumulation was addressed in the NBS report. The NBS report found that while snow may completely cover the vent terminal, the snow eventually melts from the heated vapors emanating out of the vent. Prior to the snow melting, the NBS report found that the snow cover did not impact the performance of the vent. This makes sense since the purpose of the vent is to balance the pressure in the drainage system with atmospheric pressure. The snow cover is not dense enough to prevent the balancing of pressure in the piping system.

The current code requires the vent to terminate 6 inches above the anticipated snow cover. That requirement remains intact. However, when the vent is covered, such as by a solar panel or architectural feature, it cannot be covered by snow such that the vent doesn't perform properly. Thus, the vent could terminate at a 2 inch height above a sloped roof.

In the mountain west, shearing of the roof vent is a problem when the snow and ice melt and slide off of sloped roofs. By extending the vent higher through the roof, there is a greater force applied on the vent that can result in the pipe being sheared off. If the vent is lowered, the force on the vent during snow and ice slides is also lowered. This may reduce the shearing incidents of vent pipes. However, that is not part of the reason for lowering the vent terminal height. The vent would be protected if installed at a lower height. Hence, the snow and ice slides would have little to no impact on the vent since it is covered.

Plumbing contractors in the mountain west with heavy snow and ice accumulations have found that the more practical solution is to extend the vent through the roof closer to the peak of the roof. Thus, the force from sliding snow and ice is lowered. This has not been addressed in this code change and is more of a regional issue addressed by knowledgeable local contractors in the area.

The remaining issue that is not often addressed for vent terminals is the impact of wind. During windy conditions, the vent terminal can create a reduced pressure zone that siphons the trap seal. This is often called a Venturi effect. The other concern is downdrafts that can increase the pressure in the drainage system. However, downdrafts have not had a major impact on the drainage system based on the termination height above the roof. While the possibility exists that a lower vent termination height could result in higher wind downdrafts, this has not proven to be the case. However, the code requirement addresses downdrafts by requiring the covering to prevent any adverse impact from wind.

What the plumbing profession must acknowledge is that solar is a viable source of energy for a building. As such, accommodations must be made to allow for the maximum area of roof coverage with solar panels. This may require the adjustment in the height of the vent terminal. This section will also coordinate with the new requirements found in Chapter 9 on solar panels.

While accommodations must be made, there cannot be a sacrifice of public health. The lowering of the vent terminal to 2 inches on a sloped roof will not impact public health. This was proven by the NBS study published in 1954. Furthermore, modern building practices will result in a water tight vent terminal that will perform as intended.

**Cost Impact:** Will not increase the cost of construction  
This change provides options. As such, there is no cost implication.

P215-15 Part II :  
P3103.1-BALLANCO4130

---

## **Public Hearing Results**

### **Part II**

**Committee Action:** **Approved as Submitted**

**Committee Reason:** The committee agreed with the proponent's published reason statement.

**Assembly Action :** **None**

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : David Beahm, Warren County Virginia, representing Virginia Building Code Official Association and Virginia Plumbing and Mechanical Inspectors Association requests Disapprove.**

**Commenter's Reason:** The airflow over a covered vent pipe has not evaluated. Too short of vent pipe above the roof could invite entry by rodents. Vent piping is sometimes used for drain clearing so have covered vents would be a problem for that type of operation. Too short of vent might cause problems with roof flashing replacement.

#### *Public Comment 2:*

**Proponent : John LaTorra, representing Tri-Chapter Code Committee (jtlatorra@gmail.com) requests Disapprove.**

**Commenter's Reason:** The identical proposal in Part I was disapproved by the IPC Committee. Part II was approved as submitted by the IRC Plumbing Committee. If these actions were to be sustained, this would create a conflict between the IPC and the IRC Plumbing provisions. We are not aware of any reason why there should be a difference between the two codes in regards to plumbing vent terminations. We also support the reasons the IPC Committee disapproved this proposal. A 2" vent extension will not be adequate for many roof flashings available. A 2" vent extension may lead to increased entry by rodents. A 2" vent extension covered by a solar panel will probably increase the potential for nesting. A vent extension, particularly serving a water closet and covered by a solar panel, would eliminate a common opportunity for drain cleaning.

## Table 909.1 (New), 909.2

### Proposed Change as Submitted

**Proponent :** Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com)

## 2015 International Plumbing Code

Delete and substitute as follows:

TABLE 909.1  
MAXIMUM LENGTH OF FIXTURE DRAIN  
FROM FIXTURE TRAP TO VENT CONNECTION<sup>a,b</sup>  
(FEET)

Fixture drain pipe size (inches)	Vent connection at a horizontal drain pipe			Vent connection at a vertical drain pipe					
				Sanitary tee fitting fixture drain connection to the vertical drain pipe			Tee-wye fitting fixture drain connection to the vertical drain pipe <sup>c</sup>		
	Slope of fixture drain <sup>d</sup> (inches per foot)			Slope of fixture drain <sup>d</sup> (inches per foot)			Slope of fixture drain <sup>d</sup> (inches per foot)		
	<u>1/8</u>	<u>1/4</u>	<u>1/2</u>	<u>1/8</u>	<u>1/4</u>	<u>1/2</u>	<u>1/8</u>	<u>1/4</u>	<u>1/2</u>
1-1/4	NP	5	2.5	NP	3.5	2	NP	1.5	1
1-1/2	NP	6	3	NP	5	3	NP	4	2
2	NP	8	4	NP	6	4	NP	4.5	4
3	24	12	6	10	8	6	6	6	6
4	32	16	8	12	10	8	8	8	8

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 inch per foot = 83.3 mm/m.

a. Developed length.

b. NP = Not permitted

c. A tee-wye fitting is also known as a combination-wye-and-eight-bend fitting.

d. Fixture drain shall be at uniform slope.

### Delete without substitution:

**909.2 Venting of fixture drains.** The total fall in a *fixture drain* due to pipe slope shall not exceed the diameter of the *fixture drain*, nor shall the vent connection to a *fixture drain*, except for water closets, be below the weir of the trap.

**Reason:** When table 909.1 was revised, it only incorporated some of the provision in the report on self siphonage, BMS 126, published in 1951. The report identified that fixture could connect to tee wye fittings. However, the distance from trap to vent is greatly reduced. This change includes the allowance of a connection to a vertical drain through a tee wye. The other change that is necessary is to address when a pitch greater than ¼ inch per foot is used. The greater the pitch, the shorter the length between the trap and the vent. This table has been used in the State of Wisconsin for more than 20 years. The distances are consistent with the results of the self siphonage report from the National Bureau of Standards. Section 909.2 must be deleted to be consistent with the revised table. Otherwise, the connection to a tee wye would not be permitted.

**Cost Impact:** Will not increase the cost of construction  
This will reduce the cost of construction when a vent distance can be extended.

P217-15 : T909.2-BALLANCO3385

**Public Hearing Results**

**Committee Action:** **Disapproved**

**Committee Reason:** A "t-wye" designated fitting was introduced in this table but these fittings are not addressed in the code.

**Assembly Action :** None

**Individual Consideration Agenda**

*Public Comment 1:*

Proponent : **Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com)** requests Approve as Modified by this Public Comment.

**Modify as Follows:**

**2015 International Plumbing Code**

**TABLE 909.1  
MAXIMUM LENGTH OF FIXTURE DRAIN FROM FIXTURE TRAP TO VENT CONNECTION<sup>a,b</sup>  
(FEET)**

Fixture drain pipe size (inches)	Vent connection at a vertical drain pipe								
	Vent connection at a horizontal drain pipe			Sanitary tee fitting fixture drain connection to the vertical drain pipe			Tee-wye <u>Combination wye and eighth bend fitting</u> fixture drain connection to the vertical drain pipe <sup>c</sup>		
				Slope of fixture drain <sup>d,c</sup> (inches per foot)			Slope of fixture drain <sup>d,c</sup> (inches per foot)		
1/8	1/4	1/2	1/8	1/4	1/2	1/8	1/4	1/2	
1-1/4	NP	5	2.5	NP	3.5	2	NP	1.5	1
1-1/2	NP	6	3	NP	5	3	NP	4	2

2	NP	8	4	NP	6	4	NP	4.5	4
3	24	12	6	10	8	6	6	6	6
4	32	16	8	12	10	8	8	8	8

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 inch per foot = 83.3 mm/m.

- a. Developed length.
- b. NP = Not permitted
- c. ~~A tee-wye fitting is also known as a combination wye and eighth bend fitting.~~ Fixture drain at uniform slope.
- d. ~~Fixture drain at uniform slope.~~

**Commenter's Reason:** The Committee did not have a problem with the technical content of this change. The only concern was with the use of the term "tee-wye." The proposed modification address that concern by changing tee-wye to combination wye and eighth bend.

While some of the fitting standards use the term tee-wye for these types of fittings, other standards only identify the fitting as a combination wye and eighth bend. Since all standards use the term combination wye and eighth bend, this is the correct term to use in the table. Furthermore, this is the term used in the code.

P217-15

# P220-15 Part I

## 915.1

### **Proposed Change as Submitted**

**Proponent :** Billy Smith, American Society of Plumbing Engineers Legislative Committee, representing American Society of Plumbing Engineers Legislative Committee (bsmith@aspe.org)

**NOTE:** PART II DID NOT RECEIVE A PUBLIC COMMENT AND IS ON THE CONSENT AGENDA. PART II IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY FOLLOWING ALL OF PART I.

## **2015 International Plumbing Code**

### **Revise as follows:**

**915.1 Type of fixtures.** *A combination waste and vent system shall not serve fixtures other than floor drains, sinks, lavatories and drinking fountains. Combination waste and vent systems shall not receive the discharge from a ~~food waste disposer or~~ clinical sink.*

**Reason:** The American Society of Plumbing Engineers supports the efforts of the American Society of Plumbing Engineer Research Foundation (ASPE RF) regarding plumbing research to justify plumbing code requirements. The ASPE Legislative Committee reviewed the ASPE RF research regarding the impact of food waste disposers on combination waste and vent systems. Based on the technical findings of this research, there is no technical justification for placing a limitation on the discharge of food waste disposers to combination waste and vent systems. The Research Report of the findings has been published and is available for review on the ASPE website,  
[http://aspe.org/sites/default/files/webfm/ASPERF/rf\\_report\\_foodwaste.pdf](http://aspe.org/sites/default/files/webfm/ASPERF/rf_report_foodwaste.pdf)

The report is found under the Research Foundation heading. It would appear that the original limitation on food waste disposers was based on a perceived problem. Having researched the original code change, there was no research nor field problems identified to support the limitation. Without proper research or field experience, the limitation should not have been included in the code.

**Cost Impact:** Will not increase the cost of construction  
It's going to allow an installation that previously wasn't permitted thus lowering the cost of production.

P220-15 Part I : 915.1-  
SMITH4838

---

## **Public Hearing Results**

### **Part I**

The following is errata (the reason was omitted in publication). This was not posted on the ICC website :

**Reason:** The American Society of Plumbing Engineers

supports the efforts of the American Society of Plumbing Engineer Research Foundation (ASPE RF) regarding plumbing research to justify plumbing code requirements. The ASPE Legislative Committee reviewed the ASPE RF research regarding the impact of food waste disposers on combination waste and vent systems. Based on the technical findings of this research, there is no technical justification for placing a limitation on the discharge of food waste disposers to combination waste and vent systems. The Research Report of the findings has been published and is available for review on the ASPE website,

[http://aspe.org/sites/default/files/webfm/ASPERF/rf\\_report\\_foodwas](http://aspe.org/sites/default/files/webfm/ASPERF/rf_report_foodwas)

The report is found under the Research Foundation heading. It would appear that the original limitation on food waste disposers was based on a perceived problem. Having researched the original code change, there was no research nor field problems identified to support the limitation. Without proper research or field experience, the limitation should not have been included in the code.

(The remainder of the proposal is unchanged.)  
(Errata already incorporated into cdpACCESS.)

**Committee Action:**

**Disapproved**

**Committee Reason:** The proposal did not have a reason statement and there was not a link to the study provided.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com) requests Approve as Submitted.**

**Commenter's Reason:** The only reason for not accepting this change was that the supporting statement was missing from the cdpACCESS. However, an errata added the supporting statement.

Part 2 of this change was recommended for approval. The ASPE RF study proved that there is no reason for restricting the connection of food waste disposers to combination waste and vent systems.

#### *Public Comment 2:*

**Proponent : Max Weiss, representing Plumbing & Drainage Institute (max@weissresearch.net) requests Approve as Submitted.**

**Commenter's Reason:**

A committee member commented (testified from the dias) negatively to this proposal; the testimony offered from the dias was procedurally un rebuttable.

The testimony cited an ASPE Research Foundation study examining the effect of food waste disposer effect on trap seal in combination waste and vent connections. The testimony incorrectly reported the findings of that study.

There was no measurable effect on trap seal integrity with discharge from a food waste disposer. The report of the study is freely available at ASPE Research Foundation at

[www.aspe.org/sites/default/files/webfm/ASPE%20RF/rf\\_report\\_food%20waste.pdf](http://www.aspe.org/sites/default/files/webfm/ASPE%20RF/rf_report_food%20waste.pdf).

I conducted the study and I authored the study report. If scientific validity and engineering soundness are the hallmarks of code drafting, then there is no evidence to support a decision of "dissapprove". This proposal should be "Approved as Submitted."

Max Weiss, Executive Director  
Plumbing & Drainage Institute

**P220-15 Part I**

## **P220-15 Part II**

### **P3111.1**

#### **Proposed Change as Submitted**

**Proponent :** Billy Smith, American Society of Plumbing Engineers Legislative Committee, representing American Society of Plumbing Engineers Legislative Committee (bsmith@aspe.org)

### **2015 International Residential Code**

#### **Revise as follows:**

**P3111.1 Type of fixtures.** A combination waste and vent system shall not serve fixtures other than floor drains, sinks and lavatories. ~~A combination waste and vent system shall not receive the discharge of a food waste disposer.~~

**Reason:** The American Society of Plumbing Engineers supports the efforts of the American Society of Plumbing Engineer Research Foundation (ASPE RF) regarding plumbing research to justify plumbing code requirements. The ASPE Legislative Committee reviewed the ASPE RF research regarding the impact of food waste disposers on combination waste and vent systems. Based on the technical findings of this research, there is no technical justification for placing a limitation on the discharge of food waste disposers to combination waste and vent systems. The Research Report of the findings has been published and is available for review on the ASPE website,  
[http://aspe.org/sites/default/files/webfm/ASPERF/rf\\_report\\_foodwaste.pdf](http://aspe.org/sites/default/files/webfm/ASPERF/rf_report_foodwaste.pdf).

The report is found under the Research Foundation heading. It would appear that the original limitation on food waste disposers was based on a perceived problem. Having researched the original code change, there was no research nor field problems identified to support the limitation. Without proper research or field experience, the limitation should not have been included in the code.

**Cost Impact:** Will not increase the cost of construction  
It's going to allow an installation that previously wasn't permitted thus lowering the cost of production.

**None**

# P221-15 Part I

**915.1, 915.2, 915.2.1, 915.2.2, 915.2.3, 915.2.4, 915.2.5, 915.1.1 (New)**

## **Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

**NOTE:** PART II DID NOT RECEIVE A PUBLIC COMMENT AND IS ON THE CONSENT AGENDA. PART II IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY FOLLOWING ALL OF PART I.

## **2015 International Plumbing Code**

### **Revise as follows:**

**915.1 Type of fixtures.** ~~A combination waste and vent system shall not only serve fixtures other than floor drains, sinks, lavatories and drinking fountains.~~ A combination waste and vent system shall be considered to be the vent for those fixtures. The developed length of a fixture drain to the combination waste and vent system piping shall not exceed the limitations of Table 909.1. ~~Combination waste and vent systems shall not receive the discharge from a food waste disposer or clinical sink.~~

**915.2 Installation.** The only vertical pipe of a *combination waste and vent system* shall be the connection between ~~the~~ a fixture drain and ~~the~~ a horizontal combination waste and vent pipe. The length of the vertical distance pipe shall not exceed 8 feet (2438 mm).

**915.2.1 Slope.** The slope of a horizontal combination waste and vent ~~pipe piping~~ shall not exceed one-half unit vertical in 12 units horizontal (4-percent slope) and shall not be less than that indicated in Table 704.1.

**915.2.2 Size and length.** The size of a combination waste and vent ~~pipe piping~~ shall be not less than that indicated in Table 915.2.2. The horizontal length of a *combination waste and vent system* shall be unlimited.

**915.2.3 Connection Vent connection.** ~~The~~ A combination waste and vent system shall be provided with a dry vent connected at any point within the system or the system shall connect to a horizontal drain or building drain, that serves vented fixtures located on the same floor. *Combination waste and vent systems* connecting to building drains receiving only the discharge from one or more stacks shall be provided with a dry vent. The dry vent connection ~~connected~~ to the combination waste and vent pipe shall extend vertically to a point not less than 6 inches (152 mm) above the flood level rim of the highest fixture being vented by the combination waste and vent system before ~~offsetting horizontally.~~ horizontal offsets in the dry vent piping are allowed.

**915.2.4 Vent size.** The dry vent connected to the combination waste and vent system shall be sized for the total *drainage fixture* unit load in accordance with Section 906.2.

### **Delete without substitution:**

~~**915.2.5 Fixture branch or drain.** The *fixture branch* or *fixture drain* shall connect to the combination waste and vent within a distance specified in Table 909.1. The combination waste and vent pipe shall be considered the vent for the fixture.~~

**Add new text as follows:**

**915.1.1 Single fixture systems.** A horizontal *fixture drain* shall be considered to be a *combination waste and vent system* provided that the *fixture drain* size complies with Table 915.2.2.

**Reason:** The primary reason for this proposal is to add new Section 915.1.1 to cover the very special situation of a single fixture combination waste and vent system.

Consider a 2 inch floor drain which, by definition, has a 2 inch trap. Where the floor drain is an emergency floor drain, Table 709.1 indicates that the dfu value is zero. Where the floor drain is not emergency floor drain, Table 709.1 indicates that the dfu value is 2. Where the floor drain is intended to receive only clear-water waste from certain types of equipment, Section 709.4.1 (through note h of Table 709.1), the dfu value is 1/2. For this example, consider that the floor drain is a 2 dfu value. Now review Table 915.2.2 and determine that a 2 inch combination waste and vent pipe can accommodate up to 3 dfu. Therefore, the 2 inch pipe from the trap of the 2 inch floor drain can be its own combination waste and vent system.

However, this is not readily apparent from existing language especially when reading existing Section 915.2.5. That section seems to indicate that the length of a fixture drain to its vent connection is always limited by the trap-to-vent distances in Table 909.1. The piping from any fixture trap to the vent connection is limited in length so that the vent connection is not below the trap weir (see Section 909.1). Table 909.1 reflects the maximum length of the fixture drain at the indicated slopes so Section 909.1 is not violated. But where the fixture drain is "oversized" according to the requirements for a combination waste and vent system, then the limit on fixture drain length for these single fixture applications is meaningless. The fixture trap cannot siphon because the pipe is oversized for the intended dfu going into the drain.

For a better flow of requirements, Section 915.2.5 was merged into Section 915.1. This was important in order to move the requirement for meeting Table 909.1 before new Section 915.1.1 to make that new section make sense.

Several minor changes were made to other sections including changing pipe to piping. Pipe implies a section of pipe without fittings. A combination waste and vent system can have horizontal bends. Some have misinterpreted that "pipe" meant that a CWV system only was allowed as a "straight run" system.

Another small but important change is in 915.2. Here, pipe really does mean pipe as in a straight run of pipe in vertical direction. Adding words to the last sentence will hopefully reinforce that it is not just the distance of 8 feet but a vertical pipe not longer than 8 feet. Note the definition for VERTICAL PIPE in chapter 2. A vertical pipe could have vertical offsets and still be considered vertical.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 18.

**Cost Impact:** Will not increase the cost of construction  
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

P221-15 Part I : 915.1-  
SNYDER5947

---

## **Public Hearing Results**

### **Part I**

**Committee Action:**

**Disapproved**

**Committee Reason:** The committee prefers the current code text. The proposed version doesn't add anything to the code.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Janine Snyder, representing Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org) requests Approve as Submitted.**

**NOTE:** PART II DID NOT RECEIVE A PUBLIC COMMENT AND IS ON THE CONSENT AGENDA. PART II IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY FOLLOWING ALL OF PART I.

**Commenter's Reason:** Part II was approved for the International Residential Code. This proposal needs to be approved for continuity between the two plumbing codes. The Committee's reason statement appears to acknowledge (by absence of any negative comment) that a single fixture drain can be considered a horizontal waste and vent. The code words are not exceptionally clear about this special case so it is necessary to have the Combination Waste and Vent section include this language.

**P3111.1, P3111.1.1 (New), P3111.2, P3111.2.1,  
P3111.2.2, P3111.2.3, P3111.2.4, P3111.3**

### **Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

## **2015 International Residential Code**

### **Revise as follows:**

**P3111.1 Type of fixtures.** A combination waste and vent system shall ~~not~~ only serve fixtures other than floor drains, sinks, lavatories and lavatories drinking fountains. A combination waste and vent system shall be considered to be the vent for those fixtures. The developed length of a fixture drain to the combination waste and vent system piping shall not exceed the limitations of Table P3105.1. Combination waste and vent systems shall not receive the discharge of ~~from~~ a food waste disposer.

### **Add new text as follows:**

**P3111.1.1 Single fixture systems.** A horizontal fixture drain shall be considered to be a combination waste and vent system provided that the fixture drain size complies with P3105.1.

### **Revise as follows:**

**P3111.2 Installation.** The only vertical pipe of a combination waste and vent system shall be the connection between ~~the~~ a fixture drain and ~~the~~ a horizontal combination waste and vent pipe. The length of the vertical distance pipe shall be not greater than 8 feet (2438 mm).

**P3111.2.1 Slope.** The slope of a horizontal combination waste and vent pipe piping shall have a slope of be not greater than  $1/2$  unit vertical in 12 units horizontal (4-percent slope). ~~The minimum slope and shall not be less than that indicated in accordance with Section P3005.3~~ P3005.2.

**P3111.2.2 Connection Vent connection.** The ~~A~~ combination waste and vent system shall be provided with a dry vent connected at any point within the system or the system shall connect to a horizontal drain or building drain, that serves vented fixtures located on the same floor. Combination waste and vent systems connecting ~~to building drains~~ receiving only the discharge from one or more stacks shall be provided with a dry vent. The dry vent connection connected to the combination waste and vent pipe shall extend vertically to a point not less than 6 inches (152 mm) above the flood level rim of the highest fixture being vented by the combination waste and vent system before offsetting horizontally. horizontal offsets in the dry vent piping are allowed.

**P3111.2.3 Vent size.** The dry vent connected to the combination waste and vent system shall be sized for the total drainage fixture unit load in

accordance with Section ~~P3113.1~~ P3111.1.

**Delete without substitution:**

~~**P3111.2.4 Fixture branch or drain.** The fixture branch or fixture drain shall connect to the combination waste and vent within a distance specified in Table P3105.1. The combination waste and vent pipe shall be considered the vent for the fixture.~~

**Revise as follows:**

**P3111.3 Size and length.** The size of a combination drain and vent pipe piping shall be not less than that specified in Table 3111.3. The horizontal length of a combination drain and vent system shall be unlimited.

**Reason:** The primary reason for this proposal is to add new Section P3111.1.1 to cover the very special situation of a single fixture combination waste and vent system.

Consider a 2 inch floor drain which by definition has a 2 inch trap. Where the floor drain is an emergency floor drain, Table P3004.1 indicates that the dfu value is zero. Where the floor drain is not emergency floor drain, note b indicates the dfu unit value is the summation of dfu discharging to the floor drain. For this example, consider that the floor drain is a 2 dfu value. Now review Table P3111.3 and determine that a 2 inch combination waste and vent pipe can accommodate up to 3 dfu. Therefore, the 2 inch pipe from the trap of the 2 inch floor drain can be its own combination waste and vent system.

However, this is not readily apparent from existing language especially when reading existing Section P3111.2.4. That section seems to indicate that the length of a fixture drain to its vent connection is always limited by the trap-to-vent distances in Table P3105.1. The piping from any fixture trap to the vent connection is limited in length so that the vent connection is not below the trap weir (see Section P3105.2). Table P3105.1 reflects the maximum length of the fixture drain at the indicated slopes so Section P3105.2 is not violated. But where the fixture drain is "oversized" according to the requirements for a combination waste and vent system, then the limit on fixture drain length for these single fixture applications is meaningless. The fixture trap cannot siphon because the pipe is oversized for the intended dfu going into the drain.

For a better flow of requirements, Section P3111.2.4 was merged into Section P3111.1. This was important in order to move the requirement for meeting Table P3105.1 before new Section P3111.1 to make that new section make sense.

Several minor changes were made to other sections including changing pipe to piping. Pipe implies a section of pipe without fittings. A combination waste and vent system can have horizontal bends. Some have misinterpreted that "pipe" meant that a CWV system only was allowed as a "straight run" system.

Another small but important change is in P3111.2. Here, pipe really does mean pipe as in a straight run of pipe in vertical direction. Adding words to the last sentence will hopefully reinforce that it is not just the distance of 8 feet but a vertical pipe not longer than 8 feet. Note the definition for VERTICAL PIPE in chapter 2. A vertical pipe could have vertical offsets and still be considered vertical.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes. This is PMGCAC Item 18.

**Cost Impact:** Will not increase the cost of construction  
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code.

# P231-15

413.1, 413.3, 1003.3.1

## Proposed Change as Submitted

**Proponent :** Julius Ballanco, JB Engineering and Code Consulting, P.C., representing InSinkErator (JBENGINEER@aol.com)

### 2015 International Plumbing Code

**Revise as follows:**

**413.1 Approval.** Domestic food waste disposers shall conform to ASSE 1008. Domestic and commercial food waste disposers shall be listed and labeled in accordance with UL 430. Food waste disposers shall not increase the *drainage fixture unit* load on the sanitary drainage system.

**413.3 Commercial food waste disposer waste outlets.** Commercial food waste disposers shall be connected to a drain not less than 1<sup>1</sup>/<sub>2</sub> inches (38 mm) in diameter. Commercial food waste disposers shall be directly connected and trapped separately from any other fixtures or sink compartments.

**1003.3.1 Grease interceptors and automatic grease removal devices required.** A grease interceptor or automatic grease removal device shall be required to receive the drainage from fixtures and equipment with greaseladen waste located in food preparation areas, such as in restaurants, hotel kitchens, hospitals, school kitchens, bars, factory cafeterias and clubs. Fixtures and equipment shall include pot sinks, prerinse sinks; soup kettles or similar devices; wok stations; floor drains or sinks into which kettles are drained; automatic hood wash units and dishwashers without prerinse sinks. Commercial food waste disposers shall not be required to discharge to a grease interceptor or to an automatic grease removal device. Grease interceptors and automatic grease removal devices shall receive waste only from fixtures and equipment that allow fats, oils or grease to be discharged. Where lack of space or other constraints prevent the installation or replacement of a grease interceptor, one or more grease interceptors shall be permitted to be installed on or above the floor and upstream of an existing grease interceptor.

**Reason:** This change merely clarifies the requirements for commercial food waste disposers. Chapter 3 already requires food waste disposers to be listed and labeled. When UL 430 was added during the last code change cycle, it was only added as a reference to domestic food waste disposers. However, the standard also regulates commercial food waste disposers.

Food waste disposers are required to connect directly to the drainage system. There have been incidents whereby there was a misinterpretation of Chapter 8 and food waste disposers were required to discharge indirectly to the drainage system because they are located in a food handling establishment. By adding the word "directly" there will not be such misinterpretation.

Finally, there have been occasions where there has been a misinterpretation of Section 1003.3.1, whereby health inspectors required grease interceptors to discharge through a grease interceptor. By adding a sentence to this section, it clarifies that this is not required by this section. The added sentence could also be converted to an exception.

**Cost Impact:** Will not increase the cost of construction  
This proposal adds clarity to the code. There is no change that impacts cost of installation.

P231-15 : 1003.3.1-  
BALLANCO3808

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** Solids are a larger source of fats, oils and greases and routing this flow around the grease interceptor would be in violation of EPA mandates. Lack of maintenance of a solids interceptor is not a sufficient reason for routing food waste disposer flow around a grease interceptor.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com) requests Approve as Submitted.**

**Commenter's Reason:** This change is necessary to coordinate with Code Change P233-15. The Committee recommended approval of P233-15, which prohibits food waste disposers from discharging through grease interceptors

#### *Public Comment 2:*

**Proponent : Max Weiss, representing Plumbing & Drainage Institute (max@weissresearch.net) requests Approve as Submitted.**

**Commenter's Reason:** There is no single credible peer reviewed scientific, engineering study supporting piping food waste solids to a grease interceptor. There are many illustrating the benefit of food waste carbon sources at waste water treatment plants. Engineering studies on the effects of ground food wastes in the collection system cite no significant deleterious effects. [New York City; Hokaido, Japan].

Discharging solids to an interceptor violates the design purpose and certifications of a grease interceptor. There is no benefit to the collection system from requiring a commercial food waste grinder to discharge to a grease interceptor. Quite the opposite. Food wastes stored in the anaerobic environment of a grease interceptor impart more harm to the collection system than if no interceptor was present at all.

FOG content of food waste solids is about equal to human feces [20%]. However, because it is not in a free-floating state, adhesion / cohesion characteristics are not the same as free-floating FOG, for which interceptors are designed and flow with little difference than feces in the collection system.

Food solids decomposition quickly consumes entrained oxygen. When oxygen levels fall, anaerobic organisms flourish, greatly accelerating the production of hydrogen

sulfide. Hydrogen sulfide, being a gas, rises to the headspace in the interceptor where aerobic organisms reduce the hydrogen sulfide to elemental sulfuric acid increasing both air water interface "halo" corrosion and subsurface corrosion.

Food wastes do not belong in a grease interceptor by any application of sound engineering.

Max Weiss, Executive Director  
Plumbing & Drainage Institute

### *Public Comment 3:*

**Proponent : Ken Loucks, Schier Products Company, representing Schier Products Company (ken.loucks@schierproducts.com) requests Disapprove.**

**Commenter's Reason:** There are multiple issues addressed with this proposal that should have been separated into at least two separate proposals. First under 413.1 the proposal clarifies that both domestic and commercial food waste disposal units should meet UL 430, which is a good idea. Second, though, under 1003.3.1 the proposal attempts to exempt food waste disposal units from being routed to a grease interceptor. This is in conflict with many pretreatment programs that require food waste disposal units to be routed through a grease interceptor, setting up a conflict between the plumbing code and pretreatment requirements, which the proponent actually acknowledged in his reason statement. Also, this change would require technical support as to why a food waste disposal unit should not be routed to a grease interceptor, something which the proponent failed to provide. Also, the proposal to add the language regarding food waste disposers under 1003.3.1 is the wrong place since the code contains a subsection (1003.3.2) specifically dealing with food waste disposers (food waste grinders). A change in language here would potentially conflict with requirements under subsection 1003.3.2.

---

P231-15

# P233-15

## 1003.3.2

### **Proposed Change as Submitted**

**Proponent :** Julius Ballanco, JB Engineering and Code Consulting, P.C., representing InSinkErator (JBENGINEER@aol.com)

## **2015 International Plumbing Code**

**Revise as follows:**

**1003.3.2 Food waste disposers restriction.** ~~Where A food waste disposers connect to grease interceptors, a solids interceptor shall separate the discharge before connecting to the grease interceptor. Solids interceptors and grease interceptors shall be sized and rated for the discharge of the food waste disposers. Emulsifiers, chemicals, enzymes and bacteria disposer shall not discharge into the food waste disposer. to a grease interceptor.~~

**Reason:** It has been well established that food waste from a disposer must not discharge through a grease interceptor. If food waste passes through a grease interceptor, it greatly reduces the efficiency of the interceptor. Food waste decomposition in a grease interceptor will dramatically increase the oxygen consumption. The food waste will also drop the pH, increase corrosion, and increase the hydrogen sulfide production. The only means of preventing this occurrence is to not have the food waste disposer discharge to the grease interceptor. Using a solids interceptor before a grease interceptor is not a viable solution. The solids interceptor will continually fill up with food waste requiring maintenance. In a food handling establishment, this maintenance could be hourly.

A food waste disposer must discharge directly to the sanitary drainage system. This code change will result in such a requirement.

**Cost Impact:** Will not increase the cost of construction  
This identifies a limitation on the discharge of food waste disposers through grease interceptor. By properly connecting the food waste disposer, the cost will be less because of material savings.

P233-15 : 1003.3.2-

### **Individual Consideration Agenda**

## *Public Comment 1:*

**Proponent : Max Weiss, representing Plumbing & Drainage Institute (max@weissresearch.net) requests Approve as Submitted.**

**Commenter's Reason:** There is no single credible peer reviewed scientific, engineering study supporting piping food waste solids to a grease interceptor. There are many illustrating the benefit of food waste carbon sources at waste water treatment plants. Engineering studies on the effects of ground food wastes in the collection system cite no significant deleterious effects. [New York City; Hokaido, Japan].

Discharging solids to an interceptor violates the design purpose and certifications of a grease interceptor. There is no benefit to the collection system from requiring a commercial food waste grinder to discharge to a grease interceptor. Quite the opposite. Food wastes stored in the anaerobic environment of a grease interceptor impart more harm to the collection system than if no interceptor was present at all.

FOG content of food waste solids is about equal to human feces [20%]. However, because it is not in a free-floating state, adhesion / cohesion characteristics are not the same as free-floating FOG, for which interceptors are designed and flow with little difference than feces in the collection system.

Food solids decomposition quickly consumes entrained oxygen. When oxygen levels fall, anaerobic organisms flourish, greatly accelerating the production of hydrogen sulfide. Hydrogen sulfide, being a gas, rises to the headspace in the interceptor where aerobic organisms reduce the hydrogen sulfide to elemental sulfuric acid increasing both air water interface "halo" corrosion and subsurface corrosion.

Food wastes do not belong in a grease interceptor by any application of sound engineering.

Max Weiss, Executive Director  
Plumbing & Drainage Institute

## *Public Comment 2:*

**Proponent : Ken Loucks, Schier Products Company, representing Schier Products Company (ken.loucks@schierproducts.com) requests Disapprove.**

**Commenter's Reason:** This proposal would mandate that the effluent from a food waste disposer be routed directly to the sanitary system. The proponent argues:  
1. "It has been well established that food waste from a disposer must not discharge through a grease interceptor."

Rebuttal: This statement lacks technical support. Where has it been "well established"? If there are studies that support the argument they should have been submitted as a part of the proposal.

2. "If food waste passes through a grease interceptor, it greatly reduces the efficiency of the interceptor. Food waste decomposition in a grease interceptor will dramatically increase the oxygen consumption. The food waste will also drop the pH, increase corrosion, and increase the hydrogen sulfide production. The only means of preventing this occurrence is to not have the food waste disposer discharge to the grease interceptor."

Rebuttal: The current language in the plumbing code under section 1003.3.2 mandates that, "where food waste grinders connect to grease interceptors, a solids interceptor shall separate the discharge before connecting to the grease interceptor." This undermines the argument made by the proponent. If the food waste is not allowed to build up in the interceptor then the interceptor would not experience the negative effects suggested by the proponent. Also, the proponent is making a technical argument with regard to the effects of food waste buildup inside a grease interceptor without having provided any industry studies or reports that would support the argument. Furthermore, the proponent failed to address what the effects of discharging food waste from a food waste disposal unit would have on a wastewater collection system. Many jurisdictions around the country object to the suggestion that food waste from food waste disposal units do not have a deleterious effect on wastewater collection systems. This is a very important issue which should have been addressed as part of such a significant change to the plumbing code.

3. "Using a solids interceptor before a grease interceptor is not a viable solution. The solids interceptor will continually fill up with food waste requiring maintenance. In a food handling establishment, this maintenance could be hourly."

Rebuttal: A solids interceptor is a very acceptable solution to preventing a grease interceptor from filling up with food waste from a food waste disposal unit. Of course, a solids interceptor will have to be maintained as it fills up. How often it will have to be maintained would be in direct correlation to how large the solids interceptor is. The proponent fails to acknowledge that a food handling establishment may choose other options than "hourly" maintenance of the solids interceptor, which could also include installing a larger solids interceptor, redirecting food scraps to something other than the food waste disposal unit or not installing a food waste disposal unit in the first place.

The current language in the plumbing code is superior to the language in this proposal.

---

**P233-15**

# P234-15

## 1003.3.2, 1003.3.3 (New)

### Proposed Change as Submitted

**Proponent :** JEFFREY HUTCHER, cleanblu, representing Cleanblu (jhutcher@pacbell.net)

## 2015 International Plumbing Code

### Revise as follows:

**1003.3.2 Food waste disposers.** Where food waste disposers connect to grease interceptors, a solids interceptor shall separate the discharge before connecting to the grease interceptor. Solids interceptors and grease interceptors shall be sized and rated for the discharge of the food waste disposers. ~~Emulsifiers, chemicals, enzymes and bacteria shall not discharge into the food waste disposer. \_~~

### Add new text as follows:

**1003.3.3 Additives to grease interceptors.** Dispensing systems that dispense interceptor performance additives to grease interceptors shall not be installed except where such systems dispense microbes for the enhancement of aerobic bio remediation of grease and other organic material, or for inhibiting growth of pathogenic organisms by anaerobic methods. Such microbial dispensing systems shall be installed only where the grease interceptor manufacturer's instructions allow such systems and the systems conform to ASME A112.14.6. Systems that discharge emulsifiers, chemicals or enzymes to grease interceptors shall be prohibited.

**Reason:** Section 1003.3.2 is outdated and ignores the advances of new technology. To include bacteria in the prohibition is not only ignoring science, it is akin to prohibiting electricity as an energy solution. bioremediation is the sole mechanism of ALL waste water treatment plants and nature's way to handle waste. Enzymes and microbes are not the same. Enzymes are dead strings of protein that disperse grease and is a common additive in dish soap. Microbes are lifeforms that eat and digest waste. Microbes can be blended (not altered) to feed on grease, sulfur, while inhibiting the growth of pathogens and other harmful organisms. Waste water treatment depends on microbes and would simply cease to function without them ; So would the human body. Yeast are microbes too. It makes our bread rise, they give us beer, wine and cheese. They are not additives. It's impossible not to have microbes in any establishment. Using Microbes in point source pollution control is enhancing already naturally occurring bacteria and introducing them to their food source. Just like yeast, the by-products are Carbon Dioxide and water. Systems designed to use aerobic Microbes are now listed and meet ASME A112.4.6, using the rigorous EPA test protocol 1664. There is no reason to exclude them in point source pollution control. Exclusion of microbial treatment would be irresponsible, unnatural and dangerous to human and animal health.

**Cost Impact:** Will not increase the cost of construction  
The microbe dispensing systems are optional and therefore, there is no additional cost of material or labor. The new section simply allows these optional systems to be installed as long as they comply with the requirements indicated by the section.

P234-15 : 1003.3.2-  
HUTCHER4455

## Public Hearing Results

**Committee Action:**

**Approved as Submitted**

**Committee Reason:** This treatment protocol exists in the standard and is being used in the California area.

**Assembly Motion:**

**Disapprove**

**Online Vote Results:**

**Successful**

Support: 61.59% (93) Oppose: 38.41% (58)

**Assembly Action :**

**Disapproved**

---

### Individual Consideration Agenda

#### *Public Comment 1:*

**Proponent : Markus Lenger, representing CleanBlu Inc. (markuslenger@cleanblu.com) requests Approve as Submitted.**

**Commenter's Reason: Regarding P 234-15**

Having served on the ASME A112.14.6 Standard Committee I can confirm that bioremediation was included in the standard. It can be found under Grease Disposal Units in the UPC and some products have already attained UPC listing for such devices.

Bioremediation of FOG is a proven science and is no longer considered novel. Montage Hotels & Resorts in Laguna Beach has successfully bioremediated their commercial kitchen effluent for the last 11-years, reducing operating costs, virtually eliminating pumping and eradicating the production of greenhouse gases.

In order to keep codes and standards current these newer technologies must be examined regularly and diligently.

#### *Public Comment 2:*

**Proponent : Assembly Action requests Disapprove.**

**Commenter's Reason:** This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. The assembly action for Disapprove was successful by a vote of 61.59% (93) to 38.41% (58) by eligible members online during the period of May 14 - May 28, 2015.

#### *Public Comment 3:*

**Proponent : Max Weiss, representing Plumbing & Drainage Institute (max@weissresearch.net) requests Disapprove.**

**Commenter's Reason:** The use of additives (chemical or bio-chemical) in grease interceptors to effect benefit to the collection system or interceptor is not supported by sound scientific evidence. There is a plethora of studies concluding negative to no measurable effect.

Proponent cited, through a committee member for which a formal ethics complaint was registered, the standard ASME A112.14.6 [FOG Disposal Systems] in support of the use of additives in grease interceptors. Billy Smith, IPC Committee Member and I authored that standard; I serve on the ASME A112.14.6 FOG Disposal Systems Project Team at this time.

That citation was completely false in its content and out of context in its application. A112.14.6 FOG Disposal Systems refers to engineered systems which utilize, electrical, thermal, electrochemical, chemical, or bio-chemical means to reduce mass and volume of the triglyceride molecule that comprises FOG. Such systems are engineered reactors designed and certified for the stated purpose. In the case of bio-chemical application of the method, the device is a fixed-film reactor containing many thousands of square feet of substrate by which to support an engineered biofilm.

Virtually every jurisdiction in the U.S. and abroad have prohibitions against what this proposal presents. Under no circumstances does ASME A112.14.6 FOG Disposal Systems provide legitimization of additives in interceptors, or any other element of a standard drainage system.

Max Weiss, Executive Director  
Plumbing & Drainage Institute

**P234-15**

# P243-15

## 1102.6, Chapter 14

### Proposed Change as Submitted

**Proponent :** Billy Smith, American Society of Plumbing Engineers Legislative Committee, representing American Society of Plumbing Engineers Legislative Committee (bsmith@aspe.org)

## 2015 International Plumbing Code

### Revise as follows:

**1102.6 Roof Drains.** Roof drains shall conform to ASME A112.6.4 or ASME A112.3.1. Roof drains shall be tested and rated in accordance with ASPE/IAPMO Z1034.

### Add new standard(s) as follows:

ASPE/IAPMO Z1034-2015 Test Method for Evaluating Roof Drain Performance

**Reason:** ASPE/IAPMO Z1034 is the new consensus standard for testing and rating roof drains for their flow rate. The current code requires the manufacturer to publish their flow rates. The flow rates are determined by testing to this standard. The testing requirements in the standard are consistent with the results published in the ASPE Research Foundation Roof Drainage Research Report. The standard also allows flexibility in design to allow manufacturers to develop their own test rig for certifying their roof drains.

**Cost Impact:** Will increase the cost of construction  
There are already cost associated with testing of roof drains. However, this being a new consensus standard, cost could increase.

**Analysis:** A review of the standard proposed for inclusion in the code, ASPE/IAPMO Z1034-2015, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

P243-15 : 1102.6-  
SMITH5403

---

## Public Hearing Results

### Committee Action:

**Disapproved**

**Committee Reason:** This proposal will severely restrict the selection of drains that can be used as only a few manufacturers have starting testing. ASME A112.6.4 is being revised and will include performance testing requirements so all manufacturers will have to comply as part of the compliance to this drain standard.

**Analysis.** For staff analysis of the content of ASPE/IAPMO Z1034 with regard to the ICC criteria for referenced standards (Section 3.6 of CP #28), please visit: <http://www.iccsafe.org/wp-content/uploads/2015-Proposed-Standards-Group-A-Final.pdf>

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com) requests Approve as Submitted.**

**Commenter's Reason:** This standard is a new standard published within the last year. As a result it takes time for manufacturers to have their products tested to this standard. However, this code will not be published until 2018. Then jurisdictions will have to adopt the code. Hence, the manufacturers have three years to have all their roof drains tested. This is adequate time since the testing only takes a matter of minutes, not days, weeks, or months.

In order for the roof drainage system to be sized according to the new methodology in the 2015 code, the information on the flow rate through a roof drain is necessary. This is already required in the code. The reference to the new standard will merely provide a consistent means of evaluating all manufacturers. That is the purpose of this standard.

This change must be adopted in order to properly size roof drainage systems.

## P245-15

1106.1, 1106.2, 1106.2.1 (New), Table 1106.2.1 (New), 1106.2.1.1 (New), 1106.2.1.2 (New), 1106.2.2 (New), 1106.2.2.1 (New)

### Proposed Change as Submitted

**Proponent :** Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com)

## 2015 International Plumbing Code

Revise as follows:

**1106.1 General.** The size of the vertical conductors and leaders, building *storm drains*, building storm *sewers* and any horizontal branches of such drains or *sewers* shall be based on the 100-year hourly rainfall rate indicated in Figure 1106.1 or, on other rainfall rates determined from approved local weather data or, where an engineered roof drainage piping system is used, in accordance with the rainfall rates indicated in Section 1106.2.2.

**1106.2 Size of storm drain drainage piping.** ~~Vertical and horizontal storm drain~~  
Storm drainage piping shall be sized based on the flow rate through the roof drain. The flow rate in *storm drain* piping shall not exceed that specified in Table 1106.2.2. ~~accordance with Section 1106.2.1 or Section 1106.2.2.~~

Add new text as follows:

**1106.2.1 Roof drainage.** The stormwater drainage flow rate from a roof surface shall be in accordance with Table 1106.2.1 using a rainfall rate of a 60 minute duration storm of 100 year return period and the horizontal projected area of the roof. Stormwater drainage flow from a roof surface through secondary (emergency) roof drainage means shall not be considered when determining the flow rate for the primary storm drainage piping system.

**TABLE 1106.2.1  
ROOF DRAINAGE FLOW RATE**

Roof Drainage Area (sq ft)	Drainage Flow Rate (gpm)					
	Based on Rainfall Rates (in/hr)					
	1	2	3	4	5	6
500	5	10	16	21	26	31
1000	10	21	31	42	52	62
1500	16	31	47	62	78	94
2000	21	42	62	83	104	125

<u>7500</u>	<u>78</u>	<u>156</u>	<u>234</u>	<u>312</u>	<u>390</u>	<u>468</u>
<u>8000</u>	<u>83</u>	<u>166</u>	<u>249</u>	<u>332</u>	<u>416</u>	<u>499</u>
<u>9000</u>	<u>94</u>	<u>187</u>	<u>281</u>	<u>374</u>	<u>468</u>	<u>561</u>
<u>10000</u>	<u>104</u>	<u>208</u>	<u>312</u>	<u>416</u>	<u>519</u>	<u>623</u>
<u>11000</u>	<u>114</u>	<u>229</u>	<u>343</u>	<u>457</u>	<u>571</u>	<u>686</u>
<u>12000</u>	<u>125</u>	<u>249</u>	<u>374</u>	<u>499</u>	<u>623</u>	<u>748</u>

**1106.2.1.1 Roof drain.** The roof drain shall have a manufacturer's published flow rate greater than or equal to the stormwater drainage flow rate determined in Section 1106.2.1. The flow rate used for sizing the roof drainage system shall be the roof drain manufacturer's published flow rate based at a head height of 4 inches (102 mm) of water ponding. Roof drainage piping shall be sized in accordance with Table 1106.2.

**1106.2.1.2 Elevation of secondary roof drainage means .** The bottom of the opening for secondary (emergency) roof drainage means shall be not less than 2 inches (51 mm) and not more than 3 inches (76 mm) higher than the lowest opening of the primary roof drain served by the secondary (emergency) roof drainage means.

**1106.2.2 Engineered roof drain flow rate.** Vertical and horizontal storm drain piping shall be sized based on the flow rate through the roof drain. The flow rate through a roof drain shall be based on the maximum anticipated height of water ponding above the roof drain that serves a roof area subjected to a rainfall rate of a 60-minute duration storm of 100-year return period and a 5-minute duration storm of 10-year return period. The flow rate through a roof drain shall be determined from the specific roof drain manufacturer's published flow rate at the maximum anticipated height of water ponding. The size of storm drainage piping from the roof drains to the termination of the storm drainage piping system shall be not less than the sizes indicated in Table 1106.2. The maximum anticipated height of water ponding above a roof drain and the stormwater drainage flow from a roof surface shall not include the effects of storm water drainage through any secondary (emergency) roof drainage means.

**1106.2.2.1 Elevation of secondary roof drainage means.** The bottom of the opening for secondary (emergency) roof drainage means shall be not less than 2 inches (51 mm) higher that the lowest opening of the primary roof drain served by the secondary (emergency) roof drainage means.

**Reason:** ASPE Research Foundation and IAPMO cosponsored research on the performance of roof drains in storm drainage system. The code change further updates the code requirements based on the recommendations in the ASPE RF report. The research report states the problem and the justification for this change. The research report is included with the submittal and can be downloaded at no cost at [www.aspe.org](http://www.aspe.org).

The only difference between this change and the recommendation in the ASPE RF report is the first methodology for sizing a storm drainage system in proposed Section 1106.2.1. These requirements were developed to provide a cook-book method of sizing rather than conducting a proper engineering design. As a result, this sizing method takes a very conservative approach to sizing the

drainage piping. The drainage piping will be equal to or larger than the pipe size when using the engineered design.

The sizing of the storm drainage system still relies on the values published by the roof drain manufacturers. This data identifies the flow rate based on head height through the roof drain.

Another addition to the engineered sizing requirement is the evaluation of the roof drainage system for a microburst. While a 100 year storm may appear to be the most drastic storm for sizing a system, a microburst can overpower the storm drainage piping resulting in failure of the piping system. The microburst will typically not have a significant impact on the roof loading compared to a 100 year storm of 60 minute duration.

**Bibliography:** Storm Drainage System Research Project, Flow Through Roof Drains, Ballanco, 2012, Copyright American Society of Plumbing Engineers Research Foundation

**Cost Impact:** Will not increase the cost of construction

This change only adds an optional design method. While the new method will increase the cost of construction, it is not a mandated design. If the engineered design is selected, the cost remains neutral.

P245-15 : 1106.1-BALLANCO3687

---

## **Public Hearing Results**

### **Committee Action:**

**Disapproved**

**Committee Reason:** This is a significant deviation from the flow rates that were put into the 2015 IPC. The committee is not sure why this new set of flow rates is necessary.

### **Assembly Action :**

None

---

## **Individual Consideration Agenda**

### ***Public Comment 1:***

Proponent : **Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com) requests Approve as Modified by this Public Comment.**

#### **Modify as Follows:**

### **2015 International Plumbing Code**

**1106.2.1.2 Elevation of secondary roof drainage means .** The bottom of the opening for secondary (emergency) roof drainage means shall be not less than 2 inches (51 mm) and not more than 34 inches (76102 mm) higher than the lowest opening of the primary roof drain served by the secondary (emergency) roof drainage means.

**Commenter's Reason:** Unfortunately due to a conflict with one of my code changes in Track 1, I was unable to explain this code change to the Committee. While it appears confusing, it actually is a simplified means of sizing the roof drainage system without having to complete all the calculations. As a result, there are conservative values added into the sizing method. This is necessary to account for the exact values that are not calculated.

It must be noted that this additional sizing method is an optional means of sizing the roof drainage system. The current method in the 2015 Code can still be used. Most plumbing engineers would consider the current method the preferred method. However, for some simple buildings, it would be easier and faster to use this proposed method for sizing.

The alternate method of sizing was requested by many who have had difficulty in adjusting to the new sizing method. This follows the sizing methodology that was used in previous editions of the code, however, using the values determined in the ASPE RF study or roof drainage.

The modification was requested by manufacturers to account for their combined primary and secondary roof drains. This will not impact the sizing methodology since the flow rates for the secondary roof drain must still be posted.

P245-15

# RP1-15

## P2503.4

### **Proposed Change as Submitted**

**Proponent :** Gary Kozan, CPD, representing Florida Association of Plumbing Heating Cooling Contractors  
(garyk@ridgewayplumbing.com)

## **2015 International Residential Code**

### **Revise as follows:**

**P2503.4 Building sewer testing.** The *building sewer* shall be tested by insertion of a test plug at the point of connection with the public sewer, and completely filling the *building sewer* with water and pressurizing from the lowest to the sewer to not less than 10-foot (3048 mm) head of water highest point thereof. The test pressure shall not decrease during a period of not less than 15 minutes. The *building sewer* shall be watertight at all points.

A forced sewer test shall consist of pressurizing the piping to a pressure of not less than 5 psi (34.5 kPa) greater than the pump rating and maintaining such pressure for not less than 15 minutes. The forced sewer shall be water tight at all points.

**Reason:** Subjecting a gravity house sewer to a 10-foot head test is outdated and impractical. By the time the building sewer is connected, fixtures have usually been installed, so both ends have to be plugged off before testing in order to protect the building from flooding. Leaks on gravity house sewers are rare, considering that most today are constructed with plastic pipe and contain few fittings and joints. Simply filling the sewer with water is sufficient to identify any leaks. It should be noted that public sewer mains and branch laterals downstream of the building sewer are not water tested at all.

This testing method is identical to that found in the other model plumbing code (UPC), used in many states. Florida adopted similar testing requirements in 2000. It is time that the IPC recognizes this proven practice and bring the codes closer together.

### **Bibliography:**

#### **2012 Uniform Plumbing Code:**

##### **723.0 Building Sewer Test**

**723.1 General.** Building sewers shall be tested by plugging the end of the building sewer at its points of connection with the public sewer or private sewage disposal system and ***completely filling the building sewer with water from the lowest to the highest point thereof***(emphasis added), or approved equivalent low-pressure air test. Plastic DWV piping systems shall not be tested by the air test method. The building sewer shall be watertight.

#### **2010 Florida Building Code - Plumbing**

**312.6 Gravity sewer test.** Gravity sewer tests shall consist of plugging the end of the building sewer with water at the point of connection with the public sewer, ***completely filling the building sewer with water from the lowest to the highest point thereof***(emphasis added), and maintaining such pressure for 15 minutes. The building sewer shall be watertight at all points.

**2010 Florida Building Code - Residential:**

**2503.4 Gravity sewer test.** Gravity sewer tests shall consist of plugging the end of the building sewer with water at the point of connection with the public sewer, ***completely filling the building sewer with water from the lowest to the highest point thereof***(emphasis added), and maintaining such pressure for 15 minutes. The building sewer shall be watertight at all points.

**Cost Impact:** Will not increase the cost of construction  
Reducing the head test for gravity sewers will shorten the length of the fill stack, and eliminate the need for additional test fittings, test balls, and labor to plug off the upper end of the sewer. This should translate to a modest reduction in cost of approx. \$20 - \$40 per sewer test.

RP1-15 : P2503.4-  
KOZAN3454

---

**Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The phrase "highest point thereof" seems ambiguous. The committee would like to see consistency with the 5 feet of water head test for building drains.

**Assembly Motion:**

**As Submitted**

**Online Vote Results:**

**Failed**

Support: 21.77% (32) Oppose: 78.23% (115)

**Assembly Action :**

**None**

---

**Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Gary Kozan, representing FAPHCC (garyk@ridgewayplumbing.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

**2015 International Residential Code**

**P2503.4 Building sewer testing.** The *building sewer* shall be tested by insertion of a test plug at the point of connection with the public sewer ~~and completely~~ filling the building sewer with water from and pressurizing the lowest sewer to the highest point thereof not less than 5-foot (1524 mm) head of water. The test pressure shall not decrease during a period of not less than 15 minutes. The *building sewer* shall be watertight at all points.

A forced sewer test shall consist of pressurizing the piping to a pressure of not less than 5 psi (34.5 kPa) greater than the pump rating and maintaining such pressure for not less than 15 minutes. The forced sewer shall be water tight at all points.

**Commenter's Reason:** The disapproval of RP 1-15 means the code reverts back to a 10-foot head test for exterior building sewers, while requiring only a 5-foot head

test for interior DWV testing. By approving this modification, the testing of interior and exterior DWV piping will be in sync once again.

**RP1-15**

---

# RP2-15

## P2503.5.1

### **Proposed Change as Submitted**

**Proponent :** Janine Snyder, City of Thornton, Colorado, representing Colorado Association of Plumbing & Mechanical Officials (CAPMO) (Janine.Snyder@cityofthornton.net)

## **2015 International Residential Code**

### **Revise as follows:**

**P2503.5.1 Rough plumbing.** DWV systems shall be tested on completion of the rough piping installation by water or, for piping systems other than plastic, by air, without evidence of leakage. Either test shall be applied to the drainage system in its entirety or in sections after rough-in piping has been installed, as follows:

1. Water test. Each section shall be filled with water to a point not less than ~~5~~ 10 feet (~~1524~~ 3048 mm) above the highest fitting connection in that section, or to the highest point in the completed system. Water shall be held in the section under test for a period of 15 minutes. The system shall prove leak free by visual inspection.
2. Air test. The portion under test shall be maintained at a gauge pressure of 5 pounds per square inch (psi) (34 kPa) or 10 inches of mercury column (34 kPa). This pressure shall be held without introduction of additional air for a period of 15 minutes.

**Reason:** Historically the codes required a 10 foot head on DWV systems. With the change in the 2015 to only 5 feet head the DWV system can have leaks that are undetectable therefore placing the property owner at risk for damage over the life of the structure. The 10 foot head not only eliminates that risk it ensures that the system is in fact water tight which is the purpose of the test in the first place.

**Cost Impact:** Will increase the cost of construction  
The 10 foot head requirement has been in place and is the standard for testing. The cost of replacing or repairing portions of the DWV system that have leaks that have gone undetected due to the relaxed testing pressures overrules the cost of the additional 5 foot head of water.

RP2-15 : P2503.5.1-  
SNYDER4419

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** A 5 foot of water head test is safer to perform and many contractors have never had a problem when using this test pressure. There is no need to change the test pressure back to 10 feet of water head.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

## *Public Comment 1:*

**Proponent : Janine Snyder, representing Colorado Association of Plumbing Mechanical Officials, CAPMO (Janine.Snyder@cityofthornton.net) requests Approve as Submitted.**

**Commenter's Reason:** Historically the codes required a 10 foot head on DWV systems. With the change in the 2015 to only 5 feet head the DWV system can have leaks that are undetectable therefore placing the property owner at risk for damage over the life of the structure. The 10 foot head not only eliminates that risk it ensures that the system is in fact watertight which is the purpose of the test in the first place. The plastic pipe manufacturer's don't designate residential pipe vs. commercial pipe so why should the test be different if the pipe is not. Furthermore, the change to the 2015 IPC and 2018 IPC to go to a 5 foot head test was disapproved by the committee and the subsequent assembly action also failed further reiterating the validity and necessity of the 10 foot head test requirement.

---

**RP2-15**

# RP6-15

P2802 (New), P2802.1 (New), P2802.2 (New), Table P2802.2 (New), P2802.3 (New)

## Proposed Change as Submitted

Proponent : Ed Osann, representing Natural Resources Defense Council (eosann@nrdc.org)

### 2015 International Residential Code

Add new text as follows:

#### **SECTION P2802 RADIAL DISTANCE TO CERTAIN PLUMBING FIXTURES**

**P2802.1 Scope.** The distance limitation in Section P2802.2 shall apply to the following plumbing fixtures:

1. lavatories.
2. kitchen sinks.
3. showers.
4. tub-shower combinations.

**Exception:** Plumbing fixtures connected to a hot water recirculation system.

**P2802.2 Maximum distance to certain plumbing fixtures** For hot water distribution systems serving individual dwelling units, the maximum radial distance in plan view between the location of a water heater and a plumbing fixture receiving hot water from it shall be no more than the length shown in Table P2802.2. For purposes of this determination, the location of a water heater shall be translated vertically to each floor on which a fixture served by such water heater is located.

**TABLE P2802.2  
MAXIMUM RADIAL DISTANCE BETWEEN A WATER HEATER AND CERTAIN PLUMBING FIXTURES**

<u>Dwelling Unit Floor Area (ft<sup>2</sup>)</u>	<u>Maximum Plan View distance (ft)</u>	
	<u>Two or More Story Structures</u>	<u>One-Story Structures</u>
<u>≤1000</u>	<u>20 ft.</u>	<u>30 ft.</u>
<u>&gt;1000 to ≤1600</u>	<u>30 ft.</u>	<u>40 ft.</u>
<u>&gt;1600 to ≤2200</u>	<u>40 ft.</u>	<u>50 ft.</u>
<u>&gt;2200 to ≤2800</u>	<u>45 ft.</u>	<u>55 ft.</u>
<u>&gt;2800</u>	<u>50 ft.</u>	<u>65 ft.</u>

**P2802.3 Points of Measurement** Radial distance shall be measured in plan view between the center point of the water heater and the hot water outlet serving a plumbing fixture indicated in Section P2802.1.

**Reason:** Cold or tepid water in the initial draw from a hot water outlet is often unusable for its intended purpose and is frequently purged,

resulting in a waste of water, energy, and time for residents. Pipe insulation significantly reduces heat loss and helps to ensure that hot water gets to users sooner. However, a complementary strategy is to reduce the volume of water contained in the hot water distribution system subject to cool-down. This proposal seeks to reduce entrained hot water volume by setting generous but clear limits on the distance between a hot water heater and the furthest bathroom or kitchen fixture it serves.

Providing greater proximity between the hot water source and the fixtures using hot water will reduce the need for purging. This proposal is similar in intent and effect to Section 607.2 of the International Plumbing Code, which sets a maximum developed length of 50 feet for hot water supply piping between a heat source and any hot water fixture. While not a limitation on pipe length or internal volume *per se*, this proposal will have similar results and has the advantage of requiring no special drawings nor any measurements or calculations at the job site. Rather, its simple provisions can be easily applied during project design and confirmed at plan check, and its graduated distance limits meet the need for a flexible approach that respects the diversity of types and sizes of single-family homes covered by the IRC.

Plans for most two-story production homes should comply with this provision with little or no adjustment. Most home designs where the principal length-to-width ratio of the building footprint is 2 to 1 or less should face few compliance issues. The concept may be more challenging for single-story homes, and for that reason an additional distance allowance is provided for single-story buildings. Plans for homes with long and narrow configuration may require adjustment, largely to avoid positioning the hot water heater and its furthest fixture outlet at diagonally opposite corners of the building. Avoiding such inherently inefficient designs is the primary intent of this proposal.

The specific limitations in this proposal have their origin in a review of data collected from a diverse group of 55 single-family homes under construction in California in 2010-11. A plot of house floor area and maximum length of pipe between the hot water heater and the furthest hot water fixture was developed. Based upon these plotted data, in 2011 the California Utilities Statewide Codes and Standards team developed a draft proposal setting a graduated limit on the maximum length of hot water pipe between a water heater and the furthest fixture. The proposal was estimated to save over 2500 gallons of water and over 24 therms of natural gas annually when applied to prototype homes. However, these initial pipe length criteria would have been met by just 10 out of the 55 homes surveyed. Subsequent workshops raised concerns about the challenges of field verification of pipe length subject to the limit. As a result, the concept was modified to measure radial distance in plan view, in lieu of field verification of pipe length. In its second iteration, limits were expressed as radial distances instead of pipe length, but the proposal was intended to be equally stringent. In this proposal for the IRC 2018 model code, these stringent distant limits have been increased by 50%; we estimate that over 75% of the surveyed homes in the 2010-11 data set would meet these proposed limits.

Plans not meeting the radial length limitation can come into compliance using several strategies, including fixture repositioning or hot water repositioning. The latter can often be accomplished by repositioning the proposed water heater location from an exterior garage wall to an interior garage wall; moving a basement water heater from a corner toward a more central location; or rearranging fixture locations in a bathroom to move hot water outlets closer to the water heater. Installation of a second water heater is also an option, as is a recirculation loop. Design flexibility is maintained, and architects and builders can easily identify any compliance issues at an early stage.

The IRC, as a minimum code, has a crucial role to play in curbing excessive waste of water and energy in future years by means of improved design and construction of new homes. An inefficient hot water distribution system is likely to remain in place for the life of the building, leaving owners without access to options that would have only been practical at the time of construction.

Reducing the waste of energy and water is an integral part of the stated purpose of the IRC:

#### R101.3 Intent.

The purpose of this code is to establish minimum requirements to safeguard the public safety, health and general welfare through affordability, structural strength, means of egress facilities, stability, sanitation, light and ventilation, energy conservation and safety to life and property from fire and other hazards attributed to the built environment and to provide safety to fire fighters and emergency responders during emergency operations.

This proposal, by reducing demands on energy and water systems in new homes, clearly advances the "public safety, health and general welfare" through cost-effective designs and energy conservation. Water-saving building designs reduce unnecessary water use, helping to ensure that water supplies are maintained at safe and reliable levels, protecting human health and firefighting capability as well as environmental resources. Energy- and water-saving designs, such as those meeting the criteria of this proposal, also enhance housing affordability and general welfare through reduced energy, water and sewer bills of building owners and occupants.

#### **Additional Technical Background**

A 2009 paper by Robert Hendron of the National Renewable Energy Laboratory and others quantified the waste of hot water in initial draws waiting for water to reach 105°F. Modeling the plumbing typical of a 3-bedroom, 2-bath, single-story home with a hot water distribution simulation tool found that an estimated 12% of all hot water used on an annual basis is wasted. When viewed by fixture, the results are as follows:

- Showers -- over 10% wastage.
- Kitchen sinks -- 18% wastage.
- Lavatories -- over 30% wastage.

Purging at these fixtures is responsible for 95% of the estimated total of nearly 3,000 gallons of hot water wastage annually. Of course, many new homes are built with more hot water outlets than this model's base case and with hot water distribution systems that are far less efficient. Nevertheless, this proposal will direct the attention of designers and code officials to the proximity between water heaters and those fixtures that are responsible for the great majority of hot water waste.

**Cost Impact:** Will not increase the cost of construction

This proposal is a design requirement that can be met without increasing the cost of construction. Plans that may be initially out of conformance can most commonly be adjusted with strategies that need not carry a cost penalty, such as repositioning the proposed hot water heater location from an exterior garage wall to an interior garage wall, or by rearranging fixture locations in a bathroom to move hot water outlets closer to the water heater. Such changes typically result in shorter lengths of both cold and hot water piping, thereby reducing costs. The CASE report referenced in the bibliography evaluated the cost-effectiveness of radial distance limits that were significantly more stringent than proposed here, and found them to be cost-effective in all cases. (See final report, pp. 20-21.) The report's estimate even assumed an initial cost of \$390 for additional lengths of natural gas piping and water heater vent piping, even though repositioning a water heater from an outer garage wall to an inner garage wall need not increase gas service line length. Cost savings averaging \$73 from reduced length of PEX hot water piping were estimated. Natural gas savings of 24 therms per year more than offset these costs on a life-cycle basis. What's more, no savings were calculated or credited for reduced water and sewer charges over the life of the building, which would further improve the cost-effectiveness of this measure.

RP6-15 : P2802 (New)-OSANN5261

---

**Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The distances chosen are arbitrary and do not take into account the volume of the piping between the water heater and the point of delivery. These requirements might cause multiple water heaters to need to be installed. There are hot water circulation systems available that can be used to reduce the time to obtain hot water and to reduce water waste when waiting for hot water to arrive.

**Assembly Action :**

**Individual Consideration Agenda**

***Public Comment 1:***

Proponent : **Ed Osann, Natural Resources Defense Council, representing Natural Resources Defense Council (eosann@nrdc.org) requests Approve as Submitted.**

**Commenter's Reason:** This proposal offers an easy-to-use and easy-to-verify design guide to help prevent excessive waiting time for hot water to arrive at sinks and showers. Compliance is based upon the straight-line distance between a hot water heater and a hot water fixture outlet, a distance easily confirmed at plan check. Distance limits are graduated based on the size of the house. There is no measurement of pipe volume or pipe length required.

(The straight-line distance is referred to in the proposal as "radial distance" because an equidistant limit extending from the hot water heater takes the form of an arc or circle overlaid on a house plan.)

As shown in the accompanying illustrations, the house plans of most production homes will comfortably meet the distance limits in this proposal. The proposal does not seek to optimize all home designs to produce the shortest possible wait times for hot water. Rather, as is appropriate for a base code, the proposal is intended to flag those plans with the most inherently inefficient positioning of the water heater and the fixtures it serves. House plans with long and narrow configurations and plans for very large homes may require some adjustments, most likely the repositioning of either the hot water heater or the furthest fixture outlet. A recirculation loop is another compliance option, as the distance limits do not apply to any fixture connected to a recirculation system.

Long waiting time for hot water is a well-known source of customer complaint. Excessive distances between water heaters and hot water outlets are inherently wasteful of water, energy, and time, but are easily avoided with proper attention to fixture and water heater placement.

**Illustrative Examples**

The following illustrations offer a demonstration of the simplicity of applying this proposal in practice. **Figure 1** is the most basic schematic of a very small single-story home of 1,000 square feet. As per the values in the proposed table, the straight-line distance allowed between the water heater and the outlet of a hot water fixture is 30 feet. In this example, the water heater is positioned in the corner of this house plan. If all hot water fixtures are within the 30' arc, the plan is compliant. However, if the outlet of a hot water fixture listed in the first paragraph of the proposal is located outside the 30' arc, the plan does not comply.

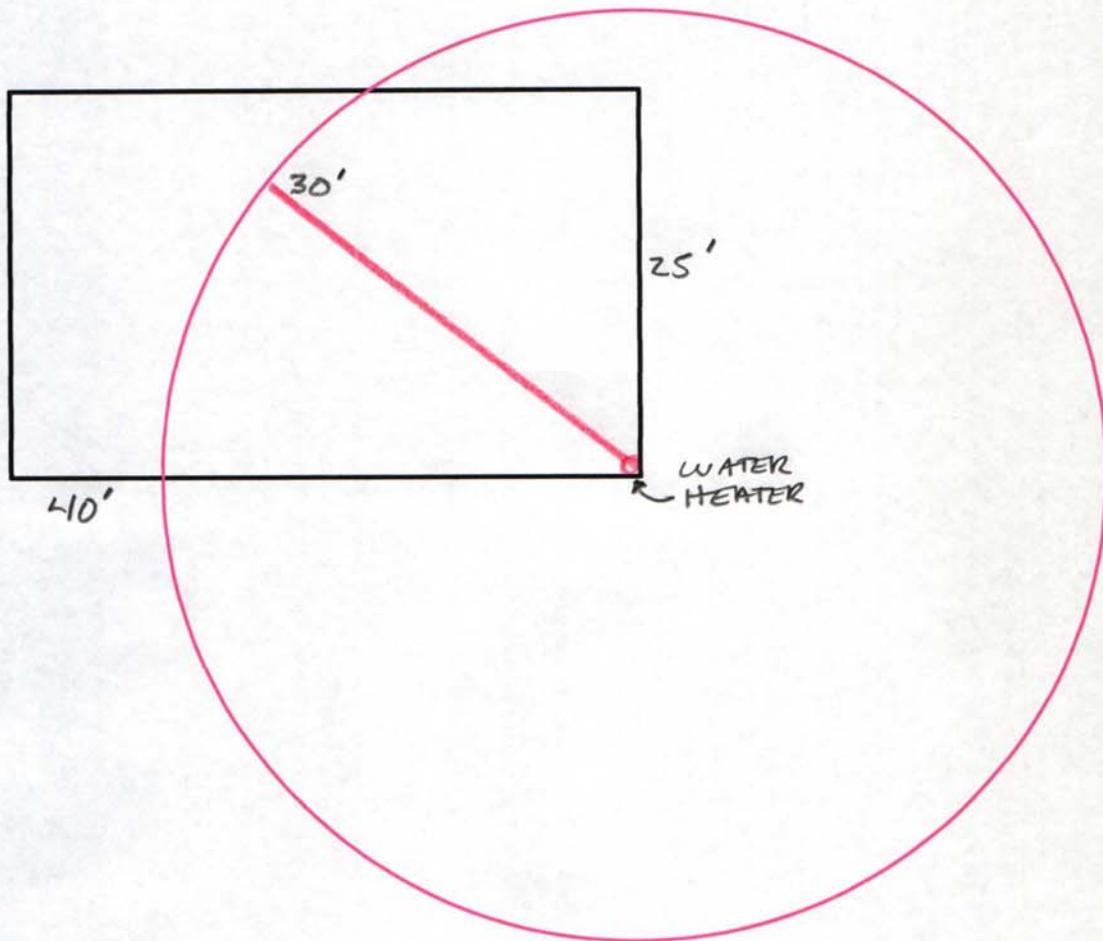

Figure 1.

1000 S.F.

1 STORY

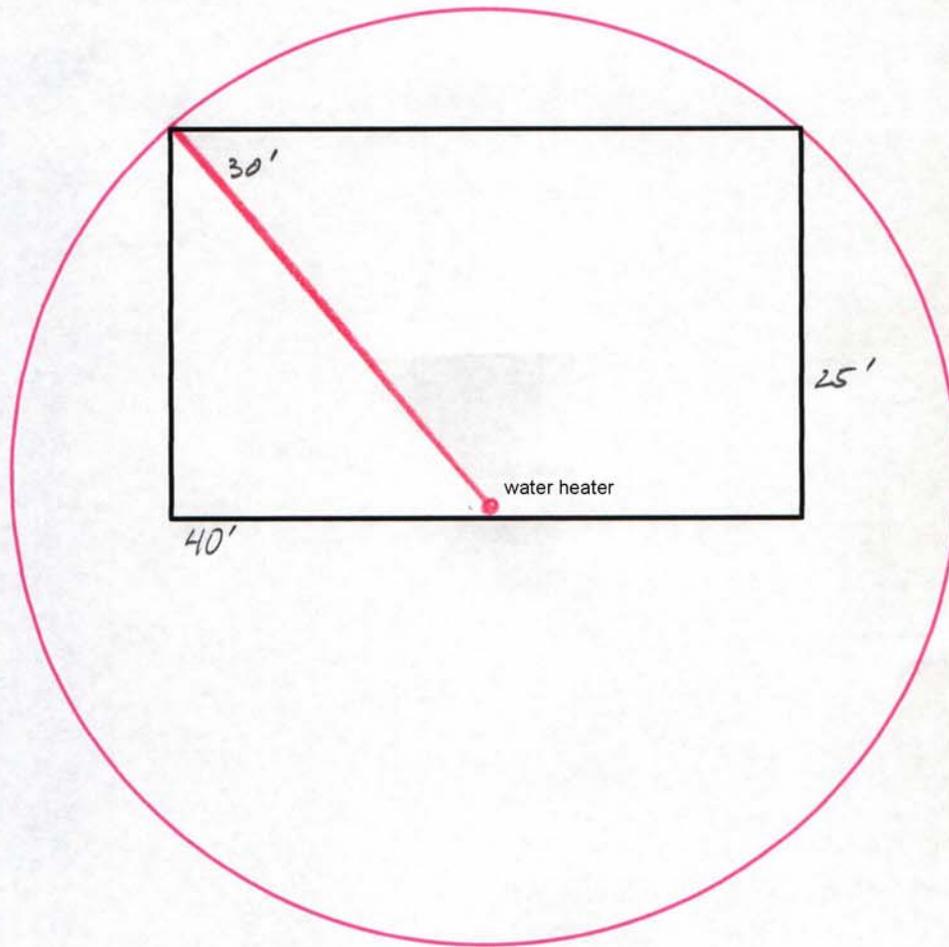

30 FT RADIAL ALLOWANCE

PLUMBING FIXTURES INSIDE CIRCLE COMPLY

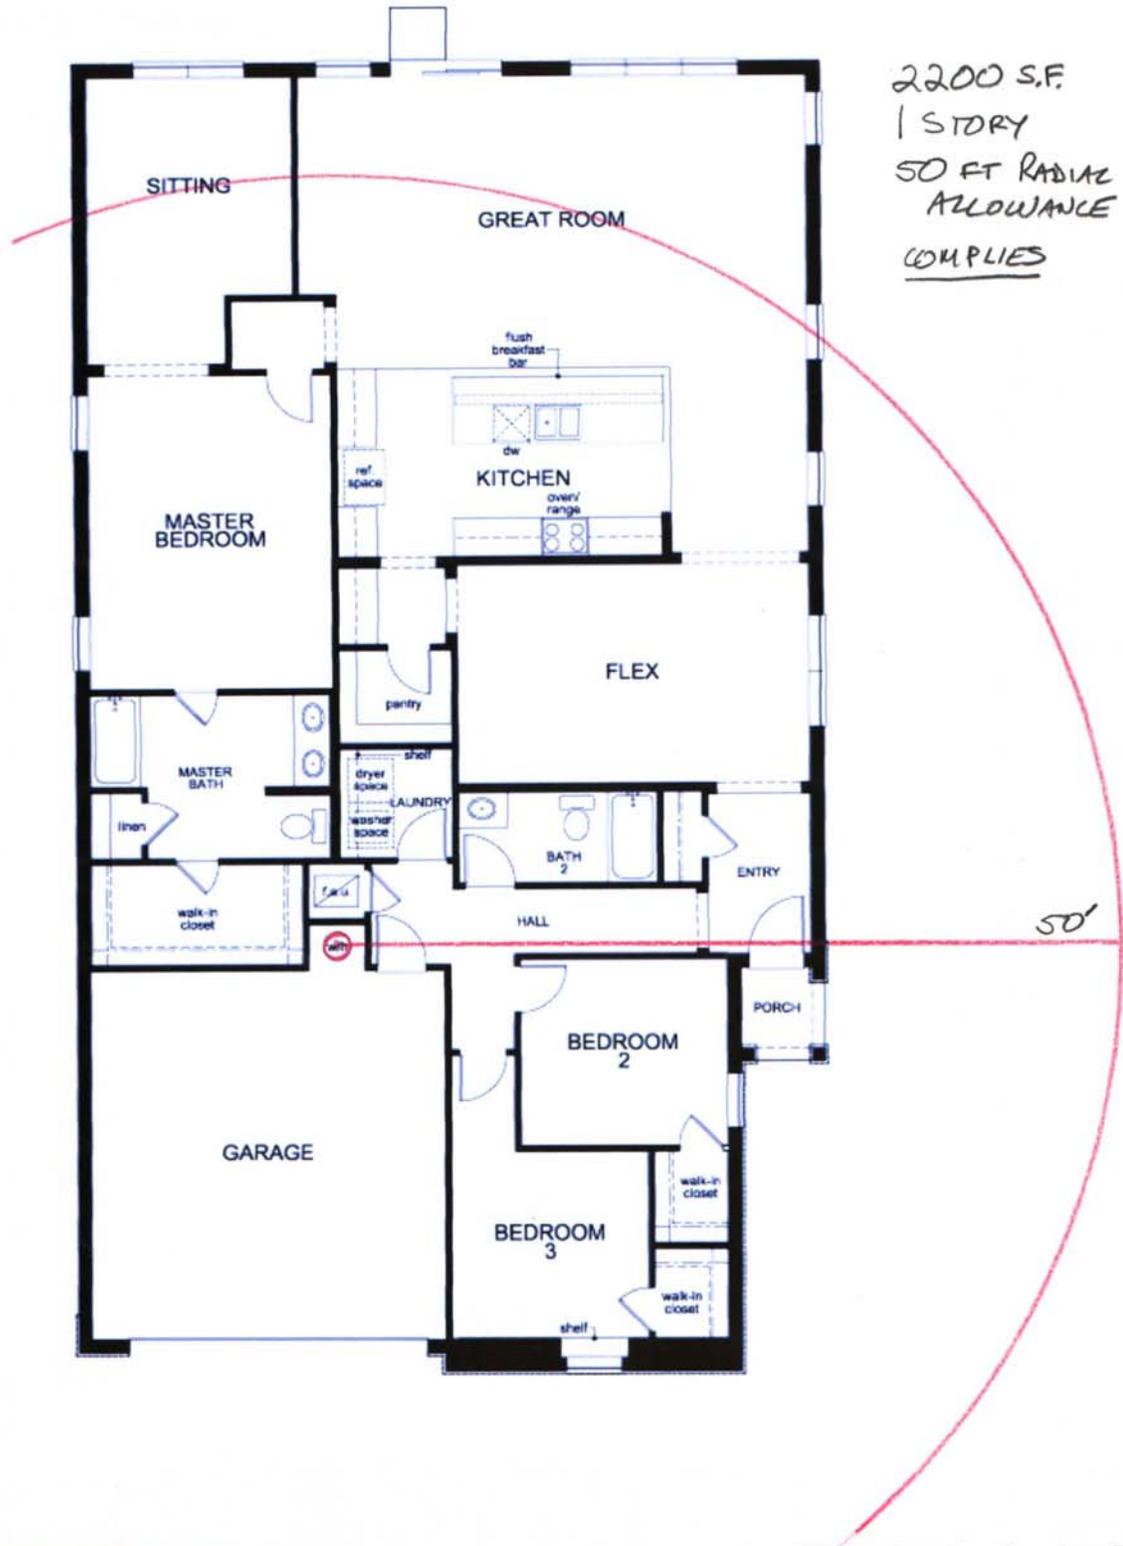

A second illustration of the same sized small home shows the effect of moving the hot water heater to a more central location. In **Figure 2**, the position of the hot water heater is at a more central point along an exterior wall. This entire home falls within the 30' arc, and the plan would be compliant for all possible locations of the hot water outlets within this home.

Figure 2.  
1000 S.F.  
1 STORY  
30 FT RADIAL ALLOWANCE  
ALL PLUMBING FIXTURES IN DWELLING COMPLY

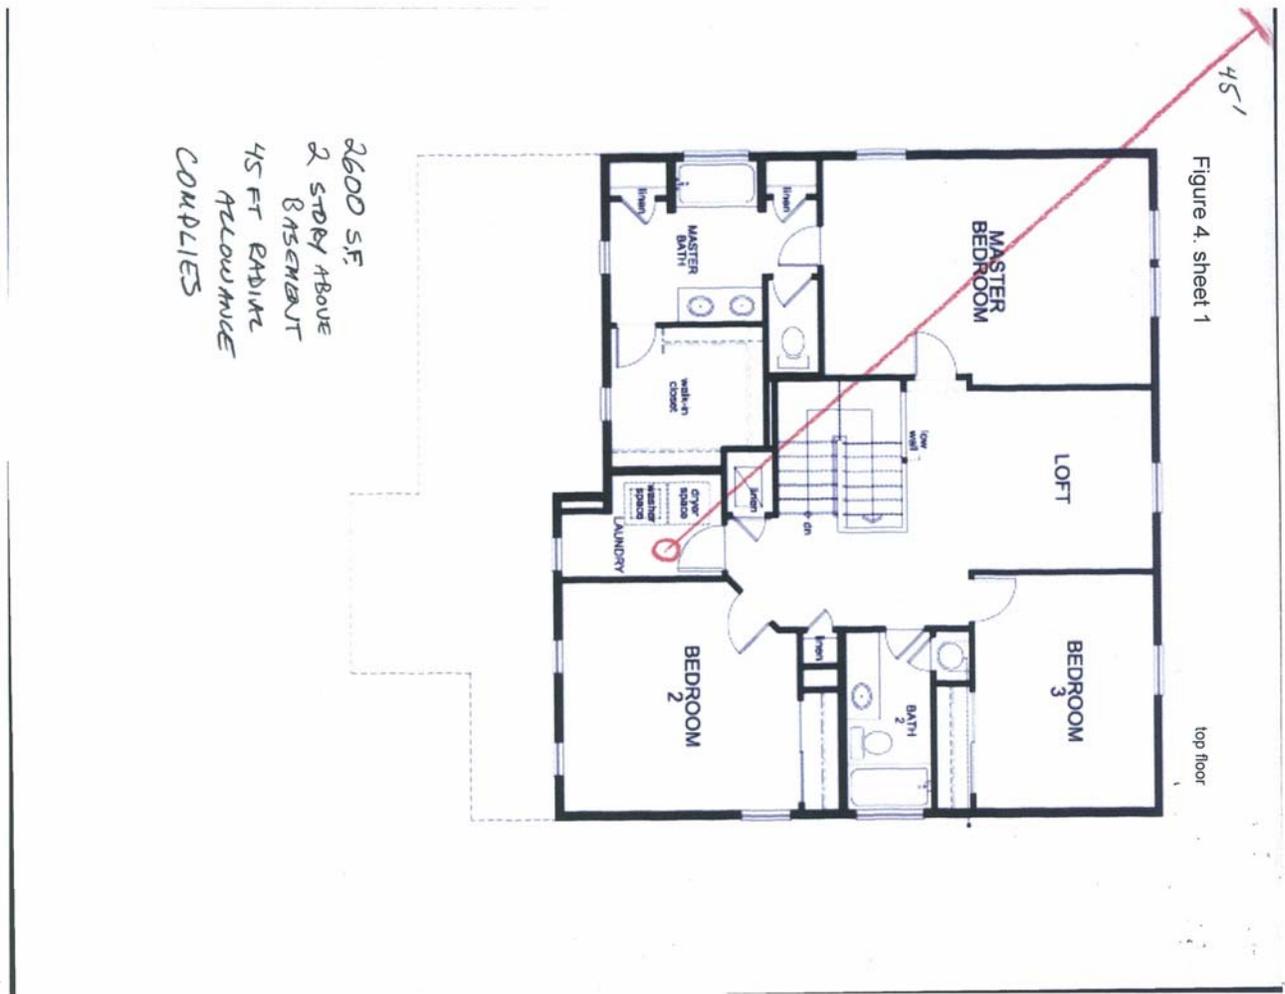

A third illustration shows the plan for a somewhat larger one-story home, with 2,200 square feet. In **Figure 3**, as per the values in the proposed table, the straight-line distance allowed between the water heater and the outlet of a hot water fixture listed in the first paragraph of the proposal is 50 feet. Here, all hot water outlets fall within the 50' arc, so the plan complies. Note, however, that *if* the master bath had been placed in the location of the sitting room, it is possible that one or more hot water outlets would have fallen outside the 50' arc, and such a plan would not comply. But some adjustment of fixture locations within the master bath by the designer would likely have brought the design into compliance.

Figure 3.

A fourth illustration demonstrates the application of the proposal to multi-story homes, in this case, a home of 2,600 square feet and a maximum straight-line distance allowance of 45 feet. In **Figure 4**, the hot water heater is located in the basement, as shown on Figure 4, Sheet 3. Section P2802.2 of the proposal specifies that the location of the hot water heater "shall be translated vertically to each floor on which a fixture served by such water heater is located." In other words, the maximum straight-line distance is applied separately on each floor, measured from a point on each floor that is directly above the location of the hot water heater in the basement. In Figure 4, one can see that the point of measurement on both the first and second floors is the same position in the plane of these floors as the position of the hot water in the plane of the basement. In this example, this relatively compact house design easily complies with the 45' maximum distance for

a home of its square footage.

## 2015 International Residential Code

### Revise as follows:

**P3201.1 Design of traps.** Traps shall be of standard design, shall have smooth uniform internal waterways, shall be self-cleaning and shall not have interior partitions except where integral with the fixture. Traps shall be constructed of lead, cast iron, copper or copper alloy or *approved* plastic. Copper or copper alloy traps shall be not less than No. 20 gage (0.8 mm) thickness. Solid connections, slip joints and couplings shall be permitted to be used on the trap inlet, trap outlet, or within the trap seal. Slip joints shall be accessible.

**Exception:** Sanitary waste valve devices complying with ASME A112.18.8 shall be an alternative to the traps required by this section where such devices are installed in accordance with the manufacturer's instructions.

**P3201.2 Trap seals.** Each fixture trap shall have a liquid seal of not less than 2 inches (51 mm) and not more than 4 inches (102 mm).

**Exception:** Sanitary waste valve devices complying with ASME A112.18.8 shall not be required to have a liquid seal.

**P3201.2.1.1 Potable water-supplied trap seal primer valve.** A potable water-supplied trap seal primer valve shall supply water to the trap. Water-supplied trap seal primer valves shall conform to ASSE 1018. The devices shall be installed in accordance with the manufacturer's instructions. The discharge pipe from the trap seal primer valve shall connect to the trap above the trap seal on the inlet side of the trap.

**P3201.2.1.2 Reclaimed or gray-water-supplied trap seal primer valve.** A reclaimed or gray-water-supplied trap seal primer valve shall supply water to the trap. Water-supplied trap seal primer valves shall conform to ASSE 1018. The devices shall be installed in accordance with the manufacturer's instructions. The quality of reclaimed or gray water supplied to trap seal primer valves shall be in accordance with the requirements of the manufacturer of the trap seal primer valve. The discharge pipe from the trap seal primer valve shall connect to the trap above the trap seal on the inlet side of the trap.

**P3201.2.1.3 Waste-water-supplied trap primer device.** A waste-water-supplied trap primer device shall supply water to the trap. Waste-

water-supplied trap primer devices shall conform to ASSE 1044. The devices shall be installed in accordance with the manufacturer's instructions. The discharge pipe from the trap seal primer device shall connect to the trap above the trap seal on the inlet side of the trap.

**P3201.2.1.4 Barrier-type trap seal protection device.** A barrier-type trap seal protection device ~~shall protect the floor drain trap seal from evaporation.~~ Barrier type floor drain trap seal protection devices shall conform to ASSE 1072. The devices shall be installed in accordance with the manufacturer's instructions.

**P3201.3 Trap setting and protection.** Traps shall be set level with respect to their water seals and shall be protected from freezing. Trap seals shall be protected from siphonage, aspiration or back pressure by an *approved* system of venting (see Section P3101). The devices shall be installed in accordance with the manufacturer's instructions.

**P3201.5 Prohibited trap designs.** The following types of traps are prohibited:

1. Bell traps.
2. Separate fixture traps with interior partitions, except those lavatory traps made of plastic, stainless steel or other corrosion-resistant material.
3. "S" traps.
4. Drum traps.
5. Trap designs with moving parts.

**Exception:** Sanitary waste valve devices complying with ASME A112.18.8 shall be permitted provided that the devices are installed in accordance with the manufacturer's instructions.

**P3201.6 Number of fixtures per trap.** Each plumbing fixture shall be separately trapped by a water seal trap. The vertical distance from the fixture outlet to the trap weir shall not exceed 24 inches (610 mm) and the horizontal distance shall not exceed 30 inches (762 mm) measured from the center line of the fixture outlet to the centerline of the inlet of the trap. The height of a clothes washer standpipe above a trap shall conform to Section P2706.1.2. Fixtures shall not be double trapped.

**Exceptions:**

1. Fixtures that have integral traps.
2. A single trap shall be permitted to serve two or three like fixtures limited to kitchen sinks, laundry tubs and lavatories. Such fixtures shall be adjacent to each other and located in the same room with a continuous waste arrangement. The trap shall be installed at the center fixture where three fixtures are installed. Common trapped fixture outlets shall be not more than 30 inches (762 mm) apart.
3. Connection of a laundry tray waste line into a standpipe for the automatic clothes-washer drain shall be permitted in accordance with Section P2706.1.2.1.

4. A water seal trap shall not be required where a sanitary waste valve device complying with ASME A112.18.8 is installed in accordance with the manufacturer's instructions.

**Add new standard(s) as follows:**

ASME A112.18.8 -2009 (Reaffirmed 2014) In-Line Sanitary Waste Valves for Plumbing Drainage Systems

**Reason:** This code change proposal is for a new plumbing product that outperforms a p-trap, but it is not a p-trap. A p-trap is based on trapping water in the drain to provide a seal between the interior of a building and the sewer gasses and odors in the public sewer. This product is called an In-Line Sanitary Waste valve. It is designed to prevent sewer odors from the building drain and public sewers from entering the building but it does not "Trap water" it uses a flexible membrane and therefore it needs to be identified separately with an exception. In-line sanitary waste valves perform better than a P-trap. P-traps will often plug when solids are put into the drain, where in-line waste valve easily pass solids. P-traps often crack and leak when exposed to freezing temperatures and P-traps will dry up and allow sewer odors to escape into the building when the fixture has not been used for a period of time. (A couple of weeks) In-line sanitary waste valves perform very well in freezing conditions and they still prevent sewer gasses from entering a building when the fixture has not been used for an extended period. Long periods of non-use is common for many seasonal type hotel, school and state park types of buildings.

Sanitary waste valves have been used extensively in many other parts of the world very successfully. (Europe, South Africa, and Asia) (See attached testimonial letters) This proposal is seeking to allow the use of in-line sanitary waste valves that conform to the requirements of the attached standard to be used in lieu of p-traps, but not replace p-traps. These devices cost more than a p-trap, so they will not take over the market. They are intended to only be used on sinks, lavatories, and bathtubs where freezing conditions may exist (in overhangs) or in seasonal buildings like cabins, vacation homes or large hotels where some wings or building may not be used for long periods, They may also be used in State Park facilities, National Park Facilities, seasonal resorts, schools, and stadiums during off-seasons or in buildings where traps can freeze or dry up. This option is currently not available and this code change is intended to give consumers a choice for a better product if they choose to purchase it.

The manufacturer went to the American Society of Mechanical Engineers to develop a Standard for this product. The standard is ASME A112.18.8, the standard was titled: "In-Line Sanitary Waste Valves for Plumbing Drainage Systems". This standard includes a "Scope" that states these devices are intended "for use as an alternate to tubular p-traps" (1-1/4 inch and 1-1/2 inch at sinks, lavatories and bathtubs only)

The standard also covers the material and performance requirements for the product. It also states that these devices are not intended for use with water closets and urinals.

The Standard includes Material Requirements for the device to comply with the Seal material requirements in ASTM F409 Standard Specification for Thermoplastic Accessible and Replaceable Plastic Tube and Tubular Fittings. It also addresses the Seal material to comply with or exceed the following material requirements from ASTM D2000: M3BA507, A14, B13, C12 and F17 or M2BG714, B14, EO14, and EO34. The ASTM D2000 standard is an industry standard for rubber and polymer products. The material requirements have been confirmed with a 3rd party laboratory test report. (Attached)

The Standard also has material requirements for the bladder/checking member material to comply with or exceed the following material requirements from ASTM D2000: M3FC607, EA14, EO16 and G11. The bladder/checking member material requirements have been confirmed with a 3rd party laboratory test report. (Attached)

Other material requirements address valve inlet dimensions, valve outlet dimensions and threaded connections.

The Standard includes performance testing requirements which includes the following tests: 1. Waterway Flow test; 2. One-Way Sealing Performance Test; 3. Airway Flow Rate; 4. Recovery from an Excess Back Pressure Test; 5. Leak Tightness Test; 6. Thermal Cycling; 7. Resistance to Household Substances: rice, diced vegetables, resistance to cleaning product, soaps, solids, kiln dried sand, and the lard test from the grease interceptor and trap seal protection device standards; 9. Resistance to Chemicals and Solvents; 10. Drop Test; and 11. Life Cycle Operation Test.

The Standard also has requirements for marking, Identification and installation Instructions.

In-Line sanitary waste valves are an innovative, hygienic, Self Sealing, Waste Valve.

In-Line sanitary waste valves can be installed vertically or horizontally (with an adaptor) and are available in 1-1/4 inch (32mm) and 1-1/2 inch (40mm) sizes.

The Recreational Vehicle industry in North America has embraced this technology because it out performs P-traps in freezing conditions and when there are periods of non-use. Another advantage over p-traps is it prevents sewage from backing up into bathtubs when there is movement and it could help prevent backflow of sewage.

**Bibliography:** Link to website for additional information:  
[http://overseas.wavin.com/overseas/HepVo\\_waste\\_valve.html](http://overseas.wavin.com/overseas/HepVo_waste_valve.html)

**Cost Impact:** Will not increase the cost of construction  
There will be no additional cost associated with this code change, because it is not mandating the use of products meeting this Standard, it is simply listing it as an alternate to a p-trap as an alternate method for a better performing installation. It is not a mandatory code change, If someone chooses to install an in-line Sanitary Waste Valve, Then it must conform to the industry Standard.

**Analysis:** A review of the standard proposed for inclusion in the code, ASME A112.18.8 -2009 (Reaffirmed 2014), with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

## **Individual Consideration Agenda**

### ***Public Comment 1:***

**Proponent : Ronald George, Plumb-Tech Design and Consulting LLC, representing Hepworth Building Products (A trading Division of Wavin UK Holdings) Ltd./HepVO requests Approve as Submitted.**

**Commenter's Reason:** This proposal was accepted by the Residential Plumbing Code committee because they obviously saw the merit in allowing this device for special conditions in which this device outperforms a P-trap in long periods of non-use and in conditions where occasional freezing may occur. Freezing conditions will cause a P-trap to fail because ice in the trap will expand and crack a P-trap. When the trap cracks, the water leaks out causing water damage and future leaks from water use in fixtures where water flows down the drain and leaks out the P-trap which can lead to mold issues if not discovered quickly. A cracked trap also eliminates the water seal and allows sewer gas to enter the building. In both of these examples a P-trap will allow sewer gas to escape into the building, where an in-line sanitary waste valve that conforms to ASME A112.18.8 with work fine in these extreme conditions. Other advantages of the device are it can prevent sewage backups from emanating from the fixture to a degree. The device will also prevent insects and vermin from entering a fixture through a dried out p-trap. During the Code hearings, there was opposition testimony that erroneously testified that these devices were intended for urinals. These devices are only manufactured for 1-1/4 inch and 1-1/2 inch tubing Not 2 inch tubing which is the outlet size for urinals. There is language in the Standard stating these devices are not intended for urinals. Finally one opponent stated the packaging calls for use on urinals. There is no such language on the U.S.A. packaging that allows them to be used on urinals. The proponent may have obtained packaging from a European model where they are used on urinals in Europe where they have smaller outlet piping. There is no such language on the U.S.A. packaging.

There was also erroneous testimony that stated this was the same code change was submitted to the IPC and turned down. That is not a true statement, the manufacturer did not submit this to the IPC they only submitted this code change to the IRC. A member of ASME committee (in an attempt to submit all ASME standards that are not currently referenced in the codes) inadvertently submitted a code change to accept the Sanitary Waste Valve Standard (ASME A112.18.8) to the wrong code. They submitted it to the Chapter 14 of the IPC without any accompanying code language in the body of the code and without the necessary exceptions related to the code sections similar to what was done in this residential code change proposal. The manufacturer intended it to be submitted to the IRC.

The Standard was incorrectly submitted to the IPC without the accompanying code language in the body of the code. So the testimony that this same code change was submitted to the IPC and denied is inaccurate. This inaccurate testimony may have swayed some votes in the on-line voting.

This code change proposal is for a new plumbing product that currently does not exist in construction codes in the USA. The device outperforms p-traps in testing with solids flushed down the pipe and when there are long periods of non-use p-traps evaporate, but the sanitary waste valve device continues to protect the building from sewer gas. The sanitary waste valve serves the same function as a trap, but it is not a water seal p-trap. A water seal p-trap is based on a dip in the tubing to catch or trap water in the drain to provide a liquid seal between the interior of a building and

the sewer gasses and odors in the public sewer system.

This product is called an "In-Line Sanitary Waste Valve" because it has an elastomeric bladder that seals very efficiently and easily opens to allow liquids and solids to pass. Its primary design application is to work in buildings that may be occasionally subjected to long periods of non-use. It does not rely on a water seal so it can sit for very long periods without water or liquids and it will still prevent sewer odors from entering the building from the public sewers.

P-traps will dry up and allow sewer odors to escape into the building when the fixture has not been used for a period of time. (Most p-traps lose their seal in a couple of weeks) Another function the Sanitary Waste valve performs better than a P-trap is it prevents freezing and cracking of a water sealed trap. As ice expands in a P-trap and it will expand and crack the trap allowing the water to drain out and cause water damage and the trap loses its seal. It does not "Trap water" it uses a flexible membrane and therefore it needs to be identified separately from a p-trap with an exception. P-traps will often plug when dirt and heavy solids are washed into the sink, lavatory or bathtub drain and they settle in the bottom of the trap. In-line sanitary waste valves easily pass these solids. P-traps often crack and leak when exposed to freezing temperatures and the ice expands and cracks the p-trap. In-line sanitary waste valves perform very well in freezing conditions and they still prevent sewer gasses from entering a building when the fixture has not been used for an extended period. Long periods of non-use is common for many seasonal type hotel, school and state park types of buildings. Sanitary waste valves have been used extensively in many other parts of the world very successfully. (Europe, South Africa, and Asia)

This proposal is seeking to allow the use of in-line sanitary waste valves that conform to the requirements of the attached ASME A112.18.8 Standard to be used as an alternate to p-traps in special conditions where freezing and evaporation are concerns. This proposal is not intended to replace p-traps. These devices cost more than a p-trap, so they will not take over the market. They are intended to only be used on sinks, lavatories, and bathtubs where freezing conditions may exist. One builder said he would like to be able to use these devices in townhomes where the second story has a cantilevered overhang where traps from the fixtures above often freeze and crack. Others have said these devices would be ideal for seasonal buildings like cabins, vacation homes, guest bathrooms, bar sinks, homes that are empty and for sale for long periods or any other building that has long periods of non-use or in any building where traps can freeze or dry up. This option is currently not available in the code and this code change is intended to give consumers a choice for a better product if they choose to purchase it.

The code addresses a few requirements for P-Traps, but there is not standard for P-traps. The manufacturer of the sanitary waste valve device realized that you cannot expect a Sanitary waste valve to fit the description of a trap and there was not standard for a trap to test the device to for equivalency. Because there is no performance standard for a P-trap, the manufacturer had to develop a standard for this new type of product. The manufacturer went to the American Society of Mechanical Engineers to develop a Standard for the product. The Standard is ASME A112.18.8, the standard was titled: "In-Line Sanitary Waste Valves for Plumbing Drainage Systems". This standard includes a "Scope" that states these devices are intended "for use as an alternate to tubular p-traps" (1-1/4 inch and 1-1/2 inch at sinks, lavatories and bathtubs only) The standard also covers the material and performance requirements for the product. It also states that "these devices are not intended for use with water closets and urinals".

The Standard includes "material requirements" for the device to comply with the seal material requirements in "ASTM F409 Standard Specification for Thermoplastic Accessible and Replaceable Plastic Tube and Tubular Fittings". It also addresses the "Seal material to comply with or exceed the following material requirements from ASTM D2000: M3BA507, A14, B13, C12 and F17 or M2BG714, B14, EO14, and EO34. The ASTM D2000 standard is an industry standard for testing rubber and polymer products. These material requirements have been confirmed with a 3rd party laboratory test report.

Test Requirements

The test requirements in the standard titled "ASME A112.18.8-2014 In-Line Sanitary Waste Valves for Plumbing Drainage Systems" are as follows:

**Waterway Flow Rate Test:** Flow rates not less than 1-1/4 in.: 9.5 gpm, valve alone on wash basin, bidet, 1-1/2 in.: 13.5 gpm, valve alone on bath, and 1-1/2 in.: 11.1 gpm, valve alone on kitchen sink.

**One-Way Sealing Performance of the Valve Test:** Apply air pressure to end of the tubing until a pressure of 2 in. (51 mm) of water, gage, is registered on the u-tube manometer. Maintain pressure for 10 sec.

**Airway Flow Rate Test:** Must flow 1 cfm minimum.

**Recovery From an Excess Back Pressure (Inversion) Condition Test:** The sink must completely drain after valve bladder is inverted and water flows into the sink.

**Leak Tightness Test:** The valve must be tested using an internal pressure of 25 psi (172 kPa) for 1 hr.

**Thermal Cycling Test:** Thermal cycling test procedure for 5 cycles and allow 5 sec of draining time between cycles:

7.9 gpm of water at a temperature of 203°F ± 4°F (95°C ± 2°C) over a period of 15 min at a constant flow rate

7.9 gpm of water at a temperature of 68°F ± 10°F (20°C ± 5°C) over a period of 10 min at a constant flow rate

**Cyclic Fatigue Test:** The valve shall allow 60 sec for draining between cycles: 1,500 cycles of 60 sec

± 2 sec duration, at a temperature of 200°F ± 4°F followed by 60 sec at a temperature of 59°F ± 10°F, flow rate 7.9 gpm ± 0.1 gpm.

**Resistance to Household Substances Test:** The material shall be placed on or around the sink outlet. Four pints of water will then be poured onto the item to flush the material from the sink. The system will then be left for 24 hr. Substances tested are uncooked long-grain rice, diced vegetable of size 1/4 in, liquid soaps, kiln-dried sand and lard—95% water, 5% melted lard, each at 150°F.

**Resistance to Chemicals and Solvents Test:** The material shall be poured into the sink outlet. After one minute, pour 4 pt of cold water into the sink outlet to flush the solvent from the sink. The system will then be left for 24 hr. Solvents were liquid drain cleaner containing sulfuric acid, mineral spirits and kerosene.

**Drop Test:** The test shall be conducted over a clean concrete surface. Hold the valve with the lowest point upside down, 3 ft above the surface and release the valve, repeat twice, changing the orientation of the valve each time.

**Life Cycle Test:** The valve under test shall undergo 20,000 cycles. A cycle comprises 10 sec exposure to the solution, followed by 10 sec of draining.

It should be noted there is no standard for a P-trap and P-traps are not subjected to any tests. This proposal is not to eliminate P-traps it is to offer an alternative to P-traps for installations where evaporation or freezing are concerns.

## *Public Comment 2:*

**Proponent : Assembly Action requests Disapprove.**

**Commenter's Reason:** This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. The assembly action for Disapprove was successful by a vote of 62.5% (95) to 37.5% (57) by eligible members online during the period of May 14 - May 28, 2015.

## *Public Comment 3:*

**Proponent : Pennie L Feehan, representing Copper Development Association (penniefeehan@me.com) requests Disapprove.**

**Commenter's Reason:** This proposal removes the use of traps, which would eliminate the requirement for vents. Section P3101.2 requires that any plumbing fixture's trap be protected from pressure differentials by a system of vents and section P3101.2.1 requires that every trap and trapped fixture shall be vented. Remove the trap and you remove the vent requirement. These devices may be allowed now on a case by case basis by the use of Section R104.11 Alternative materials, design and methods.

#### *Public Comment 4:*

**Proponent : Shawn Strausbaugh, representing VA Plumbing and Mechanical Inspectors Association (VPMIA), VA Building Code Officials Association (VBCOA) (sstrausbaugh@arlingtonva.us) requests Disapprove.**

**Commenter's Reason:** Based upon the outcome of the assembly motion vote for disapproval of this proposed change, 63% in favor of disapproval and 38% against disapproval, and the IPC committees action to disapprove this change it is clear that these mechanical devices in lieu of a water seal trap are not proper way to protect the occupants of a building or structure from sewer gases entering a structure. This type of device appears to violate the provisions prohibited trap design and by placing an exception for such a device does not solve the problem of traps with movable parts or interior partitions.

Basing the use of these devices on previous use in the recreational vehicle industry or comparing these devices to trap seal protection devices in not a fair comparison as trap seal protection devices are a secondary protection method and not a primary protection method for keeping sewer gases from entering a structure or building. The RV plumbing system and the IRC one and two family plumbing systems differ greatly and again this is type of comparison was not substantiated in the original proposal.

**RP19-15**

# RM8-15

## M1502.3 (New)

### **Proposed Change as Submitted**

**Proponent :** Julius Ballanco, JB Engineering and Code Consulting, P.C., representing In-O-Vate Technologies, Inc (JBENGINEER@aol.com)

## 2015 International Residential Code

### **Add new text as follows:**

**M1502.3 Make-up air for tight construction.** Make-up air shall be provided for clothes dryers where the air infiltration rate is known to be less than 0.4 air changes per hour (ACH). Make-up air shall be provided by a duct that communicates with the outdoors, a ventilated crawl space, or a ventilated attic space and such duct shall have a cross sectional area not less than that of a 4 inch round duct. The make-up air duct shall open into the room in which the clothes dryer is located. Make-up air duct inlets shall be provided with a screen having a mesh size not less than ¼ inch and not greater than ½ inch. The make-up air inlet shall be equipped with an air admitting damper that opens during the operation of the clothes dryer.

**Exception:** Condensing dryers shall not require make-up air.

**Reason:** Today homes are much more tightly constructed, creating an inadequate condition for the proper operation of a clothes dryer. The exhaust rate for a residential dryer ranges from 125 to 200 cfm with newer dryers favoring 200 cfm. When the air infiltration rate drops to less than 0.4 air changes per hour, this creates a condition of inadequate make-up for the clothes dryer. When there is inadequate ambient air to pull from, the dryer is starved and not capable of efficiently drying the clothes any longer. This extends the length of time for the dryer cycle wasting energy. It also reduce the life of the dryer since the fan is attempting to exhaust air that is not available.

Many clothes dryers are located in the basement of a home. When located in the basement, they have the available air in the basement as make-up air for exhausting the moisture. If a basement in 25 feet by 25 feet with an 8 foot ceiling, there is 5,000 cubic feet of available air. However, with an air exchange rate of 0.4, the available air for exhaust is 2000 cubic feet. That translates to 33.3 cfm of air. This means that the dryer has to draw air from other locations in order to properly operate, potentially pulling it from other unsafe sources.

Outside air is normally required by combustion air when the air infiltration rate is less than 0.4 as identified in Section G2407.5. This code change is consistent by requiring make-up air when the air exchange rate is below this value. The amount of air required for combustion air is normally less than the amount of make-up air for a dryer exhaust. An 80,000 Btu/hr furnace only requires between 16.6 and 26.6 cfm for combustion air, whereas the dryer requires between 125 and 200 cf

With a 4 inch duct, the make-up air can be provided at an acceptable rate. Furthermore, the fan in the clothes dryer would draw the make-up air through the make-up air duct.

A screened air admitting damper or equivalent device is necessary to prevent outside air from entering the home when the clothes dryer is not in use. The screen dimension are taken from Table 401.5 of the IMC for residential occupancies. The air admitting damper also prevents the loss of conditioned air when the dryer is not in use.

**Cost Impact:** Will increase the cost of construction  
There will be an increase cost to install a make up air duct.

RM8-15 : M1502.3  
(New)-BALLANCO3701

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** There are too many variables to apply such a requirement. Kitchen hoods don't need makeup air until they exceed an exhaust rate of 399 cfm. This is too restrictive and would apply to electric dryers.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing In-O-Vate Technologies (JBENGINEER@aol.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Residential Code**

**M1502.3 Make-up air for tight construction.** Make-up air shall be provided for clothes dryers where the air infiltration rate is known to be located in rooms or spaces having a volume of less than 0.4 air changes per hour (ACH) 15,000 cubic feet. Make-up air shall be provided by a duct through an opening that communicates with the outdoors, a ventilated crawl space, or a ventilated attic space and such duct shall have a cross-sectional area is not less than 60 square inches in area and that of a 4 inch round duct. The make-up air communicates directly or through a duct shall open into the room in which the clothes dryer is located. Make-up air duct inlets shall be provided with a screen indoor spaces having a mesh size not less than ¼ inch and not greater than ½ inch. The make-up air inlet shall be equipped volume of 15,000 cubic feet or more, the outdoors or spaces that freely communicate with an air admitting damper that opens during the operation of the clothes dryer outdoors.

**Exception:** Condensing dryers shall not require make-up air.

**Commenter's Reason:** It was clearly agreed that make up air is necessary for a clothes dryer to operate effectively. The make-up air required is not combustion air as assumed by a few. The make-up air is needed for the clothes to be dried. The clothes dryer moves the air, either heated or not, to remove the moisture from the clothes. This air is exhausted to the outdoors. The rate of exhaust air for a dryer varies based on the length of the dryer exhaust vent.

One of the concerns expressed was having a definitive number to use when a dryer requires make-up air. Using an exhaust rate of 125 cfm and an air exchange rate of 0.5 air changes per hour, the volume of air required without make-up air would be 15,000 cubic feet. Again using the 125 cfm exhaust rate and the passive air movement of 300 feet per minute, the minimum size opening would be 60 square inches. This would allow the dryer to use air from either the adjacent spaces or from

outdoors.

# RM9-15

## M1502.3

### **Proposed Change as Submitted**

**Proponent :** Julius Ballanco, JB Engineering and Code Consulting, P.C., representing In-O-Vate Technologies (JBENGINEER@aol.com)

## **2015 International Residential Code**

**Revise as follows:**

**M1502.3 Duct termination.** Exhaust ducts shall terminate on the outside of the building. Exhaust duct terminations shall be in accordance with the dryer manufacturer's installation instructions. If the manufacturer's instructions do not specify a termination location, the exhaust duct shall terminate not less than 3 feet (914 mm) in any direction from openings into buildings. Exhaust duct terminations shall be equipped with a backdraft damper. Screens shall not be installed at the duct termination. Exhaust duct penetrations of exterior wall and roof assemblies shall be sealed air-tight to prevent the dryer exhaust from re-entering the building.

**Reason:** This change clarifies that the dryer exhaust must vent to the outside without the possibility of having the dryer exhaust return to the building. In some regions, friction-fitting a ducts' end into a roof cap appears to still be acceptable. This change adds the language to require a positive leak-proof assembly that will prevent the dryer exhaust from reentering the building. The high humidity of the dryer exhaust can cause all sorts of problems within the building elements if the dryer exhaust can reenter the building. Humidity control is an important part of any building design. As such, humid lint-laden air should never be given a path to enter the building after being exhausted.

**Cost Impact:** Will not increase the cost of construction  
This change clarifies the intent of the code.

RM9-15 : M1502.3-  
BALLANCO4119

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** This subject is already covered in the IECC. How does one interpret "air tight"? This is a workmanship issue, not a code issue. All wall and roof penetrations need to be sealed anyway.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent :** Julius Ballanco, JB Engineering and Code Consulting, P.C., representing In-O-Vate Technologies (JBENGINEER@aol.com) requests Approve as Modified by this Public Comment.

**Modify as Follows:**

**2015 International Residential Code**

**M1502.3 Duct termination.** Exhaust ducts shall terminate on the outside of the building. Exhaust duct terminations shall be in accordance with the dryer manufacturer's installation instructions. If the manufacturer's instructions do not specify a termination location, the exhaust duct shall terminate not less than 3 feet (914 mm) in any direction from openings into buildings. Exhaust duct terminations shall be equipped with a backdraft damper. Screens shall not be installed at the duct termination. ~~Exhaust duct penetrations of exterior wall and roof assemblies shall be sealed airtight to prevent the dryer exhaust from re-entering the building.~~

**M1502.3.1 Roof Penetrations.** Where an exhaust termination penetrates a roof, a flashing shall be installed in accordance with Section R903.2.

**M1502.3.2 Penetrations of exterior walls.** Where an exhaust termination penetrates an exterior wall, a waterproof seal shall be made on the exterior of the wall by one of the following methods:

1. A waterproof sealant applied at the joint between the wall and the penetrating item.
2. A flashing of an approved elastomeric material.

**Commenter's Reason:** What this code change pointed out is that the code is remiss regarding penetrations of mechanical system. In the plumbing section, P2607 provides detailed requirements regarding pipe penetrations of roofs and exterior walls. However, no such section exists in the mechanical section of the code. This is highlighted in Section R905.2.8.4. This section has flashing requirements for plumbing piping systems and chimneys, but ignores duct and exhaust terminations. A proposed change will be submitted next cycle to add the requirements for duct and exhaust penetrations to R905.2.8.4.

This modification will correct the oversight regarding penetrations. Everyone acknowledged that sealing the opening around a duct termination was necessary. However, the claim was that this is addressed in the Energy Code. Exterior penetrations are not addressed in the Energy Code, only penetrations of the envelope are addressed. Quite often, exterior penetrations are not envelope penetrations.

---

**RM9-15**

# RM10-15

## M1502.3

### **Proposed Change as Submitted**

**Proponent :** Julius Ballanco, JB Engineering and Code Consulting, P.C., representing In-O-Vate Technologies (JBENGINEER@aol.com)

## **2015 International Residential Code**

**Revise as follows:**

**M1502.3 Duct termination.** Exhaust ducts shall terminate on the outside of the building. Exhaust duct terminations shall be in accordance with the dryer manufacturer's installation instructions. If the manufacturer's instructions do not specify a termination location, the exhaust duct shall terminate not less than 3 feet (914 mm) in any direction from openings into buildings. Exhaust duct terminations shall be equipped with a backdraft damper. Screens shall not be installed at the duct termination. Dryer exhaust duct terminations shall, by design, provide access for cleaning the exhaust duct.

**Reason:** The routine cleaning of the dryer exhaust ducts minimizes the potential for a fire in the duct as well as increasing the efficiency of the appliance. Duct cleaning services now provide this service for dryer exhaust ducts using a wand and brush. Many duct cleaning service companies enter the dryer exhaust duct through the duct termination. This offers an easy access to the dryer exhaust duct system. If a proper dryer exhaust terminal is not provided that allows ease of access, some companies have been known to wrongly remove the termination lid or cover creating a potential leak situation.

Examples of vent caps that duct cleaners wrongly disassemble to gain access.

Examples of vent caps that duct cleaners wrongly disassemble to gain access.

**Cost Impact:** Will increase the cost of construction  
The exhaust terminal may cost more.

RM10-15 : M1502.3-  
BALLANCO4122

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** This is a maintenance issue that the homeowners need to address. Approved exhaust terminals will already allow access for cleaning.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing In-O-Vate Technologies (JBENGINEER@aol.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

**2015 International Residential Code**

**M1502.3 Duct termination.** Exhaust ducts shall terminate on the outside of the building. Exhaust duct terminations shall be in accordance with the dryer manufacturer's installation instructions. If the manufacturer's instructions do not specify a termination location, the exhaust duct shall terminate not less than 3 feet (914 mm) in any direction from openings into buildings. Exhaust duct terminations shall be equipped with a backdraft damper. Screens shall not be installed at the duct termination. Dryer exhaust ducts that are installed in enclosed wall or ceiling cavities or in attic areas shall have duct terminations ~~shall, by design, that~~ provide access for cleaning the ~~exhaust~~-duct.

**Commenter's Reason:** It was pointed out at the first hearing that some ducts penetrate the basement wall and are readily available for cleaning on the inside of the home. The intent of this requirement was to apply to long duct runs that are not readily accessible on the interior of the building. This will allow the cleaning of the dryer exhaust duct from the outside.

The lint build up on the interior of the dryer exhaust duct presents a fire hazard. These ducts need regular cleaning to reduce the fire hazard and increase the efficiency of the dryer.

The majority of dryer exhaust terminations are held in place with screws. Removing these screws allows easy access for cleaning. This change would prevent the use of roof jacks that are not intended to be used as dryer exhaust terminals.

---

RM10-15

# RM13-15

## M1502.4.2.1 (New)

### Proposed Change as Submitted

**Proponent :** Rick Harpenau, In-O-Vate Technologies, representing In-O-Vate Technologies (rick@dryerbox.com)

## 2015 International Residential Code

**Add new text as follows:**

**M1502.4.2.1 Exhaust termination pathways.** Dryer exhaust duct terminal pathways that cause a change in direction of air flow between 45 and 90 degrees shall have an area not less than 20 percent larger than the cross sectional area of the exhaust duct served. Dryer exhaust duct terminal pathways that cause a change in direction of air flow greater than 90 degrees shall have an area not less than 30 percent larger than the cross sectional area of the exhaust duct served. Exhaust duct terminal passageways shall maintain throughout an area of not less than 12.5 square inches (8,065 sq mm).

**Reason:** The code is very sensitive and detailed as it relates to 90 degree elbows and their respective friction loss but does not prohibit or penalize for termination hoods that grossly create back pressure, reducing the efficiency of the dryer. There are wall vents and roof vents on the market that with minimal testing equipment show clearly they create as much back pressure as 3 and 4 elbows. Short of requiring testing standards for every vent termination, the council should consider language whereby the passageway increases in size to make up for the friction causing bends. If this addition to the codes makes sense, actual calculations can be provided. Bottom line, treat terminations the same as elbows and run lengths. Video Links:

[www.youtube.com/watch?v=5KnRp3eXNbk](http://www.youtube.com/watch?v=5KnRp3eXNbk)

<http://youtu.be/ZL2zV1-Gjdl?t=50s>

**Cost Impact:** Will increase the cost of construction  
The increase size may result in a higher cost.

RM13-15 : M1502.4.2.1  
(New)-HARPENAU4553

---

### Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** The proposal does not address ells. No one makes a 5 inch ell. The "terminal pathway" sounds like it describes the entire duct system. The code already contains a table for duct fittings. The percentage calculation is complicated.

**Assembly Action :**

**None**

---

### Individual Consideration Agenda

*Public Comment 1:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing In-O-Vate Technologies (JBENGINEER@aol.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

## **2015 International Residential Code**

~~**M1502.4.2.1 Exhaust termination pathways.** . Dryer exhaust duct terminal pathways that cause a change in direction of air flow between 45 and 90 degrees shall have an area not less than 20 percent larger than the cross-sectional area of the exhaust duct served. Dryer exhaust duct terminal pathways that cause a change in direction of air flow greater than 90 degrees shall have an area not less than 30 percent larger than the cross-sectional area of the exhaust duct served. Exhaust duct terminal passageways shall maintain throughout an area of not less than 12.5 square inches (8,065 sq mm).~~

**M1502.3.1.1 Increase in exhaust termination outlet size.** Where the passageway of a dryer exhaust duct terminal changes direction more than 90 degrees, the open area of the outlet of the terminal shall be not less than 15 square inches (9,677 sq mm).

**Commenter's Reason:** The Committee indicated that this language was too confusing. The modified language coordinates with the new section M1502.3.1. SMACNA lists the K factor for a 90 degree elbow as being 1 and a 130 degree elbow as being 1.2. To equal the pressure loss through the termination, the outlet open area would have to be increased by a factor of 1.2. This results in an open area of 15 square inches. This will result in the equivalent pressure loss through the exhaust termination.

---

**RM13-15**

# RM14-15

**M1503, M1503.1 (New), M1503.2 (New), M1503.2.1 (New), M1503.1, M1503.2, M1505, M1505.1**

## **Proposed Change as Submitted**

**Proponent :** Jonathan Roberts, UL LLC, representing UL LLC  
(jonathan.roberts@ul.com)

### **2015 International Residential Code**

**Revise as follows:**

#### **SECTION M1503 RANGE HOODS DOMESTIC COOKING EXHAUST EQUIPMENT**

**Add new text as follows:**

**M1503.1 General.** Domestic cooking exhaust equipment shall comply with the requirements of this section.

**M1503.2 Domestic cooking exhaust.** Where domestic cooking exhaust equipment is provided it shall comply with one of the following:

1. Overhead range hoods and downdraft exhaust equipment not integral with the cooking appliance shall be listed and labeled in accordance with UL 507.
2. Domestic cooking appliances with integral downdraft exhaust equipment shall be listed and labeled in accordance with UL 858 or ANSI Z21.1.
3. Microwave ovens with integral exhaust for installation over the cooking surface shall be listed and labeled in accordance with UL 923.

**M1503.2.1 Open top broiler exhaust.** Domestic open-top broiler units shall be provided with a metal exhaust hood, having a thickness of not less than 0.0157-inch (0.3950 mm) (No. 28 gage). Such hood shall be installed with a clearance of not less than 1/4 inch (6.4 mm) between the hood and the underside of combustible material and cabinets. A clearance of not less than 24 inches (610 mm) shall be maintained between the cooking surface and combustible material and cabinets. The hood width shall be not less than the width of the broiler unit and shall extend over the entire unit.

**Exception:** Broiler units that incorporate an integral exhaust system, and that are listed and labeled for use without an exhaust hood, shall not be required to have an exhaust hood.

**Revise as follows:**

**M1503.1 M1503.3 General Exhaust discharge.** ~~Range hoods~~ Domestic cooking exhaust equipment shall discharge to the outdoors through a duct. The duct ~~serving the hood~~ shall have a smooth interior surface, shall be air tight, shall be equipped with a back-draft damper and shall be independent of all other exhaust systems. Ducts serving ~~range hoods~~ domestic cooking exhaust equipment shall not terminate in an attic or crawl space or areas inside the building.

**Exception:** Where installed in accordance with the manufacturer's instructions, and where mechanical or natural *ventilation* is otherwise provided, *listed* and *labeled* ductless range hoods shall not be required to discharge to the outdoors.

**M1503.2 M1503.4 Duct material.** Ducts serving ~~range hoods~~ domestic cooking exhaust equipment shall be constructed of galvanized steel, stainless steel or copper.

**Exception:** Ducts for domestic kitchen cooking *appliances* equipped with down-draft exhaust systems shall be permitted to be constructed of schedule 40 PVC pipe and fittings provided that the installation complies with all of the following:

1. The duct is installed under a concrete slab poured on grade.
2. The underfloor trench in which the duct is installed is completely backfilled with sand or gravel.
3. The PVC duct extends not more than 1 inch (25 mm) above the indoor concrete floor surface.
4. The PVC duct extends not more than 1 inch (25 mm) above grade *outside of the building*.
5. The PVC ducts are solvent cemented.

**Delete without substitution:**

### **~~SECTION M1505 OVERHEAD EXHAUST HOODS~~**

**M1505.1 General.** Domestic open top broiler units shall have a metal exhaust hood, having a minimum thickness of 0.0157 inch (0.3950 mm) (No. 28 gage) with  $\frac{1}{4}$  inch (6.4 mm) clearance between the hood and the underside of combustible material or cabinets. A clearance of not less than 24 inches (610 mm) shall be maintained between the cooking surface and the combustible material or cabinet. The hood shall be not less than the width of the broiler unit, extend over the entire unit, discharge to the outdoors and be equipped with a backdraft damper or other means to control infiltration/exfiltration when not in operation. Broiler units incorporating an integral exhaust system, and *listed* and *labeled* for use without an exhaust hood, need not have an exhaust hood.

**Reason:** This proposal accomplishes the following:

1. Changes the name of Section M1503 from Range Hoods to Domestic Cooking Exhaust Equipment, which more accurately reflects the duct, makeup air, and exhaust air requirements in the section.
2. Adds a charging paragraph for the Section to M1503.1.
3. Describes the listing standards used to investigate the various types of exhaust equipment in Section M1503.2.
4. Relocates Section M1505.1 for open top broilers to section M1503.2.1.
5. Makes editorial revisions for clarity.

**Cost Impact:** Will not increase the cost of construction  
It is primarily editorial in nature.

## Public Hearing Results

**Committee Action:**

**Approved as Modified**

**Modification:**

**M1503.3 Exhaust discharge.** Domestic cooking exhaust equipment shall discharge to the outdoors through a duct. The duct shall have a smooth interior surface, shall be air tight, shall be equipped with a back-draft damper and shall be independent of all other exhaust systems. Ducts serving ~~range hoods~~domestic cooking exhaust equipment shall not terminate in an attic or crawl space or areas inside the building.

**Exception:** Where installed in accordance with the manufacturer's instructions, and where mechanical or natural ventilation is otherwise provided, listed and labeled ductless range hoods shall not be required to discharge to the outdoors.

**Committee Reason:** Approval is based on the proponent's published reason statements. The proposal is a logical reorganization of text. The modification provides consistency within the proposal regarding terminology.

**Assembly Action :**

**None**

---

### Individual Consideration Agenda

*Public Comment 1:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com) requests Approve as Modified by this Public Comment.**

**Further Modify as Follows:**

#### **2015 International Residential Code**

**M1503.2 Domestic cooking exhaust.** Where domestic cooking exhaust equipment is provided it shall comply with one of the following:

1. ~~Overhead~~ The fan for overhead range hoods and downdraft exhaust equipment not integral with the cooking appliance shall be listed and labeled in accordance with UL 507.
2. Overhead range hoods and downdraft exhaust equipment with intergral fans shall compy with UL 507.
3. Domestic cooking appliances with integral downdraft exhaust equipment shall be listed and labeled in accordance with UL 858 or ANSI Z21.1.
4. Microwave ovens with integral exhaust for installation over the cooking surface shall be listed and labeled in accordance

with UL 923.

**Commenter's Reason:** This change as originally proposed exceeds the scope of UL 507. UL 507 is a standard for fans and blowers, not range hoods. Included in the scope of the standard are overhead range hoods and downdraft exhaust equipment that have integral hoods. UL 507 does not regulate stand-alone range hoods that do not have an integral fan.

These prefabricated range hoods have served the industry successfully for many years. There is no justification for removing a viable range hood. If the code change is approved as proposed, one could only install a range hood that has an integral fan. That would be overly restrictive.

The modification corrects the mistake with the original submittal. UL 507 regulates all fans used for overhead range hoods and downdraft exhaust equipment. It also addresses range hoods and downdraft exhaust equipment with integral fans.

UL 507 does not regulate range hoods, whether prefabricated or field made. Hence, it is inappropriate to reference the standard for this application.

If this modification is not accepted, the change must be denied since the reference to UL 507 exceeds the scope of the standard. This is a violation of ICC policy.

---

# RM17-15

## M1503.4

### **Proposed Change as Submitted**

**Proponent :** Janine Snyder, City of Thornton, Colorado, representing Colorado Association of Plumbing & Mechanical Officials (CAPMO) (Janine.Snyder@cityofthornton.net)

## **2015 International Residential Code**

**Delete and substitute as follows:**

~~**M1503.4 Makeup air required.** Exhaust hood systems capable of exhausting in excess of 400 cubic feet per minute (0.19 m<sup>3</sup>/s) shall be mechanically or naturally provided with makeup air at a rate approximately equal to the exhaust air rate. Such makeup air systems shall be equipped with not less than one damper. Each damper shall be a gravity damper or an electrically operated damper that automatically opens when the exhaust system operates. Dampers shall be accessible for inspection, service, repair and replacement without removing permanent construction or any other ducts not connected to the damper being inspected, serviced, repaired or replaced.~~

Exhaust hood systems capable of exhausting in excess of 400 cubic feet per minute (0.19 m<sup>3</sup>/s) shall be mechanically or naturally provided with makeup air at a rate approximately equal to the exhaust air rate. Such makeup air systems shall be equipped with not less than one damper. Each damper shall be an electrically operated damper that automatically opens when the exhaust system operates. Dampers shall be accessible for inspection, service, repair and replacement without removing permanent construction or any other ducts not connected to the damper being inspected, serviced, repaired or replaced.

**Reason:** By practice they just don't work unless installed running downhill in the duct which can create a faulty seal within the duct allowing additional leakage. The whole intent is to have the electronic connection between the hood and damper. Volume dampers are subject to not fully closing when installed in the horizontal run due to wind and interior vs exterior pressure differentials. Additionally, they can create an unintended opening in the building envelope which is a prohibition in the energy code.

**Cost Impact:** Will increase the cost of construction  
This will slightly increase the cost of construction by returning to practices. However, the energy cost impact of having an opening into a conditioned structure from the exterior mitigates the increased construction cost.

RM17-15 : M1503.4-  
SNYDER5667

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The proposed text is too restrictive in that it eliminates gravity dampers. An option is needed for both types of dampers, gravity and motorized.

**Assembly Motion:**

**As Submitted**

**Online Vote Results:**

**Failed**

Support: 29.57% (55) Oppose: 70.43% (131)

**Assembly Action :**

**None**

**Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Janine Snyder, City of Thornton, Colorado, representing Colorado Association of Plumbing & Mechanical Officials, CAPMO (Janine.Snyder@cityofthornton.net) requests Approve as Submitted.**

**Commenter's Reason:** By practice they just don't work unless installed running downhill in the duct which can create a faulty seal within the duct allowing additional leakage. The whole intent is to have the electronic connection between the hood and damper. Volume dampers are subject to not fully closing when installed in the horizontal run due to wind and interior vs exterior pressure differentials. Additionally, they can create an unintended opening in the building envelope which is a prohibition in the energy code.

## M1506.3, R303.5, R303.5.1, R303.5.2

### Proposed Change as Submitted

**Proponent :** Mike Moore, Newport Ventures, representing Broan-NuTone, representing Newport (mmoore@newportventures.net)

## 2015 International Residential Code

### Revise as follows:

**M1506.3 Exhaust openings.** ~~Air exhaust openings shall terminate not less than 3 feet (914 mm) from property lines; 3 feet (914 mm) from operable and nonoperable openings into the building and 10 feet (3048 mm) from mechanical air intakes except where the opening is located 3 feet (914 mm) above the air intake.~~

Openings shall comply with Sections R303.5.2 and R303.6.

**R303.5 Opening location.** Outdoor intake and exhaust openings shall be located in accordance with Sections R303.5.1 and R303.5.2.

**R303.5.1 Intake openings.** Mechanical and gravity outdoor air intake openings shall be located not less than 10 feet (3048 mm) from any hazardous or noxious contaminant source, such as vents, chimneys, plumbing vents, streets, alleys, parking lots and loading docks.

For the purpose of this section, the exhaust from dwelling unit toilet rooms, bathrooms, kitchens, and kitchens other living space shall not be considered as hazardous or noxious.

#### **Exceptions:**

- ~~1. The 10-foot (3048 mm) separation is not required where the intake opening is located 3 feet (914 mm) or greater below the contaminant source.~~
- ~~2. Vents and chimneys serving fuel-burning appliances shall be terminated in accordance with the applicable provisions of Chapters 18 and 24.~~
- ~~3. Clothes dryer exhaust ducts shall be terminated in accordance with Section M1502.3.~~

**R303.5.2 Exhaust openings.** Exhaust air shall not be directed onto walkways. Air exhaust openings shall terminate not less than 3 feet (914 mm) from property lines; 3 feet (914 mm) from operable and nonoperable openings into the building; and 10 feet (3048 mm) from mechanical air intakes.

#### **Exceptions:**

1. The 10-foot (3048 mm) separation between intake and exhaust openings is not required where the intake opening is located 3 feet (914 mm) or greater below the contaminant source.
2. Vents and chimneys serving fuel-burning appliances shall be terminated in accordance with the applicable provisions of Chapters 18 and 24.
3. Clothes dryer exhaust ducts shall be terminated in accordance with Section M1502.3.

4. Where a combined exhaust and intake terminal is used to separate intake air from exhaust air originating in living space other than kitchens, a minimum separation distance between these two openings is not required provided that the exhaust air concentration within the intake air flow does not exceed 10%, as established by the manufacturer of such terminal.

**Reason:**

Combined exhaust/supply terminations are regularly installed with heating and energy recovery ventilators (H/ERVs). Their use reduces building penetrations, labor, and associated system costs. By reducing the number of penetrations, air leakage can also be reduced, resulting in space conditioning energy savings. Further, the durability of the structure can be improved through reducing entry pathways for bulk water. Combined terminations are regularly approved and installed in single family and multifamily dwelling units across the country, and manufacturer tests have demonstrated that minimum cross-contamination of airflow results from these terminations. There is currently no industry standard by which to test these units, so we have simply proposed that their performance be verified by the manufacturer, as is the practice in other areas of the code (M2002.5, R502.7, R502.8.2, R703.11.1.1, R802.7.2, R905.2.6, R1003.15.1, R1003.15.2, G2405.3, etc.). The 10% cross contamination metric is based on language in ASHRAE 62.1 that limits cross contamination of exhaust and supply streams to 10% for "air with moderate contaminant concentration, mild sensory-irritation intensity, or mildly offensive odors"; a similar exception exists in the IMC, Section 514.4. In both the IMC and ASHRAE 62.1, no standard is cited for determining cross-contamination, presumably because none yet exists. All exceptions were moved to the exhaust openings section because two of the four exceptions address only exhaust openings; the other two exceptions apply to both intake and exhaust openings, so could feasibly be located in either section.

**Cost Impact:** Will not increase the cost of construction

This proposal is expected to reduce construction costs by eliminating the need for a second wall cap and extra ducting that would otherwise be required to separate intake and exhaust airstreams.

RM20-15 : M1506.3-  
MOORE4871

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The proposal would allow any two ducts to be combined under Exception # 4.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Mike Moore, Newport Ventures, representing Broan-NuTone (mmoore@newportventures.net) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

**2015 International Residential Code**

**R303.5.2 Exhaust openings.** Exhaust air shall not be directed onto walkways. Air exhaust openings shall terminate not less than 3 feet (914 mm) from property lines; 3 feet (914 mm) from operable and nonoperable openings into the building; and 10 feet (3048 mm) from mechanical air intakes.

**Exceptions:**

1. The 10-foot (3048 mm) separation between intake and exhaust openings is not required where the intake opening is located 3 feet (914 mm) or greater below the contaminant source.
2. Vents and chimneys serving fuel-burning appliances shall be terminated in accordance with the applicable provisions of Chapters 18 and 24.
3. Clothes dryer exhaust ducts shall be terminated in accordance with Section M1502.3.
4. Where a factory-built combined exhaust and intake ~~terminal-termination~~ is used to separate intake air from exhaust air originating in living space other than kitchens, a minimum separation distance between these two openings is not required provided that the exhaust air concentration within the intake air flow does not exceed 10%, as established by the manufacturer of ~~such terminal~~ the termination.

**Commenter's Reason:** It is important to note that the only substantive change to these sections is contained in R303.5.2 Exception #4. All other changes are essentially editorial/organizational. The same language in R303.5.2 Exception #4 was recently approved unanimously by the ASHRAE 62.2 committee as addendum h to ASHRAE 62.2-2013. In transferring the language to the IRC, the committee objected to Exception #4 because "the proposal would allow any two ducts to be combined under Exception #4". This was not our intention in submitting the proposal, so it has been corrected to clarify that the combined termination must be factory-built, tested, and verified by the manufacturer that it meets the requirements of this section.

Approval of this proposal will simplify the organization of the IRC, align the IRC with ASHRAE 62.2, *Ventilation and Acceptable Indoor Air Quality in Residential Buildings*, reduce the cost of construction, reduce penetrations of the building envelope, and promote the durability of buildings.

**M1507.3, M1507.3.1, M1507.3.2, M1507.3.3, Table M1507.3.3(1), Table M1507.3.3(2), M1507.3.4 (New), Table M1507.4.4, M1507.3.5 (New), M1507.4, Table M1507.4**

## **Proposed Change as Submitted**

**Proponent:** Craig Conner, representing self (craig.conner@mac.com); Joseph Lstiburek, representing self (joe@buildingscience.com)

### **2015 International Residential Code**

**Revise as follows:**

**M1507.3 Whole-house mechanical ventilation system.** Whole-house mechanical ventilation systems shall be designed in accordance with Sections M1507.3.1 through M1507.3.3- M1507.3.6.

**M1507.3.1 System design.** *No change to text.*

**M1507.3.2 System controls.** *No change to text.*

**M1507.3.3 Mechanical ventilation rate.** The whole-house mechanical ventilation system shall provide outdoor air at ~~a continuous~~ an average rate of not less than that determined ~~in accordance with~~ by Equation 15-1 or Table M1507.3.3(1)–Table M1507.3.3.

$$Q_r = \frac{(0.01 \times A_{\text{floor}}) + [7.5 \times (N_{\text{br}} + 1)]}{\text{---}}$$

**(Equation 15-1)**

where:

Q<sub>r</sub> = ventilation flow rate, cubic feet per minute (cfm)

A<sub>floor</sub> = floor area in square feet (ft<sup>2</sup>)

N<sub>br</sub> = number of bedrooms, not less than one

~~Exception: The whole-house mechanical system is permitted to operate intermittently where the system has controls that enable operation for 25-percent of each 4-hour segment and the ventilation rate prescribed in Table M1507.3.3(1) is multiplied by the factor determined in accordance with Table M1507.3.3(2).~~

**TABLE M1507.3.3 (1)  
~~CONTINUOUS~~ WHOLE-HOUSE MECHANICAL VENTILATION SYSTEM  
AIRFLOW RATE REQUIREMENTS**

DWELLING	NUMBER OF BEDROOMS			

UNIT FLOOR AREA (square feet)	0 - 1	2 - 3	4 - 5	6 - 7	> 7
	Airflow in CFM				
<1,500	30	45	60	75	90
1,501 - 3,000	45	60	75	90	105
3,001 - 4,500	60	75	90	105	120
4,501 - 6,000	75	90	105	120	135
6,001 - 7,500	90	105	120	135	150
> 7,500	105	120	135	150	165

For SI: 1 square foot = 0.0929 m<sup>2</sup>, 1 cubic foot per minute = 0.0004719 m<sup>3</sup>/s.

**Delete without substitution:**

**TABLE M1507.3.3(2)  
INTERMITTENT WHOLE-HOUSE MECHANICAL VENTILATION RATE  
FACTORS<sup>a, b</sup>**

*Portions of table not shown for clarity*

- a. ~~For ventilation system run time values between those given, the factors are permitted to be determined by interpolation.~~
- b. ~~Extrapolation beyond the table is prohibited.~~

**Add new text as follows:**

**M1507.3.4 Ventilation quality adjustment** The required whole house ventilation rate from Section M1507.3 shall be adjusted by the system coefficient in Table 1507.3.4 based on the system type using Equation 15-2.

$Q_v = Q_r \times C_{system}$  **(Equation 15-2)**  
where:

$Q_r$  = ventilation rate in cubic feet per minute from Equation 15-1 or Table 1507.3.3

$C_{system}$  = system coefficient from Table M1507.3.4

**TABLE M1507.3.4  
SYSTEM COEFFICIENT**

--	--	--

<u>SYSTEM TYPE</u>	<u>DISTRIBUTED<sup>a</sup></u>		<u>NOT DISTRIBUTED<sup>a</sup></u>	
	<u>MIXED<sup>b</sup></u>	<u>NOT MIXED<sup>b</sup></u>	<u>MIXED<sup>b</sup></u>	<u>NOT MIXED<sup>b</sup></u>
<u>Balanced<sup>c</sup></u>	<u>0.75</u>	<u>1.0</u>	<u>1.0</u>	<u>1.25</u>
<u>Not Balanced<sup>c</sup></u>	<u>1.0</u>	<u>1.25</u>	<u>1.25</u>	<u>1.5</u>

a. "Distributed" shall apply where outdoor ventilation air is supplied directly to each bedroom and the largest common area; otherwise "not distributed" shall apply.

b. "Mixed" shall apply where not less than 70% of the whole building air volume is recirculated each hour by one or more mechanical systems, otherwise "not mixed" shall apply. Where a central heating or cooling air handler fan is used to provide the mixing, the design heating or cooling airflow rate shall be used to determine the operation time setting required.

c. "Balanced" shall apply where two or more fans simultaneously supply outdoor air and exhaust air at approximately the same rate; otherwise "not balanced" shall apply. Where outdoor air is supplied by a central forced air system, "balanced" shall apply only where the fan for such system operates simultaneously with the exhaust fan(s).

**M1507.3.5 Intermittent operation** Systems controlled to operate intermittently shall operate for not less than one hour in each four hour period. The ventilation rate provided by systems controlled to operate intermittently shall be computed as the average ventilation provided including both times of operation and non-operation.

**Revise as follows:**

~~M1507.4~~ **M1507.3.6 Local exhaust rates.** Local exhaust systems shall be designed to have the capacity to exhaust the minimum air flow rate determined in accordance with Table ~~M1507.4~~ **M1507.3.6**. Fans required by this section shall be provided with controls that enable manual override, such as an on and off switch. Fan controls shall be provided with ready access from the room served by the fan.

~~TABLE M1507.4~~ **TABLE M1507.3.6**  
**MINIMUM-REQUIRED LOCAL EXHAUST RATES FOR ONE- AND TWO-FAMILY DWELLINGS**

<b>AREA TO BE EXHAUSTED</b>	<b>EXHAUST RATES</b>
Kitchens	100 cfm intermittent or 25 cfm continuous
Bathrooms-Toilet Rooms	Mechanical exhaust capacity of 50 cfm intermittent or 20 cfm

**Reason:** This proposed change adds the equation to compute minimum ventilation rates, adjusts airflow rates based on the effectiveness of the ventilation system type, more clearly states that the occupants shall have controls to adjust the ventilation, and makes several changes to clarify the ventilation section. The equation on which Table M1507.3.3 is based is added explicitly as Equation 15-1. The equation is an alternative to the ventilation rates in Table M1507.3.3. The rate computed by Equation 15-1 is often lower than the table because the rates in the table have been rounded up to the largest floor area and highest number of bedrooms for each cell in the table.

Some types of ventilation work better than others. The proposal adds a ventilation quality adjustment (new M1507.3.4) based on the type of ventilation system.

This change improves on the code language; for example, although Section M1507.3.3 says the requirement is for a continuous rate, it is clear the section also allows intermittent ventilation. Unneeded words are eliminated. For example the existing Table M1507.3.3(2) and the discussion on "intermittent" in the exception is a long-winded way of saying rates that are averaged over 4 hour periods also work.

This change makes it clear that occupants can control kitchen and bath fans, allowing them to increase the ventilation when needed. For example, increasing the ventilation if food is burned in the kitchen, or odors in the bathroom suggest higher levels of ventilation.

Some argue ventilation rates need to be substantially increased, but they do not provide evidence that existing rates are inadequate. The existing ventilation rates in the IRC have been used in many programs over the past two decades: Environments for Living program, Engineered for Life program, Energy and Environmental Building Association (EEBA) building recommendations, DOE Building America program experience, Canada's R-2000 program and Canada's Energy Star program.

Excess ventilation causes problems. Excess ventilation causes part load humidity problems in humid climates, which can lead to mold. Excess ventilation causes buildings to get overly dry during the winter leading to problems with wood finishes and furniture. Excess ventilation can cause discomfort to occupants leading to the installation of humidifiers which can be sources of indoor pollutants, leading the occupants to turn off the ventilation system which defeats the purpose of providing ventilation. Finally excessive ventilation leads to big energy costs.

**Cost Impact:** Will not increase the cost of construction

Overall costs should not increase. The required ventilation airflow rates are based on the same equation as the existing code. Ventilation rates required by the Equation 15-1 option are the same or slightly less than in the existing Table M1507.3.3(1). There will be some increases or decreases in cost depending on the system type, with the code change encouraging the use of the more effective systems. Some options, such as providing ventilation air through a central forced air system, are an inexpensive way to provide ventilation that is both "distributed" and "mixed". Most builders are already using the larger fans in Table M1507.3.6. Operating costs should go down due to encouraging the use of more effective ventilation system types and letting the occupant control ventilation to use it when most needed.

RM24-15 : M1507.3-  
CONNER5337

## **Public Hearing Results**

**Committee Action:**

**Approved as Modified**

**Modification:**

**M1507.3.4 Ventilation quality adjustment.** The required whole house ventilation rate from Section M1507.3.3 shall be adjusted by the system coefficient in Table 1507.3.4 based on the system type using Equation 15-2.

$$Q_v = Q_r \times C_{\text{system}} \quad (\text{Equation 15-2})$$

where:

$Q_r$  = ventilation rate in cubic feet per minute from Equation 15-1 or Table 1507.3.3

$C_{\text{system}}$  = system coefficient from Table 1507.3.4

**Committee Reason:** Approval is based on the proponent's published reason statements. The modification adds the option for the table calculation.

**Assembly Action :**

**None**

**Individual Consideration Agenda**

*Public Comment 2:*

**Proponent :** Craig Drumheller, representing National Association of Home Builders (CDrumheller@nahb.org); Craig Conner, representing self (craig.conner@mac.com) requests Approve as Modified by this Public Comment.

**Modify as Follows:**

**2015 International Residential Code**

**TABLE M1507.3.4**

SYSTEM TYPE	DISTRIBUTED <sup>a</sup>		NOT DISTRIBUTED <sup>a</sup>	
	MIXED <sup>b</sup>	NOT MIXED <sup>b</sup>	MIXED <sup>b</sup>	NOT MIXED <sup>b</sup>
<u>Mixed<sup>b</sup> or Balanced<sup>c</sup></u>	0.75	<del>1.0</del>	1.0	<del>1.25</del>
<u>Not Mixed<sup>b</sup> and Not Balanced<sup>c</sup></u>	1.0	<del>1.25</del>	1.25	<del>1.5</del>

a. "Distributed" shall apply where ~~outdoor~~ a ducted system serving heating, cooling or ventilation equipment supplies air-is-supplied directly to each bedroom and the largest common area; otherwise "not distributed" shall apply.

b. "Mixed" shall apply where not less than 70% of the whole building air volume is recirculated each hour by one or more mechanical systems, otherwise "not mixed" shall apply. Where a central heating or cooling air

handler fan is used to provide the mixing, the design heating or cooling airflow rate shall be used to determine the operation time setting required. c. "Balanced" shall apply where two or more fans simultaneously supply outdoor air and exhaust air at approximately the same rate; otherwise "not balanced" shall apply. Where outdoor air is supplied by a central forced air system, "balanced" shall apply only where the fan for such system operates simultaneously with the exhaust fan(s) .

**Commenter's Reason:** The original proposal adds a ventilation quality adjustment factor to the whole-house mechanical ventilation system rates based on the effectiveness of the listed ventilation systems. Based on how homes are currently constructed, this proposal drastically increases the amount of ventilation required for most homes- this contradicts the original reason statement from the proponent. Very few homes have balanced ventilation, according to the Home Innovation Builder Practices Survey- only 7% of the homes built in 2014 used balanced ventilation with HRVs or ERVs. As originally proposed, a balanced system is necessary to reduce the required ventilation rate.

This leaves 93% of homes that will either have the same or an increased ventilation rate. In order to maintain the same rate as currently required without using a balanced system two conditions must apply, 1) there must be a supply ventilation system that brings air directly into the house and 2) a central fan is required that will recirculate 70% of the air on an hourly basis. In order to achieve the 70% re-circulation in a 2,400 square foot house, a central fan will need to run continually at 224 cfm. Neither one of these system types are common. All other systems will require a 25-50% increase in flow.

The proposed change provides a simpler table that still provides incentives for the more effective ventilation strategies and deterrents for less effective systems without penalizing typical ventilation systems that are currently acceptable in the majority of homes.

Changes include:

- Homes with forced air systems shall be considered "Distributed"
- "Mixed" and "Balanced" systems shall both get the same consideration.

Homes without a central type forced air system, balanced ventilation or other re-circulation control will have a higher ventilation rate, but as a whole, the ventilation rates should remain the same for most homes with forced air HVAC systems. If additional ventilation strategies are installed, the ventilation rate can be decreased while providing a similar indoor air quality.

### *Public Comment 3:*

**Proponent : Alisa McMahon, representing self (mcmahon.gbac@cox.net) requests Approve as Modified by this Public Comment.**

**Replace Proposal as Follows:**

## **2015 International Residential Code**

**M1507.3 Whole-house mechanical ventilation system.** Whole-house mechanical ventilation systems shall be designed in accordance with Sections M1507.3.1 through ~~M1507.3.6~~ M1507.3.5.

**M1507.3.3 Mechanical ventilation rate.** The whole-house mechanical ventilation system shall provide outdoor air at a continuous rate of not less than that determined in accordance with Equation 15-1 or Table M1507.3.3(1) M1507.3.3.

**Exception:** The whole-house mechanical ventilation system is permitted to operate intermittently where the system complies with Section M1507.3.5 ~~has controls that enable operation for 25 percent of each 4 hour segment and the ventilation rate prescribed in Table M1507.3.3(1) is multiplied by the factor determined in accordance with Table M1507.3.3(2).~~ one.

$$Q_r = \frac{(0.01 \times A_{\text{floor}}) + [7.5 \times (N_{\text{br}} + 1)]}{1} \quad (\text{Equation 15-1})$$

where:

$Q_r$  = continuous ventilation flow rate, cubic feet per minute (cfm)

$A_{\text{floor}}$  = floor area in square feet (ft<sup>2</sup>)

$N_{\text{br}}$  = number of bedrooms, not less than

**TABLE M1507.3.3

3,001-4,500	60	75	90	105	120
4,501-6,000	75	90	105	120	135
6,001-7,500	90	105	120	135	150
>7,500	105	120	135	150	165

For SI: 1 square foot = 0.0929 m<sup>2</sup>, 1 cubic foot per minute = 0.0004719 m<sup>3</sup>/s.

**M1507.3.4 Ventilation quality adjustment** The required whole house ventilation rate from Section M1507.3.3 shall be adjusted by the system coefficient in Table 1507.3.4 based on the system type using Equation 15-2.

$$Q_v = Q_r \times C_{\text{system}} \quad (\text{Equation 15-2})$$

where:

$Q_v$  = quality-adjusted ventilation flow rate, cubic feet per minute (cfm)

$Q_r$  = continous ventilation flow rate in cubic feet per minute from Equation 15-1 or Table 1507.3.3

$C_{\text{system}}$  = system coefficient from Table 1507.3.4

**TABLE M1507.3.4  
SYSTEM COEFFICIENT**

<b>SYSTEM TYPE</b>	<b>DISTRIBUTED<sup>a</sup></b>		<b>NOT DISTRIBUTED<sup>a</sup></b>	
	<b>MIXED<sup>b</sup></b>	<b>NOT MIXED<sup>b</sup></b>	<b>MIXED<sup>b</sup></b>	<b>NOT MIXED<sup>b</sup></b>
<u>Balanced<sup>c</sup></u>	<u>0.75</u>	<u>1.0</u>	<u>1.0</u>	<u>1.25</u>
<u>Not Balanced<sup>c</sup></u>	<u>1.0</u>	<u>1.25</u>	<u>1.25</u>	<u>1.5</u>

a. "Distributed" shall apply where outdoor ventilation air is supplied directly to each bedroom and the largest common area; otherwise "not distributed" shall apply.

b. "Mixed" shall apply where not less than 70% of the whole building air volume is recirculated each hour by one or more mechanical systems; otherwise "not mixed" shall apply. Where a central heating or cooling air handler fan is used to provide the mixing, the design heating or cooling airflow rate shall be used to determine the operation time setting required.

c. "Balanced" shall apply where two or more fans simultaneously supply outdoor air and exhaust air at approximately the same rate; otherwise "not balanced" shall apply. Where outdoor air is supplied by a central forced air system, "balanced" shall apply only where the fan for such system operates simultaneously with the exhaust fan(s).

**M1507.3.5 Intermittent Operation.** The whole-house mechanical ventilation system is permitted to operate intermittently where the system is controlled to operate for not less than 25-percent of each 4-hour segment. The intermittent ventilation rate shall be the quality-adjusted ventilation flow rate prescribed in Section M1507.3.4 multiplied by the factor determined in accordance with Table M1507.3.5.

**TABLE M1507.3.3 M1507.3.5  
INTERMITTENT WHOLE-HOUSE MECHANICAL VENTILATION RATE

Bathrooms-Toilet Rooms	<del>Mechanical exhaust capacity of</del> 50 cfm <del>intermittent or 20 cfm</del> <del>continuous</del>

**Commenter's Reason:** Note: Text changes are shown in relation to original code. However, "Commenter's Reasons" address the differences between "RM 24-15 as modified by committee" and commenter's proposed replacement.

1. TABLE M1507.3.3 in "RM 24-15 as modified by committee" is identical to TABLE M1507.3.3(1) in the original code. Problems with the table include:

Increments are too large (1500 square feet & 2 bedrooms).

Airflows are calculated using the maximum floor area and largest number of bedrooms in each range.

Both conditions result in higher ventilation air requirements than those calculated with Equation 15-1.

Commenter's proposed TABLE M1507.3.3:

Increments are reduced to 500 square feet and 1 bedroom.

This modification yields results more similar to Equation 15-1 and overall lower ventilation air requirements.

Equation 15-1 can be used for buildings over 5,000 square feet and/or with more than 5 bedrooms.

Examples:

Please see dashed line boxes in the tables below. In the original TABLE M1507.3.3(1), the ventilation air requirement is 90 CFM for buildings from 3,001 to 4,500 square feet with four to five bedrooms. In the commenter's proposed TABLE M1507.3.3, the ventilation air requirement for the same buildings ranges from 73 CFM to 90 CFM.

In a 3001 sq ft / 4 bedroom home, the required ventilation air requirement (CFM) is:

original code Table M1507.3.3(1)	90
proposed Table M1507.3.3	73
Equation 15-1	68

In a 3500 sq ft / 4 bedroom home, the required ventilation air requirement (CFM) is:

original code Table M1507.3.3(1)	90
proposed Table M1507.3.3	73
Equation 15-1	73

*[insert image 1 here]*

In a 4500 sq ft / 5 bedroom home, the required CFM is:

original code Table M1507.3.3(1)	90
proposed Table M1507.3.3	90
Equation 15-1	90

*[insert image 2 here]*

2. Commenter added a definition of  $Q_v$  in Section M1507.3.4 (not defined in "RM 24-15 as modified by committee").
3. Cost – Mixing and distribution are good. However, the "ventilation quality adjustment" will likely encourage central forced air integrated ventilation systems. Such systems are inexpensive to install, but very expensive to operate in all climate zones. (See operating cost data and comparison in LBNL-40378.) Neither version of this code proposal ("as modified by committee" or commenter's) includes requirements to mitigate the high operating costs and energy consumption associated with central forced air integrated ventilation systems. One example of such a measure would be ECM motors in air handler fans.
4. Intermittent Operation – Commenter's Proposed Section M1507.3.5 is essentially the original code M1507.3.3 Exception modified to include the quality-adjusted ventilation rate. Commenter's proposed TABLE M1507.3.5 is identical to TABLE M1507.3.3(2) in the original code.

The Table is a relatively foolproof approach to intermittent ventilation rate calculation. Conversely, section M1507.3.5 in "RM 24-15 as modified by committee" is not clear: "The ventilation rate provided by systems controlled to operate intermittently shall be computed as the average ventilaton [sic] provided including both times of operation and non-operation."

5.

**Bibliography:** The airflow requirements in proposed TABLE M1507.3.3 are calculated in accordance with ASHRAE 62.2-2010. However, the increments (500 square feet and 1 bedroom) follow ASHRAE 62.2-2013 (TABLE 4.1a). As in ASHRAE 62.2-2013 (TABLE 4.1a), proposed TABLE M1507.3.3 tops out at 5,000 square feet and 5 bedrooms.

## Public Comment 4:

**Proponent : Mike Moore, Newport Ventures, representing Broan-NuTone (mmoore@newportventures.net) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Residential Code**

**M1507.3 Whole-house mechanical ventilation system.** Whole-house mechanical ventilation systems shall be designed in accordance with Sections M1507.3.1 through ~~M1507.3.6~~ M1507.3.3.

**M1507.3.3 Mechanical ventilation rate.** The whole-house mechanical ventilation system shall be installed to provide outdoor air continuously at an average ~~a rate of not less greater than or equal to~~ that determined by Equation 15-1 or , alternatively, Table M1507.3.3.

$$Q_r = (0.01 \times A_{\text{floor}}) + [7.5 \times (N_{\text{br}} + 1)] \quad \text{(Equation 15-1)}$$

where:

$Q_r$  = ventilation flow rate, cubic feet per minute (cfm)

$A_{\text{floor}}$  = floor area in square feet (ft<sup>2</sup>)

$N_{\text{br}}$  = number of bedrooms, not less than one

**Exception:** The whole-house mechanical ventilation system is permitted to operate intermittently where the system has controls that enable operation for not less than one hour in each four hour period. The average ventilation rate provided by the system over each 4 hour period shall be greater than or equal to the rate calculated in accordance with this Section.

**TABLE M1507.3.3**

#### **CONTINUOUS WHOLE-HOUSE MECHANICAL VENTILATION AIRFLOW RATE**

For SI: 1 square foot = 0.0929 m<sup>2</sup>, 1 cubic foot per minute = 0.0004719 m<sup>3</sup>/s.

~~**M1507.3.6**~~ **M1507.4 Local exhaust rates.** Local exhaust systems shall have the capacity to exhaust the minimum air flow rate in accordance with Table ~~M1507.3.6~~ M1507.4. Fans required by this section shall be provided with controls that enable manual override, such as an on and off switch. Fan controls shall be provided with ready access from the room served by the fan.

**TABLE M1507.3.6 M1507.4  
MINIMUM LOCAL EXHAUST RATES**

~~**M1507.3.4 Ventilation quality adjustment**~~ The required whole house ventilation rate from Section M1507.3.3 shall be adjusted by the system coefficient in Table ~~1507.3.4~~ based on the system type using Equation ~~15-2~~.

$$Q_v = Q_f \times C_{\text{system}} \text{---(Equation 15-2)}$$

where:

$Q_f$  = ventilation rate in cubic feet per minute from Equation 15-1 or Table 1507.3.3

$C_{\text{system}}$  = system coefficient from Table 1507.3.4

~~**M1507.3.5 Intermittent operation** Systems controlled to operate intermittently shall operate for not less than one hour in each four hour period. The ventilation rate provided by systems controlled to operate intermittently shall be computed as the average ventilaton provided including both times of operation and non operation.~~

~~**M1507.3.4**~~

<del>SYSTEM TYPE</del>	<del>DISTRIBUTED<sup>a</sup></del>		<del>NOT DISTRIBUTED<sup>a</sup></del>	
	<del>MIXED<sup>b</sup></del>	<del>NOT MIXED<sup>b</sup></del>	<del>MIXED<sup>b</sup></del>	<del>NOT MIXED<sup>b</sup></del>
<del>Balanced<sup>c</sup></del>	<del>0.75</del>	<del>1.0</del>	<del>1.0</del>	<del>1.25</del>
<del>Not Balanced<sup>c</sup></del>	<del>1.0</del>	<del>1.25</del>	<del>1.25</del>	<del>1.5</del>

~~a. "Distributed" shall apply where outdoor ventilation air is supplied directly to each bedroom and the largest common area; otherwise "not distributed" shall apply.~~

~~b. "Mixed" shall apply where not less than 70% of the whole building air volume is recirculated each hour by one or more mechanical systems, otherwise "not mixed" shall apply. Where a central heating or cooling air handler fan is used to provide the mixing, the design heating or cooling airflow rate shall be used to determine the operation time setting required.~~

~~c. "Balanced" shall apply where two or more fans simultaneously supply outdoor air and exhaust air at approximately the same rate; otherwise "not balanced" shall apply. Where outdoor air is supplied by a central forced air system, "balanced" shall apply only where the fan for such system operates simultaneously with the exhaust fan(s).~~

**Commenter's Reason:** If approved as submitted, RM-24 will have the effect of radically affecting the ventilation rates and systems specified for whole-house mechanical ventilation and introducing requirements that go beyond ANSI/ASHRAE 62.2, *Ventilation and Acceptable Indoor Air Quality in Residential Buildings*. The most contentious components of this proposal are in Section M1507.3.4. Approval of this comment would remove the contentious sections of RM-24, which were recently disapproved by the ANSI/ASHRAE 62.2 committee. This comment would retain the elements of the original proposal that serve as beneficial clean-up of the language in M1507, would clarify that local exhaust systems are not required to be a of component whole-house mechanical ventilation systems, and would also reword some confusing language that the proposal introduced regarding calculation of continuous and intermittent ventilation rates.

Earlier this year, ASHRAE 62.2 deliberated multiple proposals to differentiate between the ventilation rates of distributed and nondistributed, balanced and non-balanced, and mixed versus non-mixed ventilation systems. In June, the committee voted unanimously to approve a proposal that would differentiate between balanced and non-balanced ventilation, as there is wide consensus that this makes a difference in overall ventilation effectiveness. However, the committee rejected a proposal to differentiate between distributed and nondistributed as well as mixed

versus non-mixed - largely because the research has come to very different conclusions on these topics.

RM-24 should not be approved without modification for the following reasons:

1. Approval of the original proposal would reclassify local exhaust systems as part of the whole-house mechanical ventilation system. This is not how these systems are classified by industry or within ANSI/ASHRAE 62.2 and could cause great confusion for specifiers, installers, and inspectors related to requirements.
2. ANSI/ASHRAE 62.2 deliberated and ultimately disapproved a similar proposal earlier this summer. Approval of RM-24 as submitted would result in a significant departure from the consensus standard.
3. RM-24 requires the most common ventilation systems, which are non-distributed and non-balanced, to increase their ventilation rate by 50%. This will result in a cost and energy penalty, potentially requiring higher cfm fans and increasing the energy use required to condition the ventilation air. It can also increase the risk of depressurization in dwelling units that continue to be built tighter. And, increasing ventilation rates can be expected to increase the humidity load in most dwelling units during shoulder season and summer months, which could impact occupant comfort, building durability, and indoor air quality.
4. This proposal's rationale notes that increasing ventilation rates can greatly increase humidity loads with negative consequences such as mold; however, it goes on to increase ventilation rates by as much as 50% for the most common systems.
5. This proposal heavily favors central fan integrated systems versus exhaust systems. Besides the fact that CFI systems typically use much more energy than exhaust-only systems, CFI systems can actually introduce more pollutants into a space during their operation than alternative systems, depending on duct leakage levels, duct location (i.e., attics, crawlspaces, garages), and infiltration pathways.
6. Research is split on whether or not it makes sense to mix the air within a house. The answer is, "it depends". Factors like the location of pollutants, the location of occupants, and the type of ventilation system all play a significant role in whether distribution is helpful or harmful. For example, studies have shown that kitchens can contain the most concentrated source of harmful pollutants within a house. The best response is NOT to mix air from kitchens, but to instead exhaust from the kitchen and avoid mixing.
7. Distribution of ventilation air is not always the most beneficial configuration. Benefits of distribution depend on occupancy patterns. For example, a professional couple that works during the day and is home for 10 hours, 8 of which are spent in the master bedroom, may want their ventilation air concentrated in the bedroom to get the maximum benefit out of their system.

## M1507.3.2

### **Proposed Change as Submitted**

**Proponent :** Mike Moore, Newport Ventures, representing Broan-NuTone, representing Newport (mmoore@newportventures.net)

## **2015 International Residential Code**

**Revise as follows:**

**M1507.3.2 System controls.** The whole-house mechanical ventilation system shall be provided with controls that enable manual override. Such controls shall be provided with text or a symbol that indicates the control's function.

**Reason:**

Tight homes are being outfitted with code-mandated whole-house mechanical ventilation systems. These systems are often simply a bathroom exhaust fan expected to run continuously. The problem is that without a label indicating the system's function, homeowners have no idea of the purpose of these systems and are likely to turn them off - thereby increasing the rate of accumulation of harmful indoor pollutants without their knowledge. At a minimum, these systems should be labeled to indicate that they are different than a typical bath fan.

**Cost Impact:** Will increase the cost of construction

This proposal is expected to have minimal cost impacts, as it simply involves labeling equipment for its intended purpose. This label could either be supplied from manufacturers (incremental cost would probably be <\$0.10) or field-applied.

RM25-15 : M1507.3.2-  
MOORE4894

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The proposal won't stop homeowners from shutting off the systems. It is not clear what is required to indicate control function.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent :** Mike Moore, Newport Ventures, representing Broan-NuTone (mmoore@newportventures.net) requests Approve as Modified by this Public Comment.

**Modify as Follows:**

## **2015 International Residential Code**

**M1507.3.2 System controls.** The whole-house mechanical ventilation system shall be provided with controls that enable manual override. Such controls shall be ~~provided~~ labeled with text or a symbol that indicates the ~~control system's~~ function.

**Commenter's Reason:** Without requiring a label of some sort for the whole house mechanical system, there may be no way for a code official, contractor, or homeowner to know what system in the dwelling unit is supposed to serve this function, especially in the case of an exhaust-only system that otherwise might be mistaken for a typical bath fan. Requiring a label is crucial to facilitate a code official's inspection and approval of the system. Additionally, the homeowner needs this information at a minimum to ensure that they do not unintentionally disable their whole-house ventilation system.

A similar proposal was overwhelmingly approved by the IMC committee in Memphis.

**RM25-15**

# RM26-15

## M1507.3.3, Chapter 44

### *Proposed Change as Submitted*

**Proponent :** Robby Schwarz, EnergyLogic, Inc., representing EnergyLogic, Inc. (robby@nrglogic.com)

## 2015 International Residential Code

### Revise as follows:

**M1507.3.3 Mechanical ventilation rate.** The whole-house mechanical ventilation system shall provide outdoor air at a continuous rate of ~~not less than that~~ as determined in accordance with Table M1507.3.3(1) or in accordance with Equation 15-1.

### Equation 15-1

Ventilation rate = (0.01 CFM x total square foot area of house) + [(number of bedrooms + 1) x 7.5 CFM]

**Exception:** The whole-house mechanical ventilation system is permitted to operate intermittently where the system has controls that enable operation for not less than 25-percent of each 4-hour segment and the ventilation rate prescribed in Table M1507.3.3(1) is multiplied by the factor determined in accordance with Table M1507.3.3(2).

### Add new standard(s) as follows:

ASHRAE 62.2 - 2010 Ventilation and Acceptable Indoor Air Quality in Low-Rise Residential Buildings

**Reason:** Many Builders and Designers would like to be more precise in the specification of the air that is utilized to ventilate a home. The table is good to ensure that ventilation is occurring in a home and for a quick guide for the quantity of air that is needed for whole house mechanical ventilation, but the formula is more precise especially for homes that are on the small side in the floor area chart.

**M1507.3.3 Mechanical ventilation rate.** The whole-house mechanical ventilation system shall provide outdoor air at a continuous rate of not less than that determined in accordance with Table M1507.3.3(1).

**Exception:** The whole-house mechanical ventilation system is permitted to operate intermittently where the system has controls that enable operation for not less than 25-percent of each 4-hour segment and the ventilation rate prescribed in Table M1507.3.3(1) is multiplied by the factor determined in accordance with Table M1507.3.3(2).

**TABLE M1507.3.3(1)  
CONTINUOUS WHOLE-HOUSE MECHANICAL VENTILATION SYSTEM AIRFLOW RATE REQUIREMENTS**

DWELLING UNIT FLOOR AREA (square feet)	NUMBER OF BEDROOMS				
	0 - 1	2 - 3	4 - 5	6 - 7	> 7
	Airflow in CFM				
< 1,500	30	45	60	75	90
1,501 - 3,000	45	60	75	90	105
3,001 - 4,500	60	75	90	105	120
4,501 - 6,000	75	90	105	120	135
6,001 - 7,500	90	105	120	135	150
> 7,500	105	120	135	150	165

For SI: 1 square foot = 0.0929 m<sup>2</sup>, 1 cubic foot per minute = 0.0004719 m<sup>3</sup>/s.

**TABLE M1507.3.3(2)  
INTERMITTENT WHOLE-HOUSE MECHANICAL VENTILATION RATE FACTORS<sup>a, b</sup>**

RUN-TIME PERCENTAGE IN EACH 4-HOUR SEGMENT	25%	33%	50%	66%	75%	100%
Factor <sup>a</sup>	4	3	2	1.5	1.3	1.0

a. For ventilation system run time values between those given, the factors are permitted to be determined by interpolation.

b. Extrapolation beyond the table is prohibited.

**M1507.3.3 Mechanical ventilation rate.** The whole house mechanical ventilation system shall provide outdoor air at a continuous ~~rate of not less than that as~~ determined in accordance with Table M1507.3.3(1) or the ASHRAE 62.2 formula (0.01 CFM x total sqft of house) + ((number of bedrooms +1) x 7.5CFM) .

Rational Statement:

Many Builders and Designers would like to be more precise in the specification of the air that is utilized to ventilate a home. The table is good to ensure that ventilation is occurring in a home and for a quick guide for the quantity of air that is needed for whole house mechanical ventilation, but the formula is more precise especially for homes that are on the small side in the floor area chart.

# TABLE M1507.3.3(1)

## CONTINUOUS WHOLE-HOUSE MECHANICAL VENTILATION SYSTEM AIRFLOW RATE REQUIREMENTS

DWELLING UNIT FLOOR AREA (square feet)	NUMBER OF BEDROOMS				
	0 - 1	2 - 3	4 - 5	6 - 7	> 7
< 1,500	30	45	60	75	90
1,501 - 3,000	45	60	75	90	105
3,001 - 4,500	60	75	90	105	120
4,501 - 6,000	75	90	105	120	135
6,001 - 7,500	90	105	120	135	150
> 7,500	105	120	135	150	165

- Ventilation can't be greater than what is calculated by formula

$$\text{Fan flow (CFM)} = 0.01 \text{ CFM} \times \text{your floor area} + 7.5 \times (\text{your number of bedrooms} + 1)$$

- For a 1,510 square foot 4-bedroom home,
  - (0.01 X 1510) + (7.5 times 5)
  - (15.1) + (37.5)
  - Formula Result: 52.6 CFM
  - Chart Result: 75 CFM

**Cost Impact:** Will not increase the cost of construction  
 No cost increase. Possible cost reductions by using more accurate ventilation requirements

**Analysis:** A review of the standard proposed for inclusion in the code, ASHRAE 62.2, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

RM26-15 : M1507.3.3-SCHWARZ4944

### Public Hearing Results

**Committee Action:** **Approved as Submitted**

**Committee Reason:** Approval was based on the proponent's published reason statements.

**Assembly Action :** **None**

### Individual Consideration Agenda

#### *Public Comment 1:*

**Proponent : Alisa McMahon, self, representing self (mcmahon.gbac@cox.net) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

**2015 International Residential Code**

**M1507.3.3 Mechanical ventilation rate.** The whole-house mechanical ventilation system shall provide outdoor air at a continuous rate as determined in accordance with Table M1507.3.3(1) or in accordance with Equation 15-1.

**Equation 15-1**

Ventilation rate = (0.01 CFM x total square foot area of house) + [(number of bedrooms + 1) x 7.5 CFM]

**Exception:** The whole-house mechanical ventilation system is permitted to operate intermittently where the system has controls that ~~enable operation~~ operate the system for not less than 25-percent of each 4-hour segment and the ventilation rate prescribed in Table M1507.3.3(1) is multiplied by the factor determined in accordance with Table M1507.3.3(2).

**TABLE M1507.3.3  
CONTINUOUS WHOLE-HOUSE MECHANICAL VENTILATION SYSTEM  
AIRFLOW RATE REQUIREMENTS**

DWELLING UNIT FLOOR AREA (square feet)	NUMBER OF BEDROOMS				
	<del>0-1</del>	<del>2-3</del>	<del>4-5</del>	<del>6-7</del>	<del>≥7</del>
	Airflow in CFM				
-	30	45	60	75	90
<del>1,501-3,000</del>	45	60	75	90	105
<del>3,001-4,500</del>	60	75	90	105	120
<del>4,501-6,000</del>	75	90	105	120	135
<del>6,001-7,500</del>	90	105	120	135	150
<del>≥7,500</del>	105	120	135	150	165

For SI: 1 square foot = 0.0929 m<sup>2</sup>, 1 cubic foot per minute = 0.0004719 m<sup>3</sup>/s.

**TABLE M1507.3.3(1)  
CONTINUOUS WHOLE-HOUSE MECHANICAL VENTILATION SYSTEM  
AIRFLOW RATE REQUIREMENTS**

--	--

<b><u>DWELLING UNIT FLOOR AREA (square feet)</u></b>	<b><u>NUMBER OF BEDROOMS</u></b>				
	<b><u>1</u></b>	<b><u>2</u></b>	<b><u>3</u></b>	<b><u>4</u></b>	<b><u>5</u></b>
	<b><u>Airflow in CFM</u></b>				
<u>&lt;500</u>	<u>20</u>	<u>28</u>	<u>35</u>	<u>43</u>	<u>50</u>
<u>501-1,000</u>	<u>25</u>	<u>33</u>	<u>40</u>	<u>48</u>	<u>55</u>
<u>1,001-1,500</u>	<u>30</u>	<u>38</u>	<u>45</u>	<u>53</u>	<u>60</u>
<u>1,501-2,000</u>	<u>35</u>	<u>43</u>	<u>50</u>	<u>58</u>	<u>65</u>
<u>2,001-2,500</u>	<u>40</u>	<u>48</u>	<u>55</u>	<u>63</u>	<u>70</u>
<u>2,501-3,000</u>	<u>45</u>	<u>53</u>	<u>60</u>	<u>68</u>	<u>75</u>

<u>4,001-4,500</u>	<u>60</u>	<u>68</u>	<u>75</u>	<u>83</u>	<u>90</u>
<u>4,501-5,000</u>	<u>65</u>	<u>73</u>	<u>80</u>	<u>88</u>	<u>95</u>

For SI: 1 square foot = 0.0929 m<sup>2</sup>, 1 cubic foot per minute = 0.0004719 m<sup>3</sup>/s.

**Commenter's Reason:** Problems with original TABLE M1507.3.3(1): Increments are too large (1500 square feet & 2 bedrooms).

Airflows are calculated using the maximum floor area and largest number of bedrooms in each range.

Both conditions result in higher ventilation air requirements than those calculated with Equation 15-1.

Proposed TABLE M1507.3.3(1):

Increments are reduced to 500 square feet and 1 bedroom.

This modification yields results more similar to Equation 15-1 and overall lower

ventilation air requirements.

Equation 15-1 can be used for buildings over 5,000 square feet and/or with more than 5 bedrooms.

In addition, the commenter's language clarifies the intent of the original code with respect to intermittent operation. The system must operate one hour out of four as opposed to being enabled to operate.

Examples:

Please see dashed line boxes in the tables below. In the original Table M1507.3.3(1), the ventilation air requirement is 90 CFM for buildings from 3,001 to 4,500 square feet with four to five bedrooms. In the proposed Table M1507.3.3(1), the ventilation air requirement for the same buildings ranges from 73 CFM to 90 CFM.

In a 3001 sq ft / 4 bedroom home, the required ventilation air requirement (CFM) is:

original Table M1507.3.3(1)	90
proposed Table M1507.3.3(1)	73
Equation 15-1	68

In a 3500 sq ft / 4 bedroom home, the required ventilation air requirement (CFM) is:

original Table M1507.3.3(1)	90
proposed Table M1507.3.3(1)	73
Equation 15-1	73

Example: 3001 sq ft - 4 bedroom

TABLE M1507.3.3(1)						
ORIGINAL						
floor area	bedrooms					
sq ft	0-1	2-3	4-5	6-7	>7	
<1500	30	45	60	75	90	
1501-3000	45	60	75	90	105	
3001-4500	60	75	90	105	120	
4501-6000	75	90	105	120	135	
6001-7500	90	105	120	135	150	
>7500	105	120	135	150	165	

TABLE M1507.3.3(1)					
PROPOSED					
floor area	bedrooms				
sq ft	1	2	3	4	5
<500	20	28	35	43	50
501-1000	25	33	40	48	55
1001-1500	30	38	45	53	60
1501-2000	35	43	50	58	65
2001-2500	40	48	55	63	70
2501-3000	45	53	60	68	75
3001-3500	50	58	65	73	80
3501-4000	55	63	70	78	85
4001-4500	60	68	75	83	90
4501-5000	65	73	80	88	95

Equation 15-1
Ventilation rate = (0.01 CFM x total square foot area of house) + [(number of bedrooms + 1) x 7.5 CFM]

$$\text{Ventilation rate} = 0.01 \times 3001 + 7.5 \times (4 + 1) = 68 \text{ CFM}$$

In a 4500 sq ft / 5 bedroom home, the required CFM is:

- original Table M1507.3.3(1)      90
- proposed Table M1507.3.3(1)    90
- Equation 15-1                      90

Example: 3500 sq ft - 4 bedroom

TABLE M1507.3.3(1)						
ORIGINAL						
floor area	bedrooms					
sq ft	0-1	2-3	4-5	6-7	>7	
<1500	30	45	60	75	90	
1501-3000	45	60	75	90	105	
3001-4500	60	75	90	105	120	
4501-6000	75	90	105	120	135	
6001-7500	90	105	120	135	150	
>7500	105	120	135	150	165	

TABLE M1507.3.3(1)					
PROPOSED					
floor area	bedrooms				
sq ft	1	2	3	4	5
<500	20	28	35	43	50
501-1000	25	33	40	48	55
1001-1500	30	38	45	53	60
1501-2000	35	43	50	58	65
2001-2500	40	48	55	63	70
2501-3000	45	53	60	68	75
3001-3500	50	58	65	73	80
3501-4000	55	63	70	78	85
4001-4500	60	68	75	83	90
4501-5000	65	73	80	88	95

Equation 15-1
Ventilation rate = (0.01 CFM x total square foot area of house) + [(number of bedrooms + 1) x 7.5 CFM]

$$\text{Ventilation rate} = 0.01 \times 3500 + 7.5 \times (4 + 1) = 73 \text{ CFM}$$

**Bibliography:** The airflow requirements in proposed TABLE M1507.3.3(1) are calculated in accordance with ASHRAE 62.2-2010. However, the increments (500 square feet and 1 bedroom) follow ASHRAE 62.2-2013 (TABLE 4.1a). As in ASHRAE 62.2-2013 (TABLE 4.1a), proposed TABLE M1507.3.3(1) tops out at 5,000 square feet and 5 bedrooms.

ASHRAE 62.2-2010 Ventilation and Acceptable Indoor Air Quality in Low-Rise Residential Buildings

ASHRAE 62.2-2013 Ventilation and Acceptable Indoor Air Quality in Low-Rise Residential Buildings

# RM27-15

## M1507.4 (New)

### **Proposed Change as Submitted**

**Proponent :** Craig Conner, representing self  
(craig.conner@mac.com)

## 2015 International Residential Code

### Add new text as follows:

**M1507.4 Venting and depressurization.** Each fuel-fired furnace, boiler and water heater shall comply one or more of the following:

1. It shall be a direct-vent, fan-assisted or power-vented type.
2. Where of the natural draft type, it shall be located in a dwelling unit that has only supply or balanced ventilation systems.
3. It shall be located outside of the dwelling unit's air barrier.
4. It shall be located in a mechanical room and provided with combustion air that is supplied entirely from ducts to the outdoors or from direct openings to the outdoors.

### **Exceptions:**

1. This section shall not apply to dwelling units having a tested air tightness of greater than 3 ACH50.
2. This section shall not apply to dwelling units having depressurization test results that are within the limits specified by an approved depressurization standard.

**Reason:** This proposal provides clear and practical requirements which limit the types of whole house mechanical ventilation systems which can be installed with naturally vented appliances in order to minimize the potential for back drafting. This proposal addresses the most likely scenarios where back drafting could occur and allows the whole house mechanical ventilation to assist in preventing back drafting rather than becoming a contributing factor. The requirements are consistent with Table RA301.1(1) in informative Appendix RA in the 2015 IECC where recommended depressurization limits in houses are defined. All configurations in the table with depressurization limits less than -5 Pa will no longer be able to use exhaust only whole house ventilation.

**Bibliography:** (1) Russell, Marion, Max Sherman and Armin Rudd (2005). "Review of Residential Ventilation Technologies." LBNL Report 57730, Ernest Orlando Lawrence Berkeley National Laboratory, Berkeley, California.  
<http://www.buildingscience.com/documents/guides-and-manuals/gm-review-residential-ventilation-technologies>

**Cost Impact:** Will increase the cost of construction  
This code change proposal will increase the cost of construction for certain construction configurations. In a house with a naturally vented combustion appliances where exhaust-only ventilation was the preferred method of whole house ventilation, there will be an increase in cost to change to a supply type system. According to a 2005 study(1) the additional cost to go from a single-point exhaust system to a central-fan integrated supply system (without exhaust) will be roughly

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The intent of the proposal is unclear. Would the proposal allow natural draft appliances?

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Craig Conner, representing self (craig.conner@mac.com); Shaunna Mozingo, representing self (smozingo@coloradocode.net) requests Approve as Modified by this Public Comment.**

**Replace Proposal as Follows:**

### **2015 International Residential Code**

**M1507.4 Venting and depressurization** Dwelling units that contain fuel-fired furnaces, fuel-fired boilers, or fuel-fired water heaters shall meet one or more of the following:

1. The dwelling unit shall not have a whole house mechanical ventilation system that is of an exhaust-only type.
2. The tested airtightness of the dwelling unit shall be greater than three ACH50.
3. Natural draft appliances serving the dwelling unit shall be located outside of the conditioned space.

**Commenter's Reason:** Backdrafting generally requires three things: exhaust ventilation, a tight house, and naturally drafted combustion devices. If one of these is absent, backdrafting is less likely to occur. This proposed change requires that one of the three be absent. It gives the code user the option of deciding which of the three requirements to apply in order to make backdrafting much less likely. The committee commented that the original code language was too complex. The new version is simpler and clearer.

The committee also questioned if naturally drafted appliances were allowed. As reworded it is clear that naturally drafted appliances would be allowed if one of the other options for suppressing backdrafting was used.

# RM28-15

## M1507.4

### **Proposed Change as Submitted**

**Proponent :** Anthony Floyd, City of Scottsdale, representing City of Scottsdale (afloyd@scottsdaleaz.gov)

## **2015 International Residential Code**

### **Revise as follows:**

**M1507.4 Local exhaust rates system.** Local exhaust systems shall be designed to have the capacity to exhaust the minimum air flow rate determined in accordance with Table M1507.4. Except where functioning as a component of a whole house ventilation system, exhaust fans shall be controlled by a humidity control. Humidity controls shall be capable of adjustment between a relative humidity range of 50 to 80 percent. A humidity control shall utilize manual or automatic means of adjustment and shall be a separate component or an integral component of the exhaust fan.

**Reason:** Bathroom exhaust fans are often underutilized by occupants. Properly operated exhaust fans removes moisture and odors thereby improving the functionality of the space and contributing to a healthy and sanitary environment. Unless functioning as a component of a whole house ventilation system, effective moisture and odor removal is achieved by humidity sensor controls. Humidity controls ensure the exhaust system operates when the bathroom is in use and for a period of time after the occupant has left the room. During a bath or shower, the humidity level in a bathroom can be a perfect breeding ground for mold, mildew and microorganisms that can impact your health. Excess moisture has tremendous potential for damaging a home. It cracks and peels paint, ruins gypsum wallboard, causes exterior paint failure, warps doors and rusts cabinets and fixtures. Without control, it can even cause deterioration of joists and framing. As it condenses on windows, walls, ceilings and cabinets, it attracts dirt. It encourages mildew on tile grout and generally provides an environment for increased bacterial growth.

Depending on the size of the bathroom, an intermittent exhaust fan needs to run at least 20 minutes after each shower to ensure that moisture levels are reduced. Both intermittent and continuous bathroom exhaust systems reduce the risk of mold growth which is a significant health concern in homes. Moisture sensor controlled exhaust fans are far more effective than a timed or manually operated fan or an operable window that is usually left closed during the winter and summer months of the year.

**Bibliography:** Home Ventilating Institute

- <http://www.hvi.org/publications/HowMuchVent.cfm>

GreenCodePro/CALGreen - <http://greencodepro.com/code-summaries/california-green-building-standards-code/4-506-1-bathroom-exhaust-fans>

LEED for Homes Reference Guide, 2008. p. 301-302.

**Cost Impact:** Will increase the cost of construction

Exhaust fan costs range from \$106 for an 80 cfm with humidity sensor control to \$251 for an 80 cfm with humidity sensor control, motion sensor, and quiet sound rating. The minimum cost for a roof vent kit with flex duct is \$23. Moisture controlled bathroom exhaust fans minimizes the potential for building damage, saving the cost

---

## **Public Hearing Results**

**Committee Action:**

**Approved as Modified**

**Modification:**

**M1507.4 Local exhaust system.** Local exhaust systems shall be designed to have the capacity to exhaust the minimum air flow rate determined in accordance with Table M1507.4. Except where functioning as a component of a whole house ventilation system, exhaust fans in bathrooms with a shower or bathtub shall be controlled by ~~provided with a delay timer or humidity sensor control. Humidity controls shall be capable of adjustment between a relative humidity range of 50 to 80 percent. A humidity control shall utilize manual or automatic means of adjustment and shall be a separate component or an integral component of the exhaust fan.~~

**Committee Reason:** Approval was based on the proponent's published reason statements. The modification adds a timer option to the humidity controller.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Anthony Floyd, City of Scottsdale, representing City of Scottsdale (afloyd@scottsdaleaz.gov) requests Approve as Modified by Committee.**

**Commenter's Reason:** When provided, bathroom exhaust systems reduce the risk of mold growth which is a significant health concern in homes. They are far more effective at removing moisture and odor than an operable window which is usually left closed during the winter and summer months. During a bath or shower, the humidity level in a bathroom can be a perfect breeding ground for mold, mildew and microorganisms that can impact health. Excess moisture also has tremendous potential for damaging a home. Besides peeling paint, damaging gypsum wallboard, and deteriorating framing, it encourages mildew on tile grout and provides an environment for increased bacterial growth.

Unless operating as a component of a whole house ventilation system, an exhaust fan with a delay timer or humidity sensor is an effective means to remove excessive moisture or odor. Besides saving energy with an automatic shut-off, the exhaust fan continues to run after the occupant leaves the room until the moisture is significantly reduced. Depending on the size of the bathroom, an intermittent exhaust fan needs to run at least 20 minutes after each shower to ensure that moisture levels are reduced. Both intermittent and continuous bathroom exhaust systems reduce the risk of mildew and mold growth which is a sanitary and durability concern in all homes, regardless of climate zone.

A basic delay timer switch costs \$15, while a basic humidity sensor switch costs \$46. Timer and moisture controlled exhaust fans significantly reduce the possibility of making costly moisture damage repairs to correct problems that is easy to avoid.

**Bibliography:** Home Ventilating Institute -  
<http://www.hvi.org/publications/HowMuchVent.cfm>

### *Public Comment 2:*

**Proponent : Alisa McMahon, representing self (mcmahon.gbac@cox.net) requests Approve as Modified by Committee.**

**Commenter's Reason:** see proponent's published reason statement

### *Public Comment 3:*

**Proponent : Donald Surrena, representing NAHB (dsurrena@nahb.org) requests Approve as Modified by this Public Comment.**

**Further Modify as Follows:**

## **2015 International Residential Code**

**M1507.4 Local exhaust system.** Local exhaust systems shall be designed to have the capacity to exhaust the minimum air flow rate determined in accordance with Table M1507.4. Except where functioning as a component of a whole house ventilation system, exhaust fans in bathrooms with a shower or bathtub shall be provided with a delay timer or humidity sensor control.

**Exception:** Delay timers and humidity sensor controls are not required in Climate Zones 1B through 6B.

**Commenter's Reason:** Section 303.4 Mechanical Ventilation requires whole-house mechanical ventilation in accordance with Section M1507.3 if a *dwelling unit* is 5 air changes per hour or less. The energy code does not permit air changes higher than 5, consequently all dwelling units will have whole-house ventilation systems. In dry climate zones the moisture from a bathroom will be distributed throughout the whole house. Dryer climates do not have the same problems that may arise in humid climates. A mandate to install added equipment in all circumstances is not necessary.

**Cost Impact:** This will reduce the cost of construction.

---

RM28-15

# RM29-15

## M1601.1.1

### **Proposed Change as Submitted**

**Proponent :** Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com)

## **2015 International Residential Code**

### **Revise as follows:**

**M1601.1.1 Above-ground duct systems.** Above-ground *duct systems* shall conform to the following:

1. *Equipment* connected to *duct systems* shall be designed to limit discharge air temperature to not greater than 250°F (121°C).
2. ~~Factory made~~ Listed factory-made ducts shall ~~be listed and labeled in accordance~~ comply with UL 181 ~~and installed in accordance with the manufacturer's instructions.~~
3. Fibrous glass duct construction shall conform to the SMACNA *Fibrous Glass Duct Construction Standards* or NAIMA *Fibrous Glass Duct Construction Standards*.
4. Field-fabricated and shop-fabricated metal and flexible duct constructions shall conform to the SMACNA *HVAC Duct Construction Standards—Metal and Flexible* except as allowed by Table M1601.1.1. Galvanized steel shall conform to ASTM A 653.
5. The use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.
6. *Duct systems* shall be constructed of materials having a flame spread index of not greater than 200.
7. Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:
  - 7.1. These cavities or spaces shall not be used as a plenum for supply air.
8. These cavities or spaces shall not be part of a required fire-resistance-rated assembly.
9. Stud wall cavities shall not convey air from more than one floor level.
10. Stud wall cavities and joist-space plenums shall be isolated from adjacent concealed spaces by tight-fitting fireblocking in accordance with Section R602.8.
11. Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.

**Reason:** As currently written, Item 2 mandated UL 181. However, many sheet metal manufacturers make duct in their shop. A contractors shop would in essence qualify as a factory. However, contractors do not have listing and labeling of their duct. This section is also in conflict with other items, specifically Item 3, 4, and 6. This section should simply allow the use of UL 181 duct as opposed to appearing to require compliance.

**Cost Impact:** Will not increase the cost of construction

This will lower the cost of construction by allowing any viable duct to be used in a dwelling unit.

RM29-15 : M1601.1.1-  
BALLANCO3972

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The current code text is preferred because it refers to the manufacturer's instructions.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing General Plastics (JBENGINEER@aol.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Residential Code**

**M1601.1.1 Above-ground duct systems.** Above-ground *duct systems* shall conform to the following:

1. *Equipment* connected to *duct systems* shall be designed to limit discharge air temperature to not greater than 250°F (121°C).
2. ~~Listed factory-made~~ Factory-made ducts shall be installed in accordance with the manufacturer's instructions. ~~Factory-made ducts that are listed~~ shall comply with UL 181.
3. Fibrous glass duct construction shall conform to the SMACNA *Fibrous Glass Duct Construction Standards* or NAIMA *Fibrous Glass Duct Construction Standards*.
4. Field-fabricated and shop-fabricated metal and flexible duct constructions shall conform to the SMACNA *HVAC Duct Construction Standards—Metal and Flexible* except as allowed by Table M1601.1.1. Galvanized steel shall conform to ASTM A 653.
5. The use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.
6. *Duct systems* shall be constructed of materials having a flame spread index of not greater than 200.
7. Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:
  - 7.1. These cavities or spaces shall not be used as a plenum for supply air.
8. These cavities or spaces shall not be part of a required fire-resistance-rated assembly.
9. Stud wall cavities shall not convey air from more than one floor

- level.
10. Stud wall cavities and joist-space plenums shall be isolated from adjacent concealed spaces by tight-fitting fireblocking in accordance with Section R602.8.
  11. Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.

**Commenter's Reason:** The Committee was correct to state that installed in accordance with the manufacturer's installation instructions should remain in the section. This modification corrects that oversight. The other correction is to identify the ducts as those listed as complying with UL 181. Plastic factory made ducts do not comply with UL 181 since these ducts are not within the scope of UL 181.

---

RM29-15

# RM30-15

## M1601.1.1

### **Proposed Change as Submitted**

**Proponent :** Julius Ballanco, JB Engineering and Code Consulting, P.C. (JBENGINEER@aol.com)

## **2015 International Residential Code**

**Revise as follows:**

**M1601.1.1 Above-ground duct systems.** Above-ground *duct systems* shall conform to the following:

1. *Equipment* connected to *duct systems* shall be designed to limit discharge air temperature to not greater than 250°F (121°C).
2. Factory-made ducts shall be listed and labeled in accordance with UL 181 and installed in accordance with the manufacturer's instructions.
3. Fibrous glass duct construction shall conform to the SMACNA *Fibrous Glass Duct Construction Standards* or NAIMA *Fibrous Glass Duct Construction Standards*.
4. Field-fabricated and shop-fabricated metal and flexible duct constructions shall conform to the SMACNA *HVAC Duct Construction Standards—Metal and Flexible* except as allowed by Table M1601.1.1. Galvanized steel shall conform to ASTM A 653.
5. The use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.
6. *Duct systems* shall be constructed of materials having a flame spread index of not greater than 200.
7. Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:
  - 7.1. These cavities or spaces shall not be used as a plenum for supply air.
  - 7.2. These cavities or spaces shall not be part of a required fire-resistance-rated assembly.
  - 7.3. Stud wall cavities shall not convey air from more than one floor level.
  - 7.4. Stud wall cavities and joist-space plenums shall be isolated from adjacent concealed spaces by tight-fitting fireblocking in accordance with Section R602.8.
  - 7.5. Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.
8. PVC plastic duct and fitting material shall conform to cell classification 12454-B of ASTM D1248 or ASTM D1784 and the external loading properties of ASTM D2412. The duct temperature for plastic ducts shall not exceed 150° F (66° C).

**Reason:** The PMGCAC raised a concern last cycle regarding the requirements for plastic duct above ground. The plastic duct being used above ground is the same

duct that is used for underground installations. This change will add the plastic duct requirements to the list of above ground duct systems using the language in Section M1601.1.2 to regulate the material requirement.

Item 6 in this section was originally added to the code during the initial hearings for the IRC when I proposed the inclusion of plastic ducts above ground. The Committee, at that time, thought the text would be more clear by referencing a flame spread of 200 rather than the language proposed for plastic duct. As such, plastic ducts have always been permitted by the IRC for above ground installations. This will simply add more specific requirements for the duct material.

**Cost Impact:** Will not increase the cost of construction

This change clarifies the requirement for PVC plastic duct and fittings. These are optional materials that may be used for duct construction.

RM30-15 : M1601.1.1-  
BALLANCO5109

---

## **Public Hearing Results**

**Committee Action:** **Approved as Submitted**

**Committee Reason:** Approval was based on the proponent's published reason statements.

**Assembly Action :** **None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Michael Blaszkiewicz, SABIC, representing SABIC (michael.blaszkiewicz@sabic-ip.com) requests Disapprove.**

**Commenter's Reason:** Proposal RM30-15 should be disapproved for the following reasons:

1. PVC plastic ducts are "factory-made" using the extrusion process and are not manufactured in the field; therefore, condition #2 (UL 181), already in the code, is applicable.
2. This code change contradicts the ICC Committee formal interpretation (2005) of requirements for above-ground plastic ducts: If the plastic duct meets condition #2 (Class 0 or Class 1) it is allowed; and they note that condition #6 (flame spread index not greater than 200) applies to other components of the duct system, but not to the duct itself.
3. This code change introduces ambiguity into the code. Using requirements for underground PVC plastic ducts and applying them to above-ground ducts will cause confusion. The underground duct flammability requirements are appropriately less stringent than those for above-ground and do not require the duct to meet Class 0 or Class 1. Instead, ASTM D1248 for underground PVC plastic ducts calls for ASTM D635, a small-scale horizontal burn test that is used to screen small parts used in appliances. ASTM D635 in no way compares to the applicable above ground duct large-scale flammability test requirements of condition #2, or even to the duct component requirements of condition #6.
4. Contrary to the proponent's claim that condition #6 originated "to allow plastic ducts above-ground," this less stringent flame spread was originally to address return ducts: "Return ducts, except those portions directly above the heating surface or closer than 2 feet (610 mm) to the heating unit casing,

shall be constructed of materials having a flame-spread rating not greater than 200." (1998 International One- and Two-Family Dwelling Code).

5. This code change specifies PVC as the only plastic material allowed for use in above-ground ducts while meeting less stringent requirements. No evidence was provided for this material-specific exception for PVC plastic in above-ground ducts. Any plastic that meets the appropriate code requirements should be allowed.

## *Public Comment 2:*

**Proponent : Jonathan Roberts, representing Underwriters Laboratories (jonathan.roberts@ul.com) requests Disapprove.**

**Commenter's Reason:** The suitability of a plastic air duct should be determined based on the conditions of its use. The standards being proposed are not designed to evaluate all of the conditions that are likely to be encountered in above ground applications.

1. The scope of ASTM D 1248 it indicates "This specification provides for the identification of polyethylene plastics extrusion materials for wire and cable in such a manner that the seller and the purchaser can agree on the acceptability of different commercial lots or shipments.". In other words this is a standard that can be used to determine if shipments or lots of plastic parts meets the buyer's specifications, not whether the products are suitable for use in air duct systems. In addition we cannot determine the significance of the "cell classification 12454-B" referenced in the proposal. We could not find such a reference in the standard, and there is no requirement for a rating to be marked on the product. We have no idea how compliance with this rating will be determined at the job site.
2. Similarly the scope of ASTM D 2412 indicates "This test method covers the determination of load deflection characteristics of plastic pipe under parallel-plate loading." This standard is also not specifically designed to evaluate the conditions that air ducts will see in aboveground installations. It basically evaluates the load deflection and stiffness properties of pipe, but doesn't seem to have pass-fail acceptance criteria for the test, which is confusing. Finally neither standard appears to evaluate the pipes in elevated temperatures, so we are unsure of the technical basis for the claim that they are suitable for use in 150 degree F air ducts.

Requirements are already well established for all above ground factory-made ducts, including plastic, as specified in Item 2 of Section M1601.1.1.

The requirements of UL 181 apply to materials for the fabrication of air duct and air connector systems for use in accordance with the IRC. These systems include preformed lengths of flexible or rigid ducts, materials in the form of boards for field fabrication of lengths of rigid ducts, and preformed flexible air connectors. Tests required by UL 181 include flame penetration, mold growth and humidity, temperature, static load, impact, collapse, leakage, and surface burning characteristics.

# RM32-15

## M1601.1.1

### **Proposed Change as Submitted**

**Proponent :** Robby Schwarz, representing EnergyLogic, Inc.  
(robby@nrglogic.com)

## **2015 International Residential Code**

### **Revise as follows:**

**M1601.1.1 Above-ground duct systems.** Above-ground *duct systems* shall conform to the following:

1. *Equipment* connected to *duct systems* shall be designed to limit discharge air temperature to not greater than 250°F (121°C).
2. Factory-made ducts shall be listed and labeled in accordance with UL 181 and installed in accordance with the manufacturer's instructions.
3. Fibrous glass duct construction shall conform to the SMACNA *Fibrous Glass Duct Construction Standards* or NAIMA *Fibrous Glass Duct Construction Standards*.
4. Field-fabricated and shop-fabricated metal and flexible duct constructions shall conform to the SMACNA *HVAC Duct Construction Standards—Metal and Flexible* except as allowed by Table M1601.1.1. Galvanized steel shall conform to ASTM A 653.
- ~~5. The use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.~~
5. *Duct systems* shall be constructed of materials having a flame spread index of not greater than 200.
6. Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:
  - 6.1. These cavities or spaces shall not be used as a plenum for supply or return air.
  - 6.2. These cavities or spaces shall not be part of a required fire-resistance-rated assembly.
  - 6.3. Stud wall cavities shall not convey air from more than one floor level.
  - 6.4. Stud wall cavities and joist-space plenums shall be isolated from adjacent concealed spaces by tight-fitting fireblocking in accordance with Section R602.8.
  - 6.5. Stud wall cavities in the outside walls of building envelope assemblies and the spaces between solid floor joists in any portion of the building shall not be utilized as supply or return air plenums.

**Reason:** Rational Statement:

Air is a fluid like water is a fluid. Code will not stand for a plumbing system that leaks but allows a minimum level of duct leakage even though the air that is carried through the duct system carries heat, moisture, and pollutants that can be detrimental to the building occupant and the structure. Many have read the language in the last two cycles of the code to mean that both the supply side and the return

side of an HVAC system need to be fully ducted. However the commentary has left a window of opportunity for contractors to continue to utilize building cavities for return air plenums. To be crystal clear, this code change proposal is largely in response to that and is designed to ensure that all HVAC duct systems are fully ducted to ensure life safety, long term durability, cost effectiveness, comfort and efficiency as they are all impacted by air under pressure being forced through un-ducted building cavities. A number of papers have been written about the decrease in efficiency and comfort as well as the increase in building durability issues and cost of ownership associated with air traveling through and out of un-ducted building cavities. Much of this air also is pulled into and out of the building due to the connection of the cavity to the outside. Negative pressure are a significant issue for combustion safety is a home and are more likely to impact atmospherically vented appliances through the leakage associated with building cavities used as returns. For all of these reasons and more all air pushed or pulled by an HVAC blower motor should be contained inside a duct system.

**Cost Impact:** Will increase the cost of construction

Cost implications are small with this proposal as building cavities need to be enclosed any way so air can flow through them. However this proposal is requiring that return air be enclosed in duct work and there will be a cost associated with that. However, this requirement, as well and the enhanced duct sealing requirements of the IECC, leads builders to the utilization of centralized returns which diminishes the amount of return duct work in the house drastically, maintains comfort and performance of the HVAC system, and is very cost affective.

RM32-15 : M1601.1.1-  
SCHWARZ4948

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** Floor joist cavities should be allowed for conveying return air.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Robby Schwarz, representing EnergyLogic, Inc. (robby@nrglogic.com) requests Approve as Submitted.**

**Commenter's Reason:** The ROCAH indicates that this code change was disapproved because it was the opinion of the committee that floor joist plenums should be allowed to convey return air. Plenums/building cavities should be allowed to convey return air only if the return air is being conveyed inside of a hard duct which is located within the plenum or building cavity.

Right now there is a conflict between codes as the IECC clearly says in section R403.3.5 Building Cavities (Mandatory) "Building framing cavities shall not be used as ducts or plenums.

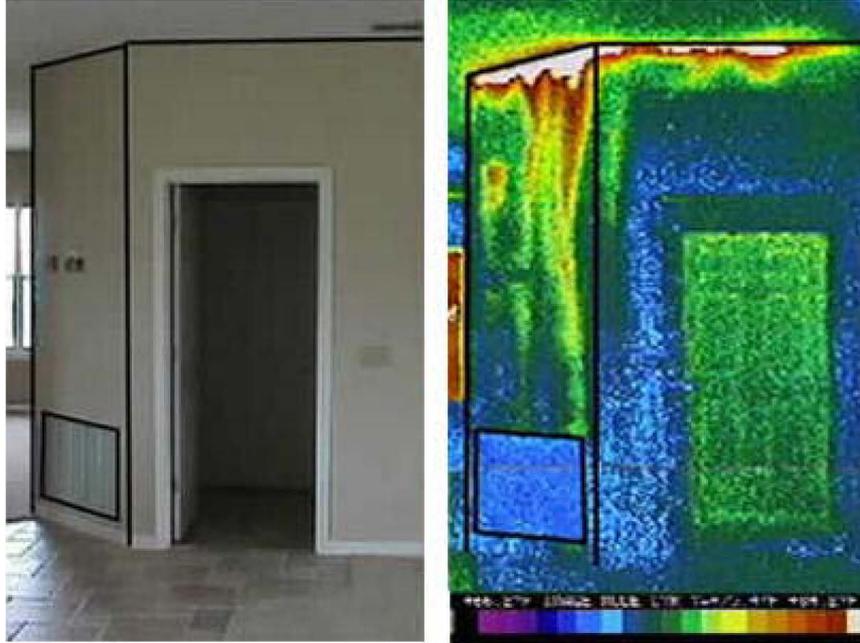

"Besides the Building Science rationale spelled out in the original reason statement demonstrating building durability, efficiency, and life safety issues associated with pressure imbalances associated with building framing plenums being used as duct work, the current code language addressed by this proposals ensures that the intent of the code will be met."...to provide a reasonable level of safety, health, property protection and public welfare..."

Combustion safety caused by uninhibited negative pressures, building durability

caused by returning warm moist air through random building cavities, indoor air quality concerns caused by pulling air from attics, crawl spaces, and other areas unknown, clearly demonstrate that both the supply side and the return side of an HVAC system should be fully ducted when placed in a plenum/building cavity, so that we can gain control and predictability of the air flowing through our buildings.

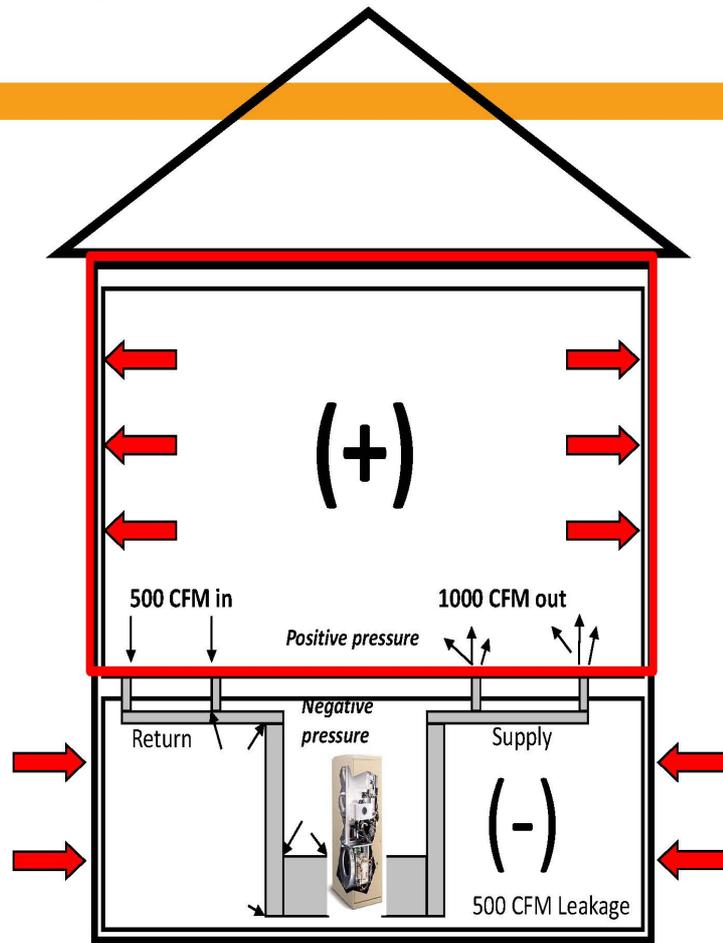

### R403.2.3 Building cavities (Mandatory)

Building framing cavities shall not be used as ducts or plenums

## System Effect

Dominant leakage on the return ducts  
Sends basement negative

## M1601.4.1

### **Proposed Change as Submitted**

**Proponent :** Donald Surrena, National Association of Home Builders, representing National Association of Home Builders (dsurrena@nahb.org)

## **2015 International Residential Code**

### **Revise as follows:**

**M1601.4.1 Joints, seams and connections.** Longitudinal and transverse joints, seams and connections in metallic and nonmetallic ducts shall be constructed as specified in SMACNA HVAC *Duct Construction Standards—Metal and Flexible* and NAIMA *Fibrous Glass Duct Construction Standards*. Joints, longitudinal and transverse seams, and connections in ductwork shall be securely fastened and sealed with welds, gaskets, mastics (adhesives), mastic-plus-embedded-fabric systems, liquid sealants or tapes. Tapes and mastics used to seal fibrous glass ductwork shall be *listed* and *labeled* in accordance with UL 181A and shall be marked "181A-P" for pressure-sensitive tape, "181 A-M" for mastic or "181 A-H" for heat-sensitive tape.

Tapes and mastics used to seal metallic and flexible air ducts and flexible air connectors shall comply with UL 181B and shall be marked "181 B-FX" for pressure-sensitive tape or "181 BM" for mastic. Duct connections to flanges of air distribution system equipment shall be sealed and mechanically fastened. Mechanical fasteners for use with flexible nonmetallic air ducts shall comply with UL 181B and shall be marked 181B-C. Crimp joints for round metallic ducts shall have a contact lap of not less than 1 inch (25 mm) and shall be mechanically fastened by means of not less than three sheet-metal screws or rivets equally spaced around the joint.

Closure systems used to seal all ductwork shall be installed in accordance with the manufacturers' instructions.

### **Exceptions:**

1. Spray polyurethane foam shall be permitted to be applied without additional joint seals.
2. Where a duct connection is made that is partially inaccessible, three screws or rivets shall be equally spaced on the exposed portion of the joint so as to prevent a hinge effect.
3. For ducts having a static pressure classification of less than 2 inches of water column (500 Pa), additional closure systems shall not be required for continuously welded joints and seams and locking-type joints and seams of other than the snap-lock and button-lock types that are located outside of conditioned spaces.

**Reason:** This proposal will reduce construction cost and still reduce energy loss that would occur due to duct leakage outside conditioned space. Low pressure longitudinal seam duct leakage is very limited and the small amount of leakage within conditioned space is still useful energy.

**Cost Impact:** Will not increase the cost of construction  
Cost decrease of up to \$314 for an average house according to research conducted by Home Innovation Research Labs.

RM36-15 : M1601.4.1-  
SURRENA5018

---

## **Public Hearing Results**

**Committee Action:** **Approved as Submitted**

**Committee Reason:** Approval was based on the proponent's published reason statements.

**Assembly Action :** **None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Craig Drumheller, representing National Association of Home Builders (CDrumheller@nahb.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Residential Code**

**M1601.4.1 Joints, seams and connections.** Longitudinal and transverse joints, seams and connections in metallic and nonmetallic ducts shall be constructed as specified in SMACNA HVAC *Duct Construction Standards—Metal and Flexible* and NAIMA *Fibrous Glass Duct Construction Standards*. Joints, longitudinal and transverse seams, and connections in ductwork shall be securely fastened and sealed with welds, gaskets, mastics (adhesives), mastic-plus-embedded-fabric systems, liquid sealants or tapes. Tapes and mastics used to seal fibrous glass ductwork shall be *listed* and *labeled* in accordance with UL 181A and shall be marked "181A-P" for pressure-sensitive tape, "181 A-M" for mastic or "181 A-H" for heat-sensitive tape.

Tapes and mastics used to seal metallic and flexible air ducts and flexible air connectors shall comply with UL 181B and shall be marked "181 B-FX" for pressure-sensitive tape or "181 BM" for mastic. Duct connections to flanges of air distribution system equipment shall be sealed and mechanically fastened. Mechanical fasteners for use with flexible nonmetallic air ducts shall comply with UL 181B and shall be marked 181B-C. Crimp joints for round metallic ducts shall have a contact lap of not less than 1 inch (25 mm) and shall be mechanically fastened by means of not less than three sheet-metal screws or rivets equally spaced around the joint.

Closure systems used to seal all ductwork shall be installed in accordance with the manufacturers' instructions.

#### **Exceptions:**

1. Spray polyurethane foam shall be permitted to be applied without additional joint seals.
2. Where a duct connection is made that is partially

inaccessible, three screws or rivets shall be equally spaced on the exposed portion of the joint so as to prevent a hinge effect.

3. For ducts having a static pressure classification of less than 2 inches of water column (500 Pa), additional closure systems shall not be required for locking type longitudinal joints and seams located within conditioned space ~~continuously welded joints and seams and locking type joints and seams of other than the snap lock and button lock types that are located outside of conditioned spaces.~~

**Commenter's Reason:** This proposal was approved at the Committee Action Hearings. The committee recognized that the cost to seal the longitudinal joints in conditioned space outweighed the benefit for this requirement; however, there was a concern that the modification contributed to the confusion of an already unclear exception.

The public comment modification does not change the meaning or intent of the original proposal. The change improves the language by removing exceptions to exceptions and also removing a redundant reference to "welded seams".

As modified, this proposal will still reduce the cost of construction up to \$314 for an average house.

---

# RM37-15

## M1602.2

### **Proposed Change as Submitted**

**Proponent :** Guy McMann, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

## **2015 International Residential Code**

### **Revise as follows:**

**M1602.2 Return air openings.** Return air openings for heating, ventilation and air conditioning systems shall comply with all of the following:

1. Openings shall not be located less than 10 feet (3048 mm) measured in any direction from an open combustion chamber or draft hood of another appliance located in the same room or space.
2. The amount of return air taken from any room or space shall be not greater than the flow rate of supply air delivered to such room or space.
3. Return and transfer openings shall be sized in accordance with the appliance or equipment manufacturers' installation instructions, Manual D or the design of the registered design professional.
4. Return air shall not be taken from a closet, bathroom, toilet room, kitchen, garage, mechanical room, boiler room, furnace room or unconditioned attic.

#### **Exceptions:**

1. Taking return air from a kitchen is not prohibited where such return air openings serve the kitchen only, and are located not less than 10 feet (3048 mm) from the cooking appliances.
2. Dedicated forced-air systems serving only the garage shall not be prohibited from obtaining return air from the garage.
5. Taking return air from an unconditioned crawl space shall not be accomplished through a direct connection to the return side of a forced-air furnace. Transfer openings in the crawl space enclosure shall not be prohibited.
6. Return air from one dwelling unit shall not be discharged into another dwelling unit.
7. Return air shall not be taken from indoor swimming pool enclosures and associated deck areas except where such space is dehumidified,

**Reason:** It is not desirable to pull return air from swimming pool areas due to the affects it would have on the system from humidity and chemical odors associated with such spaces. A dedicated system would be required or a combination of supply and exhaust. This scenario is consistent with the same dwelling built under the IMC.

**Cost Impact:** Will not increase the cost of construction  
Generally speaking this proposal is will not cause an increase is cost. If

**Online Vote Results:** **Failed**

Support: 34.59% (55) Oppose: 65.41% (104)

**Assembly Action :** **None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Guy McMann, Jefferson County Co., representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Residential Code**

**M1602.2 Return air openings.** Return air openings for heating, ventilation and air conditioning systems shall comply with all of the following:

1. Openings shall not be located less than 10 feet (3048 mm) measured in any direction from an open combustion chamber or draft hood of another appliance located in the same room or space.
2. The amount of return air taken from any room or space shall be not greater than the flow rate of supply air delivered to such room or space.
3. Return and transfer openings shall be sized in accordance with the appliance or equipment manufacturers' installation instructions, Manual D or the design of the registered design professional.
4. Return air shall not be taken from a closet, bathroom, toilet room, kitchen, garage, mechanical room, boiler room, furnace room or unconditioned attic.

#### **Exceptions:**

1. Taking return air from a kitchen is not prohibited where such return air openings serve the kitchen only, and are located not less than 10 feet (3048 mm) from the cooking appliances.
2. Dedicated forced-air systems serving only the garage shall not be prohibited from obtaining return air from the garage.

5. Taking return air from an unconditioned crawl space shall not be accomplished through a direct connection to the return side of a forced-air furnace. Transfer openings in the crawl space enclosure shall not be prohibited.
6. Return air from one dwelling unit shall not be discharged into another dwelling unit.
7. ~~Return~~ For other than dedicated HVAC systems, return air shall not be taken from indoor swimming pool enclosures and associated deck areas except where the air in such space spaces is dehumidified,

**Commenter's Reason:** The committees concern that the original language seemed to exclude dedicated systems was valid. This correction clearly excludes dedicated systems from the requirements of untreated recirculation to other spaces.

---

RM37-15

# RM38-15

## M2005.1, M2005.2, M2005.2.1

### Proposed Change as Submitted

**Proponent :** Guy McMann, Jefferson County, Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcman@jeffco.us)

## 2015 International Residential Code

### Revise as follows:

**M2005.1 General.** Water heaters shall be installed in accordance with Chapter 28, the manufacturer's instructions and the requirements of this code. ~~Water heaters installed in an attic shall comply with the requirements of Section M1305.1.3.~~ Gas-fired water heaters shall comply with the requirements in Chapter 24. Domestic electric water heaters shall comply with UL 174. Oil-fired water heaters shall comply with UL 732. Thermal solar water heaters shall comply with Chapter 23 and UL 174. Solid fuel-fired water heaters shall comply with UL 2523.

**M2005.2 Prohibited locations.** Fuel-fired water heaters shall not be located in sleeping rooms, bathrooms, toilet rooms, storage closets or a space that opens only to such room or spaces.

#### Exceptions:

1. The water heater is a direct-vent appliance installed in accordance with the terms of its listing and the manufacturer's installation instructions.
2. Where the water heater is installed in a room used as a storage closet. Water heaters located in or space that opens only into a bedroom or bathroom, the room or space shall be installed in provided with a sealed enclosure so that solid weather stripped door equipped with an approved self-closing device. All combustion air will not shall be taken directly from the living space outdoors. Installation of direct-vent water heaters within an enclosure is not required.

**M2005.2.1 Water heater access.** Access to water heaters that are located in an attic or underfloor crawl space ~~is permitted to shall be through a closet located in a sleeping room or bathroom where ventilation of those spaces is in accordance with this code. Section M1305.~~

**Reason:** This section lacks some general information and is incomplete. It is also in need of a little cleanup. There are no new requirements.

**Cost Impact:** Will not increase the cost of construction  
This proposal is strictly editorial in nature and will not cause an increase in cost.

RM38-15 : M2005.1-  
MCMANN3692

---

## Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** The "space" referred to in the proposal could be very large.

**Assembly Action :**

**None**

---

**Individual Consideration Agenda**

**Public Comment 1:**

**Proponent : Guy McMann, Jefferson County Co., representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcman@jeffco.us) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

**2015 International Residential Code**

**M2005.2 Prohibited locations.** Fuel-fired water heaters shall not be located in sleeping rooms, bathrooms, toilet rooms, storage closets or a space that opens only to such room obtain combustion air from any of the following rooms or spaces:

1. Sleeping rooms.
2. Bathrooms.
3. Toilet rooms.
4. Storage closets.

**Exceptions:**

1. The Direct-vent water heater heaters that obtain all combustion air directly from the outdoors
2. Solid fuel-fired water heaters, provided that combustion air is a direct-vent appliance installed provided in accordance with the terms of its listing and the manufacturer's manufacturer'-s installation instructions and this section.
3. Where the water heater is Water heaters installed in a room or space that opens only into a bedroom or bathroom, dedicated enclosure in which all combustion air is taken directly from the room or space outdoors. Access to such enclosure shall be provided with through a weather-stripped solid-weather-stripped door that is equipped with an approved self-closing device. All combustion air shall be taken directly from the outdoors.

**M2005.2.1 Water heater access.** Access to water heaters that are located in an *attic* or underfloor crawl space shall be in accordance with Section M1305.

**Commenter's Reason:** The committees concern that a space may be very large is unclear. The proposal has been modified to reflect the same language used in the IMC for water heater installations and prohibited locations. This will complete this section in an easy to read format. There are no new requirements. # 2 was left in place to cover any oil fired water heaters that may exist.

---

**RM38-15**

# RM40-15

## Table M2101.1, M2103.3

### Proposed Change as Submitted

**Proponent :** Curtis Dady, Viega, LLC, representing Viega, LLC  
(curtis.dady@viega.us)

## 2015 International Residential Code

Revise as follows:

**TABLE M2101.1  
HYDRONIC PIPING AND FITTING MATERIALS**

MATERIAL	USE CODE <sup>a</sup>	STANDARD <sup>b</sup>	JOINTS	NOTES
Copper tubing (type K, L or M)	1, 2	ASTM B 75, B 88, B 251, B 306, ASME B16.51	Brazed, soldered, <u>press-connected</u> and flared mechanical fittings	Joints embedded in concrete

(Portions of table not shown remain unchanged)

For SI: °C = [(°F)-32]/1.8.

- a. Use code:
  1. Above ground.
  2. Embedded in radiant systems.
  3. Temperatures below 180°F only.
  4. Low temperature (below 130°F) applications only.
  5. Temperatures below 160°F only.
- b. Standards as listed in Chapter 44.

**M2103.3 Piping joints.** Copper and copper alloy systems shall be soldered, brazed, or press-connected. Soldering shall be in accordance with ASTM B 828. Fluxes for soldering shall be in accordance with ASTM B 813. Brazing fluxes shall be in accordance with AWS A5.31. Press-connect shall be in accordance with ASME B16.51. Piping joints that are embedded shall be installed in accordance with the following requirements:

1. Steel pipe joints shall be welded.
2. Copper tubing shall be joined by brazing complying with Section P3003.6.1.
3. Polybutylene pipe and tubing joints shall be installed with socket-type heat-fused polybutylene fittings.

4. CPVC tubing shall be joined using solvent cement joints.
5. Polypropylene pipe and tubing joints shall be installed with socket-type heat-fused polypropylene fittings.
6. Cross-linked polyethylene (PEX) tubing shall be joined using cold expansion, insert or compression fittings.
7. Raised temperature polyethylene (PE-RT) tubing shall be joined using insert or compression fittings.

**Reason:** ASME B16.51 "Copper and Copper Alloy Press-Connect Pressure Fittings" is included in IMC table 1202.5 HYDRONIC PIPE FITTINGS and these joints are included in sections 1203.8 and 1203.8.3.

**Cost Impact:** Will not increase the cost of construction  
Addition of option, not requirement.

RM40-15 : M2101.1-  
DADY3675

### **Public Hearing Results**

**Committee Action:**

**Approved as Modified**

**Modification:**

**TABLE M2101.1**

**HYDRONIC PIPING AND FITTING MATERIALS**

*(No change to Table)*

**Committee Reason:** Approval is based on the proponent's published reason statements. The modification corrects the the table title.

**Assembly Action :**

**None**

### **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

#### **2015 International Residential Code**

**M2103.3 Piping joints.** Copper and copper alloy systems shall be soldered, brazed, or press-connected. Soldering shall be in accordance with ASTM B 828. Fluxes for soldering shall be in accordance with ASTM B 813. Brazing fluxes shall be in accordance with AWS A5.31. Press-connect joints shall be made in accordance with ~~ASME B16.51~~ the manufacturer's installation instructions. Piping joints that are embedded shall be installed in accordance with the following requirements:

1. Steel pipe joints shall be welded.
2. Copper tubing shall be joined by brazing complying with Section P3003.6.1.
3. Polybutylene pipe and tubing joints shall be installed with socket-type heat-fused polybutylene fittings.
4. CPVC tubing shall be joined using solvent cement joints.
5. Polypropylene pipe and tubing joints shall be installed with socket-type heat-fused polypropylene fittings.
6. Cross-linked polyethylene (PEX) tubing shall be joined using cold expansion, insert or compression fittings.
7. Raised temperature polyethylene (PE-RT) tubing shall be joined using insert or compression fittings.

**Commenter's Reason:** ASME B16.51 contains no requirements for the installation of press-connect fittings. This section regulates installation, not fitting standards. The fitting manufacturer is required to provide the installation instructions for press connect fittings. It is inappropriate to reference the standard when no installation requirements are found in the standard.

---

**RM40-15**

# RM53-15

## M2301.3.3 (New)

### Proposed Change as Submitted

**Proponent :** Robby Schwarz, EnergyLogic, Inc., representing EnergyLogic, Inc. (robby@nrglogic.com)

## 2015 International Residential Code

**Add new text as follows:**

**M2301.3.3 Labeling of solar energy systems** The solar energy installer shall provide a certificate or label that lists the following information relative to the installed solar system: Such certificate or label shall be posted near the inverter, electrical distribution panel, or other conspicuous location.

1. The date that the system was installed.
2. The name of the installation company.
3. The system type.
4. The orientation of the arrays and collectors.
5. The tilt in degrees of the arrays and collectors.
6. The square foot area of the arrays and collectors.
7. The number of panels in the arrays.
8. The peak power production of the arrays and collectors stated in watts.
9. The inverter efficiency of the arrays and collectors.
10. The loop type of the arrays and collectors.
11. The type of the arrays and collectors.
12. The storage volume of the system in cubic feet or gallons.

**Reason:** Rational Statement:

Just like the requirement to provide an insulation certificate to fully document the R-values of the insulation in each assembly of the home ensures that the code official and home owner knows and understand what has been installed in the home, this proposal ensures that everyone involved knows and understands the PV or solar thermal system that has been installed. In addition, since the requirement is in label form it is hoped that this Permanente label will live with the house and will provide meaning full information that can be used for repairs and upgrades, as well as, appraisals and sales transactions when the house is turned over.

**Cost Impact:** Will not increase the cost of construction

The cost of a label is so minimal that it should not be considered increasing the cost of construction.

RM53-15 : M2301.3.3  
(New)-SCHWARZ4982

---

## Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** The proposed text belongs in the IECC. The proposal addresses electrical components not within the scope of the code. The proposed labeling is unnecessary.

---

**Individual Consideration Agenda*****Public Comment 1:***

**Proponent : Robby Schwarz, EnergyLogic, Inc., representing EnergyLogic, Inc. (robby@nrglogic.com) requests Approve as Submitted.**

**Commenter's Reason:** The Committees Reason for disapproval was as follows. "The proposed text belongs in the IECC. The proposal addresses electrical components not within the scope of the code. The proposed labeling is unnecessary. Let's address all three of these concerns.

1. The proposed text belongs in the IECC

- This proposal should also be adopted in the IECC but in order to have consistency between the codes it should be adopted here. The items requested on the label are not only energy related and are important to understand for any contractor that may interact with the system that has been installed. Electrician, Plumber, Rater, Appraiser, etc.

2. The proposal addresses electrical components not within the scope of the code

- Chapter 23 of the IRC addresses Solar Thermal Energy Systems, Appendix U addresses Solar Electric, and Part VIII addresses Electrical issue. All of these section are associated with Solar systems which this proposal is addressing. Having a consolidated label that is permanent to the house ensure that all parties are certain of the system that has been installed.

3. The proposed labeling is unnecessary

- Many components of the building are required to be labeled. From bypass values to gas vents and insulation as noted in section N1101.14. The code has addressed the need for permanent certificates or labels to be installed in the home for specific features where a record needs to be maintained of the specifics of the installation. Solar systems are a component of the building where a permanent record would be valuable to install. Just a certificate enables other professions to quickly assess what has been installed and how their services on the house need to be performed in relation to what is installed.

---

**RM53-15**

# RM54-15

R202 (New), M2301.4.1.1 (New), M2301.4.1.2 (New)

## Proposed Change as Submitted

**Proponent :** Rex Gillespie (rex.gillespie@caleffi.com)

### 2015 International Residential Code

**Add new definition as follows:**

#### SECTION 202 DEFINITIONS

**FOOD GRADE FLUID.** Potable water or a fluid containing additives listed in accordance with the Code of Federal Regulations, Title 21, Food and Drugs, Chapter 1, Food and Drug Administration, Parts 174-186

#### SECTION 202 DEFINITIONS

**NON-FOOD GRADE FLUID.** Any fluid that is not designated as a food grade fluid.

**Add new text as follows:**

**M2301.4.1.1 Double-wall heat exchangers.** Heat exchangers utilizing a non-food grade fluid shall separate the non-food grade fluid from the potable water by means of double-wall construction. An air gap open to the atmosphere shall be provided between the two walls. The point of discharge from the air gap between the two walls of the double-wall heat exchanger shall be visible.

**M2301.4.1.2 Single-wall heat exchangers.** Where single-wall heat exchangers are used, the heat transfer fluid shall be food grade fluid..

**Reason:** This proposal seeks to align with the language that appears in the IMC Chapter 1402.8 regarding heat exchangers and add definitions of FOOD GRADE and NON-FOOD GRADE heat transfer fluids as stated in SRCC Standard 300

**Bibliography:** SRCC Standard 300, Minimum Standard for Solar Thermal Water Heating Systems, January 3, 2013.

**Cost Impact:** Will not increase the cost of construction  
The proposed changes are not anticipated to impact the cost of installation. No new equipment or features are required, and no new requirements are placed on manufacturers impacting certification or manufacturing costs. Proposed provisions provide additional clarity and direction for installers and code officials at inspection.

**Analysis:** A review of the standard proposed for inclusion in the code, CFR Title 21, Chapter 1, Parts 174-186, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

RM54-15 : M2301.4-  
GILLESPIE5131

## **Public Hearing Results**

**Committee Action:**

**Approved as Modified**

**Modification:**

### **SECTION 202 DEFINITIONS**

~~FOOD GRADE FLUID. Potable water or a fluid containing additives listed in accordance with the Code of Federal Regulations, Title 21, Food and Drugs, Chapter 1, Food and Drug Administration, Parts 174-186~~

### **SECTION 202 DEFINITIONS**

~~NON-FOOD GRADE FLUID. Any fluid that is not designated as a food grade fluid.~~

**Committee Reason:** It is important to inform mechanical contractors about cross contamination prevention, as they are informed by the IPC and IMC. The modification deletes the proposed definitions because there is no need to reference federal law regarding food safety which is not within the scope of the code.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com) requests Disapprove.**

**Commenter's Reason:** The proposed new sections will conflict with the previous section M2301.4. This section references P2902.5.2 in the plumbing section. It also references SRCC 300. The proposed text uses the term food grade. Section P2902.5.2 and Section M2301.4 use the terms essentially toxic and essentially non-toxic. This would result in a conflict and confusion to the code official. While the reason states it attempts to align with Section 1402.8 of the Mechanical Code it would conflict with the Plumbing Code and the plumbing section of the IRC. Furthermore, there is no Section 1402.8 in the Mechanical Code.

**RM54-15**

# M9-15

202

## Proposed Change as Submitted

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

### 2015 International Mechanical Code

Revise as follows:

#### SECTION 202 DEFINITIONS

**VENTILATION.** The natural or mechanical process of ~~supplying~~ introducing conditioned or unconditioned outdoor air to, ~~or removing such a~~ space and removing air from, ~~any such space~~ at an approximately equal rate.

**Reason:** The current definition dates back to when ventilation involved recirculation and has caused confusion because it still implies that ventilation involves recirculated air, when in fact, it does not. In the IMC, ventilation is by means of outdoor air only. There is no recognition of ventilation by recirculated indoor air. The revised definition makes this clear and also states a fundamental principal that ventilation does not occur without a balance of supplied air and removed air. If a system supplies 1000 cfm of outdoor ventilation air to a space, then it must exhaust, relieve or otherwise remove air at an equal rate or else the space will positively or negatively pressurize and the ventilation rate will not be realized. The revised definition is open such that it will recognize any means of supplying the outdoor air, such as by supply fans with relief fans or gravity openings and by means of exhaust fans and supply fans or gravity intake openings.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

M9-15 : 202-  
VENTILATION-  
SNYDER3253

---

## Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** Ventilation in Section 403 of the IMC is not solely supplying outdoor air. The proposal will cause confusion and conflicts with Section 401 of the IMC and also ASHRAE 62.1.

---

**Individual Consideration Agenda*****Public Comment 1:***

**Proponent : Janine Snyder, representing Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

**2015 International Mechanical Code****SECTION 202 DEFINITIONS**

**VENTILATION.** The natural or mechanical process of introducing conditioned or unconditioned outdoor air to a space and removing air from such space ~~at an approximately equal rate. . .~~

**Commenter's Reason:** The IMC committee seemed to take issue with the words "at an approximate equal rate," even though Section 403.1 states the same requirement. Those words are not essential to the definition, however, and can be omitted. Chapter 4 does indeed deal only with outdoor air for ventilation. There is no allowance for recirculated ventilation air in Chapter 4. Whether by mechanical or natural means, ventilation is the process of bringing in outdoor air and relieving or exhausting the same amount of air. The proposed definition reflects this.

---

**M9-15**

# M10-15

## 313 (New), Chapter 15

### Proposed Change as Submitted

**Proponent :** Ronald George, Self, representing Self (Ron@Plumb-TechLLC.com)

### 2015 International Mechanical Code

Add new text as follows:

#### SECTION 313 SYSTEM DESIGN CONSIDERATIONS

313.1 Design of Building Water Systems The design of building water systems shall be in accordance with ASHRAE 188.

**Add new standard(s) as follows:** ASHRAE 188 - DRAFT 4th Public Review 09262014 Legionellosis: Risk Management for Building Water Systems

**Reason:** There are many design considerations in the ASHRAE standard that will help minimize Legionella bacteria growth in building water systems which can lead to Legionnaires Disease when water droplets are aerosolized and breathed in. Following the ASHRAE Standard will minimize the risk of a person contracting Legionnaires' disease or Legionellosis by having the design team consider system maintenance procedures to control the risk of legionellosis associated with plumbing & mechanical systems.

**Bibliography:** See the following websites for more information:

[www.LegionellaPrevention.org](http://www.LegionellaPrevention.org).

<http://www.cdc.gov/legionella/about/>,

[www.Legionella.com](http://www.Legionella.com), [www.hcinfo.com](http://www.hcinfo.com)

[http://www.who.int/water\\_sanitation\\_health/emerging/legionella.pdf](http://www.who.int/water_sanitation_health/emerging/legionella.pdf)

**Cost Impact:** Will increase the cost of construction

Buildings without a history of Legionella and not fitting the requirements will not need to add to the cost of construction. A water management plan will need to be done if a building meets certain minimum requirements. The cost of construction to address temperature, stagnation and water treatment will slightly increase the cost of construction and maintenance. Any building that is operating without growing Legionella should already have these processes in place, this will simply require documentation as part of a water management plan. This will provide for system design, operation and treatment that will minimize legionella bacteria growth and help prevent Legionnaires Disease.

**Analysis:** A review of the standard proposed for inclusion in the code, ASHRAE 188, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M10-15 : 313 (New)-GEORGE5826

### Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** The proposed standard is in draft form and not likely to be completed by the Public Comment Hearings. The content could change before the draft is finalized.

**Assembly Action :**

**None**

### Individual Consideration Agenda

**Public Comment 1:**

**Proponent :** Steven Ferguson, representing American Society of Heating Refrigerating and Air-Conditioning Engineers (sferguson@ashrae.org) requests Approve as Modified by this Public Comment.

**Modify as Follows:**

## **2015 International Mechanical Code**

**313.1 Design of building water systems.** The design of building water systems shall be in accordance with ASHRAE 188.

**Modify standard(s) as follows:** ANSI/ASHRAE 188 - DRAFT\_4th Public Review\_09262014 - 2015 - Legionellosis: Risk Management for Building Water Systems

**Commenter's Reason:** The reason for disapproval of this proposal at the committee hearings was "The proposed standard is in draft form and not likely to be completed by the Public Comment Hearings. The content could change before the draft is finalized."

The Staff analysis on this standard was "Appears to be written in enforceable language. No proprietary references were noted. Consensus process stated."

In addition to the original proponent's reason statement. ASHRAE Standard 188 was developed with the intent of providing code officials and building operators information on how to manage the risk of legionellosis. ASHRAE Standard 188 was published on June 26, 2015, and is now publicly available as a final, published ANSI Standard. No substantive changes were made from the version previously provided to ICC for review.

For more information on the standard, go here: <http://www.techstreet.com/ashrae/products/1897561>

**M10-15**

# M19-15

## 401.2

### Proposed Change as Submitted

**Proponent :** Luis Escobar, representing Air Conditioning Contractors of America (luis.escobar@acca.org)

## 2015 International Mechanical Code

### Revise as follows:

**401.2 Ventilation required.** Every occupied space shall be ventilated by natural means in accordance with Section 402 or ~~by mechanical means in accordance with Section 403. Where the air infiltration rate in a dwelling unit is less than 5 air changes per hour when tested with a blower door at a pressure of 0.2 inch water column (50 Pa) in accordance with Section R402.4.1.2 of the *International Energy Conservation Code*, the dwelling unit shall be ventilated by mechanical means in accordance with Section 403.~~ Ambulatory care facilities and Group I-2 occupancies shall be ventilated by mechanical means in accordance with Section 407.

**Reason:** This proposal is intended to clarify a current point of contention in the code.

Section 401.2 begins by allowing either natural or mechanical ventilation in the design. It then goes on to require mechanical ventilation if the infiltration rate is less than 5 air changes per hour (ACH) when tested per IECC section R402.4.1.2.

However, IECC section R402.4.1.2 contains the procedures for verifying that the air leakage rate not exceed 5 ACH (climate zones 1 and 2) or 3 ACH (climate zones 3 - 8). This effectively allows the designer to pick natural ventilation up front only to get failed ultimately because of a catch-22 resulting from post-construction testing.

Further, it should be noted that the testing requirements ("air infiltration rate", i.e., "uncontrolled inward air leakage") does not comply with the IMC's definition of natural ventilation ("the movement of air into and out of a space through intentionally provided openings...").

The proposed change reverts back to the requirements in the 2009 IMC which simply allows for either natural or mechanical ventilation.

**Cost Impact:** Will not increase the cost of construction

This proposal allows the option of not installing mechanical ventilation, saving on construction costs.

M19-15 : 401.2-  
ESCOBAR5800

---

### Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** Buildings are constructed to be more airtight. Occupants don't open windows as needed for natural ventilation. This section should not revert back to 2009 text as this is a step in the wrong direction.

**Assembly Action :**

**None**

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Luis Escobar, representing ACCA  
(luis.escobar@acca.org) requests Approve as Submitted.**

**Commenter's Reason:** During discussion of this and a subsequent proposal, the committee was self-contradictory. They stated clearly that they did not wish to make mechanical ventilation mandatory but were opposed to this original proposal's intent to clarify exactly that.

Furthermore, the current language causes the problem that it points to a more stringent code IECC that may not be adopted or enforced within many jurisdictions. In those places where both are not effective, it's proven to be distinctly problematic for contractors and home builders separately and together.

The original proposed change simply and clearly allows either option, natural or mechanical ventilation. If the IECC is effective in a particular jurisdiction then its requirements remain intact.

### *Public Comment 2:*

**Proponent : Donald Surrena, NAHB, representing NAHB  
(dsurrena@nahb.org) requests Approve as Submitted.**

**Commenter's Reason:** The section as currently written in the 2015 IMC, mixes commercial, residential mechanical ventilation with IECC residential air infiltration tightness requirements. As written the section mixes dwelling units and buildings limiting how multifamily testing is done. Not allowing testing by a floor or series of dwelling units. That limiting criteria is in the energy code but it is only in the 2012 and 2015 IECC Residential section R402.4.1.2 Testing. There is no other use of the term "air infiltration" in the Mechanical Code. The issue as to whether or not natural or mechanical ventilation is needed is satisfied correctly in Section 402 (Natural Ventilation) or 403 (Mechanical Ventilation) The section as it is currently written is a hindrance to the Mechanical Code. A majority of states and jurisdictions have not adopted the 2012 or 2015 IECC and this section as written is in conflict with what states and jurisdictions have adopted. The Mechanical Code should not contain criteria from the IECC when that criteria does not represent energy code requirements most states and jurisdictions have adopted. The number of Blower door tests increases from what is required by dwelling unit compared to testing by the floor. Blower door testing for buildings by the story will be significantly increased by as much as \$164 per additional test.<sup>(a)</sup>

**Cost Impact:** This will reduce the cost of construction.

# M20-15

202 (New), 401.2

## Proposed Change as Submitted

**Proponent :** Mike Moore, Newport Ventures, representing Broan-NuTone, representing Newport (mmoore@newportventures.net)

## 2015 International Mechanical Code

Add new definition as follows:

### SECTION 202 DEFINITIONS

**NONTRANSIENT** Characterized by occupancy of a dwelling unit for greater than 30 days by occupants who are primarily permanent in nature.

Revise as follows:

**401.2 Ventilation required.** Every occupied space shall be ventilated by natural means in accordance with Section 402 or by mechanical means in accordance with Section 403. ~~Where the air infiltration rate Dwelling units in a dwelling unit is less than 5 air changes per hour when tested with a blower door at a pressure of 0.2 inch water column (50 Pa) in accordance with Section R402.4.1.2 of the *International Energy Conservation Code*, the dwelling unit nontransient residential occupancies shall be ventilated by mechanical means in accordance with Section 403. Ambulatory care facilities and Group I-2 occupancies shall be ventilated by mechanical means in accordance with Section 407.~~

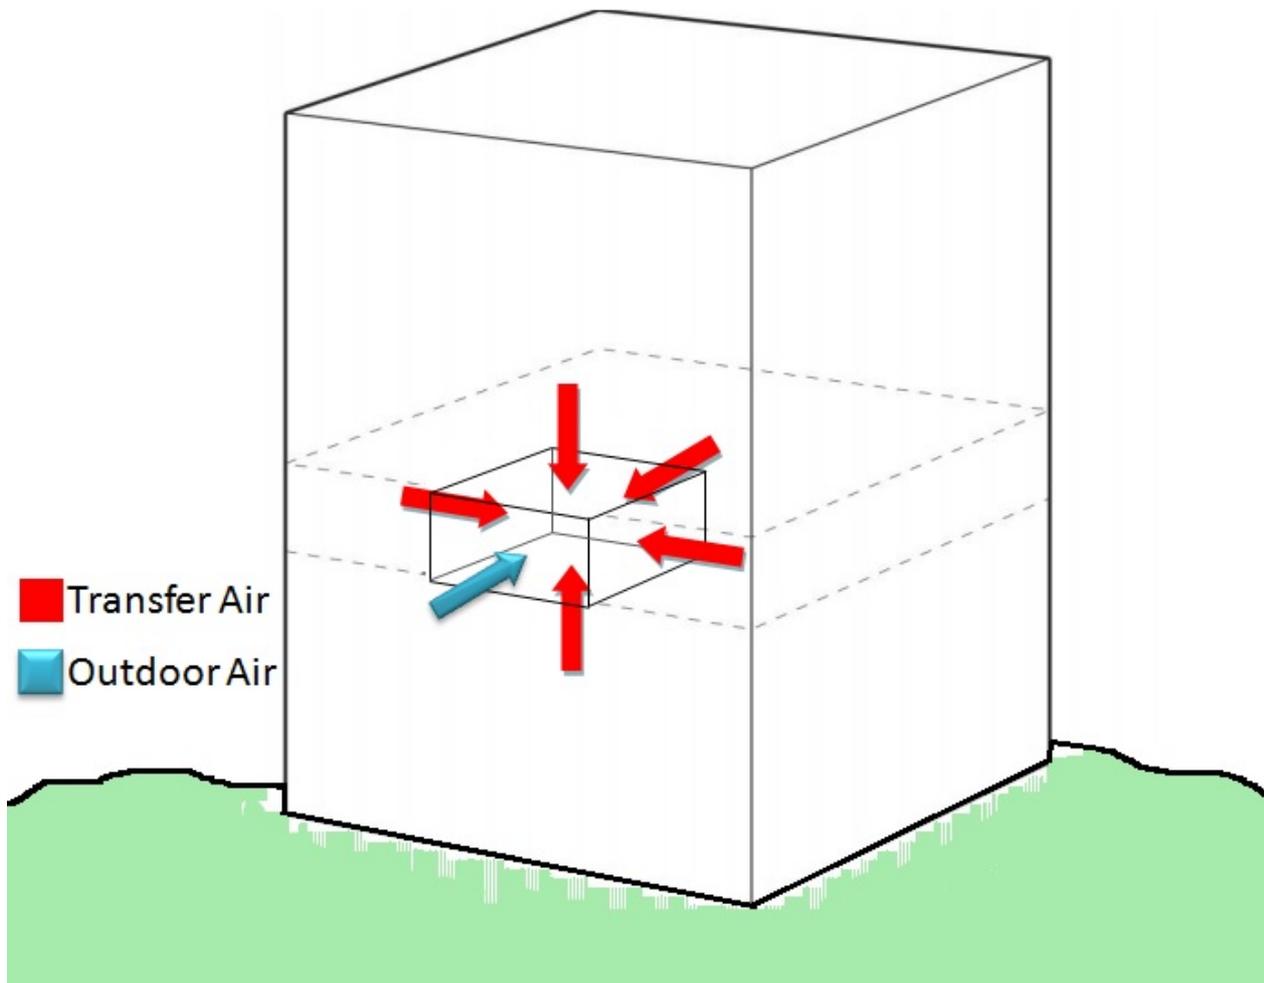

### **Reason: Compartmentalized Units are Tight and Should Require Mechanical Ventilation!**

Attached dwelling units are being built tighter than ever, with increasing focus on compartmentalization of dwelling units for suppression of fire, smoke, odors, and environmental tobacco smoke; reduced energy use for heating and cooling; improved acoustics; and improved occupant comfort. Despite dwelling units being built tighter, there is no requirement for these tight units to be provided with mechanical ventilation. This proposal introduces a requirement for mechanical ventilation in today's tight and energy efficient buildings to provide occupants with minimum acceptable indoor air quality.

So, how tight are these dwelling units covered by the IMC being built? Unfortunately, we don't know, because very little data are available on new, code-minimum units. We do know that in general, dwelling units are getting much tighter over time (see Figure 1), but how much, we're not sure. For argument's sake, let's say they're TWICE as leaky as ENERGY STAR multifamily high rise units. Sound reasonable? This would put them at about 12 ACH50.<sup>12</sup> That sounds plenty leaky to provide sufficient natural ventilation, until you consider that a significant portion of the infiltration of attached dwelling units is likely to be transfer air from neighboring units, since much less of an attached unit's surface area is adjacent to the outdoors.

For example, interior dwelling units have only 1/6 surfaces exposed to the exterior, or about 10% of the total surface area for a unit with a square floor plan. Let's assume that up to 40% of the dwelling unit leakage comes through the 10% of the surface area accounted for by the exterior wall. This number can vary widely, but is a reasonable assumption based on multiple sources and feedback from builders, developers, and energy professionals that the most difficult area to air seal in attached units is the fire rated assembly wall separating dwelling units. So, for attached dwelling units that are twice as leaky as ENERGY STAR units, the effective outdoor air leakage rate would be about 5 ACH50 (40% of 12 ACH50). This is the

leakage rate that triggers mechanical ventilation requirements in both the IRC and IMC.

<b>ENERGY STAR Tight</b>	<b>Typical Tightness</b>	
<b>Total Leakage</b>	<b>Total Leakage</b>	<b>Leakage to Outdoors</b>
~6 ACH50 (0.3 cfm50/sqft)	~12 ACH50 (assuming twice as leaky as ENERGY STAR)	~5 ACH50 (assuming 40% of leakage comes from outdoors)

Table 1. Estimating the tightness of typical attached dwelling units.

In other words, by the IRC and IMC's own standards, typical dwelling units, regardless of whether or not they have a blower door test, should be provided with mechanical ventilation. This proposal limits the requirements for mechanical ventilation to the dwelling units that will have the highest impact on occupant health - those units whose occupants are expected to be nontransient, since these account for the lion's share of pollutant exposure over time. The definition of nontransient is adapted from the IBC definition of transient.

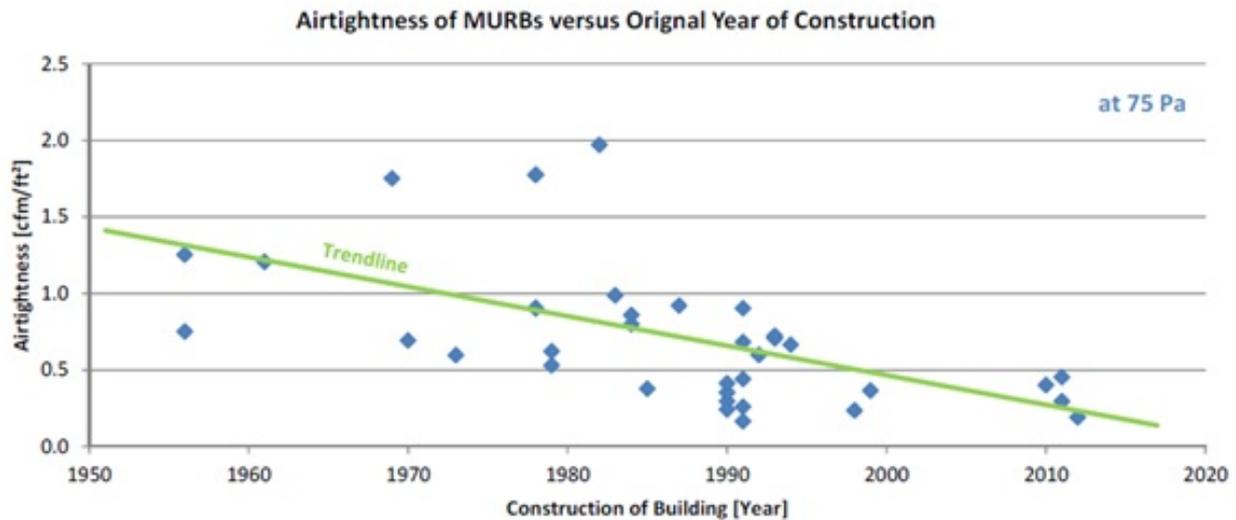

Figure 1. Airtightness of Multi-Unit Residential Buildings (MURB), by year.<sup>14</sup> The 0.4 cfm75/sqft metric for units built after 1995 would translate to about 0.3 cfm50/sqft. However, because this data set is limited and includes some high performance buildings across the U.S. and Canada, it should only be used to indicate a trend in tightness over time (dwelling units are getting tighter!) and should not be used to validate a specific leakage rate.

### Building Tight without Mechanically Ventilating Can Have Huge Health Impacts

Building tight, compartmentalized dwelling units (5 ACH50 and below) has become the new standard practice, regardless of whether or not a developer confirms the tightness with a blower door test. Of course, the one potential problem with building tight is the negative impact it has on indoor air quality if mechanical ventilation is not provided. Without mechanical ventilation, tight dwelling units can experience elevated humidity levels; increased condensation potential on windows; higher concentrations of dust mites and allergens; and higher concentrations of pollutants such as particulate matter (which can be transmitted to the circulatory system and organs after being introduced to the lungs), radon (the second leading cause of lung cancer; has also been detected in high-rise units<sup>13</sup>), formaldehyde, acetaldehyde, and other VOCs that have negative health impacts.

We spend 90% of our time indoors, so it's no wonder that health impacts associated with poor indoor air quality include increased risk or exacerbation of asthma, stroke, neurotoxicity, and cancer, among others.<sup>6,9,10</sup> Many indoor air pollutants originate from building materials and finishes. Recent studies have shown that air pollution levels in dwelling units that are not mechanically ventilated can exceed outdoor national air quality standards for CO in 7-8% of homes and NO<sub>2</sub> in 55-70% of homes, during a typical week.<sup>3</sup> Other sources point to the increase in flame retardants in building materials and finishes driven by codes and standards as contributing to the presence of these chemicals in indoor dust and air and ultimately in the bodies of people (33 different flame retardants products have now been discovered in people's bodies; health effects of many of these are still largely unknown).<sup>11</sup>

Estimates for the cost of poor indoor air quality are staggering. The cost of asthma triggered by dampness and mold in U.S. residences has been estimated at \$3.5 billion annually<sup>5</sup>, and asthma now affects one in five Americans<sup>4</sup>. While dampness and mold should be controlled as much as possible at the source, there are other pollutants where source control is not an option for many households. Even when you exclude radon and second hand smoke from the list of indoor pollutants, poor indoor air quality in U.S. residences is estimated to account for 14% of all years of life lost and years of disability associated with "noncommunicable and nonpsychiatric diseases."<sup>6</sup> Based on another study, this is roughly equal to the negative health impacts of alcohol use, diabetes, and HIV/AIDS combined.<sup>7</sup>

## **Relying on Natural Ventilation Alone Doesn't Cut it In Tight Dwelling Units**

A prominent study on occupant window operation in new (2002-2004 era) single family homes concluded that "a substantial percentage of homeowners never open their windows, especially in the winter" and that window operation coupled with natural infiltration does not provide the airflow rates necessary to achieve minimum indoor air quality.<sup>8</sup>

Nonetheless, natural ventilation through operable windows provides a useful and sometimes necessary function. Operable windows offer natural ventilation in addition to daylight and egress. Even with mechanical ventilation, a home occupant needs to be able to control their own environment, particularly in the case of an emergency such as a power failure (e.g., being able to open windows for airflow in the aftermath of a storm or blackout or in the case of equipment failure). The intention of this proposal is not to supplant natural ventilation, but to complement it.

Experience shows that where mechanical ventilation is required (i.e., all ENERGY STAR homes, low-rise dwelling units built to the 2012 IECC, all new low-rise dwelling units in CA, etc.), builders are not generally using it to trade off against natural ventilation requirements. The exception for this would be toilet rooms, which for decades have often been provided with local exhaust instead of an operable window.

At this point, mechanical ventilation is needed to provide minimum acceptable air quality for code-minimum construction. This change will ensure that the comfortable, energy efficient homes that builders and developers are now building are also provided with the systems required by national consensus standards to provide for this need.

http://perkinswill.com/sites/default/files/PerkinsWill\_FlameRetardantAlternatives.pdf. Accessed December 11, 2014.

12. The ENERGY STAR requirement for maximum total air leakage in high-rise multifamily dwelling units is 0.3 cfm50/sqft of the dwelling unit's envelope surface area. For a square, 1000 sqft unit with 9 foot ceilings, this translates to 6.3 ACH50 (the ENERGY STAR requirement for low-rise and mid-rise multifamily units is even tighter, at 3-6 ACH50, depending on climate zone). Assuming typical units are twice as leaky as high rise units would place them at ~12 ACH50 total leakage. Then, assuming that these units have 40% of their leakage to outdoors means that the effective outdoor air leakage rate would be ~5 ACH50.

14. Canada Mortgage and Housing Corporation. (2013). Air Leakage Control in Multi-Unit Residential Buildings. Project 5314.00.

**Cost Impact:** Will increase the cost of construction

For those dwelling units that are not already provided with outdoor air, retail incremental costs for compliant systems can be less than \$70. This is based on the incremental, retail cost difference between an entry-level exhaust fan (Broan 688 at \$11.56) and a quiet, higher-efficiency exhaust fan that meets the requirements of the 2012 IECC (Broan QTR080 at \$79.15). Prices were sourced from zero.com on December 19, 2014.

M20-15 : 401.2-  
MOORE4859

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The proposal addresses only dwelling units and is too extreme for single family dwellings. The proposed definition of nontransient is confusing relative to multi-family buildings verses hotels. The term transient is already defined and the proposed definition omits sleeping rooms. In some climates, the proposal is overkill. The proposal should be climatic location oriented. Cost is an issue for installing makeup air systems.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Mike Moore, Newport Ventures, representing Broan-NuTone (mmoore@newportventures.net) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Mechanical Code**

#### **SECTION 202 DEFINITIONS**

~~**NONTRANSIENT** Characterized by occupancy of a dwelling unit for greater than 30 days by occupants who are primarily permanent in nature.~~

**401.2 Ventilation required.** Every occupied space shall be ventilated by natural means in accordance with Section 402 or by mechanical means in

accordance with Section 403. Dwelling units in nontransient residential occupancies shall be ventilated by mechanical means in accordance with Section 403. Ambulatory care facilities and Group I-2 occupancies shall be ventilated by mechanical means in accordance with Section 407.

**Exception:** Mechanical ventilation is not required for dwelling units in nontransient residential occupancies where at least one of the following conditions is met:

1. The building does not have mechanical cooling and it is in Climate Zone 1 or 2.
2. The building is intended to be thermally conditioned for less than 876 hours per year.

**Commenter's Reason:** This comment is intended to address all the committee's concerns with the original proposal, as follows:

1. Committee: The proposed definition is confusing and "transient" is already defined.

Response: The definition of "nontransient" has been removed to avoid confusion and misinterpretation. The IBC already contains a definition of "transient" and multiple references to "transient" and "nontransient", which have been in use since at least the 2003 version of the IBC, so we will assume that the industry is familiar with these terms and their meanings.

2. Committee: The proposal is overkill in some climates.

Response: An exception has been introduced to exempt dwelling units in temperate climates where thermal conditioning is not provided or is not expected to occur more than 10% of the year (876 hours). This exception is derived from and aligned with ASHRAE 62.2. The term "Climate Zone" is defined in the IBC and is used in the IBC and IECC.

3. Committee: Cost is an issue for installing makeup air systems.

Response: No intentional makeup air is required by this proposal. Based on the current code requirements, exhaust, supply, or balanced systems may be used to provide dwelling unit ventilation without triggering any makeup air requirements.

4. Committee: This is "too extreme".

Response: Building and energy codes are requiring tighter construction practices for dwelling units. Benefits of these air-sealing requirements include fire resistance, sound attenuation, rodent control, odor control, and a reduction in space conditioning energy use. However, air sealing also reduces natural infiltration and leads to the need for mechanical ventilation. Additionally, air pollutants are often not discernable by occupants, so occupants are often unaware of the need to ventilate. Finally, window operation is not always a reliable form of ventilation in MF units, where opening a window could simply introduce more transfer air into a dwelling unit instead of providing required outdoor air. Following are examples of air sealing requirements in the codes that point to efforts/requirements for compartmentalization and the need for mechanical ventilation.

1. IBC, air transfer to the corridor: This is not permitted. IBC Section 1020.5: "*Corridors shall not serve as supply, return, exhaust, relief or ventilation air ducts.*"
2. ASHRAE 90.1 and IECC, air transfer through exterior walls: This is limited by requirements of ASHRAE 90.1 and the IECC, which have been widely adopted across states and include requirements to seal, caulk, gasket, or weather-strip joints, junctions, penetrations, seams, and openings in the building envelope, as well as air tightness targets in more recent versions.
3. IBC, Air transfer between units: Air transfer between units does not provide

ventilation air, but transfer air. Further, transfer air may be restricted by efforts to meet fire-resistance rating requirements of Chapters 6 and 7 of the IBC, fire-stop and fire-blocking requirements of the IRC and manufacturers of rated assemblies, sound attenuation requirements of Chapter 12 of the IBC specific to dwelling and sleeping units, and building owner efforts to manage rodents (see the IBC's optional appendix F101.3 for recommended sealing measures) and odors.

**M20-15**

# M21-15

## 401.2, 501.3

### Proposed Change as Submitted

**Proponent :** Mike Moore, Newport Ventures, representing Broan-NuTone, representing Newport (mmoore@newportventures.net)

## 2015 International Mechanical Code

### Revise as follows:

**401.2 Ventilation required.** Every occupied space shall be ventilated by natural means in accordance with Section 402 or by mechanical means in accordance with Section 403. Where Mechanical ventilation shall be required for the following:

1. Dwelling units where the air infiltration rate ~~in a dwelling unit~~ is less than 5 air changes per hour when tested with a blower door at a pressure of 0.2-inch water column (50 Pa) in accordance with Section R402.4.1.2 of the *International Energy Conservation Code*, ~~the~~
2. Kitchens in ~~dwelling unit shall be ventilated by mechanical means in accordance with Section 403~~ units.
3. Ambulatory care facilities and Group I-2 occupancies. Such ventilation shall be ventilated by mechanical means in accordance with Section 407.

**501.3 Exhaust discharge.** The air removed by every mechanical exhaust system shall be discharged outdoors at a point where it will not cause a public nuisance and not less than the distances specified in Section 501.3.1. The air shall be discharged to a location from which it cannot again be readily drawn in by a ventilating system. Air shall not be exhausted into an attic, crawl space, or be directed onto walkways.

### Exceptions:

1. Whole-house ventilation-type attic fans shall be permitted to discharge into the attic space of *dwelling units* having private attics.
2. Commercial cooking recirculating systems.
3. Where installed in accordance with the manufacturer's instructions and where mechanical ~~or natural~~ ventilation is otherwise provided in accordance with Chapter 4, *listed and labeled* domestic ductless range hoods shall not be required to discharge to the outdoors.

### Reason:

Pollutants from cooking have been identified as some of the worst in the home, in terms of health impacts. Pollution during cooking events includes NO<sub>2</sub>, CO, HCHO (formaldehyde), acrolein (produced when cooking meats and oils; used as a nerve agent in WW), polycyclic aromatic hydrocarbons, and particulate matter (which can become lodged in the lungs or pass through the lungs to the circulatory system.<sup>1,2,3,4,5,6,17,18,19,20,21</sup> Overall, indoor air pollution from residential dwelling units (excluding the impacts of radon and second hand smoke) is estimated to account for 14% of all years of life lost and years of disability associated with

"noncommunicable and nonpsychiatric diseases."<sup>7</sup> Based on another study, this is roughly equal to the negative health impacts of alcohol use, diabetes, and HIV/AIDS combined.<sup>8</sup> The lion's share of the health impacts of poor indoor air quality in dwelling units has been linked to particulate matter, and indoor particulate matter is emitted when cooking on both electric and gas stoves.<sup>3,7,9</sup>

Overall, the primary source of particulate matter in non-smoking dwelling units is unvented cooking.<sup>1</sup> Natural ventilation alone is an insufficient means to provide required ventilation because it relies on pressure differentials that may or may not exist, and when they exist, the pressure differential could be equally as likely to spread the pollutant throughout the dwelling unit and neighboring units as it would be to exhaust the pollutant directly to the outdoors. Further, studies have shown that occupants often do not operate windows for ventilation.<sup>10,11</sup> Concerns with window operation include security and discomfort (including severe draft in winter).

To improve the health and life safety of dwelling unit occupants, this proposal would require that mechanical ventilation be provided for all kitchens in dwelling units. Some compelling facts and quotes on kitchen pollutants and ventilation follow.

- Simulations show that where a natural gas cooktop is used without a vented range hood, "62%, 9%, and 53% of occupants are routinely exposed to NO<sub>2</sub>, CO, and HCHO (formaldehyde) levels that exceed acute health-based standards and guidelines."<sup>12</sup>
- "Emissions of nitrogen dioxide in homes with gas stoves exceed the EPA's definition of clean air in an estimated 55 percent to 70 percent of those homes, according to one model; a quarter of them have air quality worse than the worst recorded smog (nitrogen dioxide) event in London. Cooking represents one of the single largest contributors, generating particulate matter (formally known as PM<sub>2.5</sub>) at concentrations four times greater than major haze events in Beijing."<sup>13</sup>
- Increased exposure to NO<sub>2</sub> in dwelling units has been associated with an increased number of asthma attacks.<sup>14,15,16</sup>
- "People don't need to radically change their lifestyles. We need to change the building codes so that everyone gets a venting range hood."- Dr. Jennifer Logue, Research Scientist with Lawrence Berkeley National Laboratory<sup>13</sup>

**Cost Impact:** Will increase the cost of construction

For those units that do not already install kitchen exhaust, the cost of construction will increase, depending on equipment selection. Exhaust hoods start around \$30 retail (e.g., Broan economy hood #403001, 2-speed, moving 160 cfm, priced on zoro.com at \$33.36 with free shipping on December 19, 2014). Most dwelling units have some sort of recirculating exhaust hood at a minimum, so the actual incremental cost could probably be disregarded for the equipment itself. For units that are recirculating only, installed cost to the GC for ducting is estimated at ~\$13/linear foot for 3.25x10" duct (RS Means 2013 Residential Cost Data, adjusted for inflation).

M21-15 : 401.2-  
MOORE4909

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** Not every kitchen needs mechanical ventilation. The proposed text belongs in Section 505. The proposal is not considerate of the kitchen size. It would be difficult to size the exhaust system. The requirements should be tailored to the climatic location.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Mike Moore, Newport Ventures, representing Broan-NuTone (mmoore@newportventures.net) requests Approve as Modified by this Public Comment.**

**Replace Proposal as Follows:**

### **2015 International Mechanical Code**

**505.1 Domestic systems.** Where domestic ~~range hoods and cooktops, ranges, or open-top broilers are installed, they shall be provided with a domestic appliances equipped with downdraft cooking exhaust are provided, such hoods and appliances system.~~ Domestic cooking exhaust systems shall discharge to the outdoors through sheet metal ducts constructed of galvanized steel, stainless steel, aluminum or copper. Such ducts shall have smooth inner walls, shall be air tight, shall be equipped with a backdraft damper, and shall be independent of all other exhaust systems.

#### **Exceptions:**

1. In Group R occupancies, domestic cooking exhaust systems are not required where at least one of the following conditions is met:
  - 1.1. The building does not have mechanical cooling and it is in Climate Zone 1 or 2.
  - 1.2. The building is intended to be thermally conditioned for less than 876 hours per year.
2. In other than Group I-1 and I-2, where installed in accordance with the manufacturer's instructions and where mechanical ~~or natural~~ ventilation is otherwise provided in accordance with Chapter 4, listed and labeled ductless range hoods shall not be required to discharge to the outdoors.
3. Ducts for domestic kitchen cooking appliances equipped with downdraft exhaust systems shall be permitted to be constructed of Schedule 40 PVC pipe and fittings provided that the installation complies with all of the following:
  - 3.1. The duct shall be installed under a concrete slab poured on grade.
  - 3.2. The underfloor trench in which the duct is installed shall be completely backfilled with sand or gravel.
  - 3.3. The PVC duct shall extend not more than 1 inch (25 mm) above the indoor concrete floor surface.
  - 3.4. The PVC duct shall extend not more than 1 inch

(25 mm) above grade outside of the building.  
3.5. The PVC ducts shall be solvent cemented.

~~**505.4 Other than Group R.** In other than Group R occupancies, where domestic cooking appliances are utilized for domestic purposes, such appliances shall be provided with domestic range hoods. Hoods and exhaust systems shall be in accordance with Sections 505.1 and 505.2.~~

**Commenter's Reason:** The original proposal's reason statement provides extensive rationale behind why exhaust should be provided for kitchens, based on well documented health concerns, and will not be repeated here. This comment revises and improves upon the original proposal based on the following committee input:

1. Committee: Not every kitchen needs mechanical ventilation. The requirement should be tailored to the climatic location.

Response: This comment introduces an exception that does not require mechanical ventilation in Group R occupancies when window operation might be expected to occur regularly (i.e., Climate Zones 1 and 2 where no space conditioning system is installed or where space conditioning is expected to happen very infrequently; 876 hours corresponds to 10% of the year). This exception was derived from ASHRAE 62.2. "Climate zone" is defined and used in the IBC and IECC, so no new definition is required here. This exception does not apply to "other than Group R occupancies", as they are already required to have a range hood under 505.4. Please note that the text of 505.4 has been deleted, but the requirement still remains; it is just rolled up into 505.1 to streamline and simplify the text in this section. This exception does not apply to "other than Group R occupancies", as they are already required to have a range hood under 505.4. Please note that the text of 505.4 has been moved to exception #1 of 505.1 to improve the organization of the section. No changes are made to the existing requirement of 505.4.

2. Committee: The proposed text belongs in Section 505.

Response: We agree and have incorporated this suggestion.

3. Committee: The proposal is not considerate of the kitchen size. It would be difficult to size the exhaust system.

Response: Requirements for kitchen exhaust air flow rates are located in Chapter 4, Table 403.3.2.3 and Table 403.3.1.1. Depending on the type of occupancy, the requirements are either static (as is the case for dwelling units: 100 cfm required for intermittent or 25 cfm continuous), or they are determined as a function of the kitchen size for food service operations (i.e., cfm/sqft). Where domestic range hoods are installed in dwelling units, the static requirement still applies. And where domestic kitchen exhaust systems are installed in locations other than dwelling units, the calculation of cfm based on kitchen square footage is very simple. This proposal and comment do not make any changes to existing kitchen exhaust rates within the code.

Please note that exception #2 has been retained to permit specification of other exhaust systems within the kitchen, such as wall or ceiling mounted exhaust fans. This can be a cost-savings measure in some cases and may be pursued when ducting a range hood could otherwise prove difficult. Finally, this comment was drafted after consulting ICC staff to ensure that it could merge easily with M44, in the case that M44 is approved in the public comment hearings.

202 (New), 403.1, 403.3, 403.3.1, 403.3.2, 403.3.2.1, 403.3.2.2, 403.3.2.3

## Proposed Change as Submitted

**Proponent :** Mike Moore, Newport Ventures, Representing Broan-NuTone, representing Newport (mmoore@newportventures.net)

## 2015 International Mechanical Code

Add new definition as follows:

### SECTION 202 DEFINITIONS

**NONTRANSIENT** Characterized by occupancy of a dwelling unit for greater than 30 days by occupants who are primarily permanent in nature.

Revise as follows:

**403.1 Ventilation system.** Mechanical ventilation shall be provided by a method of supply air and return or *exhaust air* except that mechanical ventilation air requirements for ~~Group R-2, R-3 and R-4 occupancies three stories and less~~ dwelling units in height above grade plane nontransient residential occupancies shall be provided by an exhaust system, supply system or combination thereof. The amount of supply air shall be approximately equal to the amount of return and *exhaust air*. The system shall not be prohibited from producing negative or positive pressure. The system to convey *ventilation air* shall be designed and installed in accordance with Chapter 6.

**403.3 Outdoor air and local exhaust airflow rates.** ~~Group R-2, R-3 and R-4 occupancies three stories and less~~ Dwelling units in height above grade plane nontransient residential occupancies shall be provided with outdoor air and local exhaust in accordance with Section 403.3.2. All other buildings intended to be occupied shall be provided with outdoor air and local exhaust in accordance with Section 403.3.1.

**403.3.1 Other buildings intended to be occupied.** The design of local exhaust systems and ventilation systems for outdoor air for occupancies other than ~~Group R-2, R-3 and R-4 three stories and less above grade plane~~ dwelling units in nontransient residential occupancies shall comply with Sections 403.3.1.1 through 403.3.1.5.

**403.3.2 ~~Group R-2, R-3 and R-4~~ Dwelling units in nontransient residential occupancies, three stories and less.** The design of local exhaust systems and ventilation systems for outdoor air in ~~Group R-2, R-3 and R-4 occupancies three stories and less~~ dwelling units in height above grade plane nontransient residential occupancies shall comply with Sections 403.3.2.1 through 403.3.2.3.

**403.3.2.1 Outdoor air for dwelling units in nontransient residential occupancies.** *No change to text.*

Delete without substitution:

~~**403.3.2.2 Outdoor air for other spaces.** Corridors and other common areas within the conditioned space shall be provided with outdoor air at a rate of not less than 0.06 cfm per square foot of floor area.~~

**Revise as follows:**

**TABLE 403.3.2.3  
MINIMUM REQUIRED LOCAL EXHAUST RATES FOR GROUP R-2, R-3, AND  
R-4 DWELLING UNITS IN NONTRANSIENT RESIDENTIAL OCCUPANCIES**

<b>AREA TO BE EXHAUSTED</b>	<b>EXHAUST RATE CAPACITY</b>
Kitchens	100 cfm intermittent or 25 cfm continuous
Bathrooms and toilet rooms	50 cfm intermittent or 20 cfm continuous

For SI: 1 cubic foot per minute = 0.0004719 m<sup>3</sup>/s.

**Reason:** This proposal is intended to simplify the optional mechanical ventilation compliance path for all dwelling units in nontransient residential occupancies, regardless of building height. This change is aligned with a recent scope change in standards ASHRAE 62.2 and 62.1 that moved jurisdiction of dwelling units in nontransient residential occupancies to the scope of ASHRAE 62.2, regardless of building height.<sup>1</sup> This change was strongly supported by both committees, primarily for the following reason:

- Ventilation rates for dwelling units in nontransient residential occupancies should be consistent across all units, regardless of building height. Why should a dwelling unit in a 4 story building require an outdoor air ventilation rate that is up to two times greater than that in a 3 story building?

Approval of this particular proposal to the IMC would have the following benefits:

- More closely align the IMC's ventilation requirements with consensus standards without requiring the user to access or purchase those standards.
- Simplify the design, specification, and enforcement of outdoor air ventilation and exhaust requirements for dwelling units in nontransient residential occupancies, regardless of building height.
- Save significant energy: As an example, the IMC currently requires a 1000 sqft, 2 bedroom apartment with 9 foot ceilings to be provided with 53 cfm of outdoor air when located in a three story building (using equation 4-9). For the identical unit in a four story building, the IMC requires 53-105 cfm of outdoor air, depending on the type of HVAC system installed (equations 4-1 and 4-2, and tables 403.3.1.1 and 403.3.1.1.2). So, up to 50% of the ventilation energy currently required for high-rise dwelling units can be saved by simply transitioning all ventilation requirements for dwelling units in nontransient residential occupancies to those currently contained in Section 403.3.2.

**Bibliography:**

1. ASHRAE 62.2-2013 Addendum G. To access a free copy, please contact ASHRAE at (404) 636-8400.

**Cost Impact:** Will not increase the cost of construction

This change is not expected to increase the cost of construction because it serves to simplify the design, specification, and enforcement of outdoor air ventilation and exhaust requirements for dwelling units in nontransient residential occupancies, regardless of building height.

M23-15 : 403-  
MOORE4858

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** With the deletion of Section 403.2.2, corridors would no longer be covered. Nontransient is not the exact opposite of transient. Sleeping rooms are not addressed.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Mike Moore, Newport Ventures, representing Broan-NuTone (mmoore@newportventures.net) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Mechanical Code**

#### **SECTION 202 DEFINITIONS**

~~**NONTRANSIENT** Characterized by occupancy of a dwelling unit for greater than 30 days by occupants who are primarily permanent in nature.~~

**403.3 Outdoor air and local exhaust airflow rates.** Dwelling units in nontransient residential occupancies shall be provided with outdoor air and local exhaust in accordance with Section 403.3.2. ~~All other~~ Other spaces in buildings intended to be occupied shall be provided with outdoor air and local exhaust in accordance with Section 403.3.1.

**403.3.1 Other spaces within buildings intended to be occupied.** *No change to text.*

**Commenter's Reason: It is important to note that this proposal does not introduce any new requirements for mechanical ventilation.** The intent of this proposal is to align the IMC with recent revisions to the scopes of ASHRAE 62.1 and ASHRAE 62.2. The proposal is meant to simplify and streamline mechanical ventilation provisions for dwelling units where required. This will lead to greater consistency in design, specification, and enforcement of code provisions.

Unfortunately, there was confusion with the proposal and its effects at the first hearing, which I hope to resolve here by responding to the committee's objections.

1. Committee: With the deletion of Section 403.2.2, corridors would no longer be covered.

Response: Corridors are not considered residential dwelling units, and so would no longer be covered under Section 403.2.2. Instead, corridors,

common areas, and other areas of residential occupancies that are not within residential dwelling units would be addressed in Section 403.3.1, as they have been historically. No change will result in the ventilation requirements for these areas.

2. Committee: Sleeping rooms are not addressed.

Response: sleeping rooms have different facilities than dwelling units and so do not have the same ventilation requirements. Moving forward, ventilation requirements for sleeping units will still be covered under Section 403.2.2, as they are currently.

3. Committee: Nontransient is not the exact opposite of transient.

Response: "Transient" is defined in the IBC and both "nontransient" and "transient" are used in IBC Section 310. I've deleted the proposed definition of "nontransient" to avoid any confusion that could otherwise be caused. We can assume that industry is familiar with the terms "nontransient" and "transient" since they have been used in the IBC since at least 2003.

---

**M23-15**

# M31-15

## 501.3.1

### **Proposed Change as Submitted**

**Proponent :** Mike Moore, Newport Ventures, representing Broan-NuTone, representing Newport (mmoore@newportventures.net)

## **2015 International Mechanical Code**

**Revise as follows:**

**501.3.1 Location of exhaust outlets.** The termination point of exhaust outlets and ducts discharging to the outdoors shall be located with the following minimum distances:

1. For ducts conveying explosive or flammable vapors, fumes or dusts: 30 feet (9144 mm) from property lines; 10 feet (3048 mm) from operable openings into buildings; 6 feet (1829 mm) from exterior walls and roofs; 30 feet (9144 mm) from combustible walls and operable openings into buildings which are in the direction of the exhaust discharge; 10 feet (3048 mm) above adjoining grade.
2. For other product-conveying outlets: 10 feet (3048 mm) from the property lines; 3 feet (914 mm) from exterior walls and roofs; 10 feet (3048 mm) from operable openings into buildings; 10 feet (3048 mm) above adjoining grade.
3. For all *environmental air* exhaust: 3 feet (914 mm) from property lines; 3 feet (914 mm) from operable openings into buildings for all occupancies other than Group U, and 10 feet (3048 mm) from mechanical air intakes. Such exhaust shall not be considered hazardous or noxious. Where a combined exhaust and intake terminal is used to separate intake air from exhaust air originating in living space other than kitchens, a minimum separation distance between these two openings shall not be required, provided that the exhaust air concentration within the intake air flow does not exceed 10%, as established by the manufacturer of such terminal.
4. Exhaust outlets serving structures in flood hazard areas shall be installed at or above the elevation required by Section 1612 of the *International Building Code* for utilities and attendant equipment.
5. For specific systems see the following sections:
  - 5.1. Clothes dryer exhaust, Section 504.4.
  - 5.2. Kitchen hoods and other kitchen exhaust *equipment*, Sections 506.3.13, 506.4 and 506.5.
  - 5.3. Dust stock and refuse conveying systems, Section 511.2.
  - 5.4. Subslab soil exhaust systems, Section 512.4.
  - 5.5. Smoke control systems, Section 513.10.3.
  - 5.6. Refrigerant discharge, Section 1105.7.
  - 5.7. Machinery room discharge, Section 1105.6.1.

**Reason:**

Combined exhaust/supply terminations are regularly installed with heating and energy recovery ventilators (H/ERVs) used for dwelling units. Their use reduces building penetrations, labor, and associated system costs. By reducing the number of penetrations, air leakage can also be reduced, resulting in space conditioning energy savings. Further, the durability of the structure can be improved through reducing entry pathways for bulk water. Combined terminations are regularly approved and installed in single family and multifamily dwelling units across the country, and manufacturer tests have demonstrated that minimum cross-contamination of airflow results from these terminations. There is currently no industry standard by which to test these units, so we have simply proposed that their performance be verified by the manufacturer, as is the practice in other areas of the code (IMC Sections 513.10.1, 801.14, 1002.2, 1006.3, 1006.7, 1007.2, 1102.2.2.3, 1108.1 exception 3, 1206.7, 1210.6.6.2, etc.). The 10% cross contamination metric is based on language in ASHRAE 62.1 that limits cross contamination of exhaust and supply streams to 10% for "air with moderate contaminant concentration, mild sensory-irritation intensity, or mildly offensive odors"; a similar exception exists in the IMC, Section 514.4. In both the IMC and ASHRAE 62.1, no standard is cited for determining cross-contamination, presumably because none yet exists.

**Cost Impact:** Will not increase the cost of construction

This proposal is expected to reduce construction costs by eliminating the need for a second wall cap and extra ducting that would otherwise be required to separate intake and exhaust airstreams.

M31-15 : 501.3.1-  
MOORE4876

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** Research does exist to support the required separation requirements in the IMC and ASHRAE 62.1.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Mike Moore, Newport Ventures, representing Broan-NuTone (mmoore@newportventures.net) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Mechanical Code**

**501.3.1 Location of exhaust outlets.** The termination point of exhaust outlets and ducts discharging to the outdoors shall be located with the following minimum distances:

1. For ducts conveying explosive or flammable vapors, fumes or dusts: 30 feet (9144 mm) from property lines; 10 feet (3048 mm)

- from operable openings into buildings; 6 feet (1829 mm) from exterior walls and roofs; 30 feet (9144 mm) from combustible walls and operable openings into buildings which are in the direction of the exhaust discharge; 10 feet (3048 mm) above adjoining grade.
2. For other product-conveying outlets: 10 feet (3048 mm) from the property lines; 3 feet (914 mm) from exterior walls and roofs; 10 feet (3048 mm) from operable openings into buildings; 10 feet (3048 mm) above adjoining grade.
  3. For all *environmental air* exhaust: 3 feet (914 mm) from property lines; 3 feet (914 mm) from operable openings into buildings for all occupancies other than Group U, and 10 feet (3048 mm) from mechanical air intakes. Such exhaust shall not be considered hazardous or noxious. Where a factory-built combined exhaust and intake ~~terminal~~ termination is used to separate intake air from exhaust air originating in dwelling unit living space spaces other than kitchens, a minimum separation distance between these two openings shall not be required, provided that the exhaust air concentration within the intake air flow does not exceed 10%, as established by the manufacturer of ~~such terminal~~ the termination.
  4. Exhaust outlets serving structures in flood hazard areas shall be installed at or above the elevation required by Section 1612 of the *International Building Code* for utilities and attendant equipment.
  5. For specific systems see the following sections:
    - 5.1. Clothes dryer exhaust, Section 504.4.
    - 5.2. Kitchen hoods and other kitchen exhaust *equipment*, Sections 506.3.13, 506.4 and 506.5.
    - 5.3. Dust stock and refuse conveying systems, Section 511.2.
    - 5.4. Subslab soil exhaust systems, Section 512.4.
    - 5.5. Smoke control systems, Section 513.10.3.
    - 5.6. Refrigerant discharge, Section 1105.7.
    - 5.7. Machinery room discharge, Section 1105.6.1.

**Commenter's Reason:** The original proposal was recently approved unanimously by the ASHRAE 62.2 committee as addendum h to ASHRAE 62.2-2013. In transferring the language to the IMC, a couple valid concerns were raised as follows:

1. The proposal would exempt site-built combined terminations from the minimum separation requirements, which was not the intent, as such terminations are not expected to be designed and tested to confirm effective separation of exhaust and supply air, and

2. The proposal does not clarify that this exception only applies to dwelling units.

This comment clarifies that the exception applies only to dwelling units and to combined exhaust/intake terminations that are factory-built, and will align the IMC with ASHRAE 62.2, whose scope now applies to both low-rise and high-rise dwelling units.

## *Public Comment 2:*

**Proponent : Steven Ferguson, representing American Society of Heating Refrigerating and Air-Conditioning Engineers (sferguson@ashrae.org) requests Disapprove.**

**Commenter's Reason:** This proposal would permit cross-contamination of the intake air with up to 10% of the exhaust air, and cites a provision in ASHRAE Standard 62.1 which is intended to only be limited to energy recovery applications, and should not be applied more broadly as this proposal would permit. ASHRAE supports the disapproval of this proposal as written.

---

**M31-15**

# M32-15

## 501.6 (New)

### **Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

## 2015 International Mechanical Code

**Add new text as follows:**

**501.6 Discharge from multiple exhaust fans.** The discharge outlets of multiple exhaust fans shall not be connected to a common duct. The discharge outlets of exhaust fans serving separate dwelling units shall not be connected to a common duct.

**Reason:** If exhaust fans such as toilet and kitchen exhaust fans are connected together on the positive pressure (discharge) side of the fans, exhaust air will flow through any fan that is not running. The typical backdraft dampers do not prevent leakage and are not reliable unless cleaned and maintained. If the fans operate in parallel or have effective backdraft dampers, they could share a common discharge duct if such duct was properly sized and configured. Often such connections involve no engineering and consist of fans duct taped to a tee fitting without even increasing the duct size as necessary. If the fans serve different dwelling units, the exhaust air from one dwelling would discharge into another dwelling unit and this is unacceptable.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

**Cost Impact:** Will increase the cost of construction

This proposal will increase the cost of construction in those cases where the discharge side of exhaust fans would have been connected to a common duct, because separate exhaust terminations are required by the proposed text.

M32-15 : 501.5-  
SNYDER3260

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The proposal would not allow individual fans to discharge to a multi-story exhaust shaft having a fan on the top of the shaft. The proposal would require more roof penetrations.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

## *Public Comment 1:*

**Proponent : Amanda Hickman, InterCode Incorporated, representing Air Movement and Control Association International (amanda@intercodeinc.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Mechanical Code**

**501.6 Discharge from multiple exhaust fans.** The discharge outlets of multiple exhaust fans shall not be connected to a common duct.

**Exception:** The discharge outlets of exhaust fans serving separate dwelling units shall not be connected prohibited from connecting to a common duct where the pressure in such common duct is maintained at a negative pressure with respect to the spaces served by the exhaust fans.

**Commenter's Reason:** Multiple exhaust fans are commonly exhausted into common ducts. Backdraft dampers are sometimes insufficient, or in the case of clothes dryer exhausts, non-existent. We support this intent of the proposal to avoid cross contamination between dwellings, however, exhausting into a common duct with a larger powered shared exhaust fan maintaining a lower pressure in the common duct than that in the dwellings is a well proven and working practice. The pressure level in the common duct is typically controlled by a barometric damper or by a constant pressure system controlling the speed of the larger powered shared exhaust fan.

## *Public Comment 2:*

**Proponent : Janine Snyder, representing Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Mechanical Code**

**501.6 Discharge from multiple exhaust fans.** The discharge outlets of multiple exhaust fans shall not be connected to a common duct. The discharge outlets of exhaust fans serving separate dwelling units shall not be connected to a common duct. This section does not apply to exhaust fans that discharge to a common multiple story exhaust duct system that complies with Section 505.3.

**Commenter's Reason:** The committee was concerned that the proposed text does not allow multi-story exhaust shafts that have a common fan on the terminus. The IMC currently addresses such systems only for clothes dryers and domestic kitchen exhaust. The modification proposed will recognize the domestic kitchen multi-story shaft systems. The clothes dryer application is not relevant to this proposal. The committee was also concerned about requiring additional roof penetrations if exhaust fans are not combined for a common discharge duct. Going through the roof, soffit or sidewall with each exhaust duct is typically the best choice because joining together exhausts fans from different locations will require long duct runs which adds expense, increases duct resistance, impedes exhaust flow, invites condensation formation in the duct interior and requires sizing calculations. And of course, combining the exhaust fans to a common exhaust duct means that exhaust will flow backwards through any exhaust fan that is not running. The integral

backdraft dampers in exhaust fans will not prevent such backflow.

# M34-15

## 504.3

### **Proposed Change as Submitted**

**Proponent :** Julius Ballanco, JB Engineering and Code Consulting, P.C., representing In-O-Vate Technologies (JBENGINEER@aol.com)

## **2015 International Mechanical Code**

**Revise as follows:**

**504.3 Cleanout.** Each vertical riser shall be provided with a means for cleanout. Dryer duct terminations shall by design, provide access for cleaning the exhaust duct.

**Reason:** The routine cleaning of the dryer exhaust ducts minimizes the potential for a fire in the duct as well as increasing the efficiency of the appliance. Duct cleaning services now provide this service for dryer exhaust ducts using a wand and brush. Many duct cleaning service companies enter the dryer exhaust duct through the duct termination. This offers an easy access to the dryer exhaust duct system. If a proper dryer exhaust terminal is not provided that allows ease of access, some companies have been known to wrongly remove the termination lid or cover creating a potential leak situation.

Examples of vent caps that duct cleaners wrongly disassemble to gain access.

Examples of vent caps that duct cleaners wrongly disassemble to gain access.

**Cost Impact:** Will increase the cost of construction  
The cost may increase for a vent terminal that allows cleaning.

M34-15 : 504.3-  
BALLANCO4121

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** Lack of maintenance is the problem, not lack of access. The proposal is too vague regarding the type of access. The current code requires a means for cleanout. Short duct runs may not need access for cleaning.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent :** Julius Ballanco, JB Engineering and Code Consulting, P.C., representing In-O-Vate Technologies (JBENGINEER@aol.com) requests Approve as Modified by this Public Comment.

**Modify as Follows:**

## 2015 International Mechanical Code

**504.3 Cleanout.** Each vertical riser shall be provided with a means for cleanout. Dryer exhaust ducts that are installed in enclosed wall or ceiling cavities or in an attic area shall have duct terminations ~~shall by design,~~ that provide access for cleaning the exhaust duct.

**Commenter's Reason:** It was pointed out at the first hearing that some ducts penetrate the basement wall or sidewall of the building and are readily available for cleaning on the inside of the building. The intent of this requirement was to apply to long duct runs that are not readily accessible on the interior of the building. This will allow the cleaning of the dryer exhaust duct from the outside.

The lint build up on the interior of the dryer exhaust duct presents a fire hazard. These ducts need regular cleaning to reduce the fire hazard and increase the efficiency of the dryer.

The majority of dryer exhaust terminations are held in place with screws. Removing these screws allows easy access for cleaning. This change would prevent the use of roof jacks that are not intended to be used as dryer exhaust terminals.

---

M34-15

# M35-15

## 504.4

### **Proposed Change as Submitted**

**Proponent :** Julius Ballanco, JB Engineering and Code Consulting, P.C., representing In-O-Vate Technologies (JBENGINEER@aol.com)

## **2015 International Mechanical Code**

### **Revise as follows:**

**504.4 Exhaust installation.** Dryer exhaust ducts for clothes dryers shall terminate on the outside of the building and shall be equipped with a backdraft damper. Screens shall not be installed at the duct termination. Exhaust duct penetrations of exterior wall and roof assemblies shall be sealed air-tight to prevent dryer exhaust from re-entering the building. Ducts shall not be connected or installed with sheet metal screws or other fasteners that will obstruct the exhaust flow. Clothes dryer exhaust ducts shall not be connected to a vent connector, vent or chimney. Clothes dryer exhaust ducts shall not extend into or through ducts or plenums.

**Reason:** This change clarifies that the dryer exhaust must vent to the outside without the possibility of having the dryer exhaust return to the building. In some regions, friction-fitting a ducts' end into a roof cap appears to still be acceptable. This change adds the language to require a positive leak-proof assembly that will prevent the dryer exhaust from reentering the building. The high humidity of the dryer exhaust can cause all sorts of problems within the building elements if the dryer exhaust can reenter the building. Humidity control is an important part of any building design. As such, humid lint-laden air should never be given a path to enter the building after being exhausted.

**Cost Impact:** Will not increase the cost of construction  
This change is simply clarifying the intent of the code.

M35-15 : 504.4-  
BALLANCO4118

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** If flashed properly, lint cannot enter the building. No justification for singling out dryers as opposed to other exhaust terminals. The example photos were all installations that were improperly installed to begin with.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent :** Julius Ballanco, JB Engineering and Code Consulting, P.C., representing In-O-Vate Technologies (JBENGINEER@aol.com) requests Approve as Modified by this Public Comment.

**Modify as Follows:**

**2015 International Mechanical Code**

**302.6 Roof penetrations.** Where a pipe, duct, vent, chimney, or exhaust termination penetrates a roof, a flashing shall be installed or the penetration shall be sealed water tight.

**302.7 Penetrations of exterior walls.** Where a pipe, duct, vent, chimney, or exhaust termination penetrates an exterior wall, a waterproof seal shall be made on the exterior of the wall by one of the following methods:

1. A waterproof sealant applied at the joint between the wall and the penetrating item.
2. A flashing of an approved elastomeric material.

**504.4 Exhaust installation.** Dryer exhaust ducts for clothes dryers shall terminate on the outside of the building and shall be equipped with a backdraft damper. Screens shall not be installed at the duct termination. ~~Exhaust duct penetrations of exterior wall and roof assemblies shall be sealed air tight to prevent dryer exhaust from re-entering the building.~~ Ducts shall not be connected or installed with sheet metal screws or other fasteners that will obstruct the exhaust flow. Clothes dryer exhaust ducts shall not be connected to a vent connector, vent or *chimney*. Clothes dryer exhaust ducts shall not extend into or through ducts or plenums.

**Commenter's Reason:** What this code change pointed out is that the code is remiss regarding penetrations of mechanical system. The Plumbing Code provides detailed requirements regarding pipe penetrations of roofs and exterior walls. It also has requirements for protection of the structure. While the Mechanical Code has requirements for protection of the structure, there are no requirements for penetration of the roof or exterior wall.

This modification will correct the oversight in the Mechanical Code. Everyone acknowledged that sealing the opening around a duct termination was necessary. However, the claim was that this is addressed in the Energy Code. Exterior penetrations are not addressed in the Energy Code, only penetrations of the envelope are addressed. Quite often, exterior penetrations are not envelope penetrations.

**M35-15**

# M36-15

504.4, 504.8.2

## Proposed Change as Submitted

**Proponent :** Guy McMann, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

## 2015 International Mechanical Code

**Revise as follows:**

**504.4 Exhaust installation.** Dryer exhaust ducts for clothes dryers shall terminate on the outside of the building and shall be equipped with a backdraft damper. Screens shall not be installed at the duct termination. ~~Ducts shall not be connected or installed with sheet metal screws or other fasteners that will obstruct the exhaust flow.~~ Clothes dryer exhaust ducts shall not be connected to a vent connector, vent or chimney. Clothes dryer exhaust ducts shall not extend into or through ducts or plenums.

**504.8.2 Duct installation.** Exhaust ducts shall be supported at 4-foot (1219 mm) intervals and secured in place. The insert end of the duct shall extend into the adjoining duct or fitting in the direction of airflow. Ducts shall not be joined with screws or similar fasteners that protrude more than  $\frac{1}{8}$  inch (3.2 mm) into the inside of the duct.

**Reason:** As a result of the newer language in Section 504.8.2, this language is no longer required and will only cast doubt on Section 504.8.2.

**Cost Impact:** Will not increase the cost of construction  
.There is no cost impact as this modification is strictly editorial in nature

M36-15 : 504.4-  
MCMANN4352

---

## Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** Section 504.4 applies to both commercial and residential and this proposal would eliminate coverage for commercial installations.

**Assembly Action :**

**None**

---

## Individual Consideration Agenda

*Public Comment 1:*

**Proponent :** Guy McMann, Jefferson County, Co., representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us) requests Approve as Modified by this Public Comment.

**Modify as Follows:**

## 2015 International Mechanical Code

**504.4 Exhaust installation.** Dryer exhaust ducts for clothes dryers shall terminate on the outside of the building and shall be equipped with a backdraft damper. Screens shall not be installed at the duct termination. Ducts shall not be joined with screws or similar fasteners that protrude more than 1/8 inch (3.2 mm) into the inside of the duct. Clothes dryer exhaust ducts shall not be connected to a vent connector, vent or *chimney*. Clothes dryer exhaust ducts shall not extend into or through ducts or plenums.

**Commenter's Reason:** The committee was correct in that the proposal as originally written would leave 504.4 lacking in fastening detail for commercial ducts. The correct solution is to add this minimal fastening requirement so as not to leave it up to subjective judgment as the committee recommended. This makes this section consistent with 504.8.2

---

M36-15

# M39-15

## 504.4.1 (New)

### Proposed Change as Submitted

**Proponent :** Rick Harpenau, In-O-Vate Technologies, representing Self

## 2015 International Mechanical Code

**Add new text as follows:**

**504.4.1 Exhaust termination pathways.** Dryer exhaust duct terminal pathways that cause a change in direction of air flow between 45 and 90 degrees shall have an area not less than 20 percent larger than the cross sectional area of the exhaust duct served. Dryer exhaust duct terminal pathways that cause a change in direction of air flow greater than 90 degrees shall have an area not less than 30 percent larger than the cross sectional area of the exhaust duct served. Exhaust duct terminal passageways shall maintain throughout an area of not less than 12.5 square inches (8,065 sq mm).

**Reason:** The code is very sensitive and detailed as it relates to 90 degree elbows and their respective friction loss but does not prohibit or penalize for termination hoods that grossly create back pressure, reducing the efficiency of the dryer. There are wall vents and roof vents on the market that with minimal testing equipment show clearly they create as much back pressure as 3 and 4 elbows. Short of requiring testing standards for every vent termination, the council should consider language whereby the passageway increases in size to make up for the friction causing bends. If this addition to the codes makes sense, actual calculations can be provided. Bottom line, treat terminations the same as elbows and run lengths.

[www.youtube.com/watch?v=5KnRp3eXNbk](http://www.youtube.com/watch?v=5KnRp3eXNbk)

<http://youtu.be/ZL2zV1-Gjdl?t=50s>

**Cost Impact:** Will increase the cost of construction  
A larger opening at the termination may cost more.

M39-15 : 504.4.1 (New)-  
HARPENAU4551

---

### Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** No justification was offered for the percentage increases in area. It would be hard to determine the direction of flow changes regarding the angles. For engineered systems, the proposed text may not apply. The proposed text should apply only to dryers that depend solely on the integral blower.

**Assembly Action :**

**None**

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing In-O-Vate Technologies (JBENGINEER@aol.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Mechanical Code**

~~**504.4.1 Exhaust termination pathways.** Dryer exhaust duct terminal pathways that cause a change in direction of air flow between 45 and 90 degrees shall have an area not less than 20 percent larger than the cross-sectional area of the exhaust duct served. Dryer exhaust duct terminal pathways that cause a change in direction of air flow greater than 90 degrees shall have an area not less than 30 percent larger than the cross-sectional area of the exhaust duct served. Exhaust duct terminal passageways shall maintain throughout an area of not less than 12.5 square inches (8,065 sq mm).~~

**504.4.1.1 Increase in exhaust termination outlet size.** Where the passageway of a dryer exhaust duct terminal changes direction more than 90 degrees, the open area of the outlet of the terminal shall be not less than 15 square inches (9,677 sq mm).

**Commenter's Reason:** The Committee indicated that this language was too confusing. The modified language coordinates with the new section 504.4.1. SMACNA lists the K factor for a 90 degree elbow as being 1 and a 130 degree elbow as being 1.2. To equal the pressure loss through the termination, the outlet open area would have to be increased by a factor of 1.2. This results in an open area of 15 square inches. The pressure drop through the termination outlet would be consistent.

---

**M39-15**

# M40-15

## 504.6.1 (New)

### **Proposed Change as Submitted**

**Proponent :** Julius Ballanco, JB Engineering and Code Consulting, P.C., representing In-O-Vate Technologies, Inc. (JBENGINEER@aol.com)

## 2015 International Mechanical Code

### **Add new text as follows:**

**504.6.1 Make-up air for tight construction.** Make up air shall be provided for clothes dryers where the air infiltration rate is known to be less than 0.4 air changes per hour (ACH). Make-up air shall be provided by a duct that communicates with the outdoors, a ventilated crawl space, or a ventilated attic space and such duct shall have a cross sectional area not less than that of a 4 inch round duct. The make-up air duct shall open into the room in which the clothes dryer is located. Make-up air duct inlets shall be provided with a screen having a mesh size not less than ¼ inch and not greater than ½ inch. The make-up air inlet shall be equipped with an air admitting damper that opens during the operation of the clothes dryer.

**Exception:** Condensing dryers shall not require make-up air.

**Reason:** Today homes are much more tightly constructed, creating an inadequate condition for the proper operation of a clothes dryer. The exhaust rate for a residential dryer ranges from 125 to 200 cfm with newer dryers favoring 200 cfm. When the air infiltration rate drops to less than 0.4 air changes per hour, this creates a condition of inadequate make-up for the clothes dryer. When there is inadequate ambient air to pull from, the dryer is starved and not capable of efficiently drying the clothes any longer. This extends the length of time for the dryer cycle wasting energy. It also reduce the life of the dryer since the fan is attempting to exhaust air that is not available.

Many clothes dryers are located in the basement of a home. When located in the basement, they have the available air in the basement as make-up air for exhausting the moisture. If a basement in 25 feet by 25 feet with an 8 foot ceiling, there is 5,000 cubic feet of available air. However, with an air exchange rate of 0.4, the available air for exhaust is 2000 cubic feet. That translates to 33.3 cfm of air. This means that the dryer has to draw air from other locations in order to properly operate, potentially pulling it from other unsafe sources.

Outside air is normally required by combustion air when the air infiltration rate is less than 0.4 as identified in Section G2407.5. This code change is consistent by requiring make-up air when the air exchange rate is below this value. The amount of air required for combustion air is normally less than the amount of make-up air for a dryer exhaust. An 80,000 Btu/hr furnace only requires between 16.6 and 26.6 cfm for combustion air, whereas the dryer requires between 125 and 200 cfm.

With a 4 inch duct, the make-up air can be provided at an acceptable rate. Furthermore, the fan in the clothes dryer would draw the make-up air through the make-up air duct.

A screened air admitting damper or equivalent device is necessary to prevent outside air from entering the home when the clothes dryer is not in use. The screen dimension are taken from Table 401.5 of the IMC for residential occupancies. The air admitting damper also prevents the loss of conditioned air when the dryer is not in use.

**Cost Impact:** Will increase the cost of construction  
There is a cost to installing a make up air supply system.

M40-15 : 504.6.1 (New)-  
BALLANCO3702

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The more appropriate location is Section 504.8. This text belongs in the IRC, not the IMC.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing In-O-Vate Technologies (JBENGINEER@aol.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Mechanical Code**

**504.6.1 ~~Make-up Domestic clothes dryer make-up air for tight construction.~~** Make up air shall be provided for domestic clothes dryers where the air infiltration rate is known to be located in rooms or spaces having a volume less than 0.4 air changes per hour (ACH) 15,000 cubic feet. Make-up air shall be provided ~~by a duct through an opening that communicates with the outdoors, a ventilated crawl space, or a ventilated attic space and such duct shall have a cross-sectional area is not less than 60 square inches in area and that of a 4 inch round duct. The make-up air communicates directly or through a duct shall open into the room in which the clothes dryer is located. Make-up air duct inlets shall be provided with a screen indoor spaces having a mesh size not less than 1/4 inch and not greater than 1/2 inch. The make-up air inlet shall be equipped~~ volume of 15,000 cubic feet or more, the outdoors, or spaces that freely communicate with an air admitting damper that opens during the operation of the clothes dryer outdoors.

**Exception:** Condensing dryers shall not require make-up air.

**Commenter's Reason:** It was suggested that this section belongs in 504.8, however, that section is related to exhaust duct. Section 504.6 is the section for make-up air. The current requirements apply to commercial clothes dryers since domestic clothes dryer exhaust between 125 and 200 cfm.

It was clearly agreed that make up air is necessary for a clothes dryer to operate effectively and efficiently. The make-up air required is not combustion air as assumed by a few. The make-up air is needed for the clothes to be dried. The clothes dryer moves the air, either heated or not, to remove the moisture from the clothing. This air is exhausted to the outdoors. The rate of exhaust air for a dryer varies based on the length of the dryer exhaust vent.

One of the concern expressed was having a definitive number to use when a dryer

requires make-up air. Using an exhaust rate of 125 cfm and an air exchange rate of 0.5 air changes per hour, the volume of air required without make-up air would be 15,000 cubic feet. Again using the 125 cfm exhaust rate and the passive air movement of 300 feet per minute, the minimum size opening would be 60 square inches. This would allow the dryer to use air from either the adjacent spaces or from outdoors.

---

**M40-15**

# M41-15 Part II

## M1502.4.1

### Proposed Change as Submitted

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

**NOTE:** PART I DID NOT RECEIVE A PUBLIC COMMENT AND IS ON THE CONSENT AGENDA. PART I IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY FOLLOWING ALL OF PART II.

## 2015 International Residential Code

### Revise as follows:

**M1502.4.1 Material and size.** Exhaust ducts shall have a smooth interior finish and shall be constructed of metal having a minimum thickness of not less than 0.0157 inches (0.3950 inch(0.3950 mm) in thickness (No. 28 gage). The exhaust duct shall be round and the size shall be 4 inches (102 mm) nominal in diameter.

**Reason:** The code assumes that the dryer ducts are 4 inch round duct, but this not stated in the code. Square, rectangular and oval ducts all have differing flow characteristics and the exhaust system design is based on round duct. The code states 4 inch diameter which clearly indicates round duct, but it would be very clear to state that it must be round.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

M41-15 Part II :  
M1502.4.1-SNYDER5975

---

### Public Hearing Results

## Part II

**Committee Action:**

**Approved as Submitted**

**Committee Reason:** Approval is based on the proponent's published reason statements.

**Assembly Action :**

**None**

---

### Individual Consideration Agenda

## *Public Comment 1:*

**Proponent : Donald Surrena, representing NAHB (dsurrena@nahb.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Residential Code**

**M1502.4.1 Material and size.** Exhaust ducts shall have a smooth interior finish and shall be constructed of metal not less than 0.0157 inch(0.3950 mm) in thickness (No. 28 gage). ~~The exhaust duct shall be round and the size shall be 4 inches (102 mm) nominal in diameter.~~

**Commenter's Reason:** This proposal was modified by committee action to match M41.1-15. The committees reason was, "the proposed text is redundant with the appliance manufacturer's instructions. The current text refers to "diameter" which already implies that round duct is required".

**Cost Impact:** This will not increase the cost of construction

---

**M41-15 Part II**

## **M41-15 Part Part I**

### **504.8.1**

#### **Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

### **2015 International Mechanical Code**

#### **Revise as follows:**

**504.8.1 Material and size.** Exhaust ducts shall have a smooth interior finish and shall be constructed of metal ~~a minimum~~ not less than 0.016 inch (0.4 mm) thick in thickness. The exhaust duct shall be round and the size shall be 4 inches (102 mm) nominal in diameter.

**Reason:** The code assumes that the dryer ducts are 4 inch round duct, but this not stated in the code. Square, rectangular and oval ducts all have differing flow characteristics and the exhaust system design is based on round duct. The code states 4 inch diameter which clearly indicates round duct, but it would be very clear to state that it must be round.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

## 504.8.2

### **Proposed Change as Submitted**

**Proponent :** Julius Ballanco, JB Engineering and Code Consulting, P.C., representing In-O-Vate Technologies (JBENGINEER@aol.com)

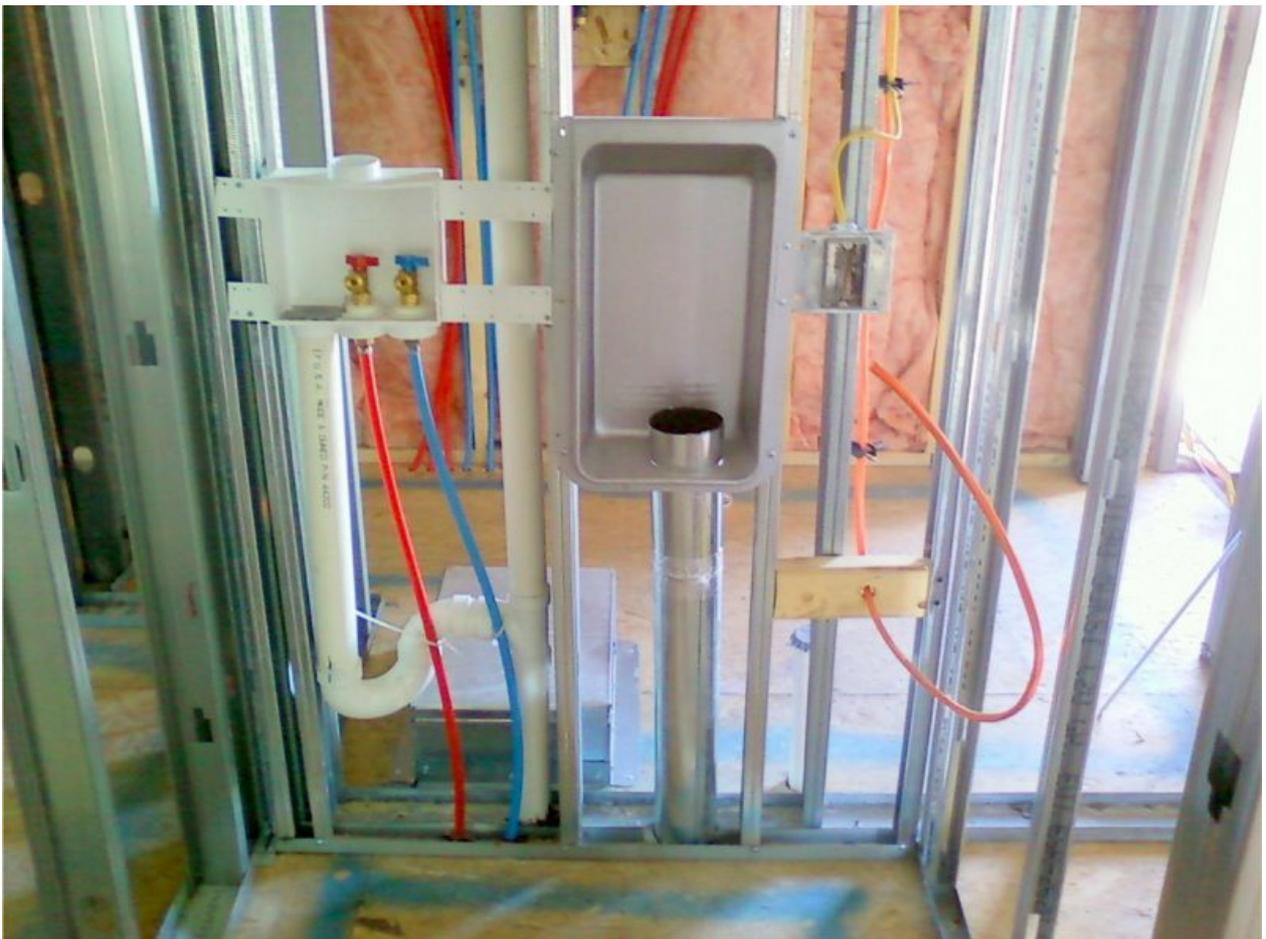

## **2015 International Mechanical Code**

### **Revise as follows:**

**504.8.2 Duct installation.** Exhaust ducts shall be supported at 4-foot (1219 mm) intervals and secured in place. The insert end of the duct shall extend into the adjoining duct or fitting in the direction of airflow. Ducts shall not be joined with screws or similar fasteners that protrude more than  $\frac{1}{8}$  inch (3.2 mm) into the inside of the duct. Where dryer exhaust ducts are enclosed in wall or ceiling cavities, such cavities shall have a least dimension of not less than 4.25 inches (108 mm). Round duct shall not be deformed.

**Reason:** The dryer exhaust duct must remain round in shape to reduce friction loss in the duct system. The length of the duct and termination are based on friction loss for round duct, not oval duct. The length of the dryer exhaust duct would have to be reduced if the 4 inch duct was oval in shape. In addition to the reduction in efficiency, the oval pipe creates a difficult connection for the consumer to make to the dryer exhaust transition hose.

A 1 inch furring strip (1x2) can be added to a 2 x 4 stud providing the 4.25 inches of space. In most cases, this "mechanical" wall is busy with other trades (plumbing drainage and vent stacks, gas piping, electric service, laundry services and water piping). A 4.25 inch space will benefit all of the trades working within that space. The minimum space required to keep the dryer exhaust duct round is 4.125 inches. This dimension could also be referenced here, however, most contractors will simply use a furring strip on a 2 x 4 to provide the minimum spacing for the duct.

Examples of "mechanical walls" showing the abundance of utilities in this wall, demonstrating the need to provide more than 3.5"

**Cost Impact:** Will increase the cost of construction  
There is an added cost of adding furring strips to a 2 x 4 wall.

M42-15 : 504.8.2-  
BALLANCO4116

## **Public Hearing Results**

**Committee Action:**

**Approved as Modified**

**Modification:**

**504.8.2 Duct installation.** Exhaust ducts shall be supported at 4-foot (1219 mm) intervals and secured in place. The insert end of the duct shall extend into the adjoining duct or fitting in the direction of airflow. Ducts shall not be joined with screws or similar fasteners that protrude more than 1/ 8 inch (3.2 mm) into the inside of the duct. Where dryer exhaust ducts are enclosed in wall or ceiling cavities, such cavities shall ~~have a least dimension~~ allow the installation of not less than 4.25 inches (108 mm). ~~Round the duct shall not be deformed~~ without deformation.

**Committee Reason:** Approval is based on the proponent's published reason statements. Deformed ducts can fail during cleaning operations. The manufacturer's

instructions do not address cavity size and duct deformation. The modification eliminates an exact dimension.

**Assembly Action :**

**None**

---

**Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Donald Surrena, representing NAHB (dsurrena@nahb.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

**2015 International Mechanical Code**

**504.8.2 Duct installation.** Exhaust ducts shall be supported at 4-foot (1219 mm) intervals and secured in place. The insert end of the duct shall extend into the adjoining duct or fitting in the direction of airflow. Ducts shall not be joined with screws or similar fasteners that protrude more than  $\frac{1}{8}$  inch (3.2 mm) into the inside of the duct. Where dryer exhaust ducts are enclosed in wall or ceiling cavities, such ~~cavities~~ cavities shall allow the installation of the duct without deformation reducing the cross-sectional area of the duct. Where oval duct is used, it shall have the same cross-sectional area as required for round duct and it shall be limited to installation in a wall cavity. The portion of oval duct installed in a dryer exhaust duct system shall not exceed a total of ten feet (3048mm) in length. The use of oval duct shall reduce the total allowable length of the dryer exhaust duct by five feet (1524mm).

**Commenter's Reason: Reason:** This modification would permit the use of oval duct in a 2x4 cavity. The restriction of length for oval duct as well as the reduction in total length insures the performance of the duct and allows optional construction methods.

**Cost Impact:** This will reduce the cost of construction.

---

**M42-15**

# M43-15

## 504.8.2

### **Proposed Change as Submitted**

**Proponent :** Guy McMann, Jefferson County, Colorado., representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

## **2015 International Mechanical Code**

### **Revise as follows:**

**504.8.2 Duct installation.** Exhaust ducts shall be supported at ~~4-foot intervals not to exceed 12 feet (1219 3657 mm) intervals and~~ and shall be secured in place. The insert end of the duct shall extend into the adjoining duct or fitting in the direction of airflow. Ducts shall not be joined with screws or similar fasteners that protrude more than  $\frac{1}{8}$  inch (3.2 mm) into the inside of the duct.

**Reason:** Twelve feet is what is found in the SMACNA Manual for 4 inch duct as strapping every 4 feet is unnecessarily restrictive.

**Cost Impact:** Will not increase the cost of construction  
This proposal will actually *decrease* costs by not having to install as many hangers and the labor to do so.

M43-15 : 504.8.2-  
MCMANN3570

---

### **Public Hearing Results**

#### **Committee Action:**

**Disapproved**

**Committee Reason:** The 12 foot interval is too great for ducts that are not mechanically fastened and rely on taped joints only. The current 4 foot interval provides stability for ducts being cleaned mechanically.

#### **Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent :** Guy McMann, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us) requests Approve as Submitted.

**Commenter's Reason:** The code section already states that the duct needs to be secured in place regardless of the hanger spacing. Mechanical cleaning wont be an issue if ducts are secured in place as already required. The committee also stated this hanger spacing wont provide stability for joints that are taped only. Tape alone is not a fastening choice to begin with. The SMACNA Standard indicates a 4 inch duct can be properly installed at 12 foot intervals. Four foot intervals are over restrictive.

# M44-15

## 505, 505.1 (New), 505.2 (New), 505.1, 505.4 Proposed Change as Submitted

**Proponent :** Jonathan Roberts, UL LLC, representing UL LLC  
(jonathan.roberts@ul.com)

### 2015 International Mechanical Code

Revise as follows:

#### SECTION 505 DOMESTIC ~~KITCHEN~~ COOKING EXHAUST EQUIPMENT

Add new text as follows:

**505.1 General.** Domestic cooking exhaust equipment shall comply with the requirements of this section.

**505.2 Domestic cooking exhaust.** Where domestic cooking exhaust equipment is provided it shall comply with the following as applicable:

1. Overhead range hoods and downdraft exhaust equipment not integral with the cooking appliance shall be listed and labeled in accordance with UL 507.
2. Domestic cooking appliances with integral downdraft exhaust equipment shall be listed and labeled in accordance with UL 858 or ANSI Z21.1.
3. Microwave ovens with integral exhaust for installation over the cooking surface shall be listed and labeled in accordance with UL 923.

Revise as follows:

~~**505.1 505.3 Domestic systems. Exhaust ducts.** Where domestic range hoods and domestic appliances equipped with downdraft Domestic cooking exhaust are provided, such hoods and appliances equipment~~ shall discharge to the outdoors through sheet metal ducts constructed of galvanized steel, stainless steel, aluminum or copper. Such ducts shall have smooth inner walls, shall be air tight, shall be equipped with a backdraft damper, and shall be independent of all other exhaust systems.

#### Exceptions:

1. In other than Group I-1 and I-2, where installed in accordance with the manufacturer's instructions and where mechanical or natural ventilation is otherwise provided in accordance with Chapter 4, listed and labeled ductless range hoods shall not be required to discharge to the outdoors.
2. Ducts for domestic kitchen cooking appliances equipped with downdraft exhaust systems shall be permitted to be constructed of Schedule 40 PVC pipe and fittings provided that the installation complies with all of the following:
  - 2.1. The duct shall be installed under a concrete slab poured on grade.

- 2.2. The underfloor trench in which the duct is installed shall be completely backfilled with sand or gravel.
- 2.3. The PVC duct shall extend not more than 1 inch (25 mm) above the indoor concrete floor surface.
- 2.4. The PVC duct shall extend not more than 1 inch (25 mm) above grade outside of the building.
- 2.5. The PVC ducts shall be solvent cemented.

**505.4 Other than Group R.** In other than Group R occupancies, where domestic cooktops, ranges, and open-top broilers are used for domestic purposes, ~~domestic cooking appliances are utilized for domestic purposes,~~ ~~such appliances shall be provided with domestic range hoods.~~ Hoods and exhaust systems shall be ~~in accordance with Sections 505.1 and 505.2.~~ provided.

**Add new standard(s) as follows:**

ANSI Z21.1 - 2010 Household Cooking Gas Appliances

UL 507 - 2014 Standard for Safety Electric Fans

**Reason:** The IMC currently has no criteria for exhaust hoods and downdraft equipment. This proposal accomplishes the following:

1. Includes a new charging Section 505.1 that is similar to other charging sections in the IMC.
2. New section 505.2 describes the listing standards used to investigate the various types of exhaust equipment.
3. Section 505.3 (formerly Section 505.1) was retitled "Exhaust ducts" to more accurately reflect what is covered in the section. Some edits were made to clarify the wording. No substantive changes were made to the requirements for the exhaust ducts.
4. Section 505.4 was revised to clarify the types of domestic cooking appliance that requires a domestic cooking exhaust system. Without this change an exhaust system could be required for a coffee maker, wall mounted oven, rice cooker, etc.

**Cost Impact:** Will increase the cost of construction

In most cases there should be no increase in costs if exhaust hoods and downdraft equipment are listed to the specified standards, which appears to be common practice.

**Analysis:**

A review of the standard proposed for inclusion in the code, UL 507, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M44-15 : 505-  
ROBERTS5747

---

**Public Hearing Results**

**Committee Action:**

**Approved as Modified**

**Modification:**

**505.4 Other than Group R.** In other than Group R occupancies, where domestic cooktops, ranges, and open-top broilers are ~~installed~~ used for domestic purposes, domestic cooking exhaust systems shall be provided.

**Committee Reason:** The code needs the added coverage for domestic exhaust equipment and needs to reference the relevant product standards. The modification limits the application to domestic uses as was intended in the revised text of Section 505.4, however, such distinction was lost as the section was originally revised.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

#### **2015 International Mechanical Code**

**505.2 Domestic cooking exhaust.** Where domestic cooking exhaust equipment is provided it shall comply with the following as applicable:

1. ~~Overhead~~ The fan for overhead range hoods and downdraft exhaust equipment not integral with the cooking appliance shall be listed and labeled in accordance with UL 507.
2. Overhead range hoods and downdraft exhaust equipment with integral fans shall comply with UL 507.
3. Domestic cooking appliances with integral downdraft exhaust equipment shall be listed and labeled in accordance with UL 858 or ANSI Z21.1.
- 3 4. Microwave ovens with integral exhaust for installation over the cooking surface shall be listed and labeled in accordance with UL 923.

**Commenter's Reason:** This change as originally proposed exceeds the scope of UL 507. UL 507 is a standard for fans and blowers, not range hoods. Included in the scope of the standard are overhead range hoods and downdraft exhaust equipment that have integral hoods. UL 507 does not regulate stand-alone range hoods that do not have an integral fan.

These prefabricated range hoods have served the industry successfully for many years. There is no justification for removing a viable range hood. If the code change is approved as proposed, one could only install a range hood that has an integral fan. That would be overly restrictive.

The modification corrects the mistake with the original submittal. UL 507 regulates all fans used for overhead range hoods and downdraft exhaust equipment. It also addresses range hoods and downdraft exhaust equipment with integral fans.

UL 507 does not regulate range hoods, whether prefabricated or field made. Hence, it is inappropriate to reference the standard for this application.

If this modification is not accepted, the change must be denied since the reference to UL 507 exceeds the scope of the standard. This is a violation of ICC policy.

# M46-15

## 505.2, 505.2.1 (New)

### **Proposed Change as Submitted**

**Proponent :** Mike Moore, Newport Ventures, representing Broan-NuTone, representing Newport (mmoore@newportventures.net)

## 2015 International Mechanical Code

### Revise as follows:

**505.2 Makeup air required.** ~~Exhaust hood systems~~  
Where one or more gas, liquid, or solid-fuel burning appliances that are neither direct vent nor use a mechanical draft venting system are located within a dwelling unit's air barrier, each exhaust system capable of exhausting in excess of 400 cfm (0.19 m<sup>3</sup>/s) shall be mechanically or passively provided with makeup air at a rate approximately equal to the exhaust air rate. Such makeup air systems shall be equipped with a means not less than one damper that complies with Section 505.2.1.

**Exception:** Makeup air is not required for exhaust systems installed for the exclusive purpose of closure space cooling and shall intended to be automatically controlled to start and operate simultaneously with the exhaust system. operated only when windows or other air inlets are open.

### Add new text as follows:

**505.2.1 Makeup air dampers.** Where makeup air is required by Section 505.2, such dampers shall comply with this section. Dampers shall be gravity or barometric dampers or electrically operated dampers that automatically open when the exhaust system operates. Dampers shall be accessible for inspection, service, repair and replacement without removing permanent construction or any other ducts not connected to the damper being inspected, serviced, repaired or replaced. Gravity or barometric dampers shall not be used in passive makeup air systems except where the dampers are rated to provide the design makeup airflow at a pressure differential of 0.01 in. w.c. (3 Pa) or less.

### Reason:

Backdrafting of combustion appliances typically presents the greatest danger associated with depressurizing a space. Field tests have confirmed that naturally vented combustion appliances (i.e., those that are not mechanically vented or direct-vent) are the most susceptible to depressurization, and measures should be taken to provide makeup air (MUA) for large exhaust appliances when such appliances are located within the dwelling unit's air barrier. ASHRAE 62.2, the consensus standard for Ventilation and Acceptable Indoor Air Quality in residential dwelling units, does not require MUA when combustion appliances are mechanically vented or are direct-vent. The ASHRAE 62.2 committee recently reviewed the 62.2 section requiring MUA, and the general consensus (no vote taken) was a reaffirmation that the MUA requirement should not apply to mechanically vented or direct-vent combustion appliances, due to lack of data to substantiate their susceptibility to backdrafting.

This proposal would relax the MUA requirement in the IMC for dwelling units by aligning it more closely with ASHRAE 62.2. Similar changes have been made to this section in Florida's and Virginia's adoptions of the IRC, which has a similar requirement to the IMC.

The proposal introduces a new section to address MUA dampers specifically, with the second and third sentences in Section 505.2.1 taken verbatim from the 2015 IRC. The last sentence introduces a new requirement for gravity or barometric dampers. It makes no sense to design a system to provide MUA if the damper does not open before the combustion appliance starts spilling. So, the new requirement is intended to ensure that when MUA is required, any gravity or barometric damper used to provide MUA shall engage at the pressure differential above which naturally drafted combustion appliances can be expected to backdraft (3 Pa, based on an acceptable 5%-20% failure rate across all outdoor conditions)<sup>1</sup>. This proposed requirement only applies to gravity or barometric dampers in "passive" MUA systems, which are those provide MUA without the assistance of a fan. Gravity or barometric dampers in "active" MUA systems are excluded from this requirement because we assume that the fan will create a sufficient pressure differential to open the damper.

**Bibliography:**

1. Bohac, D., et al. (2002). Ventilation and Depressurization Information for Houses Undergoing Remodeling. Accessed on Dec 5, 2014 at: <http://www.mncee.org/getattachment/eedb1afc-f50e-4833-b450-d52233f58ce0/>.

**Cost Impact:** Will not increase the cost of construction  
This proposal is expected to reduce construction costs by reducing the number of scenarios requiring makeup air for kitchen exhaust.

M46-15 : 505.2.1 (New)-  
MOORE4887

---

**Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** Section 505.2 is under domestic kitchens. Space cooling and the exception are unrelated to Section 505. If electric appliances are used, they are no longer covered for makeup air. The code needs a holistic instead of a piece-meal approach to air balance and makeup air. The proposal eliminates the system control requirements and may relax the requirements for exhaust.

**Assembly Action :**

**None**

---

**Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Mike Moore, Newport Ventures, representing Broan-NuTone (mmoore@newportventures.net) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

**2015 International Mechanical Code**

**505.2 Makeup air required.** Where one or more gas, liquid, or solid-fuel burning appliances that are neither direct vent nor use a mechanical draft venting system are located within a dwelling unit's air barrier, ~~each~~ kitchen exhaust system systems capable of exhausting in excess of 400 cfm (0.19 m<sup>3</sup>/s) shall be mechanically or passively provided with *makeup air* at a rate approximately equal to the *exhaust air* rate. Such *makeup air* systems

shall be equipped with not less than one damper that complies with Section 505.2.1.

~~**Exception:** Makeup air is not required for exhaust systems installed for the exclusive purpose of space cooling and intended to be operated only when windows or other air inlets are open.~~

**Commenter's Reason:** The IRC mechanical committee unanimously approved a companion proposal to this one, so approval of this proposal will align the domestic kitchen range hood makeup air requirements of the IRC and IMC. Based on the IMC committee's input, this comment removes the exception for exhaust systems intended for space cooling. The committee noted that this section only pertains to domestic kitchen exhaust, so exempting something that is not addressed by the section is not necessary.

The committee rightly surmised that if electric appliances are not used, no makeup air requirements would exist for range hoods. This is correct, and it is the intention of this proposal to waive the kitchen exhaust makeup air requirements for this situation as well as for others that provide assurance that backdrafting will not occur during operation of the kitchen exhaust system. We are assuming that the primary purpose of requiring makeup air for kitchen exhaust systems is to ensure that they do not backdraft combustion appliances within a dwelling unit. This assumption is aligned with ASHRAE 62.2, which provides similar exemptions for makeup air requirements. A dwelling unit that has all electric appliances, direct vent appliances, or has located any non-direct vent combustion appliances outside of its air barrier is not expected to experience backdrafting of combustion gases during the operation of the kitchen exhaust system. So, these cases should be exempt from makeup air requirements.

The proposal and comment permit the use of gravity dampers for makeup air, as is already permitted in the IRC. However, these dampers may only be used if they meet a new minimum performance spec to ensure that they are designed to open before dangerous levels of depressurization are reached with respect to combustion appliances.

Approval of the proposal as modified will provide for the design of domestic kitchen exhaust makeup air to achieve a minimum acceptable level of life safety while reducing costs.

---

M46-15

# M50-15

## 506.3.2.5

### **Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

## **2015 International Mechanical Code**

**Revise as follows:**

**506.3.2.5 Grease duct test.** Prior to the use or concealment of any portion of a grease duct system, a leakage test shall be performed. Ducts shall be considered to be concealed where installed in shafts or covered by coatings or wraps that prevent the ductwork from being visually inspected on all sides. The permit holder shall be responsible to provide the necessary *equipment* and perform the grease duct leakage test. A ~~light-~~ water test shall be performed to determine that all welded and brazed joints are liquid tight.

A ~~light-~~ water test shall be performed by passing a ~~lamp having a power rating of not less than 100 watts~~ grease duct pressure washing equipment through the entire section of ductwork to be tested and visually inspecting for leakage of water. The ~~lamp~~ pressure washing equipment shall be ~~open so as to emit light equally in all directions perpendicular to the duct walls~~ of a type used for professionally cleaning commercial kitchen grease ducts. A test shall be performed for the entire duct system, including the hood-to-duct connection. ~~The~~ Where the duct work shall be permitted to be is tested in sections, ~~provided that every~~ no joint is tested shall be excluded from testing. For *listed* factory-built grease ducts, this test shall be limited to duct joints assembled in the field and shall exclude factory welds.

**Reason:** The light test required currently has many deficiencies. Openings in overlapped joint welds would not allow light to reach the observer. Pinhole leaks may not allow enough light through to be observed. The faults in the joints could be on sides not observed during the test and some duct sides may not be visible at all when installed. How fast can the lamp be pulled through the duct? What if the ambient light is bright or it is sunlight? What are the chances that a light test will disclose any, much less, all of the faults in joints? A test with pressurized duct cleaning equipment will expose all faults in the joints by visible water leakage. This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

**Cost Impact:** Will increase the cost of construction

This proposal will increase the cost of construction because the proposed water test will require more labor and equipment than the currently required light test.

## Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** The proposal does not state the duration, pressure or temperature requirements for the water test. Light tests are used successfully. Power washing should be only an option, not the required test. This is overkill for short duct runs. If the duct gets wet during the test, it will impossible to find the leaks.

**Assembly Action :**

**None**

---

### Individual Consideration Agenda

#### *Public Comment 1:*

**Proponent : Steven Ferguson, representing American Society of Heating Refrigerating and Air-Conditioning Engineers (sferguson@ashrae.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

#### **2015 International Mechanical Code**

**506.3.2.5 Grease duct test.** Prior to the use or concealment of any portion of a grease duct system, a leakage test shall be performed in accordance with Section 506.3.2.5.1 or 506.3.2.5.2, or an approved equivalent test shall be performed. Ducts shall be considered to be concealed where installed in shafts or covered by coatings or wraps that prevent the ductwork from being visually inspected on all sides. The permit holder shall be responsible to provide the necessary *equipment* and perform the grease duct leakage test. ~~A water test shall be performed to determine that all welded and brazed joints are liquid tight.~~

~~A water test shall be performed by passing grease duct pressure washing equipment through the entire section of ductwork to be tested and visually inspecting for leakage of water. The pressure washing equipment shall be of a type used for professionally cleaning commercial kitchen grease ducts. A test shall be performed for the entire duct system, including the hood to duct connection. Where the duct work is tested in sections, no joint shall be excluded from testing. For *listed* factory built grease ducts, this test shall be limited to duct joints assembled in the field and shall exclude factory welds.~~

**506.3.2.5.1 Grease duct light test.** The light test shall be performed by passing a lamp having a power rating of not less than 100 W through the entire section of ductwork to be tested. The lamp shall be open so as to emit light equally in all directions perpendicular to the duct walls. Light from the duct interior shall not be visible through any exterior surface of the duct during the test.

**506.3.2.5.2 Grease duct water pressure test.** The water pressure test shall be performed by use of a pressure washer operating at a

pressure of not less than 1500 psi (10 342 kPa) and simulating cleaning operations. The water shall be applied directly to all areas to be tested. Water applied to the duct interior shall not be visible on any exterior surface of the duct during the test. For *listed* factory-built grease ducts, this test shall be limited to duct joints assembled in the field and shall exclude factory welds.

**Commenter's Reason:** A grease duct leakage test is important and the code mandates such tests. However, limiting the test to one method does not recognize the successful use of modified light and air pressure test methods that are being applied successfully in some code jurisdictions. In some installations such as exterior duct systems installed during freezing weather conditions the use of pressurized water may not be practical or safe. Delaying construction while waiting for changes in the weather may also not be practical. In these situations an alternate light test, pressure test or other test acceptable to the AHJ is needed. For many grease duct installations that use short runs of accessible duct the inspector may find light or air pressure tests as effective as water but at a much lower cost. In some cases, especially those difficult to access for inspection a combination of test methods may be most practical using one for initial test and others to confirm successful repair of welds or other joints where leaks were found during the initial test. One may be a better actual test in the field. A water test shouldn't be the only viable option.

---

M50-15

# M51-15

202 (New), 506.5.2 (New)

## Proposed Change as Submitted

**Proponent :** Shawn Strausbaugh, Arlington County, VA representing the VA Plumbing and Mechanical Officials Association (VPMIA) and the VA Building Code Officials Association (VBCOA) Guy McMann, Jefferson County CO, representing the CO Association of Plumbing and Mechanical Officials (CA, representing Arlington County, VA representing the VA Plumbing and Mechanical Inspectors Association (VPMIA) and the VA Building Code Officials Association (VBCOA) (sstrausbaugh@arlingtonva.us)

## 2015 International Mechanical Code

Add new definition as follows:

### SECTION 202 DEFINITIONS

**POLLUTION CONTROL UNIT (PCU)** Manufactured equipment that is installed in a grease exhaust duct system for the purpose of extracting smoke, grease particles, and odors from the exhaust flow by means of a series of filters.

Add new text as follows:

**506.5.2 Pollution Control Units.** Pollution control units shall be installed in accordance with the manufacturer's installation instructions and shall be in accordance with all of the following:

1. Pollution control units shall be listed and labeled in accordance with UL 1978.
2. Fans serving pollution control units shall be listed and labeled in accordance with with UL 762.
3. Pollution control units shall be mounted and secured in accordance with the manufacturer's installation instructions and the International Building Code.
4. Pollution control units located indoors shall be listed and labeled for such use. Where enclosed duct systems, as required by Section 506.3.11, are connected to a pollution control unit, such unit shall be located in a room or space having the same fire-resistance rating as the duct enclosure. Access shall be provided for servicing and cleaning of the unit. The space or enclosure shall be ventilated in accordance with the manufacturer's installation instructions.
5. A clearance of not less than 18 inches (457 mm) shall be maintained between the pollution control unit and combustible material.
6. Roof mounted pollution control units shall be listed for exterior installation and shall be mounted not less than 18 inches (457 mm) above the roof.

7. Exhaust outlets for pollution control units shall be in accordance with Section 506.3.13.
8. An airflow differential pressure control shall be provided to monitor the pressure drop across the filter sections of a pollution control unit. When the airflow is reduced below the design velocity, the airflow differential pressure control shall activate a visual alarm located in the area where cooking operations occur.
9. Pollution control units shall be provided with a factory installed fire suppression system.
10. Service space shall be provided in accordance with the manufacturer's instructions for the pollution control unit and the requirements of Section 306.
11. Wash down drains shall discharge through a grease interceptor and shall be sized for the flow. Drains, shall be sealed with a trap or other approved means to prevent air bypass. Where a trap is utilized it shall have a seal depth that accounts for the system pressurization and evaporation between cleanings.
12. Protection from freezing shall be provided for the water supply and fire suppression systems where such systems are subject to freezing.
13. Duct connections to pollution control units shall be in accordance with Section 506.3.2.3. Where water splash or carryover can occur in the transition duct as a result of a washing operation, the transition duct shall slope downward toward the cabinet drain pan for a length not less than 18 inches (457 mm). Ducts shall transition to the full size of the units inlet and outlet openings.
14. Extra heavy duty appliance exhaust systems shall not be connected to pollution control units except where such units are specifically designed and listed for use with solid fuels.
15. Pollution control units shall be maintained in accordance with the manufacturer's instructions.

**Reason:** Pollution Control Units have been manufactured by numerous companies for several years. The desire to limit the amount of smoke, grease, and other particulate at the exhaust outlets of commercial cooking appliances has driven the use of these units as numerous entities are requiring these types of units to be installed. These unit and there minimum construction and installation standards need to be addressed in the mechanical code.

**Cost Impact:** Will increase the cost of construction  
 The cost of construction of these specific units may be increased by manufacturers if their current unit did not meet the minimum requirements per this new section. As we do not represent manufacturers it is difficult to substantiate if this proposed change will have create such a cost increase or not

M51-15 : 506.5.2 (New)-  
 STRAUSBAUGH3640

---

## **Public Hearing Results**

**Committee Action:**

**Approved as Modified**

**Modification:**

**506.5.2 Pollution Control Units.** Where provided, ~~Pollution-pollution~~ control units shall be installed in accordance with the manufacturer's installation instructions and shall be in accordance with all of the following:

1. Pollution control units shall be listed and labeled in accordance with UL 1978.
2. Fans serving pollution control units shall be listed and labeled in accordance with with UL 762.
3. Pollution control units shall be mounted and secured in accordance with the manufacturer's installation instructions and the International Building Code.
4. Pollution control units located indoors shall be listed and labeled for such use. Where enclosed duct systems, as required by Section 506.3.11, are connected to a pollution control unit, such unit shall be located in a room or space having the same fire-resistance rating as the duct enclosure. Access shall be provided for servicing and cleaning of the unit. The space or enclosure shall be ventilated in accordance with the manufacturer's installation instructions.
5. A clearance of not less than 18 inches (457 mm) shall be maintained between the pollution control unit and combustible material.
6. Roof mounted pollution control units shall be listed for exterior installation and shall be mounted not less than 18 inches (457 mm) above the roof.
7. Exhaust outlets for pollution control units shall be in accordance with Section 506.3.13.
8. An airflow differential pressure control shall be provided to monitor the pressure drop across the filter sections of a pollution control unit. When the airflow is reduced below the design velocity, the airflow differential pressure control shall activate a visual alarm located in the area where cooking operations occur.
9. Pollution control units shall be provided with a factory installed fire suppression system.
10. Service space shall be provided in accordance with the manufacturer's instructions for the pollution control unit and the requirements of Section 306.
11. Wash down drains shall discharge through a grease interceptor and shall be sized for the flow. Drains, shall

be sealed with a trap or other approved means to prevent air bypass. Where a trap is utilized it shall have a seal depth that accounts for the system pressurization and evaporation between cleanings.

12. Protection from freezing shall be provided for the water supply and fire suppression systems where such systems are subject to freezing.
13. Duct connections to pollution control units shall be in accordance with Section 506.3.2.3. Where water splash or carryover can occur in the transition duct as a result of a washing operation, the transition duct shall slope downward toward the cabinet drain pan for a length not less than 18 inches (457 mm). Ducts shall transition to the full size of the units inlet and outlet openings.
14. Extra heavy duty appliance exhaust systems shall not be connected to pollution control units except where such units are specifically designed and listed for use with solid fuels.
15. Pollution control units shall be maintained in accordance with the manufacturer's instructions.

**Committee Reason:** Approval was based on the proponent's published reason statements. These units are being installed today and need coverage. The modification removes any ambiguity about whether these units are required to be installed.

**Assembly Action :**

**None**

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : Steven Ferguson, representing American Society of Heating Refrigerating and Air-Conditioning Engineers (sferguson@ashrae.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

#### **2015 International Mechanical Code**

**506.5.2 Pollution Control Units.** Where provided, pollution control units shall be installed in accordance with the manufacturer's installation instructions and shall be in accordance with all of the following:

1. Pollution control units shall be listed and labeled in accordance with applicable requirements of UL 1978 and UL710.
2. Fans serving pollution control units shall be listed and labeled in

- accordance with with UL 762.
3. Pollution control units shall be mounted and secured in accordance with the manufacturer's installation instructions and the International Building Code.
  4. Pollution control units located indoors shall be listed and labeled for such use. Where enclosed duct systems, as required by Section 506.3.11, are connected to a pollution control unit, such unit shall be located in a room or space having the same fire-resistance rating as the duct enclosure. Access shall be provided for servicing and cleaning of the unit. The space or enclosure shall be ventilated in accordance with the manufacturer's installation instructions.
  5. A clearance of not less than 18 inches (457 mm) shall be maintained between the pollution control unit and combustible material except where otherwise listed for reduced clearance to combustible materials.
  6. Roof mounted pollution control units shall be listed for exterior installation and shall be mounted not less than 18 inches (457 mm) above the roof except where otherwise listed for reduced clearance to combustible materials.
  7. Exhaust outlets for pollution control units shall be in accordance with Section 506.3.13.
  8. An airflow differential pressure control shall be provided to monitor the pressure drop across the filter sections of a pollution control unit. When the airflow is reduced below the design velocity, the airflow differential pressure control shall activate a visual alarm located in the area where cooking operations occur.
  9. Pollution control units shall be provided with ~~a factory an~~ approved automatic fire extinguishing system installed in accordance with the ~~fire suppression~~ extinguishing system manufacturer's instructions.
  10. Service space shall be provided in accordance with the manufacturer's instructions for the pollution control unit and the requirements of Section 306.
  11. Wash down drains shall discharge through a grease interceptor and shall be sized for the flow. Drains, shall be sealed with a trap or other approved means to prevent air bypass. Where a trap is utilized it shall have a seal depth that accounts for the system pressurization and evaporation between cleanings.
  12. Protection from freezing shall be provided for the water supply and fire suppression systems where such systems are subject to freezing.
  13. Duct connections to pollution control units shall be in accordance with Section 506.3.2.3. Where water splash or carryover can occur in the transition duct as a result of a washing operation, the transition duct shall slope downward toward the cabinet drain pan for a length not less than 18 inches (457 mm). Ducts shall transition to the full size of the units inlet and outlet openings.
  14. Extra heavy duty appliance exhaust systems shall not be connected to pollution control units except where such units are specifically designed and listed for use with solid fuels.
  15. Pollution control units shall be maintained in accordance with the manufacturer's instructions.

**Commenter's Reason:** Addition of UL 710 in requirement 1 - UL 710 is a needed additional reference for this type of application  
Addition to requirements 5 and 6- this is a new requirement in UL 710, so the addition would make the proposal consistent with UL710.

Addition to requirement 9 - this is to be consistent with NFPA 96 Section 9.3.3. The fire suppression system does not necessarily need to be factory supplied as several manufacturers will provide units that are pre-piped and provide a connection point for the fire suppression propellant and agents - some fire suppression chemicals require HAZMAT treatment and as a result are provided in the field rather than shipped from the manufacturer.

## *Public Comment 2:*

**Proponent : Shawn Strausbaugh, representing Arlington County, VA representing VA Plumbing and Mechanical Inspectors Association, VA Building Code Official Association (sstrausbaugh@arlingtonva.us) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Mechanical Code**

**506.5.2 Pollution Control Units.** ~~Where provided,~~ The installation of pollution control units shall be installed in accordance with the manufacturer's installation instructions and ~~shall be in accordance with~~ all of the following:

1. Pollution control units shall be listed and labeled in accordance with UL 1978.
2. Fans serving pollution control units shall be listed and labeled in accordance with with UL 762.
3. Pollution control units shall be mounted and secured in accordance with the manufacturer's installation instructions and the International Building Code.
4. Pollution control units located indoors shall be listed and labeled for such use. Where enclosed duct systems, as required by Section 506.3.11, are connected to a pollution control unit, such unit shall be located in a room or space having the same fire-resistance rating as the duct enclosure. Access shall be provided for servicing and cleaning of the unit. The space or enclosure shall be ventilated in accordance with the manufacturer's installation instructions.
5. A clearance of not less than 18 inches (457 mm) shall be maintained between the pollution control unit and combustible material.
6. Roof mounted pollution control units shall be listed for exterior installation and shall be mounted not less than 18 inches (457 mm) above the roof.
7. Exhaust outlets for pollution control units shall be in accordance with Section 506.3.13.
8. An airflow differential pressure control shall be provided to monitor the pressure drop across the filter sections of a pollution

- control unit. When the airflow is reduced below the design velocity, the airflow differential pressure control shall activate a visual alarm located in the area where cooking operations occur.
9. Pollution control units shall be provided with a factory installed fire suppression system.
  10. Service space shall be provided in accordance with the manufacturer's instructions for the pollution control unit and the requirements of Section 306.
  11. Wash down drains shall discharge through a grease interceptor and shall be sized for the flow. Drains, shall be sealed with a trap or other approved means to prevent air bypass. Where a trap is utilized it shall have a seal depth that accounts for the system pressurization and evaporation between cleanings.
  12. Protection from freezing shall be provided for the water supply and fire suppression systems where such systems are subject to freezing.
  13. Duct connections to pollution control units shall be in accordance with Section 506.3.2.3. Where water splash or carryover can occur in the transition duct as a result of a washing operation, the transition duct shall slope downward toward the cabinet drain pan for a length not less than 18 inches (457 mm). Ducts shall transition to the full size of the units inlet and outlet openings.
  14. Extra heavy duty appliance exhaust systems shall not be connected to pollution control units except where such units are specifically designed and listed for use with solid fuels.
  15. Pollution control units shall be maintained in accordance with the manufacturer's instructions.

**Commenter's Reason:** The committee's modification of adding " Where provided" creates additional language that is not needed as there is not a charging section requiring the installation of PCU units. If the "where provided" language is needed in this new section then this language would need to be added to numerous code sections for equipment that is not required by the code to be installed. We have rewritten the first sentence in this new code section to make it clear that these pieces of equipment are not required however if they are installed they must conform to the manufactures installation instructions and the rest of the requirements under this new section.

# M56-15

## 507.6.1

### Proposed Change as Submitted

**Proponent :** Guy McMann, Jefferson County, Colorado., representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcman@jeffco.us)

## 2015 International Mechanical Code

### Revise as follows:

**507.6.1 Capture and containment test.** The permit holder shall verify capture and containment performance of the exhaust system. This field test shall be conducted with all appliances under the hood at operating temperatures, with all sources of outdoor air providing *makeup air* for the hood operating and with all sources of recirculated air providing conditioning for the space in which the hood is located operating. Capture and containment shall be verified visually by observing smoke or steam produced by actual or simulated cooking, such as with that provided by smoke candles, smoke puffers, and similar means generators.

**Reason:** The term "smoke generators" includes all forms of smoke producing products and cleans up the section a little bit.

**Cost Impact:** Will not increase the cost of construction  
There will be no additional cost as this is only an editorial modification and clarification.

M56-15 : 507.6.1-  
MCMANN3574

---

### Public Hearing Results

**Committee Action:**

**Approved as Submitted**

**Committee Reason:** Approval was based on the proponent's published reason statements.

**Assembly Action :**

**None**

---

### Individual Consideration Agenda

#### *Public Comment 1:*

**Proponent :** Steven Ferguson, representing American Society of Heating Refrigerating and Air-Conditioning Engineers (sferguson@ashrae.org) requests Approve as Modified by this Public Comment.

**Modify as Follows:**

## 2015 International Mechanical Code

**507.6.1 Capture and containment test.** The permit holder shall verify

capture and containment performance of the exhaust system. This field test shall be conducted with all appliances under the hood at operating temperatures, with all sources of outdoor air providing *makeup air* for the hood operating and with all sources of recirculated air providing conditioning for the space in which the hood is located operating. Capture and containment shall be verified visually by observing smoke or steam produced by actual or simulated cooking, such as that provided by smoke ~~generators~~ candles and smoke puffers. Smoke bombs shall not be used.

**Commenter's Reason:** ASHRAE recommends disapproval and a clarification as a modification. The term generator is too generic. Generators do not differentiate between smoke candles and smoke bombs. The source of Section 507.6.1 is ASHRAE Standard 154, which prohibits smoke bombs because of the large volume it produces which does not represent an actual cooking process. We are ok with the concept of cleaning up of the language, however, we want to be clear that smoke bombs should not be used for this type of test, and the currnet proposal permits the use of smoke bombs.

**M56-15**

# M58-15

## 510.8

### **Proposed Change as Submitted**

**Proponent :** Peter Levitt, Sternvent, representing Sternvent (plevitt@sternvent.com)

## **2015 International Mechanical Code**

### **Revise as follows:**

**510.8 Suppression required.** Ducts shall be protected with an *approved* automatic fire suppression system installed in accordance with the *International Building Code*. Dust collection system ducts shall be protected by a spark detection and extinguishing system.

#### **Exceptions:**

1. An approved automatic fire suppression system shall not be required in ducts conveying materials, fumes, mists and vapors that are nonflammable and noncombustible under all conditions and at any concentrations.
2. Automatic fire suppression systems shall not be required in metallic and noncombustible, nonmetallic exhaust ducts in semiconductor fabrication facilities.
3. An *approved* automatic fire suppression system shall not be required in ducts where the largest cross-sectional diameter of the duct is less than 10 inches (254 mm).
4. For laboratories, as defined in Section 510.1, automatic fire protection systems shall not be required in laboratory hoods or exhaust systems

**Reason:** Many designers of dust collection systems are not familiar with what type of fire suppression system is suitable for a dust collection system duct and the associated dust particle conveying velocity of 3000-5000 feet per minute. If a source of ignition such as a spark enters a dust collection system, burning embers will travel towards the dust collector. Due to the small mass of the embers and high transport velocity in the duct, there will not be enough heat generated to activate a thermocouple sprinkler head. A photocell spark detection and extinguishing system is typically used. This technology is defined and recognized by NFPA in #69 and recognized in #664.

#### **Bibliography:**

NFPA 69

NFPA 664

and

*NFPA Guide to Combustible Dusts*

Authors; Walter Frank & Samuel Rodgers

Editor; Guy Colonna

2012

Pages 171-178

**Cost Impact:** Will increase the cost of construction

While a thermocouple sprinkler head has a cost of aprox \$100 and the cost of the spark detection system is \$5,000-\$8,000, the spark detection system will prevent a fire or explosion in the dust collector and as a result prevent property loss, injury & loss of life, whereas a thermocouple head will be ineffective in this application.

**M58-15 : 510.8-  
LEVITT5228**

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** No criteria is proposed for the spark detection system. The proposal could be interpreted that fire suppression is not required. Other methods of protection could be used besides that proposed. The exceptions might not apply if a spark detection system is required.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Peter Levitt, representing self  
(plevitt@sternvent.com) requests Approve as Submitted.**

**Commenter's Reason:** M 58-15

Peter Levitt's reply to committee comments;

1. The criteria that spark detection & extinguishing system should be the method of fire suppression for dust collection system ducts 10" dia & larger is that many people reading section 510.8 believe that a traditional sprinkler head should be used. A sprinkler head is not suitable in a high velocity duct. A dust collection system duct velocity is 4000 feet per minute. The beginning of a fire in the duct is sparks & burning embers, which do not generate enough heat to trigger a traditional sprinkler head. This is not common knowledge. AHJ's are approving traditional sprinkler heads in dust collector ducts, because they are not aware that a sprinkler head, by itself is ineffective in certain applications, such as dust collection systems. NFPA 652, 654 & 664 require spark/ember detectors that activate a water spray.
2. The proposal states that there should be detection & extinguishing. The extinguishing is the fire suppression.
3. I am not aware of another effective method of fire suppression for a dust collection duct.
4. The proposed text is compatible with each of the four exceptions currently in the code. I do not see any conflict.

Peter Levitt is the product manager of Sternvent, a manufacturer of dust collectors. Sternvent does not manufacture spark detection & extinguishing systems. Peter is a committee member of NFPA 664 & 484

**M58-15**

# M60-15

## 511.1.3

### **Proposed Change as Submitted**

**Proponent :** Peter Levitt, Sternvent, representing Sternvent (plevitt@sternvent.com)

## **2015 International Mechanical Code**

### **Revise as follows:**

**511.1.3 Conveying systems exhaust discharge.** An exhaust system shall discharge to the outside of the building either directly by flue or indirectly through the bin or vault into which the system discharges, except where the contaminants have been removed. Exhaust system discharge shall be permitted to be recirculated provided that the solid particulate has been removed at a minimum efficiency of 99.9 percent at 10 microns (10.01 mm) and where flammable vapors are present in the exhaust flow, such vapor concentrations are less than 25 percent of the LFL, and approved equipment is used to monitor as determined by a hazard analysis. Where flammable vapor concentrations are greater than 25% of the vapor concentration. LFL, the exhaust system discharge shall not be recirculated.

**Reason:** The current wording of section 511.1.3 requires vapor monitoring equipment for all dust collection systems that recirculate the filtered air back to the building, *regardless if vapors are ever present*. Dust collection system air streams rarely include flammable or non-flammable vapors. Vapors are not a part of the process or created by cutting wood, grinding metals, conveying chemical or food products, etc. Vapors are more likely to be part of the air stream for refuse conveying. The current requirement for vapor monitoring equipment for all dust collectors that recirculate the air seems to be *overly burdensome*. I believe the current text first appeared in the 2009 edition.

Some code enforcers who are familiar with section 511.1.3 have been requiring flammable vapor detection systems for woodworking shops in schools, maintenance and commercial facilities, that do not have flammable vapors, because of the IMC requirement.

Flammable vapor detection systems are typically used in industrial processes where there is the potential for flammable vapors to exist in the work area and there is also a potential ignition source. Some applications include; printing, paint manufacturing, commercial painting and storage areas.

**Cost Impact:** Will not increase the cost of construction

A typical flammable vapor detection system cost \$10,000-\$15,000.

End users, who do not have flammable vapors in their air stream or have flammable vapors that have a concentration of less than 25% of the LFL and need to recirculate the filtered air from the dust collection system, will no longer need to purchase a flammable vapor detection system and therefore save \$10,000-\$15,000.

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The current code requirement is not overly burdensome and is needed for life safety. What is being conveyed in the system can change as operations change. Discharging the exhaust to the outdoors is an alternative to the current code requirements.

**Assembly Action :**

**None**

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Peter Levitt, representing self (plevitt@sternvent.com) requests Approve as Submitted.**

**Commenter's Reason:** M 60-15

Peter Levitt's reply to committee comments;

- Section 511 Dust, Stock and Refuse Conveying Systems is applicable to woodworking dust collection systems. Woodworking shops & school wood shops do not typically contain flammable vapors. The requirement for a flammable vapor detection (FVD) system to be included with all exhaust systems that recirculate the air back to the building (typically a dust collection system), was added to 511.1.3 two revision cycles back.
- During the past five years, Sternvent has received engineer's specifications for two high school wood shop dust collection systems that specified a flammable vapor detection system, because it is required by IMC511.1.3. There are rarely, if ever, flammable vapors in wood shops. However, the code requires FVD system if the air is to be recirculated, regardless if flammable vapors are or would likely ever be present.
- If flammable vapors were common in wood shops or other manufacturing facilities, then the room lighting & machine motors would have to be explosion proof NEMA 7 design for code compliance. Rarely is there a need for this, because there are rarely, if ever, flammable vapors present.
- The two FVD manufacturers I have contacted were not willing to provide their equipment unless it was an industrial setting & vapors were known to exist. They need to know what vapors will be present & in what concentration.
- A typical FVD system cost \$15,000. This is greater than the cost of many dust collectors.

- Flammable vapor detection equipment is designed for use with industrial ovens & dryers, when flammable vapors are normally present. Requiring FVD systems for all dust collectors that recirculate the filtered air back to the building does not seem to have any practical or scientific basis.
- Requiring ALL ventilation systems for dust, stock & refuse to have a FVD system, would be similar to requiring that a carbon monoxide detection system always be included as well.
- I have been designing & selling dust collection systems for over thirty years. I am not aware of any fire loss history due to a dust collector & flammable vapors.
- Although, discharging the filtered air exhaust to the outdoors is an alternative & does not require a FVD, as the code is currently written, this is not an acceptable alternative for most customers because of the energy loss of heated or cooled air. Our customers have mandates to be green.
- My recommendation is that IF flammable vapors are present or likely could be present, then the air should not be recirculated back to the building. There is no need to mandate that every time the air is recirculated to the building for a dust, stock or refuse conveying system, a flammable vapor detection system is required.
- Luckily, few AHJ's and fire protection engineers have been reading and requiring the FVD called for in 511.1.3. (We have only had two requests in five years.) It is not good for any of us to have a code requirement which appears to be too broad. Thank you for your time and consideration.

Peter Levitt is the product manager of Sternvent, a manufacturer of dust collectors. Sternvent does not manufacture spark detection & extinguishing systems. Peter is a committee member of NFPA 664 & 484

# M62-15

601.5

## **Proposed Change as Submitted**

**Proponent :** Guy McMann, Jefferson County Colorado, representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

## **2015 International Mechanical Code**

**Revise as follows:**

**601.5 Return air openings.** Return air openings for heating, ventilation and air-conditioning systems shall comply with all of the following:

1. Openings shall not be located less than 10 feet (3048 mm) measured in any direction from an open combustion chamber or draft hood of another appliance located in the same room or space.
2. Return air shall not be taken from a hazardous or insanitary location or a refrigeration room as defined in this code.
3. The amount of return air taken from any room or space shall be not greater than the flow rate of supply air delivered to such room or space.
4. Return and transfer openings shall be sized in accordance with the appliance or equipment manufacturer's installation instructions, ACCA Manual D or the design of the registered design professional.
5. Return air taken from one dwelling unit shall not be discharged into another dwelling unit.
6. Taking return air from a crawl space shall not be accomplished through a direct connection to the return side of a forced air furnace. Transfer openings in the crawl space enclosure shall not be prohibited.
7. Return air shall not be taken from a closet, bathroom, toilet room, kitchen, garage, boiler room, furnace room or unconditioned attic.

### **Exceptions:**

1. Taking return air from a kitchen is not prohibited where such return air openings serve the kitchen and are located not less than 10 feet (3048 mm) from the cooking appliances.
2. Dedicated forced air systems serving only the garage shall not be prohibited from obtaining return air from the garage
8. Return air shall not be taken from indoor swimming pool enclosures and associated deck areas except where such spaces are dehumidified.

**Reason:** It is not desirable to pull return air from swimming pool areas due to the affects it would have on the system from humidity and chemical odors associated with such spaces. A dedicated system would be required or a combination of supply and exhaust or the air should be dehumidified.

**Cost Impact:** Will not increase the cost of construction  
No cost unless the air is treated.

M62-15 : 601.5-  
MCMANN3834

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The proposed text would prohibit the installation of a dedicated HVAC system for the pool area.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Steven Ferguson, representing American Society of Heating Refrigerating and Air Conditioning Engineers (sferguson@ashrae.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Mechanical Code**

**601.5 Return air openings.** Return air openings for heating, ventilation and air-conditioning systems shall comply with all of the following:

1. Openings shall not be located less than 10 feet (3048 mm) measured in any direction from an open combustion chamber or draft hood of another appliance located in the same room or space.
2. Return air shall not be taken from a hazardous or insanitary location or a refrigeration room as defined in this code.
3. The amount of return air taken from any room or space shall be not greater than the flow rate of supply air delivered to such room or space.
4. Return and transfer openings shall be sized in accordance with the appliance or equipment manufacturer's installation instructions, ACCA Manual D or the design of the registered design professional.
5. Return air taken from one dwelling unit shall not be discharged into another dwelling unit.
6. Taking return air from a crawl space shall not be accomplished through a direct connection to the return side of a forced air furnace. Transfer openings in the crawl space enclosure shall not be prohibited.
7. Return air shall not be taken from a closet, bathroom, toilet room, kitchen, garage, boiler room, furnace room, indoor swimming pool enclosure and associated deck area, or unconditioned attic.

**Exceptions:**

1. Taking return air from a kitchen is not prohibited where such return air openings serve the kitchen and are located not less than 10 feet (3048 mm) from the cooking appliances.
2. Dedicated forced air systems serving only the garage shall not be prohibited from obtaining return air from the garage
3. ~~Return air shall not be taken from~~ Dedicated HVAC systems serving indoor swimming pool enclosures and associated deck areas except where shall not be prohibited from obtaining return air from such spaces are dehumidified. swimming pool enclosures and associated deck areas

**Commenter's Reason:** Class 2 air, such as humid contaminated air in swimming pool enclosures, should not be transferred into class 1 air spaces for cross contamination and humidification control reasons. This proposes to clarify the requirement and making an exception to permit air from swimming pool enclosures to be recirculated from the same or similar spaces within the building.

## *Public Comment 2:*

**Proponent : Guy McMann, Jefferson County, Co., representing Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcman@jeffco.us) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

## **2015 International Mechanical Code**

**601.5 Return air openings.** Return air openings for heating, ventilation and air-conditioning systems shall comply with all of the following:

1. Openings shall not be located less than 10 feet (3048 mm) measured in any direction from an open combustion chamber or draft hood of another appliance located in the same room or space.
2. Return air shall not be taken from a hazardous or insanitary location or a refrigeration room as defined in this code.
3. The amount of return air taken from any room or space shall be not greater than the flow rate of supply air delivered to such room or space.
4. Return and transfer openings shall be sized in accordance with the appliance or equipment manufacturer's installation instructions, ACCA Manual D or the design of the registered design professional.
5. Return air taken from one dwelling unit shall not be discharged into another dwelling unit.
6. Taking return air from a crawl space shall not be accomplished through a direct connection to the return side of a forced air furnace. Transfer openings in the crawl space enclosure shall not be prohibited.
7. Return air shall not be taken from a closet, bathroom, toilet room, kitchen, garage, boiler room, furnace room or unconditioned attic.

### **Exceptions:**

1. Taking return air from a kitchen is not prohibited where such return air openings serve the kitchen

- and are located not less than 10 feet (3048 mm) from the cooking appliances.
2. Dedicated forced air systems serving only the garage shall not be prohibited from obtaining return air from the garage
8. Return air shall not be taken from indoor swimming pool enclosures and associated deck areas except where the air in such spaces is dehumidified in accordance with Section 403.2.1 item # 2, or where such spaces are ~~dehumidified~~ served by dedicated HVAC systems.

**Commenter's Reason:** The committees concern that the original language seemed to exclude dedicated systems was valid. This correction clearly excludes dedicated systems from the requirement of untreated recirculation to other spaces.

### *Public Comment 3:*

**Proponent : Brent Ursenbach, Salt Lake County, representing Utah Chapter ICC (bursenbach@slco.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

## **2015 International Mechanical Code**

**601.5 Return air openings.** Return air openings for heating, ventilation and air-conditioning systems shall comply with all of the following:

1. Openings shall not be located less than 10 feet (3048 mm) measured in any direction from an open combustion chamber or draft hood of another appliance located in the same room or space.
2. Return air shall not be taken from a hazardous or insanitary location or a refrigeration room as defined in this code.
3. The amount of return air taken from any room or space shall be not greater than the flow rate of supply air delivered to such room or space.
4. Return and transfer openings shall be sized in accordance with the appliance or equipment manufacturer's installation instructions, ACCA Manual D or the design of the registered design professional.
5. Return air taken from one dwelling unit shall not be discharged into another dwelling unit.
6. Taking return air from a crawl space shall not be accomplished through a direct connection to the return side of a forced air furnace. Transfer openings in the crawl space enclosure shall not be prohibited.
7. Return air shall not be taken from a closet, bathroom, toilet room, kitchen, garage, boiler room, furnace room or unconditioned attic.

#### **Exceptions:**

1. Taking return air from a kitchen is not prohibited where such return air openings serve the kitchen and are located not less than 10 feet (3048 mm) from the cooking appliances.
2. Dedicated forced air systems serving only the

garage shall not be prohibited from obtaining return air from the garage

8. Return air shall not be taken from indoor swimming pool enclosures and associated deck areas ~~except where~~ .

**Exceptions:**

1. Where the air from such spaces are is dehumidified in accordance with Sections 403.2.1 Item #2.
2. Dedicated HVAC systems serving only such spaces.

**Commenter's Reason:** The original proposal correctly identified it is generally not desirable to draw return air from a pool area, where the moisture and chemical odors may be distributed through other areas of a building. This public comment addresses concerns identified by both the IFGC and IMC committees.

A similiar proposal FG 38, was modified during the IFGC Hearings, but disapproved by the committee; however an Assembly Motion for As Modified was successful. The IMC committee disapproved this proposal, as it prohibited the installation of a dedicated HVAC system for a pool enclosure. This public comment includes the FG 38 modification, made during the development hearings, and an exception for dedicated system, which has also been added to FG 38 by Public Comment.

M62-15

# M64-15

## 602.1

### **Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

## **2015 International Mechanical Code**

### **Revise as follows:**

**602.1 General.** Supply, return, exhaust, relief and ventilation air plenums shall be limited to uninhabited crawl spaces, areas above a ceiling or below the floor, attic spaces ~~and~~ , mechanical equipment rooms and the framing cavities addressed in Section 602.3. Plenums shall be limited to one fire area. Air systems shall be ducted from the boundary of the fire area served directly to the air-handling equipment. Fuel-fired appliances shall not be installed within a plenum.

**Reason:** Section 602.3 is in the plenum Section 602 and covers stud and joist space plenums, however, Section 602.1 does not recognize such plenums. Section 602.1 limits plenums to a list of spaces that excludes stud and joist space plenums. This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

**Cost Impact:** Will not increase the cost of construction  
This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

M64-15 : 602.1-  
SNYDER3267

---

### **Public Hearing Results**

**Committee Action:**

**Approved as Submitted**

**Committee Reason:** Approval was based on the proponent's published reason statements. Under this proposal, framing cavities will no longer be excluded.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Marcelo Hirschler, representing GBH International (gbhint@aol.com) requests Disapprove.**

**Commenter's Reason:** Section 602.3 states that these spaces are "sort of" plenums but are not to be used as plenums for supply air. Therefore adding them into section 602.1 seems almost a contradiction, since section 602.1 is specifically intended for "supply, return, exhaust, relief and ventilation air plenums". At present the "stud cavity and joist space plenums" addressed in 602.3 are not specifically required to comply with the requirements of 602.1 and that is as it should be. Moreover, M65 proposes to exclude these "sort of" plenums from the materials of construction requirements for plenums. This is something that is necessary. It is something that was introduced in a recent code cycle but was implicit before, in that the materials of construction of plenums (when exposed to the air flow) clearly need to meet the same fire safety requirements as the materials contained in the plenum (when exposed to the air flow).

## 602.2

### **Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

## **2015 International Mechanical Code**

### **Revise as follows:**

**602.2 Construction.** *Plenum* enclosure construction materials that are exposed to the airflow shall comply with the requirements of Section 703.5 of the *International Building Code* or such materials shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

The use of gypsum boards to form plenums shall be limited to systems where the air temperatures do not exceed 125°F (52°C) and the building and mechanical system design conditions are such that the gypsum board surface temperature will be maintained above the airstream dew-point temperature. Air plenums formed by gypsum boards shall not be incorporated in air-handling systems utilizing evaporative coolers.

**Exception:** The materials from which the stud and joist space plenums addressed in Section 602.3 are constructed shall not be required to comply with Section 703.5 of the International Building Code and shall not be required to have a maximum flame spread index of 25 and a maximum smoke-developed index of 50 when tested in accordance ASTM E 84 or UL723.

**Reason:** The significant change to Section 602.2 did not specifically address stud and joist space plenums. It is assumed that that Section 602.2 was intended to apply to spaces such as under-floor and above-ceiling spaces utilized as plenums. If Section 602.2 does apply to stud and joist space plenums, then such plenums would not be allowed to be constructed with wood studs, wood joists, wood trusses and wood floor decking. Section 602.2 should not have the effect of banning the common variety of stud and joist space plenums.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction because no additional labor, materials, equipment, appliances or devices are mandated beyond what is currently required by the code nor are the code requirements made more stringent.

M65-15 : 602.2-  
SNYDER3268

---

## **Public Hearing Results**

**Committee Action:****Disapproved**

**Committee Reason:** The change to the 2015 IMC to require 25/50 flame/smoke indices for the materials that bound the plenum was significant, and this proposal would be a step backwards.

**Assembly Action :****None**

---

**Individual Consideration Agenda****Public Comment 1:**

**Proponent : Janine Snyder, representing Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:****2015 International Mechanical Code**

**602.2 Construction.** *Plenum* enclosure construction materials that are exposed to the airflow shall comply with the requirements of Section 703.5 of the *International Building Code* or such materials shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

The use of gypsum boards to form plenums shall be limited to systems where the air temperatures do not exceed 125°F (52°C) and the building and mechanical system design conditions are such that the gypsum board surface temperature will be maintained above the airstream dew-point temperature. Air plenums formed by gypsum boards shall not be incorporated in air-handling systems utilizing evaporative coolers.

**Exception:** ~~The~~ The construction materials from which the for stud and joist space cavity plenums addressed that are in compliance with Section 602.3 are and constructed with gypsum board on both membranes of the wall assembly shall not be required to comply with Section 703.5 of the International Building Code and shall not be required to have a maximum flame spread index of 25 and a maximum smoke-developed index of 50 when tested in accordance ASTM E 84 or UL723.

**Commenter's Reason:** Stud cavities constructed of wood or steel studs and gypsum board are used for return air in many occupancies and they should not be prohibited over the concern for wood studs not having a 25/50 flame/smoke index. It is unnecessarily restrictive to apply Section 602.2 to stud cavities in wall assemblies constructed of wood studs and gypsum board membranes. Note that Section 602.2 has already eliminated the use of joist cavities as plenums in wood framed construction, and this revised exception is only addressing stud cavities for return air in wood or steel framed construction.

---

**M65-15**

# M71-15

## 602.2.1.7

### **Proposed Change as Submitted**

**Proponent :** Michael Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservices.com)

## **2015 International Mechanical Code**

**Revise as follows:**

**602.2.1.7 Plastic plumbing pipe and tube.** Plastic piping and tubing used in plumbing systems ~~shall be listed and~~ shall exhibit a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

**Reason:** While some of the exceptions for products in this section of the mechanical code contain, "listed and labeled" language, some have no mention of "listing and labeling", section 602.2.1.7 oddly only says, "listed".

We propose to delete, "listed" from this section, as it is inconsistent with the other language.

**Cost Impact:** Will not increase the cost of construction  
This proposal seeks to determine if the "listing / listing and labeling" language is correct compared with other sections, and seeks conformity in the language. Thus the code with this proposal added will not cause the cost of construction to increase.

M71-15 : 602.2.1.7-  
CUDAHY4606

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** Disapproval was based on the action taken on M76-15.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent :** David Seiler, Arkema, Inc., representing Arkema (dave.seiler@arkema.com) requests **Approve as Modified by this Public Comment.**

**Modify as Follows:**

## **2015 International Mechanical Code**

**602.2.1.7 Plastic plumbing pipe and tube.** Plastic piping and tubing used in plumbing systems shall be listed and labeled and shall exhibit a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

**Commenter's Reason:** The proposal identified an anomaly in the current code language for ASTM E84 testing for plastic piping. The reason statement reads: "While some of the exceptions for products in this section of the mechanical code contain, "listed and labeled" language, some have no mention of "listing and labeling", section 602.2.1.7 oddly only says, "listed"."

Because the parent section in 602.2.1 contains a requirement that materials installed in plenums be either noncombustible, or be listed and labeled to ASTM E84, the intent of the code is clear. Furthermore, Exception 5.3 in 602.2.1 includes "Materials listed and labeled for installation within a plenum."

The correct requirement for plastic plumbing pipe and tube is listing and labeling. This public comment modifies the proposal to correctly capture the intent of the code.

---

**M71-15**

# M75-15

## 602.2.1.7

### **Proposed Change as Submitted**

**Proponent :** Marcelo Hirschler, representing GBH International (gbhint@aol.com)

## **2015 International Mechanical Code**

**Revise as follows:**

### **602.2.1.7 Plastic plumbing pipe and tube.**

Plastic piping and tubing used in plumbing systems shall be listed and labeled and shall exhibit a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723.

**Reason:** This section was added at the last edition. When the language was developed the section was written stating that the plastic piping and tubing needs to be "listed" instead of "listed and labeled" as other products in plenums are.

**Cost Impact:** Will increase the cost of construction  
If jurisdictions approved plastic piping and plumbing items that were listed but not listed and labeled they will, in future, have to be both listed and labeled.

M75-15 : 602.2.1.7-  
HIRSCHLER3529

---

### **Public Hearing Results**

**Committee Action:** **Disapproved**

**Committee Reason:** Disapproval was based on the action taken on M76-15.

**Assembly Action :** **None**

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent :** Marcelo Hirschler, representing GBH International (gbhint@aol.com) requests **Approve as Submitted**.

**Commenter's Reason:** Approve proposal as submitted. It is essential that plastic pipe and tubing be listed and labeled. This is being submitted in case concerns are raised about M76.

M75-15

---

# M76-15

## 602.2.1.7

### **Proposed Change as Submitted**

**Proponent :** Jonathan Roberts, UL LLC, representing UL LLC  
(jonathan.roberts@ul.com)

## **2015 International Mechanical Code**

### **Revise as follows:**

**602.2.1.7 Plastic plumbing pipe piping and tube tubing.** Plastic piping and tubing used in plumbing systems exposed within a plenum shall be listed and shall exhibit labeled as having a flame spread index of not more- greater than 25 and a smoke-developed index of not more greater than 50 when tested in accordance with ASTM E 84 or UL 723.

**Exception:** Plastic water distribution piping and tubing listed and labeled in accordance with UL 2846 as having a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread distance not greater than 5 feet (1524 mm), and installed in accordance with its listing.

### **Add new standard(s) as follows:**

UL 2846-14, Fire Test of Plastic Water Distribution Plumbing Pipe for Visible Flame and Smoke Characteristics

**Reason:** This proposal accomplishes the following:

1. Clarifies that this section is only applicable to plastic piping and tubing exposed within a plenum, using wording similar to Section 602.2.1.3.
2. Makes grammatical revisions for consistency.
3. Allows an option for water distribution piping and tubing to be listed to the UL 2846 criteria noted.

UL 2846 is an ANSI standard that includes a test method for determining values of flame propagation distance and optical smoke density for individual pairs of plastic plumbing pipes for distribution of potable water that can be installed in ducts, plenums, and other spaces used for environmental air. The scope of this standard can be viewed at <http://ulstandards.ul.com/standard/?id=2846>.

The acceptance criteria specified (peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread distance not greater than 5 feet) is consistent with values in Sections 602.2.1.1, 602.2.1.2 and 602.2.1.3.

**Cost Impact:** Will not increase the cost of construction

This proposal provides an alternative method for evaluating plastic water distribution system piping and tubing.

### **Analysis:**

A review of the standard proposed for inclusion in the code, UL 2846, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

## **Public Hearing Results**

**Committee Action:**

**Approved as Modified**

**Modification:**

**602.2.1.7 Plastic plumbing piping and tubing.** Plastic piping and tubing used in plumbing systems ~~exposed within a plenum~~ shall be listed and labeled as having a flame spread index not greater than 25 and a smoke-developed index not greater than 50 when tested in accordance with ASTM E 84 or UL 723.

**Exception:** Plastic water distribution piping and tubing listed and labeled in accordance with UL 2846 as having a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread distance not greater than 5 feet (1524 mm), and installed in accordance with its listing.

**Committee Reason:** Approval is based on the proponent's published reason statements. The modification eliminates redundant words because this section is about materials within plenums. The deleted words would allow materials to cover the pipes where such materials were not listed for the application of covering pipes.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Michael Cudahy, representing Plastic Pipe and Fittings Association (mikec@cmservices.com) requests Approve as Submitted.**

**Commenter's Reason:** The floor modification to delete the language, "exposed within a plenum" was recommended in error, and PPFA recommends we approve the original submitted proposal from UL.

"Exposed within a plenum" and similar language is repeated in section 602 at least seven times, and is very standard language for multiple products, including;

wiring, optical fiber and communication raceways (602.2.1.1)  
fire sprinkler piping (602.2.1.2)  
pneumatic tubing (602.2.1.3)  
electrical equipment (602.2.1.4)  
and  
discrete plumbing and mechanical products (602.2.1.5)

Pipe, like any other product, can be installed within a plenum if fully enclosed. To omit this language would be in error, and inconsistent with the rest of that code section, would cause confusion, and we recommend the original proposal as it was submitted by UL.

## *Public Comment 2:*

**Proponent : David Seiler, Arkema, Inc., representing Arkema (dave.seiler@arkema.com) requests Approve as Modified by Committee.**

**Commenter's Reason:** We support the modification by the committee, which ensures that a loophole contained in the proposal is not introduced into the mechanical code. As submitted, the proposal could allow the covering of piping with non-approved materials to avoid "exposure" within the plenum space as a means to negate the current test requirement for ASTM E84. It is also important that the introduction of UL2846 be properly scoped; the committee modification ensures that.

---

M76-15

# M77-15

## 602.2.1.7

### **Proposed Change as Submitted**

**Proponent:** David Seiler, Arkema Inc, representing Arkema Inc.  
(dave.seiler@arkema.com)

## **2015 International Mechanical Code**

**Revise as follows:**

**602.2.1.7 Plastic plumbing pipe and tube.** Plastic piping and tubing used in plumbing systems shall be listed and shall exhibit a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723 without any liquid in the pipe and utilizing the full width of the test apparatus tunnel during such tests.

**Reason:** This is a simple clarification to confirm the testing procedure of ASTM E84

**Bibliography:** NFPA 90A, ASTM E84, UL 723

**Cost Impact:** Will not increase the cost of construction  
This clarification makes no change in the material types that currently meet the code, thus there is no cost impact.

M77-15 : 602.2.1.7-  
SEILER4331

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** It is not necessary for the code to clarify what is in the test standards, nor is it necessary to focus on a single aspect of such standards.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent :** Marcelo Hirschler, representing GBH International  
(gbhint@aol.com) requests Approve as Submitted.

**Commenter's Reason:** This proposal works very well in conjunction with the approved text from M76 and it is consistent with the requirements of ASTM E84. The added language is needed because this requirement is often violated by

manufacturers of pipes or pipe materials who use test specimens that are less than full width and, in some cases, use plastic pipes filled with water to get better results. The code needs to be clear on critical aspects when abundant examples of violations exist.

UL 2846 (accepted for inclusion in the IMC by M76) provides a means for alternate testing (as an exception) for those "plastic water distribution piping and tubing" products that have been listed to UL 2846. In UL 2846 there is an explicit statement that liquids shall not be used during testing, which is why this added clause is not needed for the exception. There is no need for a double exception for these materials, as would be provided by the use of test specimens that don't **strictly** comply with ASTM E84.

ASTM E84 allows variations from the standard full width sheet testing **only** for (a) materials that have a standard mounting method developed (as a standard practice, described in section 6.8 of ASTM E84), (b) for adhesives and trim that have been listed and (c) for materials for which a specific test method exists (described in Appendix X5 of ASTM E84).

**None of these methods include plastic piping.**

Language in ASTM E84 (2015a) - sections 6.3, 6.8 and appendix X5:

6.3 The size of the test specimen shall be:

Width: between 20 and 24 in. (508 and 610 mm)

Length: 24 ft + 12 in. — 6 in.

Thickness: maximum 4 in. (101 mm).

NOTE 1 - The test apparatus is not designed for testing at thicknesses greater than 4 in. (101 mm), but has the ability to be modified if required. This is accomplished through (a) modifications to the test apparatus lid to maintain an airtight seal, and (b) the introduction, usually of additional sample/lid supports above the test apparatus ledges. Due to the composition of some materials, test results obtained at a thickness greater than 4 in. (101 mm) will potentially vary from results of a test on the same material tested at a thickness of 4 in. (101 mm) or less.

6.3.1 The test specimen shall not be required to conform to the test specimen length and width described in 6.3 when the material complies with 6.3.1.1-6.3.1.3.

NOTE 2 - When tests are conducted with materials installed at less than full width, representing the end-use width, any resulting flame spread and smoke developed indices will not relate to indices obtained with the calibration material, which is tested using the specimen width described in 6.3.

6.3.1.1 Materials for which there is a standard practice to address specimen preparation and mounting with this test method shall be tested as described in the appropriate standard practice (see 6.8).

6.3.1.2 Adhesives and trim shall be permitted to be tested in the width or length, or both, specified in their listings, or as part of their conditions for being labeled, by a nationally recognized testing laboratory.

6.3.1.3 Materials and products for which there is a specific test method or application standard requiring the use of the apparatus described in Section 5 shall be permitted to be tested in accordance with that specific test method or application standard (see Appendix X5).

6.8 In addition to the above provisions, the standard practices listed below shall be used for specimen preparation and mounting of the relevant test materials. For all other products, guidance on mounting methods is provided in Appendix X1.

E2231 for pipe and duct insulation materials.

E2404 for paper, polymeric (including vinyl and expanded vinyl) and textile wall and ceiling covering materials, facings or wood veneers intended to be applied on site over a wood substrate.

E2573 for site-fabricated stretch systems.

E2579 for the following wood products: solid board, lumber and timber products (including solid boards, lumber, timber, fingerjoined lumber, glulam, laminate wood, laminated veneer lumber and parallel strand lumber products), panel products (including fibreboard, hardboard, oriented strandboard, waferboard, and plywood panel products), decorative wood products (including fine woodwork, millwork and moulding) and shingles and shakes used as interior wall and ceiling finish and interior trim as well as to laminated products factory-produced with a wood

substrate.

E2599 for reflective insulation, radiant barrier and vinyl stretch ceiling materials for building applications.

E2688 for tapes up to and including 8 in. (203.2 mm) in width.

E2690 for caulks and sealants intended to be applied up to and including 8 in. (203.2 mm) in width.

E2988 for Flexible Fibrous Glass Insulation for Metal Buildings.

#### X5. SPECIFIC TEST METHODS AND APPLICATION STANDARDS

X5.1 The following standards address testing of materials in accordance with test methods that are applications or variations of this test method or apparatus.

X5.1.1 Wires and cables for use in air-handling spaces are covered by NFPA 262.

X5.1.2 Pneumatic tubing for control systems are covered by UL 1820.

X5.1.3 Combustible sprinkler piping is covered by UL 1887.

X5.1.4 Optical fiber and communications raceways are covered by UL 2024.

X5.1.5 Materials required to meet the extended Test Method E84 to a 30-min duration are covered by Test Method E2768.

## *Public Comment 2:*

**Proponent : David Seiler, Arkema, Inc., representing Arkema (dave.seiler@arkema.com) requests Approve as Modified by this Public Comment.**

### **Modify as Follows:**

## **2015 International Mechanical Code**

**602.2.1.7 Plastic plumbing pipe and tube.** Plastic piping and tubing used in plumbing systems shall be listed and labeled and shall exhibit a flame spread index of not more than 25 and a smoke-developed index of not more than 50 when tested in accordance with ASTM E 84 or UL 723 . Test specimens shall have a width of not less than 20 inches (508mm) and not greater than 24 inches (610mm). Tests shall be conducted without any liquid in the pipe and utilizing the full width of the test apparatus tunnel during such tests specimens.

**Commenter's Reason:** The proposal was submitted to provide guidance to testing and certification agencies about a very important aspect of fire testing for plastic pipes located within plenum spaces.

The committee reason for disapproval states that it is unnecessary for the code to clarify what is in the standards, but when there is confusion and disagreement in the testing and certification industry, these types of clarifications become essential to safeguard public safety. The codes rely on test methods for evaluating building materials and products; in many cases the code references do contain specific provisions to clarify test parameters, modify certain provisions, or provide guidance to manufacturers and testing agencies on demonstrating code compliance.

This proposal covers such a test standard reference. ASTM E84 (also known as the Steiner Tunnel Test) is used for a broad variety of building materials and products, including plastics. The standard provides guidance on how to prepare material specimens in order to ensure consistently *comparative* and repeatable testing. Product evaluation entities, including ICC-ES, have issued product "approvals" based on testing conducted "in general accordance with" or using "modified versions" of ASTM E84; those product approvals are then used as evidence of code compliance.

ASTM E84 provides guidance on materials testing by establishing a minimum

specimen width of 20". Testing of material specimens with less than 20" width can provide a false sense of security (and an inaccurate flame spread and/or smoke developed index) by reducing the fuel load during the test. There is no reason that arrays of plastic pipe specimen(s) cannot be appropriately mounted within the test tunnel.

Additionally, manufacturers have tested plastic pipes to ASTM E84 with water or other liquid present in the pipe specimen(s). Testing plastic condensate or drain pipes that are normally empty as installed in the intended end use by filling them with water violates a basic premise of the code: demonstration of code compliance *must* be based on representative specimens tested as they are intended to be used.

The modification in this comment includes three technical changes:

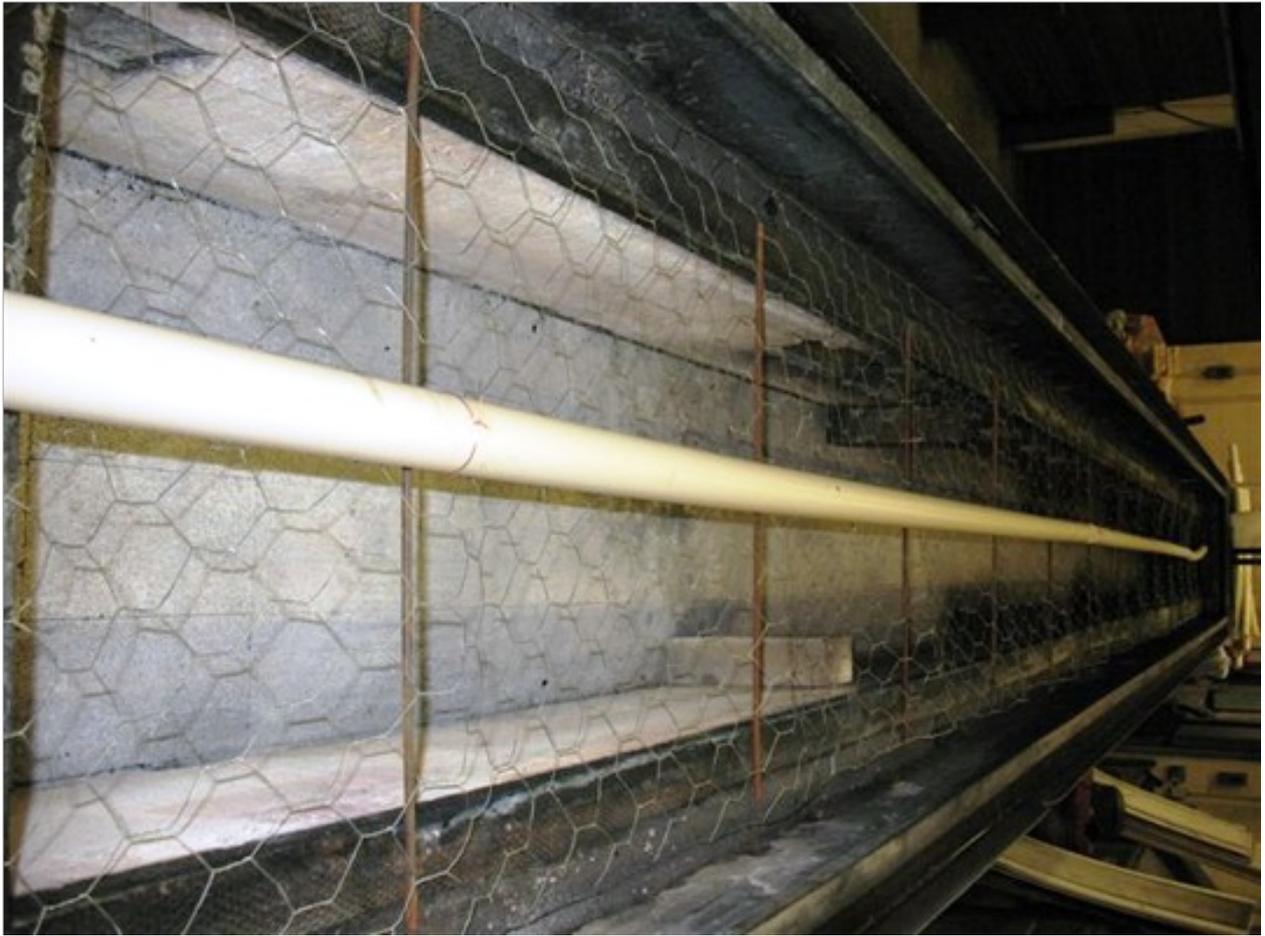

1. Adds "labeled" to the requirement for testing to be consistent with the committee action on M76-15.
2. Specifies a minimum width for test specimens; the 20" width is included in ASTM E84.
3. Clarifies that plastic pipes for use in plenums must be tested without the addition of liquids in the test specimens.

Leading certification bodies agree with our stance on these test parameters. In correspondence on this matter, UL stated they would decline to test (let alone certify) plastic pipes with water in the specimen(s). UL further states that while they would conduct ASTM E84/UL723 tests with specimens at less than full width for the purposes of product development "for the applicant's use only", they would *not* provide product certification for products tested in that manner.

Approving this proposal as modified by this public comment will set the appropriate level of fire safety by requiring that plastic pipes manufactured for use in plenums be tested in *full* accordance with ASTM E84 and without adding water. Despite the committee reason statement to the contrary, these safeguards are essential.

Attached to this reason statement is a letter from UL to Arkema on the subject of plastic pipe testing, and several photographs showing installed pipe configurations and testing illustrations.

August 20, 2014

Arkema Inc.  
Rosemary Heinze  
Marketing Manager - Fluoropolymers  
900 First Ave  
King of Prussia, PA 19406

Subject: Clarification on Testing of Pipes

Dear Rosemary,

This letter clarifies our recent discussions. In your e-mail last month, you inquired:

*If Arkema had materials that they would like to test to this standard (UL723 / ASTM E84) which seems to allow (1) water filled pipes, (2) pipes up to 6" in diameter, and (3) single pipes in the tunnel rather than full width testing; would UL agree to perform these tests and provide a flame and smoke value listing for use in compliance with ASTM E84/UL 723?*

Thanks for your inquiry Rosemary. The basic answer to your questions is that at this time, UL would decline to provide certification for the pipe products in the manner described. We expounded on this discussion through various calls and e-mails. This letter intends to confirm those discussions.

1. UL would decline testing and certification of water filled pipes because:
  - a. When the flame breaches the pipe wall, water could disperse throughout the tunnel. The water interferes with the test results, and UL does not believe this is within the intent of the comparative test method UL723 / ASTM E84. At ASTM and at NFPA 90A, UL has continually supported that pipes, when tested, should not be filled with water.
  - b. UL believes that even pipes that are "intended" to be filled with water, may for various reasons be found empty in the field, and become subject to fire exposure without water in them.
  - c. In committee discussions, there have been misunderstandings expressed about testing thermoplastic sprinkler pipe in accordance with UL1887. This confirms that in accordance with UL1887, pipes are not intended to be tested filled with water.
2. UL will test pipes up to 6 in. diameter under our Preliminary Investigation or Verification Service for the Applicant's use only, but not provide certification:
  - a. Experience shows that in most instances single or double lengths of large diameter pipes significantly increase the volume in the tunnel apparatus during the test. This disrupts the normal air flow through the tunnel which can result in a reduction in the 4 ½ ft. flame front and a reduction in the normal interior furnace temperature. This could have a significant effect on the flame spread index and smoke developed index. The Report accompanying such test results would clearly state these observations.
  - b. Because of these test performance dynamics that alter the results, UL would decline to provide certification when these dynamics occur.

UL LLC  
12 Laboratory Drive, Research Triangle Park, NC 27709-3995 USA  
T: 919.549.1400 / F: 919.547.6000 / W: UL.com

3. Lastly, UL would test small diameter, single pipes in the tunnel rather than full width testing under our Preliminary Investigation or Verification Service for the Applicant's use only, but would not provide certification. The reason is that testing less than full width in this method has not been clearly defined or permitted within UL723 or ASTM E84. As you are aware, this continues to be heavily debated within the ASTM committees. In addition, testing less than full width conflicts with NFPA 90A. We do not know if the results from a single pipe length would satisfy the needs of the other Codes.

As an outgrowth of the need for an alternate test method for testing pipe, recently UL Standards received a ballot for a proposal to develop a new UL Standard for Plastic Pipe. The scope of this Standard UL2846 is limited to plumbing pipes for distribution of potable water that can be installed in ducts, plenums, and other spaces used for environmental air. The method determines flame propagation distance and optical smoke density for individual pairs of plastic. The intended pass / fail criteria are flame travel of < 5 feet, peak optical density < 0.5, and average optical density < 0.15. This method addresses pipe sizes 4 in. and less in diameter and uses the UL1887 tray to mount two pipes side-by-side. This test method does not cover plastic pipes when installed adjacent (side to side) in quantities greater than two.

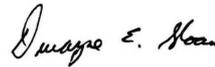

Should you or anyone have any questions, please do not hesitate to contact me.

Very truly yours,

Randall Laymon

## 602.2.1.8 (New)

### **Proposed Change as Submitted**

**Proponent :** Marcelo Hirschler, representing GBH International (gbhint@aol.com)

## 2015 International Mechanical Code

**Add new text as follows:**

**602.2.1.8 Pipe insulation.** Pipe insulation in plenums shall comply with the requirements of Section 604.

**Reason:** Section 602 contains the requirements for materials in plenums. However, pipe insulation in plenums, which is supposed to comply with the same requirements as duct insulation (shown in section 604) is not specifically included. The default requirements in section 602 are simply a flame spread index of 25 and a smoke developed index of 50, when tested in accordance with ASTM E84. However, section 604 contains further details, including the requirements to meet testing in accordance with ASTM C411, the temperature requirements and the details of the mounting method for ASTM E84 (which should be in accordance with ASTM E2231). Some people may consider this as implicit but it is always better to be explicit rather than implicit. ASTM E2231 is entitled Standard Practice for Specimen Preparation and Mounting of Pipe and Duct Insulation Materials to Assess Surface Burning Characteristics and it deals with both pipe and duct insulation and it is already referenced in section 604 of the IMC.

**Cost Impact:** Will increase the cost of construction  
This provides a pointer to clarify a missing requirement and should not affect requirements. However, if some jurisdictions now handle pipe insulation in plenums different from duct insulation then the requirements would change for those jurisdictions.

M78-15 : 602.2.1.8  
(New)-HIRSCHLER3525

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** Disapproval was based on the action taken on M79-15

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent :** Marcelo Hirschler, representing GBH International (gbhint@aol.com) requests Approve as Submitted.

**Commenter's Reason:** I support the committee action on proposal M79. This public comment is being presented simply in case the approval of M79 is challenged. The code is silent about pipe insulation at present.

# M80-15

## 602.2.2 (New)

### **Proposed Change as Submitted**

**Proponent :** Brian Helms, Charlotte Plastics, representing Charlotte Pipe and Foundry (brian.helms@charlottepipe.com)

## **2015 International Mechanical Code**

**Add new text as follows:**

**602.2.2 Plastic piping in plenums.** Plastic piping installed in plenums shall be tested in strict accordance with the requirements of ASTM E84 and UL723 including the mounting method used and the size of the sample tested. Modified tests that use mounting methods or sample sizes different than those required by the E84 and UL723 shall not be accepted as proof of compliance.

**Reason:** The requirements found in STM E84 and UL723 are the requirements. Changing the sample size or mounting methods to enable a plastic pipe manufacturer to achieve a passing grade ignore the basis by which the existing requirements exist. That reason is the protection of the health and safety of the occupants of the building. Allowing the use of modified tests exposes all plastic pipe manufacturers to liability which some might not wish to accept.

**Cost Impact:** Will not increase the cost of construction  
This change merely highlights that the requirement of the standards regarding a product's acceptability for use in a plenum be followed without alteration. The practice of modifying or altering the requirements of ASTM E84 and UL 723 has been gaining momentum in the industry and diluting results that are intended to provide safety to the industry by measuring flame spread and smoke development of material used in a plenum. This change does not add to the cost of construction.

M80-15 : 602.2.2 (New)-  
HELMS5401

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** This proposal would bring the code into the business of writing test standards. Who determines if the test methods were modified. The adjective "strict" before the word accordance implies that there is some other level of compliance with the standard requirements and that AHJ approval may be involved.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Brian Helms, representing Charlotte Pipe and Foundry (brian.helms@charlottepipe.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

**2015 International Mechanical Code**

**602.2.2 Plastic piping in plenums.** Plastic piping installed in plenums shall be tested in ~~strict~~ accordance with the requirements of ASTM E84 and UL723 ~~including the mounting method used and the size of the sample tested.~~ Modified tests that use mounting methods or sample sizes different than those required by ~~the~~ ASTM E84 and UL723 shall not be accepted as proof of compliance.

**Commenter's Reason:** ASTM E84 has long been the benchmark for the use of combustible piping materials in plenum applications. This proposal does not request the code body to rewrite the standard. Instead, this proposal empowers officials to reject products that have supposedly passed the requirements of ASTM E84 via questionable methods and enables them to ask for detailed test reports. Currently, the IMC does not include any recourse for code officials or specifying design professionals to combat the growing problem of some manufacturers intentionally altering some methods in these standards for the purpose of getting a passing 25/50 flame spread/smoke developed result. This proposal is a step in the right direction to keep manufacturers honest and to reduce safety liability for code officials, engineers, contractors and manufacturers.

---

**M80-15**

# M93-15

## 603.8, 603.8.3

### **Proposed Change as Submitted**

**Proponent :** Charles Stock, Spunstrand Inc., representing Spunstrand Inc.

## **2015 International Mechanical Code**

### **Revise as follows:**

**603.8 Underground ducts.** Ducts shall be *approved* for underground installation. Metallic ducts not having an *approved* protective coating shall be completely encased in not less than 2 inches (51 mm) of concrete. Nonmetallic and plastic ducts shall comply with UL 181.

**603.8.3 Plastic ducts and fittings.** Plastic ducts shall be constructed only of PVC having a minimum pipe stiffness of 8 psi (55 kPa) at 5-percent deflection when tested in accordance with ASTM D 2412. Plastic duct fittings shall be constructed of either PVC or high-density polyethylene. Plastic duct and fittings shall be utilized in underground installations only and all exposed surfaces shall have a Class 0 or Class 1 flame and smoke rating in accordance with UL 181. The maximum design temperature for systems utilizing plastic duct and fittings shall be 150°F (66°C).

**Reason:** The further clarification in section 603.8 and the addition of section 603.8.3 are mainly intended to insure that the use of improper materials does not slip through the code cracks. This should eliminate the use of highly flammable and excessive smoke-generating materials in an HVAC duct system regardless of its installation location above or below ground. All duct and fittings used for HVAC systems in the Uniform Mechanical Code and the International Mechanical Code call for the interior of the duct and plenums to be rated Class 0 or Class 1 per UL 181, which is a flame spread of 25 and a smoke development of 50 or less. These standards are used for ducts and plenums for both safety and liability concerns which should apply to underground duct and fittings as well. The indication that PVC or HDPE, which do not meet Class 1 or Class 0 per UL 181, can be used solely because it is buried seems to drastically contradict the other code sections. Duct systems, both above and below ground, should comply with applicable UL 181 standards. It should also be noted that the maximum temperature rating for PVC and HDPE is usually 140deg F. Limit switches on residential and commercial air handlers are normally set at 160deg F and air temperatures in the ductwork can often run up to 140deg F. If a \$25 limit switch fails, the temperatures can then easily exceed 140deg F. It is inappropriate to install a material in a duct system in which the air exceeds the ducts maximum temperature rating with no safety factor.

**Cost Impact:** Will not increase the cost of construction  
Any products that are not completely code compliant, meeting UL 181 and ASTM C-518, were not and should not be considered in determining the cost impact of these proposed changes. With that said, there would be no cost impact as there are currently three U.S. manufacturers providing code approved product with numerous others who could if they are willing to enter the market.

M93-15 : 603.8-  
STOCK5654

---

## **Public Hearing Results**

## Committee Action:

**Disapproved**

**Committee Reason:** The code should refer to just ducts as opposed to nonmetallic and plastic. UL181 is not the appropriate standard. There is no rationale for limiting plastic underground ducts to PVC only.

## Assembly Action :

**None**

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : Charles Stock, representing Spunstrand Inc requests Approve as Modified by this Public Comment.**

#### **Modify as Follows:**

### **2015 International Mechanical Code**

**603.8 Underground ducts.** Ducts shall be *approved* for underground installation and shall achieve a class 0 or 1 rating when tested in accordance with ASTM E-84 or UL 723. Metallic ducts not having an *approved* protective coating shall be completely encased in not less than 2 inches (51 mm) of concrete. ~~Nonmetallic and plastic ducts shall comply with UL 181.~~

**603.8.3 Plastic ducts and fittings.** ~~Plastic ducts shall be constructed only of PVC having or FRP and shall have a minimum pipe stiffness of 8 psi (55 kPa) at 5-percent deflection when tested in accordance with ASTM D 2412. Plastic duct fittings shall be constructed only of either PVC, PVC, FRP, or high-density polyethylene. Plastic duct and fittings shall be utilized in underground installations only and all exposed surfaces shall have a Class 0 or Class 1 flame and smoke rating in accordance with UL 181. The maximum design temperature for systems utilizing plastic duct and fittings shall be 150°F (66°C).~~

#### **Commenter's Reason:**

Spunstrands goal in requesting approval of the proposed code changes is simply to clarify and strengthen the code for underground ductwork. We desire to stop the use of potentially unsafe products which continue to be accepted and installed through some of the current interpretations of code verbiage. As product offerings change and new products enter the market it is important that the code evolves accordingly to maintain the desired level of clarity and direction for all manufacturers, designers, installers, and inspectors.

Leaving IMC 603.8 and 603.8.3 as is will do nothing but create a race to the bottom when it comes to underground duct materials. Since Spunstrand started making ductwork for underground applications, we have had the desire to manufacture a safe, code-compliant product. However, without the proposed type of modifications and additions, Spunstrand and other manufacturers, in order to compete with new products, will be forced by ICC and its voters to offer and supply less-safe non-class 1 products. In the end, the failure to act by the voters and subsequent shift to accepting poorer-performing products would contradict what ICC and its members claim their codes are intended to accomplish.

Throughout the mechanical codes, all aboveground ducts are to comply with the strict standards of achieving class 0 or 1 per ASTM E-84 or UL 723. Knowing that with fuel, oxygen, and heat/flame there is fire, it is only logical that an underground HVAC duct system intended to convey air/oxygen would have the potential to see all three if, and only if, the ductwork itself is a fuel. So why not limit the use of duct materials that contribute to fire whether it be above or below ground by requiring

underground duct to show compliance with the flame and smoke requirements of ASTM E-84 or UL 723? There are some that believe a duct being non-toxic, non-caustic, and installed underground should be enough of a justification for overlooking this point. However, this doesn't change the fact that non-class 0/1 duct material may spread or contribute to the spread of flame throughout a building more and faster than a class 0/1 material; it may also generate or contribute to the generation of more smoke than a class 0/1 material. If flame propagation and smoke generation are not important, just because the materials are non-toxic, non-caustic, and underground, then no change to the code is needed here. However, if there is value in showing that flame and smoke performance characteristics are important regardless of where in the building envelope they are, then I urge you to vote for the approval of the changes proposed here.

The additions to 603.8.3 will clarify the use of FRP duct/fittings along with continued use of PVC duct and PVC/HDPE fittings. They will also insure that modified versions of these recognized materials are not installed. The additional "only" disclaimers are intended to prohibit PVC, FRP, or HDPE "like" products from being acceptable for underground installations. While, despite their performance characteristics, the addition of PVC duct and PVC/HDPE fittings were allowed into the IMC decades ago these additions will allow code-compliant FRP duct, which has been used for decades as well, to be acknowledged while limiting non-compliant products from being utilized.

In the end, it is our belief that ICC and its members can either wait until there is an issue or catastrophe caused by, or contributed to by, non-compliant or under-performing products that are using the "open" verbiage currently in 603.8 and 603.8.3 or they can be proactive and clarify now that ICC, its members, and its inspectors do desire "...to protect the health, safety, and welfare of people by creating safe buildings..."

---

**M93-15**

# M95-15

## 603.8.3

### **Proposed Change as Submitted**

**Proponent :** Terrence Cahill, Crawford Company, representing Crawford Company (tcahill@crawford-company.com)

## **2015 International Mechanical Code**

### **Revise as follows:**

**603.8.3 Plastic ducts and fittings.** Plastic ducts shall be constructed of PVC a Class 0 or Class 1 duct material having a flame spread index of 25 or less and a smoke development index of 50 or less, when tested in accordance with ASTM E-84 or UL 723. Ducts shall have a minimum pipe stiffness of 8 psi (55 kPa) at 5-percent deflection when tested in accordance with ASTM D 2412. ~~Plastic duct fittings shall be constructed of either PVC or high density polyethylene.~~ Plastic duct and fittings shall be utilized in listed and labeled for underground installations ~~only~~. The maximum design temperature for systems utilizing plastic duct and fittings shall be 150°F (66°C).

**Reason:** Section 603.8.3 should be updated to include all listed and labeled plastic duct options. Of primary concern is the lack of requirement for a NFPA Class 1 duct material (less than 25 Flame spread, and less than 50 Smoke development) for underground HVAC duct. For Health and Safety reasons we feel that this should be a minimum requirement for all HVAC duct.

Throughout the IMC there is a uniformity that requires Class 0 or Class1, listed and labeled material for nonmetallic duct components. Underground nonmetallic duct, Section 603.8.3 should not be an exception. The following sections are examples of the Class 0 or Class1 requirements:

-510.8 Hazardous Exhaust - Duct construction \*1 (see attachment File A)

-602.2.1 Materials within plenums \*2

-603.5 Nonmetallic ducts \*3

-603.6.2 Flexible air connectors \*4

-604.3 Coverings and Linings \*5

The Uniform Mechanical Code (UMC) -2012 is also clear on requirements for Class 0 or Class 1 Duct Materials. Reference the following sections:

- 506.1 Product Conveying Ducts - Materials \*6

-602.2 Combustibles within Ducts or Plenums \*7.

The current IMC code section 603.8.3 limits underground HVAC duct materials to PVC or HDPE, neither of which are a Class 0 or Class 1 duct material. When this code section was written these materials may have been the best choice for corrosion resistant underground duct. There are new duct products that are ICC-ES tested and listed with a PMG listing for underground duct. One of the principle ICC-ES requirements for underground nonmetallic duct is that it be ASTM E84 Class 0 or Class1 material. This code change will acknowledge these new approved materials and set standards that are consistent and uniform as new duct materials are introduced.

After the 9/11 disaster FEMA, AWWA, NYPD and others put out independent reports on what improvements could be to the building codes in order to reduce the number of casualties in future disasters. These organizations independently concurred that in the event of catastrophic episode, all ductwork within a building should have the capability of being used for exhaust duct. By requiring Class 0 or Class 1 duct

material in section 603.8.3 this recommendation is ensured as these types of duct materials will not readily melt and collapse in fire situations. Both PVC and HDPE will readily melt and HDPE specifically has been shown to easily burn, even in underground applications.

This proposed Code change will ensure reliability, safety and uniformity with all nonmetallic duct applications.

**Cost Impact:** Will not increase the cost of construction

The proposed code change will have little if any effect on the cost of an installed underground duct systems. Even though the raw material cost of the called out PVC and HDPE are less than the resins used for fiberglass reinforced plastic, the installation requirements tend to even out the installed finished project cost. As an example, corrosion resistant high strength filament wound fiberglass duct does not require concrete encasement as metallic and some nonmetallic duct materials do.

As HVAC design engineers are trending more and more towards designing buildings utilizing Displacement Ventilation systems, larger diameter underground ducts are required. Nonmetallic, code approved duct material options already exist that are more cost effective for large diameter duct than the section 603.8.3 mentioned PVC or HDPE. The proposed code change to Class 0 or Class1 duct material will encourage the development of even more cost effective duct materials that also incorporate this life saving requirement. The real issue is health and safety and that is hard to put a price on.

**December 2014 Quoted List Pricing**

Size	Price / Foot	90dg Elbow
24"PVC	89.95	1,077.00
24" HDPE	83.88	617.00

M95-15 : 603.8.3-  
CAHILL3564

**Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** There was no justification for deleting HDPE plastic materials. There was no justification for requiring 25/50 flame/smoke indices. Disapproval was based on the action taken on M93-15.

---

**Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Terrence Cahill, Crawford Company, representing Crawford Company (tcahill@crawford-company.com) requests Approve as Modified by this Public Comment.**

**Replace Proposal as Follows:**

**2015 International Mechanical Code**

**603.8.3 Plastic ducts and fittings.** Plastic ducts and fittings shall be constructed of PVC ~~having~~ , fiberglass reinforced plastic (FRP) or high density polyethylene (HDPE) and shall have a minimum pipe stiffness of 8 psi (55 kPa) at 5-percent deflection when tested in accordance with ASTM D 2412. ~~Plastic duct fittings shall be constructed of either PVC or high density polyethylene.~~ Plastic duct and fittings shall be utilized in underground installations only. The maximum design temperature for systems utilizing plastic duct and fittings shall be 150°F (66°C).

**Commenter's Reason:** This is in response to having code change proposal M95-15 rejected at the Code Hearings in April.

Realizing that underground PVC or HDPE duct does not have to be a class 0 or class 1 duct material as required by ICC-ES LC1014, we propose this alternate change to code section 603.8.3 through the Public Comment process.

Reasons:

1. IMC code section 603.8.3 should acknowledge all LC1014 tested, PMG listed nonmetallic duct. Currently it reads "...shall be PVC... Plastic duct fittings constructed of either PVC or high density polyethylene". There are at least two manufactures of fiberglass reinforced plastic (FRP) that have a PMG listing for underground HVAC duct.
2. ICC-ES has accepted our fees and all of our expensive test data, and in turn we have been granted a PMG listing ( see attachment) for underground duct. Without having FRP mentioned along with other materials in the IMC code section 603.8.3, it seems our time, money and effort have been for naught.
- 3 Customers, Architects, Engineers Code Officials and Contractors should know that fiberglass reinforced plastic duct is a code approved option for underground HVAC duct. It should be acknowledged in IMC code section 603.8.3.

# M96-15

603.9

## Proposed Change as Submitted

**Proponent :** Donald Surrena, National Association of Home Builders, representing National Association of Home Builders (dsurrena@nahb.org)

### 2015 International Mechanical Code

#### Revise as follows:

**603.9 Joints, seams and connections.** All longitudinal and transverse joints, seams and connections in metallic and nonmetallic ducts shall be constructed as specified in SMACNA *HVAC Duct Construction Standards—Metal and Flexible* and NAIMA *Fibrous Glass Duct Construction Standards*. All joints, longitudinal and transverse seams and connections in ductwork shall be securely fastened and sealed with welds, gaskets, mastics (adhesives), mastic-plus-embedded-fabric systems, liquid sealants or tapes. Tapes and mastics used to seal fibrous glass ductwork shall be listed and labeled in accordance with UL 181A and shall be marked "181 A-P" for pressure-sensitive tape, "181 A-M" for mastic or "181 A-H" for heat-sensitive tape. Tapes and mastics used to seal metallic and flexible air ducts and flexible air connectors shall comply with UL 181B and shall be marked "181 B-FX" for pressure-sensitive tape or "181 B-M" for mastic. Duct connections to flanges of air distribution system equipment shall be sealed and mechanically fastened. Mechanical fasteners for use with flexible nonmetallic air ducts shall comply with UL 181B and shall be marked "181 B-C." Closure systems used to seal all ductwork shall be installed in accordance with the manufacturer's instructions.

**Exception:** For ducts having a static pressure classification of less than 2 inches of water column (500 Pa), additional closure systems shall not be required for continuously welded joints and seams and locking-type joints and seams of other than the snap-lock and buttonlock types for ducts that are located outside of conditioned spaces.

**Reason:** This proposal will reduce construction cost and still reduce energy loss that would occur due to duct leakage outside conditioned space. Low pressure longitudinal seam duct leakage is very limited and the small amount of leakage within conditioned space is still useful energy.

**Bibliography:** Estimated Costs of the 2015 IRC Codes Changes, Home Innovation Research Labs, Upper Marlboro, MD, December 2014, Report Reference No: MAT 1, Page 33

**Cost Impact:** Will not increase the cost of construction  
Cost decrease of up to \$314 for an average house according to research conducted by Home Innovation Research Labs.

M96-15 : 603.9-  
SURRENA5017

---

## Public Hearing Results

**Committee Action:****Approved as Submitted**

**Committee Reason:** The leakage rate for snap-lock and button-lock joints is insignificant and acceptable within conditioned spaces.

**Assembly Action :****None**

---

**Individual Consideration Agenda****Public Comment 1:**

**Proponent : Craig Drumheller, representing National Association of Home Builders (CDrumheller@nahb.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:****2015 International Mechanical Code**

**603.9 Joints, seams and connections.** All longitudinal and transverse joints, seams and connections in metallic and nonmetallic ducts shall be constructed as specified in SMACNA *HVAC Duct Construction Standards—Metal and Flexible* and NAIMA *Fibrous Glass Duct Construction Standards*. All joints, longitudinal and transverse seams and connections in ductwork shall be securely fastened and sealed with welds, gaskets, mastics (adhesives), mastic-plus-embedded-fabric systems, liquid sealants or tapes. Tapes and mastics used to seal fibrous glass ductwork shall be listed and labeled in accordance with UL 181A and shall be marked "181 A-P" for pressure-sensitive tape, "181 A-M" for mastic or "181 A-H" for heat-sensitive tape. Tapes and mastics used to seal metallic and flexible air ducts and flexible air connectors shall comply with UL 181B and shall be marked "181 B-FX" for pressure-sensitive tape or "181 B-M" for mastic. Duct connections to flanges of air distribution system equipment shall be sealed and mechanically fastened. Mechanical fasteners for use with flexible nonmetallic air ducts shall comply with UL 181B and shall be marked "181 B-C." Closure systems used to seal all ductwork shall be installed in accordance with the manufacturer's instructions.

**Exception:** For ducts having a static pressure classification of less than 2 inches of water column (500 Pa), additional closure systems shall not be required for locking type longitudinal joints and seams located within conditioned space. ~~continuously welded joints and seams and locking type joints and seams of other than the snap lock and buttonlock types for ducts that are located outside of conditioned spaces.~~

**Commenter's Reason:** This proposal was approved at the Committee Action Hearings. The committee recognized that the cost to seal the longitudinal joints in conditioned space outweighed the benefit for this requirement; however, there was a concern that the modification contributed to the confusion of an already unclear exception.

The public comment modification does not change the meaning or intent of the original proposal. The change improves the language by removing exceptions to exceptions and also removing a redundant reference to "welded seams".

As modified, this proposal will still reduce the cost of construction up to \$314 for an

average house.

# M98-15

604.3

## **Proposed Change as Submitted**

**Proponent :** Mike Fischer, Kellen Company, representing The Center for the Polyurethanes Industry of the American Chemistry Council (mfischer@kellencompany.com)

## **2015 International Mechanical Code**

**Revise as follows:**

**604.3 Coverings and linings.** Coverings and linings, including adhesives where used, shall have a flame spread index not more than 25 and a smoke-developed index not more than 50, when tested in accordance with ASTM E 84 or UL 723, using the specimen preparation and mounting procedures of ASTM E 2231. Duct coverings and linings shall not flame, glow, smolder or smoke when tested in accordance with ASTM C 411 at the temperature to which they are exposed in service. The test temperature shall not fall below 250°F (121°C). Coverings and linings shall be listed and labeled.

**Exception:** Polyurethane foam insulation that is spray applied to the exterior of ducts in attics and crawlspaces shall have a smoke-developed index not greater than 450, subject to all of the following requirements:

1. The foam plastic insulation complies with the requirements of Section 2603 of the *International Building Code*.
2. The foam plastic insulation is protected against ignition in accordance with the requirements of Section 2603.4.1.6 of the *International Building Code*.

**Delete without substitution:**

~~**604.4 Foam plastic insulation.** Foam plastic used as duct coverings and linings shall conform to the requirements of Section 604.~~

**Reason:** The proposal adds an exception allowing a greater smoke-developed index for some applications of foam plastic insulation on the exterior surfaces of ducts in attics or crawlspaces under certain specified conditions. The exception applies only to foam insulation meeting the requirements of IBC Section 2603 and the ignition barrier requirements in IBC Section 2603.4.1.6. This additional option is consistent with the options in Section M1601.3 of the IRC.

Additionally the proposal removes a circular reference in Section 604.4.

**Cost Impact:** Will not increase the cost of construction the proposal clarifies existing requirements and adds an option consistent with the IRC; it adds no additional mandatory provisions.

M98-15 : 604.3-  
FISCHER5593

---

## **Public Hearing Results**

**Committee Action:**

**Approved as Modified**

**Modification:**

**604.3 Coverings and linings.** Coverings and linings, including adhesives where used, shall have a flame spread index not more than 25 and a smoke-developed index not more than 50, when tested in accordance with ASTM E 84 or UL 723, using the specimen preparation and mounting procedures of ASTM E 2231. Duct coverings and linings shall not flame, glow, smolder or smoke when tested in accordance with ASTM C 411 at the temperature to which they are exposed in service. The test temperature shall not fall below 250°F (121°C). Coverings and linings shall be listed and labeled.

**Exception:** Polyurethane foam insulation that is spray applied to the exterior of ducts in attics and crawlspaces shall have a flame spread index not greater than 75 and a smoke-developed index not greater than 450, subject to all of the following requirements:

1. The foam plastic insulation complies with the requirements of Section 2603 of the *International Building Code*.
2. The foam plastic insulation is protected against ignition in accordance with the requirements of Section 2603.4.1.6 of the *International Building Code*.

**604.4 Foam plastic insulation.** Foam plastic used as duct coverings and linings shall conform to the requirements of Section 604.

**Committee Reason:** Approval was based on the proponent's published reason statements. The use of spray foam insulation is growing and the code needs to address it. The modifications restore Section 604.4 to ensure proper code enforcement and provide both flame and smoke indices to fully assess the material.

**Assembly Action :**

**None**

---

**Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Mike Fischer, Kellen, representing The Center for the Polyurethanes Industry of the (mfischer@kellencompany.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

**2015 International Mechanical Code**

**604.3 Coverings and linings.** ~~Coverings~~ Duct coverings and linings, including adhesives where used, shall have a flame spread index not more than 25 and a smoke-developed index not more than 50, when tested in accordance with ASTM E 84 or UL 723, using the specimen preparation and mounting procedures of ASTM E 2231. Duct coverings and linings shall not flame, glow, smolder or smoke when tested in accordance with ASTM C 411 at the temperature to which they are exposed in service. The test temperature shall not fall below 250°F (121°C). Coverings and linings shall be listed and labeled.

**Exception:** Polyurethane foam insulation that is spray applied to the exterior of ducts in attics and crawlspaces shall ~~have a flame spread index not more than 75 and a smoke developed index not greater than 450,~~ be subject to all of the following requirements:

1. The foam plastic insulation shall have a flame spread index not greater than 75 and a smoke developed index not greater than 450, when tested in accordance with ASTM E84 or UL 723, using the specimen preparation and mounting procedures of ASTM E2231.

2. The foam plastic insulation shall not flame, glow, smolder or smoke when tested in accordance with ASTM C411 at the temperature to which the foam plastic insulation is exposed in service. The test temperature shall not fall below 250 degrees F (121 degrees C).

3. The foam plastic insulation complies with the requirements of Section 2603 of the *International Building Code*.

4. The foam plastic insulation is protected against ignition in accordance with the requirements of Section 2603.4.1.6 of the *International Building Code*.

**Commenter's Reason:** The code proposal was intended to provide for the use of foam plastic insulation for duct coverings in a manner consistent with the provisions for foam plastics in crawlspaces using surface burning characteristics in IBC Section 2603, and the ignition barrier requirements of IBC 2603.4.1.6. The proposal as modified by the committee creates some ambiguity regarding the requirements for testing to ASTM C411 and the provisions for appropriate mounting methods of ASTM E2231.

This modified proposal retains the intent of the proposal and the committee but clarifies that the appropriate requirements for hot surface performance testing remain in effect.

## *Public Comment 2:*

**Proponent : Marcelo Hirschler, representing GBH International (gbhint@aol.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

## **2015 International Mechanical Code**

**604.3 Coverings and linings.** ~~Coverings~~ Duct coverings and linings, including adhesives where used, shall have a flame spread index not more than 25 and a smoke-developed index not more than 50, when tested in accordance with ASTM E 84 or UL 723, using the specimen preparation and mounting procedures of ASTM E 2231. Duct coverings and linings shall not

flame, glow, smolder or smoke when tested in accordance with ASTM C 411 at the temperature to which they are exposed in service. The test temperature shall not fall below 250°F (121°C). Coverings and linings shall be listed and labeled.

**Exception:** Polyurethane foam insulation that is spray applied to the exterior of ducts in attics and crawlspaces shall ~~have a flame spread index not more than 75 and a smoke developed index not greater than 450,~~ be subject to all of the following requirements:

1. The foam plastic insulation shall have a flame spread index not greater than 75 and a smoke developed index not greater than 450, when tested in accordance with ASTM E84 or UL 723, using the specimen preparation and mounting procedures of ASTM E2231.

2. The foam plastic insulation shall not flame, glow, smolder or smoke when tested in accordance with ASTM C411 at the temperature to which the foam plastic insulation is exposed in service. The test temperature shall not fall below 250 degrees F (121 degrees C).

3. The foam plastic insulation complies with the requirements of Section 2603 of the *International Building Code*.

4. The foam plastic insulation is protected against ignition in accordance with the requirements of Section 2603.4.1.6 of the *International Building Code*.

**Commenter's Reason:** There were two inadvertent omissions when this proposal was accepted by the technical committee. The ducts can be quite hot and, therefore, the foam plastic insulation must meet the requirements of ASTM C411, to avoid it degrading too fast in use. The other omission is that the mounting method for testing to ASTM E84 needs to be added, just like in the charging paragraph. In summary, the exception is for the foam plastic used on the outside of ducts to be tested to ASTM E84 with a flame spread index of 75 and a smoke developed index of 450 (instead of 25/50 when it is inside) and it must be covered by an ignition barrier.

The change to add the word "duct" at the beginning of the sentence is for consistency only.

### *Public Comment 3:*

**Proponent : Tony Crimi, representing North American Insulation Manufacturers Association (tcrimi@sympatico.ca) requests Disapprove.**

**Commenter's Reason:** The proposal adds an exception allowing a greater smoke-developed index for some applications of foam plastic insulation on the exterior surfaces of ducts in attics or crawlspaces, but does not offer any substantiation to justify this relaxation for all building types. A plenum is a highly sensitive space, used for handling environmental air distribution to a building. The codes are justifiably very restrictive with regards to all materials which are permitted within air ducts and air-handling systems, yet this proposal would permit foamed plastics with up to 450 smoke developed to be installed without any limitation on the quantities of these materials.

As Approved, this proposal eliminates the requirement for both the 25/50 flame spread and smoke developed requirements, and the need to test for in-service temperature performance using ASTM C411. The ASTM C411 testing applies to the determination of the performance of commercial pipe forms of thermal insulating

materials when exposed to simulated hot-surface application conditions. The term "hot-surface performance" has reference to testing in a simulated end-use temperature. This test method refers primarily to high-temperature insulations that are applicable to hot-side temperatures in excess of 200°F (93°C). By exempting foamed plastic pipe insulations from this testing, they are permitted to be used in any application without a proper evaluation of this hazard. An ignition barrier installed on the outer surface of the foamed plastic will not protect the material from ignition, or from flaming, glowing, smoldering or smoke emission as the Code currently requires for other pipe insulation materials.

While the exception applies to foam insulation meeting the requirements of IBC Section 2603 and the ignition barrier requirements in IBC Section 2603.4.1.6, Ignition barriers are not tested, are not required to prevent smouldering combustion, and do not prevent large quantities of smoke from being emitted. The IBC and IMC recognize that ignition barriers are not always sufficient to protect foamed plastics. As a result, thermal barriers, which are tested to NFPA 275 and do provide some limitation on the volume of smoke permitted to be emitted, are often required in critical locations. For example, 1407.10.2 requires MCM's and HPL's to be separated from the interior of a building (not just the plenum) by an approved, tested thermal barrier. Similarly, 2603.4 requires foam plastic shall be separated from the interior of a building by an approved and tested thermal barrier, with some exceptions provided based on performance testing. IBC 2603.5.2 also requires any foam plastic insulation to be separated from the building interior by a thermal barrier, unless special approval is obtained on the basis of Section 2603.9. At a minimum, thermal barrier protection should be required.

We support the comment in the Committee reason which identifies the fact that spray applied foam plastics are becoming more common, and the Codes needs to address those materials. However, the Codes need to do that by identifying appropriate solutions, rather than by relaxing existing fire safety measures in plenums to match the minimum level of protection permitted for interior finishes. There has been no research and insufficient substantiation provided to justify this significant relaxation in fire safety.

### *Public Comment 4:*

**Proponent : Tim Earl, representing GBH International (tearl@gbhinternational.com) requests Disapprove.**

**Commenter's Reason:** This proposal as passed referenced flame spread requirements without specifying the proper mounting method. It also failed to reference the requirements of ASTM C411. If this is not corrected with a Public Comment, request disapproval.

---

M98-15

# M99-15

## 604.7, 202 (New), Chapter 15

### Proposed Change as Submitted

**Proponent :** Lamont Millspaugh, Reflectix, Inc., representing Reflective Insulation Manufacturers Association International (monty.millspaugh@reflectixinc.com)

## 2015 International Mechanical Code

### Revise as follows:

**604.7 Identification.** External duct insulation, except spray polyurethane foam, and factory-insulated flexible duct shall be legibly printed or identified at intervals not greater than 36 inches (914 mm) with the name of the manufacturer, the thermal resistance *R*-value at the specified installed thickness and the flame spread and smoke-developed indexes of the composite materials. ~~Duct~~ For other than reflective duct insulation, duct insulation product *R*-values shall be based on insulation only, excluding air films, vapor retarders or other duct components, and shall be based on tested *C*-values at 75°F (24°C) mean temperature at the installed thickness, in accordance with recognized industry procedures. The *R*-value for external reflective duct insulation shall be determined in accordance with ASTM C1668 and the installed thickness shall include the enclosed air spaces. The installed thickness of duct insulation used to determine its *R*-value shall be determined as follows:

1. For duct board, duct liner and factory-made rigid ducts not normally subjected to compression, the nominal insulation thickness shall be used.
2. For duct wrap, the installed thickness shall be assumed to be 75 percent (25 percent compression) of nominal thickness.
3. For factory-made flexible air ducts, the installed thickness shall be determined by dividing the difference between the actual outside diameter and nominal inside diameter by two.
4. For spray polyurethane foam, the aged *R*-value per inch, measured in accordance with recognized industry standards, shall be provided to the customer in writing at the time of foam application.

### Add new definition as follows:

#### SECTION 202 DEFINITIONS

**REFLECTIVE DUCT INSULATION** A thermal insulation assembly consisting of one or more surfaces that have an emittance of 0.1 or less and that bound an enclosed air space or spaces.

### Add new standard(s) as follows:

ASTM C1668-12 Standard Specification for Externally Applied Reflective Insulation Systems on Rigid Duct in Heating, Ventilation, and Air Conditioning (HVAC) Systems

**Reason:** The purpose of this proposal is to provide clear and specific requirements for reflective duct insulation. This language improves the code by providing installers and building officials with a clear path on the specifications that pertain to this product, as well as adding the appropriate definition and an ASTM standard. The same definition and similar language for reflective duct insulation was approved into the 2015 IRC Section M 1601.3.

Reflective duct insulation is a well-established type of material/system and it has an ASTM standard specification, namely ASTM C 1668 Standard Specification for Externally Applied Reflective Insulation Systems on Rigid Duct in Heating, Ventilation, and Air Conditioning (HVAC) Systems. It has been in the market for over 10 years and has nationwide distribution and installation.

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction. The proposal only clarifies the requirements for a type of insulation material that is currently not properly regulated by the code. It incorporates standard industry practice not presently reflected in the code, but does not make this type of insulation mandatory.

**Analysis:** A review of the standard proposed for inclusion in the code, ASTM C1668, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

M99-15 : 604.7-  
MILLSPAUGH4868

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** This product needs to be stamped with the product R-value for both the insulation alone and the insulation with an air space. The product installation would be better understood if the product-only R-value was indicated. This product is commonly installed without an air space between it and the duct. There is a significant difference in performance between installing the product with an air space and without an air space.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Amanda Hickman, InterCode Incorporated, representing Reflective Insulation Manufacturer's Association International (amanda@intercodeinc.com) requests Approve as Submitted.**

**Commenter's Reason:** Unfortunately, during the hearing, there was some confusion on the part of the Committee regarding reflective duct insulation labeling. These products ARE labeled with the R-values. There are two installation methods. The product can be installed directly around the duct or it can be installed using spacers. There is one R-value for each method.

There is nothing in the code that prohibits the use of reflective duct insulation and, in fact, this product is commonly and widely used throughout the country. To the Committee's point cited in the Report on the Committee Action Hearing, this is exactly why the proposed language is absolutely needed. This language will ensure that proper installation of this product occurs.

**Document to Address Committee “Reason” Issue:** Issue pertained to labeling the product with and without an air space incorporated into the assembly.

**Industry Standard Labeling Practice:** Products that require spacers (to provide stated R-value) are labeled with the product installed directly to the duct (no spacer) and the product installed utilizing a spacer (typically 0.75 inches).

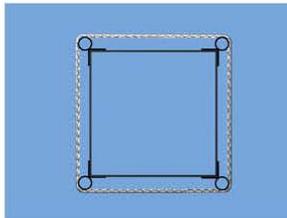

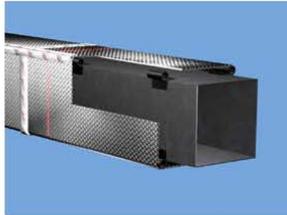

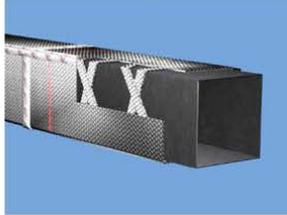

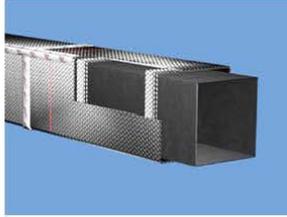

**Code Official Verification of Proper Installation:** It is a very straight forward exercise to determine if a product is installed with or without a spacer. Simply push on the underside of the product at 5 inch intervals, parallel to the duct, for 25 inches. This will provide verification if the product was installed with or without the spacers.

**Graphics Depicting Product Installed With and Without Spacers:**

**Without Spacers – R-4.2:**

With 0.75" Spacers – R-6.0:

# M101-15

## 605.4 (New)

### **Proposed Change as Submitted**

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

## **2015 International Mechanical Code**

**Add new text as follows:**

**605.4 Bypass pathways** Air handling equipment and HVAC equipment shall be designed and installed to limit the amount of airflow that bypasses the air filters and shall comply with the following:

1. Channels, racks and other filter retaining constructions that do not seal tightly to the filter frame by means of a friction fit shall be provided with a means to seal the filter frame to the filter retaining construction.
2. Where standard size filters are installed in banks of multiple filters, gaskets shall seal the gap between the frames of adjacent filters. As an alternative to gaskets, the frames of adjacent filters shall be compressed by means of spring elements that are built into the filter retaining construction.
3. Channels, racks and other filter retaining constructions shall be sealed to the duct or housing of the HVAC equipment served by the filters.
4. Filter access doors in ducts and HVAC equipment shall be designed to limit the amount of airflow that bypasses the filters.
5. Field or shop fabricated spacers shall not be installed for the purpose of replacing the intended size filter with a smaller size filter.
6. Gaskets and seals shall be provided with access for repair, maintenance and replacement.

**Reason:** The proposed text is taken from the 2015 IGCC.

This important fundamental requirement to prevent airflow from bypassing air filters should be a basic requirement in the IMC, not just in a high performance green building code.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

**Cost Impact:** Will increase the cost of construction

This proposal will increase the cost of construction because sealing and/or gaskets will be required beyond that which is normally provided in air handling systems.

**M101-15 : 802.2-  
SNYDER3269**

## Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** The proposed text is difficult to enforce and is appropriate for the IGCC, but overkill for the IMC. The equipment manufacturer's instructions already cover this.

**Assembly Action :**

**None**

---

### Individual Consideration Agenda

#### *Public Comment 1:*

**Proponent : Janine Snyder, representing Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Mechanical Code**

**605.4 Bypass pathways** Air handling equipment and HVAC equipment shall be designed and installed to limit the amount of airflow that bypasses the air filters. Filter access doors in ducts and shall comply with the following:-

- ~~1. Channels, racks and other filter retaining constructions that do not seal tightly to the filter frame by means of a friction fit HVAC equipment shall be provided with a means designed to seal limit the filter frame to amount of airflow that bypasses the filter retaining construction.~~
- ~~2. Where standard size filters are installed in banks of multiple filters, gaskets shall seal the gap between the frames of adjacent filters. As an alternative to gaskets, the frames of adjacent filters shall be compressed by means of spring elements that are built into the filter retaining construction.~~
- ~~3. Channels, racks and other filter retaining constructions shall be sealed to the duct or housing of the HVAC equipment served by the filters.~~
- ~~4. Filter access doors in ducts and HVAC equipment shall be designed to limit the amount of airflow that bypasses the filters.~~
- ~~5. Field or shop fabricated spacers shall not be installed for the purpose of replacing the intended size filter with a smaller size filter.~~
- ~~6. Gaskets and seals shall be provided with access for repair, maintenance and replacement.~~

**Commenter's Reason:** The committee felt that the proposed text was overkill and difficult to enforce, so the text was simplified to capture the basic intent. This text is more detailed in the IGCC and a simple basic version is proposed for the IMC. This text will curtail leakage but will not require absolutely airtight equipment and ducts.

---

M101-15

# M104-15

## 916.1, CHAPTER 15

### Proposed Change as Submitted

**Proponent :** Jennifer Hatfield, J. Hatfield & Associates, PL,  
representing Association of Pool & Spa Professionals  
(jhatfield@apsp.org)

## 2015 International Mechanical Code

### Revise as follows:

**916.1 General.** Pool and spa heaters shall be installed in accordance with the manufacturer's instructions. Oil-fired pool and spa heaters shall be tested in accordance with UL 726. Electric pool and spa heaters shall be tested in accordance with UL 1261, UL 1563 or CSA C22.2 No. 218.1. Gas-fired pool heaters shall comply with ANSI Z21.56/CSA 4.7. Pool and spa heat pump water heaters shall comply with UL 1995, AHRI 1160, or CSA C22.2 No. 236.

### Add new standard(s) as follows:

AHRI 1160 (I-P) -09 Performance rating of Heat Pump Pool Heaters

ANSI Z21.56a/CSA 4.7 -2013 Gas Fired Pool Heaters

CSA C22.2 No. 236-11 Cooling Equipment

CSA C22.2 No. 218.1-M89(R2011) Spas, Hot Tubs and Associated Equipment

UL 1563-2009 Standard for Electric Spas, Hot Tubs and Associated Equipment-with revisions through July 2012

**Reason:** This proposal is needed to ensure consistency with what standards are required for the various pool heaters in Section 316.2 and Table 316.2 of the International Swimming Pool & Spa Code. This same proposal has been submitted to Section M2006.1 of the IRC.

**Bibliography:** International Swimming Pool & Spa Code, Section 316.2 & Table 316.2

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction and ensures the applicable standards for the various pool heaters are provided within all the I-codes that address pool heaters.

**Analysis:** A review of the standard proposed for inclusion in the code, AHRI 1160 (I-P), ANSI Z21.56a/CSA 4.7, CSA C22.2 No. 236, CSA C22.2 No. 218.1, UL 1563, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

## Public Hearing Results

**Committee Action:**

**Approved as Modified**

**Modification:**

**916.1 General.** Pool and spa heaters shall be installed in accordance with the manufacturer's instructions. Oil-fired pool and spa heaters shall be tested in accordance with UL 726. Electric pool and spa heaters shall be tested in accordance with UL 1261, ~~UL 1563 or CSA C22.2 No. 218.1.~~ Gas-fired pool heaters shall comply with ~~ANSI Z21.56/CSA 4.7.~~ Pool and spa heat pump water heaters shall comply with UL 1995, ~~AHRI 1160,~~ or CSA C22.2 No. 236.

**Exception:** Portable residential spas and portable residential exercise spas shall comply with UL 1563 or CSA C22.2 No. 218.1.

**Committee Reason:** Approval was based on the proponent's published reason statements. The modification deletes AHRI 1160 which is already referenced in the IECC. Gas heaters are covered by the IFGC and the new exception recognizes integral heaters in spas listed to UL1563.

**Assembly Action :**

**None**

---

### Individual Consideration Agenda

*Public Comment 1:*

**Proponent : Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

#### **2015 International Mechanical Code**

**916.1 General.** Pool and spa heaters shall be installed in accordance with the manufacturer's instructions. Oil-fired pool and spa heaters shall be tested in accordance with UL 726. Electric pool and spa heaters shall be tested in accordance with UL 1261. Pool and spa heat pump water heaters shall comply with UL 1995 or CSA C22.2 No. 236.

**~~Exception:~~** Portable residential spas and portable residential exercise spas shall comply with UL 1563 or CSA C22.2 No. 218.1.

**Commenter's Reason:** The proposed new exception is not an exception. It is a requirement consistent with the general requirements of the section.

**929 (New), 929.1 (New), 929.2 (New), 929.3 (New), 929.4 (New), 929.5 (New), 929.6 (New), 929.7 (New), CHAPTER 15**

## **Proposed Change as Submitted**

**Proponent :** Jonathan Roberts, UL LLC, representing UL LLC  
(jonathan.roberts@ul.com)

## **2015 International Mechanical Code**

**Add new text as follows:**

### **SECTION 929**

#### **UNVENTED ALCOHOL FUEL-BURNING DECORATIVE APPLIANCES**

**929.1 General** Unvented alcohol fuel-burning decorative appliances shall be listed and labeled in accordance with UL 1370 and shall be installed in accordance Section 304.1.

**929.2 Prohibited use** Unvented alcohol fuel-burning decorative appliances shall not be used as the sole source of comfort heating in a dwelling unit.

**929.3 Input rating** Unvented alcohol fuel-burning decorative appliances shall not have an input rating in excess of 0.25 gallons of fuel per hour (0.95 liters per hour).

**929.4 Prohibited locations** Unvented alcohol fuel-burning decorative appliances shall not be installed within occupancies in Groups E and I. The location of unvented alcohol fuel-burning decorative appliances shall comply with Section 303.

**929.5 Fuel** Unvented alcohol fuel-burning decorative appliances shall be used only with the specific fuel marked on the appliance nameplate.

**929.6 Ventilation** Fresh air infiltration into the room in which the unvented alcohol fuel-burning decorative appliance is installed shall be provided in accordance with the markings on the appliance and the manufacturer's instructions.

**929.7 Installation in fireplaces** An unvented alcohol fuel-burning decorative appliance shall not be installed in a factory-built fireplace or masonry fireplace except where specifically identified for such use in accordance with the appliance manufacturer's installation instructions.

**Add new standard(s) as follows:**

UL 1370-11, Unvented Alcohol Fuel Burning Decorative Appliances, with revisions through January, 2014

**Reason:** This proposal provides requirements for the installation of unvented, self-contained alcohol-fuel-burning appliances. These appliances are intended for decorative purposes, though there may be limited radiant and convection-air comfort

heating. They are not intended to be utilized as a primary heat source. They are not provided with means for duct connection nor is there electrical/mechanical assist of heated air movement, such as a fan-blower assembly. The basic standard used to test and list these products is UL 1370, "Unvented Alcohol Fuel Burning Decorative Appliances", which is an ANSI consensus standard. There are five manufacturers of these appliances.

Denatured alcohol is formulated for the application. As part of the requirements of UL 1370, the appliances are tested for use only with the specific fuel marked on the appliance nameplate. These appliances are limited to a maximum input rate of 0.25 gallons of fuel per hour (0.95 liters per hour). Installation is intended to be in accordance with local codes, the manufacturer's installation instructions and any markings on the appliance. These appliances may be floor mounted or wall mounted. They may be installed in a solid-fuel-burning fireplace adapted for the purpose and, when so marked, in a factory-built solid-fuel-burning fireplace in accordance with the manufacturer's instructions. They are not intended for use in bathrooms or bedrooms nor for institutional use.

**Cost Impact:** Will not increase the cost of construction  
This would permit the use of a new type of equipment to be installed.

**Analysis:** A review of the standard proposed for inclusion in the code, UL 1370, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

**M106-15 : 929 (New)-  
ROBERTS4108**

---

### **Public Hearing Results**

**Committee Action:** **Disapproved**

**Committee Reason:** The quantity of fuel allowed in such units is excessive. The allowable NOx emissions are above the EPA limits for such. These units should be prohibited in other occupancies besides Group E and I.

**Assembly Action :** **None**

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : Bo Manalo, representing EcoSmart Fire (bo@ecosmartfire.com) requests Approve as Submitted.**

**Commenter's Reason:**

I strongly support and urge you to accept Proposal M 106-15. This is long overdue and will minimize the mis-classification of this product category, Unvented Alcohol-fuel Burning Decorative Appliances. Every year, there are approximately 15,000-20,000 installations and this category should be provisioned in the code to ensure that only products listed under the appropriate standard is allowed. It will help eliminate installation of unsafe products.

The current category in the code is too generalized and applies only to Unvented Gas

Appliances. The safety standards used between the two categories are totally different and therefore should be separated to avoid mis-classification. The proposal is covered by the safety standard ANSI/UL 1370 for Unvented Alcohol Fuel-burning Decorative Appliances. The construction, performance, and products of combustion requirements are identical to both categories but listed under different standards. Frequently, the AHJ requires a product listing according to UL127, as provisioned in the IMC. This provision is specifically for gas-fired appliances and added in the code long before Unvented Alcohol Fuel burning appliances were developed.

Agan, I urge you to accept Proposal M 106-15. This will help ensure that this new and popular product category is listed to the appropriate standard and installed safely, properly, and fully provisioned in the IMC.

## *Public Comment 2:*

**Proponent : Jonathan Roberts, representing Underwriters Laboratories (jonathan.roberts@ul.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Mechanical Code**

**929.4 Prohibited locations** Unvented alcohol fuel-burning decorative appliances shall not be installed within occupancies in Groups E, F, H, I, M, S, and U. The location of unvented alcohol fuel-burning decorative appliances shall comply with Section 303.

**Commenter's Reason:** This public comment addresses the committee comments as follows:

**"The quantity of fuel allowed in such units is excessive."** The quantity of the fuel allowed in these appliances is limited in Section 929.3 to a quart of fuel per hour. The fuel is denatured alcohol, specifically formulated for use in these appliances. The fire code regulates the quantity and storage of flammable liquids used to refill the appliance.

**"The allowable NOx emissions are above the EPA limits for such."** The established emission levels in ANSI/UL 1370 are the same as required by ANSI Z21.11.2 for unvented room heaters, which is already permitted in Section G2445 of the International Residential Code and Section 621 of the International Fuel Gas Code. The method used in these ANSI standards to measure the emissions is different than the method used by EPA. In ANSI/UL 1370 and ANSI Z21.11.2, the nitrogen dioxide concentration of the combustion products is required to not exceed 0.002 percent in an air free sample, which means any dilution air is factored out, whereas the EPA requirement is an ambient reading.

**"These units should be prohibited in other occupancies besides Group E and I."** Agree that these units should not be installed in several other occupancies. The proposal now includes those additional occupancies in Section 929.4. These units are intended for installation only in A, B, and R occupancies, as further limited by Section 303.3 of the IMC. These units are intended for decorative purposes, though there may be limited radiant and convection-air comfort heating.

## *Public Comment 3:*

**Proponent : Craig Conner, representing self**

## **(craig.conner@mac.com) requests Disapprove.**

**Commenter's Reason:** The IMC committee correctly disapproved M106-15, stating "*The allowable NOx emissions are above the EPA limits for such.*" Unvented alcohol-burning appliances rely on diluting their exhaust pollutants in indoor air, the same air the occupants' breath. Using indoor air to dilute pollutant levels is a very poor way to manage pollutants

Unvented alcohol-burning appliances should not be installed in indoor living or working spaces. These devices exhaust all combustion bi-products, including nitrogen dioxide, into the indoor air. The pollutants can accumulate to unsafe levels; levels that exceed the Environmental Protection Agency's (EPA's) air quality standards. Controls on these devices allow them to burn until the fuel is exhausted, unless manually extinguished. Provisions for combustion and ventilation air are inadequate.

The EPA identifies nitrogen dioxide as one of "six principal pollutants" (1). The nitrogen dioxide levels allowed in exhaust by the unvented alcohol-burning appliance "safety standard" greatly exceed EPA's ambient air quality standard (more below). Pollutants allowed in the exhaust can rapidly raise the pollutant levels in small areas to well above the EPA air quality standards.

Again, the proposed unvented alcohol-burning appliance safety standard, UL 1370, allows exhaust to greatly exceed the EPA's National Ambient Air Quality Standards. But, by how much? UL 1370 limits nitrogen dioxide in exhaust gases to 20,000 ppb (parts per billion) (2). EPA's "primary" air quality standard, an ambient air quality standard, for nitrogen dioxide is 100 ppb (3). Therefore, the exhaust flue gas pollutants, which vent directly into the room air, can be 200 TIMES that of EPA's air quality standard.

How does the flue gas exhaust volume from one hour of unvented alcohol-burning appliance use compare to the volume of the "small" room in UL 1370? UL 1370 small room is 200 cubic feet of room for each 1000 btu/hr of appliance (4). The flue gas volume from one hour of use is about 4% of that minimum room volume (5). If these gases from one hour of use stayed in the room they would be about 8 TIMES the EPA air quality standard in that one hour(6).

One measure of chemical toxicity is the IDLH level (Immediately Dangerous to Life and Health). The National Institute for Occupational Safety and Health value for IDLH for nitrogen dioxide is the same level that the "safety standard" allows unvented alcohol-burning appliances to exhaust(7).

Some nitrogen dioxide does leave the room or is otherwise dissipated. It reacts with surfaces of the room, moves into other rooms or is indirectly exhausted outside after being vented into the indoor air. Sometimes called a "decay rate", this might cut the nitrogen dioxide by half, which still puts a small room well above the EPA's air quality standard. In the second hour of use, the room starts with the nitrogen dioxide from the previous hour at a level already above the EPA standard. Subsequent hours are worse as pollutant levels build.

What are the health effects of increased nitrogen dioxide? According to the American Lung Association(8): inflamed airways, cough and wheezing, reduced lung function, increased asthma attacks, more emergency room and hospital admissions, increased respiratory infection, such as influenza. The ALA notes unvented heaters as one source for nitrogen dioxide. A required warning label from UL 1370 suggests more health issues: "People with breathing problems should consult a physician

before using the unvented decorative appliance."(9) Really? It is wholly unrealistic to expect people to check with their doctor before they go into a building with an appliance.

Homes and buildings can also have other sources of nitrogen dioxide. This can compound the issue further. Gas stoves or ovens usually start with low, but safe, levels of nitrogen dioxide. Buildings near busy roads, freeways, or airports often start with higher levels. Large urban areas tend to be worse; for example Chicago, Detroit, Atlanta, Los Angeles, and the northeast corridor are worse. (8) Assuming a higher level is already present, unvented alcohol-burning appliances will further increase that level and more quickly exceed safe levels.

Experience with these devices in Europe is instructive. A European safety study reported: "*Such fireplaces have become increasingly popular in the recent years and simultaneously a number of severe accidents have been recorded. Therefore such appliances are seen to present an emerging safety issue.*" (10) "... *the most common accidents are related to users refilling hot appliances, where the fuel self-ignites spontaneously and burns the user or causes property damage, and accidents related to wall-mounted fireplaces that fall down from the wall and burn nearby users or property. Spilling of fuel is also a common accident, when the fuel gets into closed compartments in the fireplace where it evaporates and causes explosions or deflagration when the fireplace is ignited or when it get hot enough.*" (11)

These devices are sold as simple to install and DIY, which seems likely to add risk of poor installation, and/or falling out and dumping burning fuel.

The same European study did measurements of emissions for four unvented alcohol-burning appliances. It reported "*All four fireplaces exceed the threshold values laid down by WHO [World Health Organization]. The excess is from 7 to 30 times higher than allowed and it occurs within the first hour of operation.*" (12)

Combustion air is an issue. UL 1370 requires instruction to the users that "*In a house of typical construction, that is, one that is not of unusually tight construction due to heavy insulation and tight seals against air infiltration, an adequate supply of air for combustion and ventilation is provided through infiltration.*" (13) The terms "*unusually tight construction*", "*heavy insulation*", and "*tight seals against air infiltration*" are not specifically defined in UL 1370 or the I-codes. Given the greater air tightness required by the current IECC, relying on new building infiltration as ventilation is a poor assumption.

The directions on room size are unreasonable. UL 1307 directs that instructions to the user state "... *if used in a small room where less than 200 cubic feet ... of air space is provided for each 1000 Btu per hour of unvented decorative appliance rating ... the door(s) to adjacent room(s) should be kept open or a window to the outside should be opened at least 1 inch ....*" (13). Unvented alcohol-burning appliances should not rely on the user to open doors or windows for combustion and ventilation air.

The unvented alcohol-burning appliances don't have a thermostat or timer. They burn until manually shut off, or until the fuel is exhausted. Most don't have a device to sense bad air quality. What happens if someone falls asleep in a small room? Given the maximum fuel volume (1.3 gallon) and maximum burn rate (0.25 gallon/h, about 18000 Btu/h) these devices could burn 5 hours, or more at lower rates. Barring the occupants shutting them off, they would burn until the fuel is exhausted no matter what the impact on the occupants, temperature, or air quality.

The IMC committee stated "*The quantity of fuel allowed in such units is excessive*"; which is a comment on the volume of fuel in the device, and/or the volume of fuel stored at the home. UL 1370 allows 1.3 gallons of fuel in the devices (14); enough fuel to start a fire or endanger occupants should the device fall. The devices falling off the wall is one scenario the European study warned has occurred. In addition the volume of fuel stored on site presents a risk. The mandatory warning label states (15) "*Always Store (Intended Fuel) Outdoors and Away From Other Fuel Containers.*" This seems likely to be ignored sometimes, as it is much more convenient to store the fuel inside and closer to the use. The fuel is easy to order in quantity on line (16). Up to 32 gallon orders are an option. Again, it would seem likely some of the fuel will be stored near its use, which would also potentially create a fire hazard.

In summary, unvented alcohol-burning appliances pollute the living and working space, and create health and fire hazards. The code should not allow permanently installed unvented alcohol-burning appliances in the living and working space.

Notes:

(1) From the EPA web site:

*"The Clean Air Act ... requires EPA to set National Ambient Air Quality Standards ... for pollutants considered harmful to public health and the environment."* "EPA has set National Ambient Air Quality Standards for six principal pollutants..."<http://www.epa.gov/air/criteria.html>

(2) Section 13.10 of UL 1370 limits nitrogen dioxide in the exhaust (called "air free sample") to "0.002 %" or in the units of the EPA air quality standard, this is 20,000 ppb.

(3) From the EPA website:

The 100 ppb is a "*primary standard*" intended to "*provide public health protection, including protecting the health of 'sensitive' populations such as asthmatics, children, and the elderly*". <http://www.epa.gov/air/criteria.html>

(4) UL 1370 Section 22.2.3 (s)

(5) The calculation of exhaust volume compared to room volume:

Natural gas has 1028 btu/cf. <http://www.eia.gov/tools/faqs/faq.cfm?id=45&t=8>

Each cf of natural gas vents 8.5 cf of air [http://www.engineeringtoolbox.com/fuels-air-flue-gas-d\\_170.html](http://www.engineeringtoolbox.com/fuels-air-flue-gas-d_170.html) (Air is only 21% oxygen, other gases are not part of combustion, but are vented also.)

1000 Btu / 200 cf of room volume is the suggested minimum room, or 5 Btu / cf  
 $5 \text{ Btu} / (1028 \text{ Btu/cf}) * 8.5 = 0.04$ , or 4% of the small room volume

(6) Exhaust is 200 times EPA air quality standard. It fills 4% of the room volume.

$200 * 0.04 = 8$  times EPA air quality standard.

(7) National Institute for Occupational Safety and Health guide to chemical hazards for nitrogen dioxide. <http://www.cdc.gov/niosh/npg/npgd0454.html>

(8) From the American Lung Association:

<http://www.lung.org/healthy-air/outdoor/resources/nitrogen-dioxide.html>

**M106-15**

# M109-15 Part I

## 929.1 (New)

### Proposed Change as Submitted

**Proponent :** Janine Snyder, representing Plumbing, Mechanical, and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org)

## 2015 International Mechanical Code

**Add new text as follows:**

**929.1 Air-handler enclosures.** Where an air-handler, electric furnace or heat pump unit is installed in an enclosure with a fuel-fired appliance, the circulating air for the air-handler, furnace and heat pump shall be conveyed to the blower housing from outside of the enclosure by continuous air-tight ducts.

**Reason:** Section 918.4 of the IMC, Section 618.7 of the IFGC and Section G2442.7 of the IRC all address this issue well for fuel-fired warm-air furnaces, but, are silent on other appliances such as fuel-fired water heaters and boilers that are likely to be in the same enclosure. Heat pump units, cooling air-handlers and electric furnaces would have the same effect on appliance vents if the return air was not ducted back to the blower housing. It is not just warm-air furnaces that the code should be concerned about. Any blower can create strong negative pressures in the enclosure where the return is pulled through louvered doors or grilles instead of ducts connected to the blower. A fuel-fired water heater or boiler in the enclosure should be addressed as well as the warm-air furnace in the same enclosure.

This proposal is submitted by the ICC Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC) The PMGCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance assigned International Codes or portions thereof. This includes both the technical aspects of the codes and the code content in terms of scope and application of referenced standards. The PMGCAC has held one open meeting and multiple conference calls which included members of the PMGCAC. Interested parties also participated in all conference calls to discuss and debate the proposed changes.

**Cost Impact:** Will increase the cost of construction

This proposal will increase the cost of construction in those cases where the return air for an air handler, heat pump or electric furnace would have been pulled through a louvered door or grille and through the enclosure, instead of through ductwork connected directly to the unit.

M109-15 Part I : 929.1  
(New)-SNYDER5976

### Public Hearing Results

## Part I

**Committee Action:**

**Disapproved**

**Committee Reason:** Disapproval is consistent with, and was based on the issues raised for, Parts II and III

**Assembly Action :**

**None**

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Janine Snyder, representing Plumbing, Mechanical and Fuel Gas Code Action Committee (PMGCAC@iccsafe.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Mechanical Code**

**929.1 Air-handler enclosures.** ~~Where an air handler, electric furnace or heat pump unit~~ a gas-fired appliance is installed in a space that also contains an enclosure with a fuel-fired appliance, air handler and the circulating supply air for ~~from the air handler~~ air handler is conveyed by ducts to spaces outside of the space containing the air handler, furnace and heat pump ~~the return air shall be conveyed to the blower housing from outside of the enclosure~~ space containing the air handler to the air handler by continuous air-tight ducts.

**Commenter's Reason:** The IFGC, IRC and IMC committees were concerned that the term "enclosure" is not defined and could include an entire floor level. This public comment replaces the term enclosure with a "space containing the appliance" to address that concern and to imitate the current text of Section 618.7 of the IFGC and Section 918.4 of the IMC. The committees also expressed concern that the proposed text would impact direct-vent appliances, however, the IFGC Section 618.7 and IMC Section 918.4 make no special allowance for direct-vent appliances. Direct-vent appliances are not exempt from Sections 618.7 and 918.4 currently nor should they be exempt from this new proposed code section.

**M109-15 Part III**

# M119-15

202 (New), 1104.2.2

## **Proposed Change as Submitted**

**Proponent :** Jeffrey Shapiro, International Institute of Ammonia Refrigeration, representing International Institute of Ammonia Refrigeration (jeff.shapiro@intlcodeconsultants.com)

## **2015 International Mechanical Code**

**Add new definition as follows:**

### **SECTION 202 DEFINITIONS**

**LOW-PROBABILITY PUMP.** A pump that does not rely on a dynamic shaft seal as a singular means of containment to prevent atmospheric release of the pumped fluid.

**Revise as follows:**

**1104.2.2 Industrial occupancies and refrigerated rooms.** This section applies only to industrial occupancies and refrigerated rooms for manufacturing, food and beverage preparation, meat cutting, other processes and storage. Machinery rooms are not required where all of the following conditions are met:

1. The space containing the machinery is separated from other occupancies by tight construction with tight-fitting doors.
2. Access is restricted to authorized personnel.
3. The floor area per occupant is not less than 100 square feet (9.3 m<sup>2</sup>) where machinery is located on floor levels with exits more than 6.6 feet (2012 mm) above the ground. Where provided with egress directly to the outdoors or into *approved* building exits, the minimum floor area shall not apply.
4. Refrigerant detectors are installed as required for machinery rooms in accordance with Section 1105.3.
5. Surfaces having temperatures exceeding 800°F (427°C) and open flames are not present where any Group A2, B2, A3 or B3 refrigerant is used (see Section 1104.3.4).
6. All electrical *equipment* and appliances conform to Class 1, Division 2, *hazardous location* classification requirements of NFPA 70 where the quantity of any Group A2, B2, A3 or B3 refrigerant, other than ammonia, in a single independent circuit would exceed 25 percent of the lower flammability limit (LFL) upon release to the space.
7. All refrigerant-containing parts in systems with a total connected compressor power exceeding 100 horsepower (hp) (74.6 kW) ~~drive power~~, except evaporators used for refrigeration or dehumidification; condensers used for heating; control and pressure relief valves for either; low-probability pumps; and connecting piping, shall be located either outdoors or in a *machinery room*.

**Reason:** The modification of the 100 HP power threshold in Item 7 clarifies that this is compressor drive power, which is the terminology used in IAR 2 Section 4.2.3 and ASHRAE 15 Section 7.2.2(g). The change ensures that the drive power for liquid pumps and other motorized equipment attached to the system is not improperly added.

Recognition of low-probability pumps acknowledges the superior leak resistance of these pumps and encourages their use to increase safety. The approach is modeled after the current IMC approach for low-probability systems, as defined in Chapter 2.

Because low-probability systems are inherently more resistant to atmospheric releases than high-probability systems, the IMC permits more widespread use of low-probability systems. With respect to pumps, experience has shown that pump leaks are typically associated with failed seals on rotating (dynamic) parts, which can result in events ranging from a simple nuisance release to a hazardous condition requiring an emergency response. This proposal will encourage the use of pumps that are hermetically sealed or similar in lieu of pumps that rely on dynamic seals to contain refrigerant.

**Cost Impact:** Will not increase the cost of construction

The proposal will not increase the cost of construction because the first portion of the change is a clarification of current provisions, and the second portion of the change is an optional path to compliance. Standard pumps will continue to be permitted when they are located in refrigerant machinery rooms.

M119-15 : 1104.2.2-  
SHAPIRO4766

---

## **Public Hearing Results**

**Committee Action:**

**Approved as Submitted**

**Committee Reason:** Approval was based on the proponent's published reason statements.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Jeffrey Shapiro, representing International Institute of Ammonia Refrigeration (jeff.shapiro@intlcodeconsultants.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Mechanical Code**

#### **SECTION 202 DEFINITIONS**

**LOW-PROBABILITY PUMP.** A pump that ~~does not rely on a dynamic shaft seal as a singular means of containment~~ is designed to prevent atmospheric release of the pumped fluid by one of the following methods: 1. The pump is permanently sealed. 2. The pump incorporates a static seal. 3. The pump incorporates not less than two sequential dynamic shaft seals to isolate the pumped fluid from atmosphere at shaft penetrations and automatically shuts down upon failure of any seal.

**Commenter's Reason:** The definition of low-probability pump is based on correlation with IIAR 2, and the definition in IIAR 2 was updated following approval of M119 in Memphis. This proposal updates the proposed IMC text to maintain correlation between the IMC and IIAR 2.

**M119-15**

---

# M128-15

## 1107.2

### **Proposed Change as Submitted**

**Proponent :** Maureen Traxler, Seattle Dept of Planning & Development, representing Washington Association of Building Officials Technical Code Development Committee (maureen.traxler@seattle.gov)

## **2015 International Mechanical Code**

### **Revise as follows:**

**1107.2 Piping location.** Refrigerant piping that crosses an open space that affords passageway in any building shall be not less than 7 feet 3 inches (2210 mm) above the floor unless the piping is located against the ceiling of such space. Refrigerant piping shall not be placed in any of the following:

1. a fire-resistance-rated exit access corridor.
2. an interior exit stairway.
3. an interior exit ramp.
4. an exit passageway.
5. an elevator, dumbwaiter or other shaft containing a moving object or in any .
6. a shaft that has openings to living quarters one or to means of egress. Refrigerant piping shall not be installed in an enclosed public stairway, more openings into a dwelling unit or sleeping unit.
7. a shaft that has one or more openings into a fire-resistance-rated exit access corridor, interior exit stairway landing or ramp, or means of egress. exit passageway.

**Reason:** The current code prohibits refrigerant piping in "means of egress" and in shafts with openings into "means of egress." The IBC definition is "A continuous and unobstructed path of vertical and horizontal egress travel from any occupied portion of a building or structure to a public way..." In other words, the means of egress includes all occupied spaces in a building, so prohibiting refrigerant piping in the means of egress means it's prohibited almost everywhere. Section 1107.2 is copied from ASHRAE 15 but this proposal gives it a reasonable interpretation that identifies specific locations where refrigerant piping is prohibited, and allows it to be installed in occupied buildings. This proposal is meant as an interpretation of the term "means of egress" as used in the ASHRAE language, without changing the intended meaning of the term.

**Cost Impact:** Will not increase the cost of construction  
This proposal does not increase the cost of construction because it merely interprets an ambiguous term that is in the current code.

M128-15 : 1107.2-  
TRAXLER4752

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The proposal does not address living quarters. The term "exit" could condense items 1 through 4 into a single item. The terminology is

---

**Individual Consideration Agenda**

**Public Comment 1:**

**Proponent : Jeffrey Shapiro, representing International Institute of Ammonia Refrigeration (jeff.shapiro@intlcodeconsultants.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

**2015 International Mechanical Code**

**1107.2 Piping location.** Refrigerant piping that crosses an open space that affords passageway in any building shall be not less than 7 feet 3 inches (2210 mm) above the floor unless the piping is located against the ceiling of such space. Refrigerant piping shall not be placed in any of the following:

1. a fire-resistance-rated exit access corridor.
2. an interior exit stairway.
3. an interior exit ramp.
4. an exit passageway.
5. an elevator, dumbwaiter or other shaft containing a moving object.
6. a shaft that has one or more openings into a ~~dwelling unit or sleeping unit.~~
7. ~~a shaft that has one or more openings into a fire-resistance-rated exit access corridor, interior exit stairway or ramp, or exit passageway.~~

**Commenter's Reason:** The intent of this proposal is primarily to correct an error in the code. When the provisions in Section 1107.2 were first included in the code, the term "means of egress" was used differently. When the code changed to use a 3-part means of egress (exit access, exit and exit discharge), this section should have been updated to correlate, but it was not. The proposal, as modified by this public comment, provides the necessary update and clarifies that regulations for locating refrigerant piping are only intended to apply to the exit portion of the 3-part means of egress (not the exit access or exit discharge).

When this item was discussed by the committee, it was suggested that Items 1-4 of the proposal could be replaced by the term "exit" to simplify the text, but this is not correct because there are some exit components that are not intended to be captured by Items 1-4, such as exterior exits. Although consolidation is nice when possible, the separate items listed in the public comment are necessary to accurately reflect how the code should be applied.

With respect to committee's comments regarding the exclusion of "living quarters" and terminology issues, there was no intent in the original proposal to fix anything other than the "means of egress" concern. Nevertheless, we attempted to deal with this during the discussion, and things became confused, which led to the disapproval recommendation. Upon further consideration, it is clear that the current provisions that prohibit installation of refrigerant piping in shafts serving dwelling or sleeping areas, living quarters, etc. are unnecessary. Refrigerant concentration limits in ASHRAE 15 already limit refrigerant quantities such that a release into the smallest occupied space will not create an acute health risk for occupants. So, such a release into a shaft connecting to an occupied space, which is an even lesser risk than a release directly into a sleeping area, is likewise not a health risk. Thereby this comments recommends a revision to delete the unnecessary text.

## Public Comment 2:

**Proponent : Maureen Traxler, representing Washington Assn of Building Officials Technical Code Committee (maureen.traxler@seattle.gov); Julius Ballanco, JB Engineering and Code Consulting, P.C., representing Self (JBENGINEER@aol.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Mechanical Code**

**1107.2 Piping location.** Refrigerant piping that crosses an open space that affords passageway in any building shall be not less than 7 feet 3 inches (2210 mm) above the floor unless the piping is located against the ceiling of such space. Refrigerant piping shall not be placed in any of the following:

1. a fire-resistance-rated exit access corridor.
2. an interior exit stairway.
3. an interior exit ramp.
4. an exit passageway.
5. an elevator, dumbwaiter or other shaft containing a moving object.
6. ~~a shaft that has one or more openings into a dwelling unit or sleeping unit.~~
7. a shaft that has one or more openings into a fire-resistance-rated exit access corridor, interior exit stairway or ramp, or exit passageway.

**Commenter's Reason:** The primary purpose of this code change proposal was to clarify what is meant by "means of egress." Items 1-4 in the proposal clearly specify which elements of a means of egress are prohibited as locations for refrigerant piping. The Committee suggested that items 1-4 could be collapsed under the term "exit." However, since item

Most of the discussion before the Code Development Committee, however, was about "living quarters" and "dwelling units." Some people said the proposed change in terminology would broaden the restrictions on location of refrigerant piping, while others said the change added clarity. On further consideration, we believe the limitation on location of refrigerant piping in shafts with openings into either living quarters or dwelling and sleeping units is onerous and antiquated.

Ballanco: ASHRAE 15 is currently undergoing revisions to correlate with the Building and Mechanical Code. It was recognized that the text used to describe where refrigerant piping cannot be installed was confusing and inconsistent with Building Code language. This proposed change will clarify where refrigerant piping cannot be installed. The modification cleans up the proposal such that it is consistent with ASHRAE 15.

---

Steel	ASME B16.5; ASME B16.9; ASME B16.11; ASME B16.28; ASTM A 53; ASTM A 106; ASTM A 234; ASTM A 420; ASTM A 536; ASTM A 395; ASTM F 1476; ASTM F 1548

**Add new standard(s) as follows:**

ASSE 1061-2011 Performance Requirements for Push Fit Fittings.

**Reason:** ASSE 1061 Performance Requirements for Push Fit Fittings was originally published in 2006 and referenced in the 2009 IPC. These fittings have been used in the industry for over 15 years.

**Cost Impact:** Will not increase the cost of construction  
Proposal addresses fittings and methods already used in the industry.

**Analysis:** A review of the standard proposed for inclusion in the code, ASSE-1061, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

**Public Hearing Results**

**Committee Action:**

**Approved as Submitted**

**Committee Reason:** Approval was based on the proponent's published reason statements.

**Assembly Action :**

**None**

---

**Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Gary Morgan, representing Viega LLC (gary.morgan@viega.us) requests Approve as Modified by this Public Comment.**

**Further Modify as Follows:**

**2015 International Mechanical Code**

**1203.11 Cross-linked polyethylene (PEX) plastic tubing.** Joints between cross-linked polyethylene plastic tubing and fittings shall conform to Sections 1203.11.1 , 1203.11.2 and ~~1203.11.2~~ 1203.11.3. Mechanical joints shall conform to Section 1203.3.

**1203.11.1 Compression-type fittings.** Where compression-type fittings include inserts and ferrules or O-rings, the fittings shall be installed without omitting the inserts and ferrules or O-rings.

**1203.11.2 Plastic-to-metal connections.** Soldering on the metal portion of the system shall be performed not less than 18 inches (457 mm) from a plastic-to-metal adapter in the same water line.

**1203.11.3 Push-fit Joints.** Push-fit joints that create a seal on the outside diameter of the tubing shall not be used with tubing that has an EVOH oxygen barrier layer.

**1203.16 Raised temperature polyethylene (PE-RT) plastic tubing.** Joints between raised temperature polyethylene tubing and fittings shall conform to Sections 1203.16.1 , ~~1203.16.2~~ and ~~1203.16.2~~ 1203.16.3. Mechanical joints shall conform to Section 1203.3.

**1203.16.1 Compression-type fittings.** Where compression-type fittings include inserts and ferrules or O-rings, the fittings shall be installed without omitting the inserts and ferrules or O-rings.

**1203.16.2 PE-RT-to-metal connections.** Solder joints in a metal pipe shall not occur within 18 inches (457 mm) of a transition from such metal pipe to PE-RT pipe.

**1203.16.3 Push-fit Joints.** Push-fit joints that create a seal on the outside diameter of the tubing shall not be used with tubing that has an EVOH oxygen barrier layer.

**Commenter's Reason:** The proponent of this proposal also proposed a floor amendment to address a concern which exists for using push-to-connect type fittings on hydronic oxygen barrier type PEX and PE-RT tubing containing an EVOH (Ethlene Vinyl Alcohol) layer as the oxygen barrier. The floor modification was a very good one however the technical committee felt that the floor language did not do a good job describing the word "layer" as it pertained specifically to the material of concern in this case the EVOH layer material.

First of all it is widely known and accepted in the hydronics industry that one should never use an OD sealing push-to-connect type fitting on PEX or PE-RT tubing which contains an EVOH layer as the EVOH layer should not be directly exposed to the pressurized water or water/glycol mixture as the EVOH will eventually be dissolved and a potential leak path could allow water to escape between the tube outer wall and the O-Ring seal. All fittings used with EVOH layered PEX or PE-RT hydronic tubing use a fitting design which seals on the ID of the pipe and does not allow the fluid media to come into contact with the EVOH barrier layer.

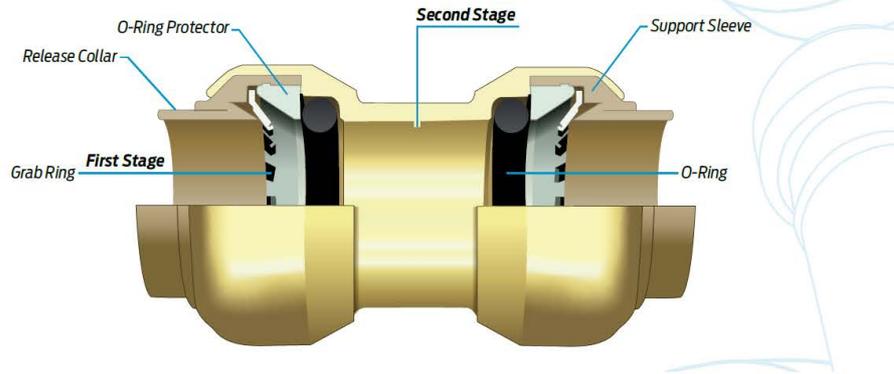

However it is completely appropriate for ASSE 1061 to be included in the hydronics fittings table as there are other pipe types which do not contain an outer EVOH layer (Copper and CPVC) and also there are PEX and PE-RT tubes used without an EVOH layer in systems where no ferrous materials are used. It is for that reason that I am proposing to include the propent's original floor modifications with slight additions describing the layer as one of EVOH material in the sections of the code specific to PEX and PE-RT fittings which would then contain the prohibition from using a OD sealing type push-fitting type joint IF an EVOH layer is present. The original floor modification did not define specifcally the EVOH as the layer material which could be problematic and therefore the technical committee rejected the ammendment because of the unclarity of what it means by "layer". My proposal addresses this concern and that of the original proponent.

Please review the attached illustration document which helps explain exactly the details of what is being discussed here. The first drawing illustration shows what a somewhat typical push-to-connect fitting looks like that uses an O-ring to seal against the outermost surface of the tubing. The second photo illustration shows

what PEX looks like with a typical EVOH outer layer. I appreciate your approval of these proposed ammendments to M137.

Public Comment: Supporting information  
M137-15 : Adding ASSE 1061 Push-fit fittings to TABLE 1202.5  
HYDRONIC PIPE FITTINGS

The SharkBite® connection system uses an advanced push-fit design that works in two stages. When the tube is inserted into the fitting it passes the first stage through a release collar and then through a stainless steel grab ring. The grab ring has teeth that open out and grip onto the tube. At the second stage the tube is pushed through an o-ring protector which aligns the tube. A specially formulated o-ring is then compressed between the wall of the fitting and the tube before the end of the tube reaches the tube stop.

## Proposed Change as Submitted

**Proponent :** Tom Leatherbee, Oklahoma Floodplain Managers Association, representing Oklahoma Floodplain Managers Association (tleatherbee@cityofdelcity.org); Rebecca Quinn, RCQuinn Consulting, Inc., representing on behalf of Federal Emergency Management Agency (rcquinn@earthlink.net)

## 2015 International Property Maintenance Code

**Add new text as follows:**

**301.4 Structures located in flood hazard areas.** For structures located in flood hazard areas as defined in the International Building Code, all costs of all repairs and improvements necessary to bring the exterior and interior of a structure, excluding exterior property, into compliance with the minimum standards of this code shall be included when determining substantial improvement, including all costs related to correcting cited violations.

**Revise as follows:**

**[A] 110.1 General.** The *code official* shall order the *owner* or owner's authorized agent of any *premises* upon which is located any structure, which in the *code official's* or owner's authorized agent judgment after review is (1) so deteriorated or dilapidated or has become so out of repair as to be dangerous, unsafe, insanitary or otherwise unfit for human habitation or occupancy, and such that it is unreasonable to repair the structure, to demolish and remove such structure; or (2) if such structure is capable of being made safe by repairs, to repair and make safe and sanitary, or to board up and hold for future repair or to demolish and remove at the *owner's* option; or (3) where there has been a cessation of normal construction of any structure for a period of more than two years, the *code official* shall order the *owner* or owner's authorized agent to demolish and remove such structure, or board up until future repair; or (4) where structures, if located in flood hazard areas established in the *International Building Code*, are determined to have incurred *substantial damage*, the *code official* shall order the owner to demolish and remove such structure, or board up until future repair. Boarding the building up for future repair shall not extend beyond one year, unless *approved* by the building official.

**Add new definition as follows:**

### SECTION 202 DEFINITIONS

**SUBSTANTIAL DAMAGE.** Damage of any origin sustained by a structure whereby the cost of restoring the structure to its before-damaged condition would equal or exceed 50 percent of the market value of the structure as of the date the code official issues an order pursuant to this code.

### SECTION 202 DEFINITIONS

**SUBSTANTIAL IMPROVEMENT.** Any repair, reconstruction, rehabilitation, alteration, addition or improvement of a building or structure, the cost of which equals or exceeds 50 percent of the market value of the structure before the improvement or repair is started. If the structure has sustained substantial damage, as defined in the International Building Code or the International Existing Building Code, any repairs are considered substantial improvement regardless of the actual repair work performed. For the purpose of this code, the term does not include any alteration of a historic structure provided that the alteration will not preclude the structure's continued designation as a historic structure.

**Reason:** The broad scope and intent of the IPMC can create difficulties for code officials attempting to apply the code to dilapidated structures in flood hazard areas that when those structures are determined to not comply with IPMC provisions intended to ensure public health, safety and welfare. The flood provisions of the IBC, IRC, and IEBC apply to buildings in flood hazard areas if the code official determines that proposed improvements are "substantial improvement" and if the code official determines buildings have incurred "substantial damage. Both terms are defined in the IBC and IEBC and require comparison of costs to market value of the building. Substantial damage may be triggered by damage of any cause. Most damage results from sudden events, such as fire, tornado, earthquake, or flood.

When applied to structures that have been neglected and become dilapidated and unsafe over time, the basic substantial damage and substantial improvement requirements can be undermined by an existing provision in the IBC/IEBC definition of substantial improvement that allows exclusion of costs to correct identified code violations. Once a structure has been cited under the IPMC, it's conceivable that most if not all costs to correct cited conditions could be excluded.

Another aspect of the IBC/IEBC definition for substantial damage is problematic when applied to buildings that have been neglected and become dilapidated and unsafe over time, and that is the determination of market value of the building. When a building is damaged by a sudden event, it is relatively straightforward to determine the market value "before the damage occurred." It is not straightforward when the damage has occurred over time - what date should be used to determine the market value "before the damage occurred"?

This proposal has two objectives: (1) to specify, for substantial damage, the date of the market value is the date the code official issues an order pursuant to the IPMC; and (2) to remove the provision that allows excluding costs to correct cited violations from the substantial improvement determination when an owner proposes repairing a building pursuant to an order issued pursuant to the IPMC.

Section 110.1 is modified by including structures determined to have incurred substantial damage in the list of conditions that warrant an order of demolition or boarding up until future repair. If future repair is pursued by the owner, the substantial damage determination means the repairs would have to bring the building into compliance with the flood provisions in the IBC or IRC, as applicable. One result of this change is that many more owners are likely to consider demolition, in which case replacement structures would have to comply with all requirements of the IBC/IRC, resulting in all the benefits associated with compliance (resistance to all loads, improved fire safety, energy efficiency, etc.).

Section 202 is modified by adding definitions for Substantial Damage and Substantial Improvement; however, both definitions differ from those in the IBC and IEBC. The proposed definition of Substantial Damage makes clear that the market value of the structure is the date of the code official's order pursuant to the IPMC, avoiding an ambiguity. Without this clarification, an owner may claim the market value should be the value of the building before maintenance starting being neglected, which could be many years in the past (and typically not easy to determine). The proposal to specify the market value as of the date of an order is likely be a higher market value (thus raising the 50% threshold) than the market value as of the date an application for a permit to perform repairs is received (which may be a year or more after the citation is issued), as recommended in FEMA guidance in Section 4.5 of FEMA's Substantial Improvement/ Substantial Damage Desk Reference (FEMA P-758).

The proposed definition of Substantial Improvement removes the provision that allows exclusion of certain costs, thus requiring the costs of all work to be included in the calculation.

Section 301 is modified by adding a new section with plain language that makes it clear all interior and exterior costs are included when Substantial Improvement is determined, and emphasizes that all costs of all repairs and improvements necessary to correct existing cited violations must be included.

Without these amendments, dilapidated and unsafe buildings in flood hazard areas might not trigger the substantial improvement and substantial damage requirements, and thus could be repaired and remain vulnerable to future flooding. In many communities, many buildings that are cited under the IPMC are low income housing. If allowed to remain at-risk of flooding, people who have few resources to recover loss of personal property will remain exposed to flooding.

The combined result of these amendments is to strengthen the applicability of the IPMC as it relates to structures in flood hazard areas by identifying substantial damage as a trigger for a demolition order, removing ambiguity with regard to determining market value for substantial damage determinations, and eliminating an enforcement problem created by the exclusion of some repair costs from the substantial improvement calculation.

A real-life example illustrates the difficulties that will be easier to address if this proposal is approved. A code official was faced with ordering demolition of a dilapidated apartment complex that had been damaged by flooding and left unrepaired for several years (see Figure). The code official, pursuant to the IBC and the community's floodplain management regulations, determined that the structures were substantially damaged. The code official concurrently issued a demolition order pursuant to Section 110 of the IPMC, as the structures were unsafe, insanitary, and unreasonable to repair. This demolition order cited specific exterior and interior conditions in making these determinations. Subsequent application for a remodel permit was denied because the work proposed was determined to be substantial improvement, and the applicant did not propose bringing the building into compliance with the flood requirements. On appeal, the property owner challenged the substantial damage/substantial improvement determinations because virtually all of the proposed repairs would be to correct cited violations of the IPMC, and thus the applicant claimed those costs should be excluded from the determination.

Had the code official's order to demolish or bring the building into compliance been overturned, the apartment buildings could have been repaired in a manner that left them at continued risk for flooding, contrary to the intent of IBC 1612 and local flood damage prevention regulations. These specific buildings, as a result of a somewhat unrelated proceeding, were eventually demolished and the land redeveloped with commercial buildings that incorporate significant flood mitigation measures.

Figure. Interior Condition at Kristie Manor Apartments at time of Demolition Order and Substantial Damage Declaration. The buildings had flooded multiple times, each time experiencing further deterioration. Note the high water mark and mold. Had the apartment buildings been repaired without bringing it into compliance with the flood requirements, the structures and occupants would have remained at risk for this sort of damaging and life-threatening flooding due to their location in a floodway.

**Bibliography:** Substantial Improvement/Substantial Damage Desk Reference, FEMA P-758. Federal Emergency Management Agency. 2010.  
<http://www.fema.gov/library/viewRecord.do?id=4160>

**Cost Impact:** Will not increase the cost of construction  
 The effect on costs will vary on a case-by-case basis. There are scenarios where demolishing and rebuilding fully compliant will likely be less expensive than retrofitting or elevating an existing building to bring it into compliance with the flood requirements. Long-term maintenance and operations cost would also be less, and the cost of NFIP flood insurance will be considerably lower. Costs may increase in other scenarios, especially when Substantial Improvement is triggered because costs to correct existing cited violations are not subtracted, although the cost of NFIP flood insurance will be considerably lower than if the building remains at risk to flooding.

PM1-15 : 301.4 (New)-  
 LEATHERBEE4956

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The committee felt this change would create a conflict with the IBC and IEBC with regard to the proposed definitions. Also, the definition of substantial improvement is not used as a trigger for any requirements it is only mentioned when calculating costs. The committee also has concerns about the limiting language that would require the property to be boarded up rather than secured against unlawful entry.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### **Public Comment 1:**

**Proponent : Tom Leatherbee, Oklahoma Floodplain Managers Association, representing Oklahoma Floodplain Managers Association (tleatherbee@cityofdelcity.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Property Maintenance Code**

#### **SECTION 202 DEFINITIONS**

~~**SUBSTANTIAL IMPROVEMENT.** Any repair, reconstruction, rehabilitation, alteration, addition or improvement of a building or structure, the cost of which equals or exceeds 50 percent of the market value of the structure before the improvement or repair is started. If the structure has sustained substantial damage, as defined in the International Building Code or the International Existing Building Code, any repairs are considered substantial improvement regardless of the actual repair work performed. For the purpose of this code, the term does not include any alteration of a historic structure provided that the alteration will not preclude the structure's continued designation as a historic structure.~~

#### **SECTION 202 DEFINITIONS**

~~**SUBSTANTIAL DAMAGE.** Damage of any origin sustained by a structure whereby the cost of restoring the structure to its before damaged condition would equal or exceed 50 percent of the market value of the structure as of the date the code official issues an order pursuant to this code.~~

**301.4 Structures located in flood hazard areas.** For structures located in flood hazard areas as defined in the International Building Code, all costs of all repairs and improvements necessary to bring the exterior and interior of a structure, excluding exterior property, into compliance with the minimum standards of this code shall be included when determining substantial improvement and substantial damage, including all costs related to correcting ~~existing and identified~~ violations. The market value of the structure on the date the code official issues and initial notice of violation or order shall be the market value used to make the substantial improvement or substantial damage determination.

**[A] 110.1 General.** The *code official* shall order the *owner* or owner's authorized agent of any *premises* upon which is located any structure, which in the *code official's* or owner's authorized agent judgment after review is (1) so deteriorated or dilapidated or has become so out of repair as to be dangerous, unsafe, insanitary or otherwise unfit for human habitation or occupancy, and such that it is unreasonable to repair the structure, to demolish and remove such structure; or (2) if such structure is capable of being made safe by repairs, to repair and make safe and sanitary, or to board up and hold for future repair or to demolish and remove at the *owner's* option; or (3) where there has been a cessation of normal

construction of any structure for a period of more than two years, the *code official* shall order the *owner* or owner's authorized agent to demolish and remove such structure, or board up until future repair; ~~or (4) where structures, if located in flood hazard areas established in the *International Building Code*, are determined to have incurred *substantial damage*, the *code official* shall order the owner to demolish and remove such structure, or board up until future repair.~~ Boarding the building up for future repair shall not extend beyond one year, unless *approved* by the building official.

**Commenter's Reason: Reason:** The broad scope of and intent of the IPMC can create difficulties for code officials attempting to apply the code to dilapidated structures in flood hazard areas when those structures are determined to not comply with IPMC provisions intended to ensure public health, safety and welfare. The original code change proposal sought to address these difficulties in multiple ways . The Committee was concerned that the original proposal created a conflict with definitions found in the IBC and IEBC. This Comment removes the definitions, thus relying on the definitions in the IBC and IEBC, while retaining the exclusionary value language that is critical to ensuring that the cost of repairs associated with violations identified under the IPMC are included in determining substantial improvement and substantial damage. Further, the exclusionary language is combined with language creating a valuation date that provides clarity for both the Code Official and the property owner. This comment also modifies the original proposal's use of the word cited, replacing it with "existing and identified", which is more consistent with the language found within the code and within the IBC. This comment restores Section 110.1 to its original language. Without the adoption of this comment, due to the nature of the IPMC and its inherently broad scope, the substantial damage and substantial improvement provisions in the IBC can be effectively undermined whenever a notice of violation or order is issued for affected structures in flood hazard areas.

---

PM1-15

# PM4-15

## 304.1.1, 305.1.1, 306.1.1

### Proposed Change as Submitted

**Proponent :** David Bonowitz, David Bonowitz, S.E., representing Existing Buildings Subcommittee, National Council of Structural Engineers Associations (dbonowitz@att.net)

## 2015 International Property Maintenance Code

### Revise as follows:

**304.1.1 Unsafe conditions.** ~~The following~~  
~~Unsafe~~ conditions shall be determined as unsafe and shall be repaired or replaced to comply in compliance with the ~~International Building Code~~ or the ~~International Existing Building Code~~ as required for existing buildings:

- ~~1. The nominal strength of any structural member is exceeded by nominal loads, the load effects or the required strength;~~
- ~~2. The anchorage of the floor or roof to walls or columns, and of walls and columns to foundations is not capable of resisting all nominal loads or load effects;~~
- ~~3. Structures or components thereof that have reached their limit state;~~
- ~~4. Siding and masonry joints including joints between the building envelope and the perimeter of windows, doors and skylights are not maintained, weather resistant or water tight;~~
- ~~5. Structural members that have evidence of deterioration or that are not capable of safely supporting all nominal loads and load effects;~~
- ~~6. Foundation systems that are not firmly supported by footings, are not plumb and free from open cracks and breaks, are not properly anchored or are not capable of supporting all nominal loads and resisting all load effects;~~
- ~~7. Exterior walls that are not anchored to supporting and supported elements or are not plumb and free of holes, cracks or breaks and loose or rotting materials, are not properly anchored or are not capable of supporting all nominal loads and resisting all load effects;~~
- ~~8. Roofing or roofing components that have defects that admit rain, roof surfaces with inadequate drainage, or any portion of the roof framing that is not in good repair with signs of deterioration, fatigue or without proper anchorage and incapable of supporting all nominal loads and resisting all load effects;~~
- ~~9. Flooring and flooring components with defects that affect serviceability or flooring components that show signs of deterioration or fatigue, are not properly anchored or are incapable of supporting all nominal loads and resisting all load effects;~~
- ~~10. Veneer, cornices, belt courses, corbels, trim, wall facings and similar decorative features not properly anchored or that are anchored with connections not capable of supporting all nominal~~

- loads and resisting all load effects;
11. ~~Overhang extensions or projections including, but not limited to, trash chutes, canopies, marquees, signs, awnings, fire escapes, standpipes and exhaust ducts not properly *anchored* or that are *anchored* with connections not capable of supporting all nominal loads and resisting all load effects;~~
  12. ~~Exterior stairs, decks, porches, balconies and all similar appurtenances attached thereto, including *guards* and handrails, are not structurally sound, not properly *anchored* or that are *anchored* with connections not capable of supporting all nominal loads and resisting all load effects; or~~
  13. ~~Chimneys, cooling towers, smokestacks and similar appurtenances not structurally sound or not properly *anchored*, or that are anchored with connections not capable of supporting all nominal loads and resisting all load effects.~~

**Exceptions:**

1. Where substantiated otherwise by an *approved* method.
2. Demolition of unsafe conditions shall be permitted where *approved* by the *code official*.

**305.1.1 Unsafe conditions.** ~~The following Unsafe conditions shall be determined as unsafe and shall be repaired or replaced to comply in compliance with the *International Building Code* or the *International Existing Building Code* as required for existing buildings:~~

1. ~~The nominal strength of any structural member is exceeded by nominal loads, the load effects or the required strength;~~
2. ~~The anchorage of the floor or roof to walls or columns, and of walls and columns to foundations is not capable of resisting all nominal loads or load effects;~~
3. ~~Structures or components thereof that have reached their limit state;~~
4. ~~Structural members are incapable of supporting nominal loads and load effects;~~
5. ~~Stairs, landings, balconies and all similar walking surfaces, including *guards* and handrails, are not structurally sound, not properly *anchored* or are *anchored* with connections not capable of supporting all nominal loads and resisting all load effects;~~
6. ~~Foundation systems that are not firmly supported by footings are not plumb and free from open cracks and breaks, are not properly *anchored* or are not capable of supporting all nominal loads and resisting all load effects.~~

**Exceptions:**

1. Where substantiated otherwise by an *approved* method.
2. Demolition of unsafe conditions shall be permitted when *approved* by the *code official*.

**306.1.1 Unsafe conditions.** ~~Where any of the following conditions cause the component or system to be beyond its limit state, the component or system shall be determined as unsafe~~  
Unsafe components and systems shall be repaired or replaced to comply in compliance with the *International Building Code* or the *International Existing Building Code*

*Building Code* ~~as required for existing buildings:~~

- ~~1. Soils that have been subjected to any of the following conditions:
  - ~~1.1. Collapse of footing or foundation system;~~
  - ~~1.2. Damage to footing, foundation, concrete or other structural element due to soil expansion;~~
  - ~~1.3. Adverse effects to the design strength of footing, foundation, concrete or other structural element due to a chemical reaction from the soil;~~
  - ~~1.4. Inadequate soil as determined by a geotechnical investigation;~~
  - ~~1.5. Where the allowable bearing capacity of the soil is in doubt; or~~
  - ~~1.6. Adverse effects to the footing, foundation, concrete or other structural element due to the ground water table.~~~~
- ~~2. Concrete that has been subjected to any of the following conditions:
  - ~~2.1. Deterioration;~~
  - ~~2.2. Ultimate deformation;~~
  - ~~2.3. Fractures;~~
  - ~~2.4. Fissures;~~
  - ~~2.5. Spalling;~~
  - ~~2.6. Exposed reinforcement; or~~
  - ~~2.7. Detached, dislodged or failing connections.~~~~
- ~~3. Aluminum that has been subjected to any of the following conditions:
  - ~~3.1. Deterioration;~~
  - ~~3.2. Corrosion;~~
  - ~~3.3. Elastic deformation;~~
  - ~~3.4. Ultimate deformation;~~
  - ~~3.5. Stress or strain cracks;~~
  - ~~3.6. Joint fatigue; or~~
  - ~~3.7. Detached, dislodged or failing connections.~~~~
- ~~4. Masonry that has been subjected to any of the following conditions:
  - ~~4.1. Deterioration;~~
  - ~~4.2. Ultimate deformation;~~
  - ~~4.3. Fractures in masonry or mortar joints;~~
  - ~~4.4. Fissures in masonry or mortar joints;~~
  - ~~4.5. Spalling;~~
  - ~~4.6. Exposed reinforcement; or~~
  - ~~4.7. Detached, dislodged or failing connections.~~~~
- ~~5. Steel that has been subjected to any of the following conditions:
  - ~~5.1. Deterioration;~~
  - ~~5.2. Elastic deformation;~~
  - ~~5.3. Ultimate deformation;~~
  - ~~5.4. Metal fatigue; or~~
  - ~~5.5. Detached, dislodged or failing connections.~~~~
- ~~6. Wood that has been subjected to any of the following conditions:
  - ~~6.1. Ultimate deformation;~~
  - ~~6.2. Deterioration;~~
  - ~~6.3. Damage from insects, rodents and other vermin;~~
  - ~~6.4. Fire damage beyond charring;~~~~

- ~~6.5. Significant splits and checks;~~
- ~~6.6. Horizontal shear cracks;~~
- ~~6.7. Vertical shear cracks;~~
- ~~6.8. Inadequate support;~~
- ~~6.9. Detached, dislodged or failing connections; or~~
- ~~6.10. Excessive cutting and notching.~~

**Exceptions:**

1. Where substantiated otherwise by an *approved* method.
2. Demolition of unsafe conditions shall be permitted where *approved* by the *code official*.

**Reason:** This proposal corrects errors and removes duplication in the IPMC of provisions already covered more appropriately in the IBC and IEBC.

Unsafe conditions are rare and represent extreme situations. As such, they are outside the general scope (see Section 101.2) and intent (101.3) of the IPMC. Rather, they are more properly addressed by the IBC and IEBC, which already define unsafe conditions to include "inadequate maintenance" and provide remedial administrative procedures (IBC Section 116, IEBC Section 115). In fact, the IPMC relies on the IEBC definitions of unsafe and dangerous, as it does not provide its own definitions in Chapter 2.

Thus, unsafe conditions need only be mentioned in the IPMC to note that they are unacceptable and must be eliminated, which is what this proposal would say. Otherwise, the current listings of specific unsafe conditions are duplicative, often unenforceable, outside the scope of a maintenance code, and in many cases just wrong.

Consider the many references in these three sections to structural elements and their resistance to "nominal loads" and "all load effects." Nominal loads include full Wind and Earthquake loads. Applying these provisions as currently written would cause every building more than about 20 years old to be labeled dangerous and unsafe even in the absence of deterioration or damage. Further, by referencing structural loads and capacities, simple implementation of the IPMC would require regular assessment by a structural engineer, which is certainly beyond the code's intent.

Consider the many references to structural "soundness." This term is undefined and unenforceable. Provisions requiring structurally sound conditions were removed from the IBC and IEBC for this reason over the last several code cycles.

Consider the several references to a component's "limit state." These references are inappropriate because, as defined in the IBC, there are multiple possible limit states. Merely exceeding a serviceability limit state (especially as contemplated by Section 306.1.1) almost never makes a building or component unsafe.

Consider the many references to deterioration. Deterioration is indeed a sign that maintenance is needed, but it is not a reason to label a building or component unsafe. Similarly, corrosion, elastic deformation, spalling, and cracks (especially as listed in Section 306.1.1) are often normal and are not of themselves reason to label a building or component unsafe. (The IEBC definition of unsafe includes "inadequate maintenance," meaning "not enough to maintain health, safety, and welfare," not merely non-compliant or imperfect maintenance.)

Despite the deletion of these long lists, the proposal results in no loss of substance. As noted, unsafe conditions are already defined and addressed in the IEBC. More specifically, each of the items proposed for deletion is already covered elsewhere in the IPMC. Considering the list in Section 304.1.1:

- Items 1, 2, 3, 5, 6, and 7 address structural elements and thus are already covered by the IEBC and IBC definition of dangerous.
- Item 4 is addressed in Section 304.6.
- Item 8 is addressed in Section 304.7.

- Item 9 does not even belong in Section 304 but is addressed in Section 305.4
- Item 10 is addressed in Section 304.8.
- Item 11 is addressed in Section 304.9.
- Item 12 is addressed in Section 304.10.
- Item 13 is addressed in Section 304.11.

Considering the list in Section 305.1.1: Items 1 through 6 address structural elements and thus are already covered by the IBC and IEBC definition of dangerous. Item 5 is additionally addressed by Section 305.4.

Considering the list in Section 306.1.1: Items 1 through 6 address components in terms of their structural materials and properties and thus are already covered by the IBC and IEBC definition of dangerous.

Finally, in addition to removing the inappropriate lists, the proposal requires compliance only with the IEBC, not the IBC, because the IPMC by definition relates to existing buildings, and the IBC no longer has existing building provisions for repair or removal of unsafe conditions.

If approved, a coordinated proposal will be made in Group B to address further duplication and overlap in IPMC Section 108.

**Cost Impact:** Will not increase the cost of construction  
The proposal merely removes duplicate provisions already found in other applicable codes.

PM4-15 : 304.1.1-  
BONOWITZ5207

## **Public Hearing Results**

**Committee Action:** **Disapproved**

**Committee Reason:** Similar to PM3, the committee felt that the proposal would remove a useful tool for enforcement to remedy unsafe conditions. The IEBC is not triggered until the items on the list are discovered. The committee feels the list needs to be revised to eliminate any conflicts with the IEBC, but the list need to remain. Also, this proposal will limit repairs to the IEBC and would not permit repairs by the IBC.

**Assembly Action :** **None**

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : David Bonowitz, David Bonowitz, S.E., representing Existing Buildings Committee, National Council of Structural Engineers Associations. (dbonowitz@att.net) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

## **2015 International Property Maintenance Code SECTION 202 DEFINITIONS**

**DANGEROUS.** Any building, structure or portion thereof that meets any of the conditions described below shall be deemed dangerous:

1. The building or structure has collapsed, has partially collapsed, has moved off its foundation, or lacks the necessary support of the ground.
2. There exists a significant risk of collapse, detachment or dislodgement of any portion, member, appurtenance or ornamentation of the building or structure under service loads.

## SECTION 202 DEFINITIONS

**UNSAFE.** Buildings, structures or equipment that are unsanitary, or that are deficient due to inadequate means of egress facilities, inadequate light and ventilation, or that constitute a fire hazard, or in which the structure or individual structural members meet the definition of "Dangerous," or that are otherwise dangerous to human life or the public welfare, or that involve illegal or improper occupancy or inadequate maintenance shall be deemed unsafe. A vacant structure that is not secured against entry shall be deemed unsafe.

### **Commenter's Reason:**

Each and every sentence in the committee's reason for disapproval is demonstrably false, incorrect, or illogical:

1. "[PM 4] would remove a useful tool for enforcement to remedy unsafe conditions." No, it wouldn't. The current tool is a provision that says unsafe conditions must be repaired using the IEBC. PM 4 would say exactly the same thing, but would properly rely on the IEBC for its consistent definition of "unsafe." Having three unenforceable, incorrect, and duplicative laundry lists of non-conforming (NOT unsafe) conditions does not give the IPMC any more of a tool than the IEBC already provides. On the contrary, its many errors and misjudgments could tie the hands of building officials, reducing their discretion.

2. "The IEBC is not triggered until the terms on the list are discovered." This is a true statement, but it has nothing to do with PM 4, which does not affect this logic at all. First, you discover apparently unsafe conditions, then you repair them. PM 4 merely refers the user, properly, to the definition of "unsafe" in the IEBC -- consistent with IPMC section 201.3.

3. "The committee feels the list needs to be revised to eliminate conflicts with the IEBC, but the list need [sic] to remain." Eliminating conflicts is exactly what PM 4 would do; it is the list itself that represents the conflict. The way to eliminate conflicts is to follow the general practice of all the I-codes, including IPMC 201.3, and use consistent terms and definitions throughout. Retaining three separate lists like those addressed by PM 4 violates this principle and makes the IPMC laughably unenforceable.

HAVING SAID THAT, if IPMC users really feel that a list of unsafe conditions is needed, it happens that just such a list is already available: It is the existing definition of Unsafe, straight from the IEBC. Referencing this list of unsafe conditions in the IPMC achieves the committee's goal. By ICC standard practice, and as stipulated already in IPMC section 201.3, it is not strictly necessary to repeat definitions from one code to another. However, if the committee wants the convenience of having a list of unsafe conditions printed right in the IPMC, it can get there by simply approving this public comment and adding the two definitions as shown. (Only the definition of Unsafe is really needed here. The definition of Dangerous is included only because the definition of Unsafe refers to it, so for similar convenience it should be included in the IPMC as well.)

Members will notice that the definition of Unsafe already includes "inadequate maintenance." Thus, the current definitions give the code official all the discretion he or she needs, without having to list, in three separate places, all sorts of conditions that are not about maintenance, are not necessarily unsafe at all, and that ultimately tie the code official's hands and reduce the IPMC's credibility. (Please see the original PM 4 reason statement for details.)

4. "This proposal will limit repairs to the IEBC and would not permit repairs by the IBC." This statement refers to the fact that PM 4 deletes the reference to the IBC because the IBC no longer covers repair. Contrary to the committee's reason, IBC Section 101.4.7 and Chapter 34 refer themselves to the IEBC for repair. If the IPMC is to be taken seriously, it must keep its provisions and coordination with other codes current.

Additionally, misleading testimony in opposition was given at the hearings. An opponent read from the definition of Dangerous to show that it was not as broad as the listed items PM 4 proposes to delete. This was misleading because PM 4 refers to the IEBC definition of Unsafe, which is far broader than the definition of Dangerous and encompasses the scope of the IPMC's lists -- only without their errors and inconsistencies. But because the misleading testimony was given in re-rebuttal, it could not be corrected by the proponent.

We refer members to the original PM 4 reason statement for a detailed accounting of where the current IPMC text is incorrect, and why deleting these lists will result in no loss of substance to the IPMC and no loss of code "tools" for the building official. The text proposed by PM 4 for deletion is commentary at best, error-filled at worst. Leaving it in the IPMC, contrary to the existing defined terms already cited by IPMC 201.3, makes the IPMC meaningless, if not harmful, to effective building regulation.

The IPMC committee's reasoning is 100% wrong. If the IPMC won't maintain this code, they're making the work of ICC members that much harder. If they won't do the job, you can do it for them by overturning the committee and approving PM 4 EITHER As Submitted or As Modified by this public comment.

---

**PM4-15**

# PM5-15

**505.4, 505.5 (New), 505.6 (New), 505.7 (New), 505.8 (New)**

## **Proposed Change as Submitted**

**Proponent :** Ronald George, Plumb-Tech Design & Consulting, www.Plumb-TechLLC.com, www.ScaldPrevention.org, representing Self; Plumb-Tech Design & Consulting Services LLC; www.ScaldPrevention.org (Ron@Plumb-TechLLC.com)

## **2015 International Property Maintenance Code**

**Revise as follows:**

**505.4 Water heating facilities.** Water heating facilities shall be properly installed, maintained and capable of providing an adequate amount of hot or tempered water to be drawn at every required sink, lavatory, bathtub, shower and laundry facility ~~at a minimum temperature of 110°F (43°C).~~ A gas-burning water heater shall not be located in any *bathroom, toilet room, bedroom* or other occupied room normally kept closed, unless adequate combustion air is provided. An *approved* combination temperature and pressure-relief valve and relief valve discharge pipe shall be properly installed and maintained on water heaters.

**Add new text as follows:**

### **505.5 Maximum Hot Water Temperatures**

1. The maximum hot water temperature flowing from any kitchen sink faucet shall be 130 degrees Fahrenheit.
2. The maximum hot water temperature flowing from a lavatory faucet, shower head, bathtub filler faucet bathtub/shower combination, or whirlpool bathtub filler faucet shall be 120 degrees Fahrenheit (48.8 degrees Celcius).
3. The maximum temperature flowing from a bidet faucet shall be 110 degrees Fahrenheit (43 degrees Celcius)
4. The burner control thermostat on the water heater shall not be used to control the hot water distributiou temperature for conformance to the above hot water temperature limit requirements.

### **505.6 Minimum Hot or Tempered Water Temperatures**

1. The water temperature flowing from a lavatory shall be capable of reaching a minimum of at least 85 degrees Fahrenheit.
2. The water temperature flowing from a kitchen sink shall be capable off reaching a minimum of at least 120 degrees F.
3. The water temperature flowing from a shower, tub/shower, bathtub or whirlpool bathtub shall be capable of reaching a minimum of at least 110 degrees F.
4. The water temperature flowing from a shower, tub/shower, bathtub or whirlpool bathtub shall be capable of reaching a

minimum of at least 110 degrees F.

**505.7 Water Heater Replacement - Capacity** When a water heater is replaced, it shall be replaced with a water heater of the same delivery capacity in gallons per hour. When Calculating gallons per hour the temperature rise shall be based on the same temperature rise as the prior heater. If no temperature rise is known, the temperature rise shall be based on a 100 degree rise.

**Exception:** Where the water heater manufacturer's sizing calculations or other published water heater sizing calculations show the first hour delivery capacity of the selected water heater is adequate for the installation.

**505.8 Water Heater Replacement or system temperature changes** When a water heater is added, replaced, serviced or adjusted or if a temperature actuated mixing vale serving the hot water distribution system is adjusted, the distribution system temperatures checked to verify the temperaturrees do not exceed the limits prescribed in section 505.5 to minimize the risk of scalding.

The existing domestic hot water system shall be checked to verify if the existing shower valve and/or combination tub/shower valve has a code compliant pressure or temperature compensating type, anti-scald shower valve with a maximum temperature limit-stop adjustment conforming to ASSE 1016/ASME A112.1016/CSA B125.16, Performance requirements for automatic compensating valves for individual showers and tub/shower combinations. After the water heater has been installed and the thermostat has been adjusted to the recommended temperature and allowed to heat up until the burner shuts off, or after a thermostatic mixing valve is adjusted to a new temperature, check and adjust the maximum temperature limit-stop on every shower and tub/shower combination valve to limit the hot water temperature to a maximum of 120 Fahrenheit for scald protection. Also, adjust the outlet temperature of each point-of-use, in-line temperature limiting valve serving bathtubs, whirlpool bathtubs, or lavatories in accordance with the manufacturer's installation instructions to limit the hot water temperature to a maximum of 120 Fahrenheit for scald protection.

The thermostat on the water heater shall not be used to control the hot water distribution temperature for scald protection.

If a non-code compliant shower or tub/shower valve is present, one of more of the following methods shall be provided in the domestic hot water system to minimize the risk of scalding:

1. Replace non-code compliant shower or tub/shower valves with a code compliant shower valve conforming to ASSE 1016/ASME A112.1016/CSA B125.16, Performance requirements for automatic compensating valves for individual showers and tub/shower combinations shall be installed with the temperature limit stop adjusted in accordance with the manufacturers installation instructions to limit the hot water temperature to a maximum of 120 degrees Fahrenheit to minimize the risk of scalding. or
2. Provide a Master Temperature Actuated Mixing Valve conforming to ASSE 1017 Temperature Actuated Mixing Valve for Hot Water

- Distribution Systems at the water heater to limit the hot water temperature to a maximum of 120 degrees Fahrenheit to minimize the risk of scalding.or
3. Provide a water temperature limiting valve at or near each fixture outlet used for bathing or showering in accordance with the requirements of ASSE 1070 Water Temperature Limiting Devices located near the non-code compliant bathtub/shower or bathtub fixtures to limit the hot water temperature to a maximum of 120 degrees Fahrenheit to minimize the risk of scalding. or
  4. Provide a Temperature Actuated, Flow Reduction (TAFR) valve conforming to ASSE 1062 Temperature Actuated, Flow Reduction (TAFR) Valves for Individual Supply Fittings at the shower head and at the tub fillerspout where a combination tub/shower fixture is installed and for any other fixtures used for bathing or showering to limit the hot water temperature to a maximum of 120 degrees Fahrenheit to minimize the risk of scalding

**Add new standard(s) as follows:**

ASSE 1016-2011/ASME A112.1016-2011/CSA B125.16-2011 Automatic Compensating Valves for Individual Shower & Tub/Shower Combinations

ASSE 1017-2010 Temperature Actuated Mixing Valves for Hot Water Distribution Systems

ASSE 1062-2006 Temperature Actuated, Flow Reduction (TAFR) Valves for Individual Supply Fittings

ASSE 1070-2004 Water Temperature Limiting Devices

**Reason:** There is currently no provisions in the code to require unsafe existing plumbing installations to where scalding is a hazard. Hundreds of people are scalded each year where non-code compliant (Two-handle) shower valves are installed. This code change is iintended to address this and other hot water scald hazards in existing installations.

**What are safe hot water temperatures?**

By Ron George  
President, Ron George Design & Consulting Services  
Plumbing Engineer Magazine Aug 2009

I am often asked, "What is a safe hot water temperature for domestic hot water?" If you read the model codes, it states the maximum hot water temperature for a shower or bathtub is 120 degrees Fahrenheit. If you read the warning labels on the side of most water heaters the maximum hot water temperature is 120 degrees Fahrenheit on some labels and 125 degrees Fahrenheit on other labels. The 125 degree limit probably allows for some temperature loss before the hot water gets to the fixtures. Most water heater literature and warning labels mention the availability of thermostatic mixing valves or automatic temperature compensating valves and they recommend their use. If you look at many of the industry standards for shower mixing valves, they state the valves must have limit stops that are adjustable to limit the maximum hot water temperature to 120 degrees Fahrenheit. The testing in the standards gives test criteria for testing the shower valves to these limits.

I have served on the working groups for several plumbing industry standards committees for temperature actuated mixing valves and shower valves and it is generally agreed that 120 degrees is the maximum, safe hot water temperature. I also have served on hot water system design standards committees where the participants had agreed that maximum domestic hot water temperature from

plumbing fixtures used for bathing and washing purposes should be 120 degrees Fahrenheit. There were a few exceptions for bidets, sitz baths and whirlpool tubs that had temperatures lower than 120 degrees Fahrenheit for the recommended maximum temperatures to prevent scalding. It also should be noted that some other uses like commercial dishwashers and laundries may need temperatures higher than 120 degrees Fahrenheit. There were two temperatures discussed for each fixture during the design standard meetings. One was the "use temperature" and the other was "the maximum temperature" to prevent scalding.

It's generally agreed that 120 degrees Fahrenheit is the maximum safe hot water temperature that should be delivered from a fixture. Therefore hot water above 120 degrees Fahrenheit can be considered hazardous. Model codes address this in various plumbing code sections...

...The codes generally agree if there is a hazardous condition or a condition that is unsafe or a nuisance to life, health and property it should be corrected but in the existing building code and property maintenance code there is little guidance. It is also generally agreed that water above 120 degrees Fahrenheit at fixtures for bathing and washing with a few exceptions for lower temperatures can be considered dangerous and proper precautions should be taken to prevent the hot water from being a scalding hazard by using the proper safety devices.

When I hear about people setting their water heater to 120 degrees Fahrenheit to prevent scalding, I know they have good intentions, but most people do not know you cannot accurately control the hot water temperature leaving a water heater with the thermostat dial.

### **Maximum Hot Water Temperature to Prevent Scalding**

I have served on many industry committees dealing with hot water system code requirements, hot water system design standards and product standards related to domestic hot water systems devices for temperature control and scald prevention. There has been consensus in all of these committees that the maximum safe hot water delivery temperature for a shower or bathtub is 120 degrees Fahrenheit to prevent scalding with a few exceptions for lower temperatures for bidets and emergency eye wash fixtures. (See the attached Figure 1 - Hot Water Scald Burns - Time vs Temperature Relationship for Second and Third Degree Burns for Adults and Children)

There were discussions in a plumbing code ad-hoc committee on temperature limits for the hot water system where everyone agreed the maximum safe temperature was 120 F. The ASPE Hot water committee dealing with a proposed standard for temperature limits in hot water systems also agreed the maximum safe hot water temperature to prevent scalding is 120 Fahrenheit. Several ASSE working groups that I have served on dealing with hot water temperature controls have all have discussed the reaction time of bathers and they have taken into consideration that children, the elderly and people with disabilities usually take longer to get out of harm's way if the water suddenly gets hot and they agreed 120 Fahrenheit is the maximum safe hot water temperature that a valve should deliver. At 120 F it takes about 80 seconds to develop a second degree burn in a child and it takes about 8 minutes to develop a second degree burn in an adult. (See Figure 1) The 120 Degree F temperature limit gives bathers or users an adequate amount of time to get out of harm's way before an irreversible scald burn injury can occur. Each of these committees looked back to the data that was the result of burn studies done by Dr. Moritz and Dr. Henrique's at Harvard Medical College in the 1940s. The burn studies were done using baby pigs that had skin thicknesses similar to that of adult males. The studies exposed the pig's skin to various temperatures of hot water for various periods of time and the severity of the burns were studied and recorded. These were the studies used to develop the time and temperature exposure charts. There have been numerous white papers, seminars, and reports since then discussing the fact that burns can occur quicker than those recorded in the Moritz & Henrique's studies for adult males. The skin is thinner for children and the elderly and the amount of time to receive an irreversible 2nd degree burn injury is less because their skin is thinner. Many of the white papers use the Moritz and Dr. Henrique's original burn studies and they use a ratio of the skin thickness to come up with burn

times for thinner skin of children and the elderly. Children, the elderly and handicapped are also slower to react because it takes them more time to realize what is happening and try to react to get out of harm's way. Someone once told me an apartment complex was not intended for children or the elderly. I said everyone grows old and children often come visit so we need to consider prevention of scalds to children, the elderly and people with disabilities more so than burns to adults because burns can occur quicker for those groups.

### **The PIEV Theory for Reaction Time**

There is a PIEV theory relates to reaction time. The PIEV theory is most commonly used to address braking distance in automobile accidents. It addresses the amount of time it takes a driver to sense a problem and decide to react, then the reaction time is added to the braking time for the total distance that a car travels before stopping. The PIEV theory can also apply to reaction times for a bather with respect to hot water scalds.

PIEV relates to the amount of time it takes a person to react to a hazard. PIEV means - Perception, Intellection, Emotion and Volition. It is usually referred to as the PIEV theory. Before we recognize and react to a hazard, four specific areas of activity need to be processed by the brain for the muscles to react. Those processes are:

1. **Perception** - We need to perceive or gain a Perception of a hazard. There can be delays in the perception with limitation in sight, sound, feeling, or any other of our senses.

2. **Intellection** - We go through a period called, Intellection or the act or process of using the intellect by thinking or reasoning. The bather must determine if the hazard is legitimate and deciding either move out of the way of the hazard or eliminate the hazard by adjusting the controls or in some cases where the bather may be sitting out of the reach of the controls the bather may choose to pull the shower curtain in front of them. If the adjustment of the controls is the choice one must decide which control to turn and try to remember which way to turn each control to adjust the temperature or turn the water off in order to eliminate the hazard. If a wrong choice is made during this process it could compound the situation by making the water even hotter. I travel a lot and I often find that shower controls can be very confusing with respect to how to adjust the controls. I still find two handle shower controls that do not meet code requirements. This is critically important when there is no temperature limit on the shower controls. For example if the shower has a two-handle shower valve and 160 degree hot water is supplied to the system, then turning of the cold water first could lead to instant scalding injuries. Turning down the hot water to 120 F or below creates a system where it could incubate Legionella Bacteria to very high levels.

3. **Emotion** - There is an Emotion or evaluation factor which is defined as a conscious mental reaction (as anger or fear) subjectively experienced as strong feeling usually directed toward a specific object and typically accompanied by physiological and behavioral changes in the body with respect to deciding or assessing how we want to react. A person with reduced mental capacity or someone that is just very old will take longer to process this information and ultimately decide to react.

4. **Volition** - There is the physical Volition or deciding/choosing to act and acting. In the case of braking distance it is when the choice is made to move the foot from the gas pedal to the brake pedal and pressing on the brake pedal. This can be related to the time the bather chooses to adjust the control, and they move their hand to the shower control valve, plus the time to rotate or re-adjust the shower valve plus the time from the adjustment until the water temperature changes coming out of the shower head. Often it can take as much as 3-5 seconds to re-adjust the shower head and another few seconds until the water temperature changes coming out of the shower head. For ultra-low-flow (ULF) showers the delay from the time of the adjustment of the shower valve until the water temperature changes coming out of the shower head can be even longer. So burns can become more severe with ULF shower heads. This is one more area where water conservations measures can unintentionally make plumbing systems less safe.

As the temperature of the water increases this PIEV reaction time becomes more important. Using a bathtub/shower controller with a single handle would reduce the

mental processing time and reduce the possibility of making an error when turning off the water. As Figure 1 shows the higher the temperatures get, the quicker the burns can occur. within seconds or less and the degree and severity of the burn can be affected by this reaction time.

As you can see by the chart in Figure 1, if the water is at 140 F it will take about 0.8 seconds for a child to receive a 2nd degree irreversible burn injury and it will take about 5.6 seconds for an adult male to receive an irreversible burn injury at 140 degrees F. Everyone else will fall somewhere in between. An adult will often find it very difficult to react to a sudden change in temperature within five (5) seconds. If the shower head is an Ultra-Low-Flow (ULF) shower head the delay can be several seconds longer before the water temperature is reduced because the mixed water temperature must evacuate or flush out the hot water in the pipe riser from the shower valve to the shower head. There is basically very little or no time to react at higher temperatures. For a typical adult that is alert and aware the PIEV theory shows it can take well over five (5) seconds to react to a sudden burst of hot water in a shower. For an elderly person or a small child that is confused it could take several minutes or more before they are able to react and adjust the controls or get out of harm's way. There has been a lot of information that suggests reducing the domestic hot water temperature to 120 F or less as it flows from the fixtures will minimize scalding and allow most people to react or get out of harm's way before a scald injury occurs.

Reducing the water temperature flowing from the fixture can be done in several ways by:

1. Reducing the hot water temperature at the fixture by adjusting the maximum temperature limit-stop on the shower valve. (The best way)
2. Using local mixing valves conforming to ASSE 1070 to reduce the hot water temperature flowing from a faucet.
3. Reducing the temperature at the source (Water Heater) with the use of a master mixing valve or temperature actuated mixing valve conforming to ASSE 1017.
4. For existing non code compliant shower or tub/shower installations, Two handle tub/shower valves without a maximum temperature limit adjustment) an ASSE 1062 valve could be used. An ASSE 1062 valve is a Temperature Actuated Flow Reduction (TAFR) valve. It looks like a chrome pipe coupling and it screws on between the shower head and the shower arm. Other models screw into a tub spout or onto a sink faucet in place of the aerator. If the water flowing from fixture exceeds about 117-120 degrees Fahrenheit the TAFR valve will shut the flow of water down to just a trickle so that scalding hot water does not spray onto the bather. It can be reset by adjusting the fixture control valve to a cold water setting and when the cold water reaches the valve it will reset and begin flowing again. This can be a bit of a nuisance in buildings where the hot water temperature is erratic, but it is an inexpensive way to provide protection against scald injuries in older buildings without code compliant shower valves.

### **Water Heater Thermostats Do Not Control the Water Heater Outlet Temperatures**

If you adjust the water heater thermostat for the burner or heating element on a water heater down to 120 degrees, it will not prevent scalding. Water heater thermostats cannot be relied upon to control the hot water temperature leaving a water heater. Water heater manufacturers recommend that installers set thermostats at 120 - 125 F, and most of them ship the water heaters at an even lower temperature setting. It is not possible to set a water heater thermostat at a given temperature and get a relatively constant temperature of hot water from a water heater. The thermostat can not accurately control the water heater outlet temperature with a water heater thermostat.

My experience has been that not many people know that water heater thermostats cannot control the outlet temperature of a water heater. This warrants an explanation of how a water heater thermostat works so everyone understands the dial on the water heater does not have the accuracy to control the outlet temperature of storage type heater.

Water heater thermostats do not provide precise temperature controls for hot water systems. For example: the thermostat dial calibration test of ANSI Z21.10.1-1998, which is the applicable standard for gas-fired water heaters, allows the temperature to vary 10 degrees above or below the thermostat setting. I have talked to water heater manufacturers that have indicated that the controls can vary as much as 15 to 18 degrees Fahrenheit above or below the set point of the thermostat. From my experience, I have recorded the temperature leaving the top portion of a water heater over a long period of time during intermittent uses and saw temperature swings over 40 degrees Fahrenheit leaving the water heater. The shower valve standards do not have this kind of temperature fluctuation included their testing for all types of shower valves. The significant temperature swings are because the thermostat is inserted into the lower portion of a water heater tank and turns the fuel supply to the heater on and off. Most new water heater thermostat dials have no way to know what the temperature in the tank is. There is rarely a fixed temperature indicated on the dial, however some manufacturers publish temperatures associated with various marks on the thermostat dial or in their literature even though the dial cannot not control the outlet temperature of the water heater, it only controls when the energy to the heater is turned "on" and "off" by sensing the cold water coming into the bottom of the heater.

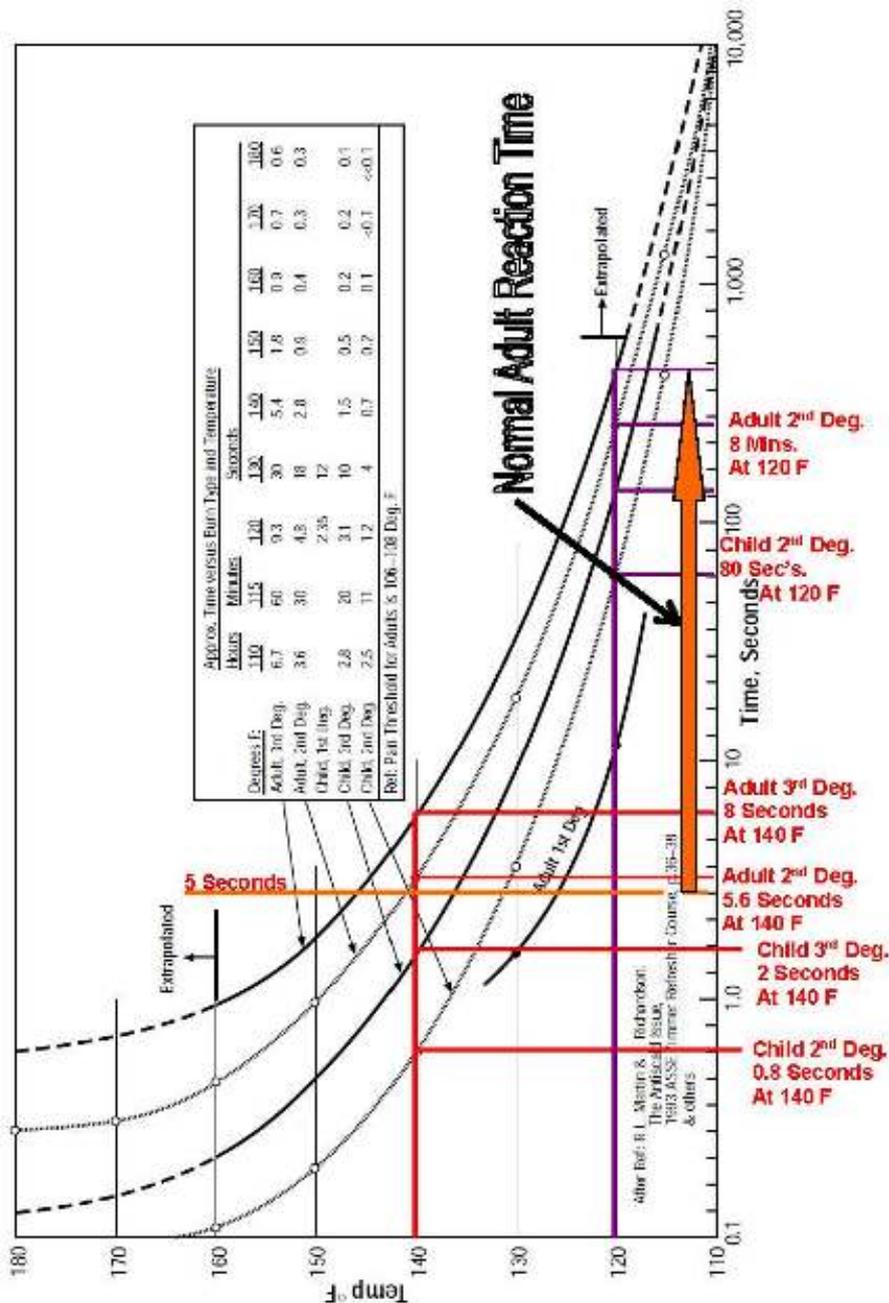

Generally, if the water heater thermostat dial is set at 120 degrees Fahrenheit, the burner would come on when the temperature at the thermostat reaches about 105 degrees Fahrenheit. The burner stays on until the water around the thermostat which is near the bottom of the heater reaches about 135 degrees Fahrenheit. (The "burner off" temperature is about 30 degrees higher than when the burner came "on" and generally about 15 degrees above the theoretical set point of the thermostat).

Most people don't realize that the maximum temperature limit test of the ANSI Z21.10.1 Gas Water Heater Standard allows the outlet water temperature of the water heater to rise significantly above the thermostat setting. This provision in the standard accounts for the phenomenon known as "stacking" or "thermal layering". The hot water is less dense and rises to the top of the hot water tank. Just like hot air rises and lifts a hot air balloon, hot water rises to the top of the tank and the cooler water drops to the bottom of the tank. Stacking or thermal layering occurs when the hot water rises to the top of the heater due to recurring short duration heating cycles caused by a frequent number of small quantity hot water uses. Frequent short draws cause cold water to enter the bottom of the water heater where the thermostatic element senses the cold water from the turbulent flow stirring in the bottom of the heater. The cold water causes the water heater to cycle on. This phenomenon can occur in any type of storage water heater and generally is more significant in vertical heaters.

I have recorded temperatures as high as 150 to 166 degrees Fahrenheit at the top of water heaters that had the thermostats set between 120 to 125 degrees Fahrenheit. Temperatures over 151 degrees Fahrenheit are extremely high temperatures and can cause serious scald burns in only a two seconds of contact with the skin. (See Table 1 - Water Temperature Effects on Adult Skin) It should be noted that the time temperature relationships in Table 1 are based upon the thickness of the skin for adult males. Children and the elderly typically have a thinner layer of the skin or epidermis and the exposure times can be shorter or the same burns can occurs in a given time at slightly lower temperatures.

**Cost Impact:** Will increase the cost of construction  
 The cost impact is minimal. The health and safety impact is one of the most significant health and safety related code changes to existing buildings in years. This code change will save countless lives and prevent countless life altering, very painful scald injuries.

**Analysis:** A review of the standard proposed for inclusion in the code, ASSE 1016-2011/ASME A112.1016-2011/CSA B125.16-2011, ASSE 1017-2010, ASSE 1062-2006 and ASSE 1070-2004, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

PM5-15 : 505.4-  
GEORGE5206

---

## **Public Hearing Results**

### **Committee Action:**

**Disapproved**

**Committee Reason:** The committee felt this proposal would place retroactive requirements into the code. Also, Section 505.5, Item 2 specifies a maximum temperature of 120 degrees Fahrenheit which conflicts with the IPC and ASHRE 90.1 for a maximum temperature of 110 degrees Fahrenheit from lavatory faucets in public facility restrooms.

### **Assembly Action :**

**None**

**Analysis.** For staff analysis of the content of ASSE 1016/ASME A112.1016/CSA B125.1611, ASSE 1017-2010, ASSE 1062-2006 and ASSE 1070-04 with regard to the ICC criteria for referenced standards (Section 3.6 of CP #28), please visit: <http://www.iccsafe.org/wp-content/uploads/2015-Proposed-Standards-Group-A-Final.pdf>.

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Ronald George, representing Self (Ron@Plumb-TechLLC.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Property Maintenance Code**

#### **505.5 Maximum Hot Water Temperatures**

- ~~1. The maximum hot water temperature flowing from any kitchen sink faucet shall be 130 degrees Fahrenheit.~~
1. The maximum hot water temperature flowing from a lavatory faucet, Bidet, shower head, bathtub filler faucet, bathtub/shower combination, or whirlpool bathtub filler faucet shall be 120 110 degrees Fahrenheit (48.8 43 degrees Celcius).
- ~~2. The maximum temperature flowing from a bidet faucet~~  
Temperature limiting devices that are part of the fixture shall be 110 degrees Fahrenheit (43 degrees Celcius) set to these limits except where temperature limiting devices do not exist, an approved temperature limiting valve conforming to ASSE 1070 shall be used to prevent excessive temperatures.
3. The burner control thermostat on the water heater shall not be used to control the hot water distributiou temperature for conformance to the above hot water temperature limit requirements.

## ~~505.6 Minimum Hot or Tempered Water Temperatures~~

- ~~1. The water temperature flowing from a lavatory shall be capable of reaching a minimum of at least 85 degrees Fahrenheit.~~
- ~~2. The water temperature flowing from a kitchen sink shall be capable of reaching a minimum of at least 120 degrees F.~~
- ~~3. The water temperature flowing from a shower, tub/shower, bathtub or whirlpool bathtub shall be capable of reaching a minimum of at least 110 degrees F.~~
- ~~4. The water temperature flowing from a shower, tub/shower, bathtub or whirlpool bathtub shall be capable of reaching a minimum of at least 110 degrees F.~~

~~**505.7 Water Heater Replacement – Capacity** When a water heater is replaced, it shall be replaced with a water heater of the same delivery capacity in gallons per hour. When Calculating gallons per hour the temperature rise shall be based on the same temperature rise as the prior heater. If no temperature rise is known, the temperature rise shall be based on a 100 degree rise.~~

~~**Exception:** Where the water heater manufacturer's sizing calculations or other published water heater sizing calculations show the first hour delivery capacity of the selected water heater is adequate for the installation.~~

*(Renumber section 505.8 to 505.6)*

**Commenter's Reason:** There are many scald cases every year that are preventable. These modifications are intended to address these issues.

## Proposed Change as Submitted

**Proponent:** Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

### 2015 International Existing Building Code

Revise as follows:

**[A] 101.4.2 Buildings previously occupied.** The legal occupancy of any building existing on the date of adoption of this code shall be permitted to continue without change, except as is specifically covered in this code, the retroactive and maintenance provisions of the *International Fire Code*, or the *International Property Maintenance Code*, or as is deemed necessary by the *code official* for the general safety and welfare of the occupants and the public.

**301.1.1 Prescriptive compliance method.** *Repairs, alterations, additions and changes of occupancy* complying with Chapter 4 of this code ~~in buildings~~, and complying with the retroactive and maintenance provisions of the *International Fire Code* shall be considered in compliance with the provisions of this code.

**301.1.3 Performance compliance method.** *Repairs, alterations, additions, changes in occupancy and relocated buildings* complying with Chapter 14 of this code, and complying with the retroactive and maintenance provisions of the *International Fire Code* shall be considered in compliance with the provisions of this code.

**301.1.2 Work area compliance method.** *Repairs, alterations, additions, changes in occupancy and relocated buildings* complying with the applicable requirements of Chapters 5 through 13 of this code, and complying with the retroactive and maintenance provisions of the *International Fire Code* shall be considered in compliance with the provisions of this code.

**1301.2 Conformance.** The building shall be safe for human occupancy as determined by the retroactive and maintenance provisions of the *International Fire Code* and the *International Property Maintenance Code*. Any *repair, alteration, or change of occupancy* undertaken within the moved structure shall comply with the requirements of this code applicable to the work being performed. Any field-fabricated elements shall comply with the requirements of the *International Building Code* or the *International Residential Code* as applicable.

**1401.3.2 Compliance with other codes.** Buildings that are evaluated in accordance with this section shall comply with the retroactive and maintenance provisions of the *International Fire Code* and *International Property Maintenance Code*.

**Reason:** This proposal is intended to clarify the intended scope of the reference to the IFC. The IFC has many roles that address new construction, retroactive construction requirements, maintenance and operational requirements. The sections addressed in this proposal are believed to focus primarily on provisions related to maintenance and retroactive provisions minimally. The IEBC itself will address what is intended to be addressed as far as further construction provisions. This is really meant as a clarification. A reference to the IFC in general should lead users to Chapter 1 which would, in Section 102 should explain how the reference is intended to be applied but this is sometimes misinterpreted.

Currently, the general reference to the IFC as in Section 1401.3.2 is sometimes interpreted as meaning the entire fire code thus negating the scoring methods benefits. Compliance in full with the new construction requirements of IFC Chapters 9 and 10 would require most aspects of fire protection and egress to be upgraded regardless of the score the current building would obtain. This was not the intent of the reference to the IFC.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: <http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction as these revisions will simply clarify that the IEBC was only intended to reference the IFC for retroactive and maintenance provisions. Therefore the level of applicability of the IFC will not change.

EB1-15 : [A] 101.4.2-  
KULIK4744

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** This proposal was disapproved based upon concern that not all states reference the IFC. This additional language does not clarify to what level you must comply with the IFC and provides unnecessary language.

**Assembly Motion:**

**As Submitted**

**Online Vote Results:**

**Successful**

Support: 50.91% (84) Oppose: 49.09% (81)

**Assembly Action :**

**Approved as Submitted**

---

### **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Assembly Action**

**requests Approve as Submitted.**

**Commenter's Reason:** This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. The

assembly action for Approve as Submitted was successful by a vote of 50.91% (84) to 49.09% (81) by eligible members online during the period of May 14 - May 28, 2015.

## Public Comment 2:

**Proponent : Edward Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Existing Building Code**

**[A] 101.4.2 Buildings previously occupied.** The legal occupancy of any building existing on the date of adoption of this code shall be permitted to continue without change, except as is specifically covered in this code, the ~~retroactive and maintenance~~ provisions of the *International Fire Code* applicable to existing buildings, or the *International Property Maintenance Code*, or as is deemed necessary by the *code official* for the general safety and welfare of the occupants and the public.

**301.1.1 Prescriptive compliance method.** *Repairs, alterations, additions and changes of occupancy* complying with Chapter 4 of this code, and complying with the ~~retroactive and maintenance~~ provisions of the *International Fire Code* applicable to existing buildings shall be considered in compliance with the provisions of this code.

**301.1.2 Work area compliance method.** *Repairs, alterations, additions, changes in occupancy and relocated buildings* complying with the applicable requirements of Chapters 5 through 13 of this code, ~~and complying with the retroactive and maintenance provisions of the International Fire Code~~ shall be considered in compliance with the provisions of this code.

**301.1.3 Performance compliance method.** *Repairs, alterations, additions, changes in occupancy and relocated buildings* complying with Chapter 14 of this code, and complying with the ~~retroactive and maintenance~~ provisions of the *International Fire Code* applicable to existing buildings shall be considered in compliance with the provisions of this code.

**1301.2 Conformance.** The building shall be safe for human occupancy as determined by the ~~retroactive and maintenance~~ provisions of the *International Fire Code* applicable to existing buildings and the *International Property Maintenance Code*. Any *repair, alteration, or change of occupancy* undertaken within the moved structure shall comply with the requirements of this code applicable to the work being performed. Any field-fabricated elements shall comply with the requirements of the *International Building Code* or the *International Residential Code* as applicable.

**1401.3.2 Compliance with other codes.** Buildings that are evaluated in accordance with this section shall comply with the ~~retroactive and maintenance~~ provisions of the *International Fire Code* applicable to existing buildings and *International Property Maintenance Code*.

**Commenter's Reason:** This original proposal is really meant as a clarification. A reference to the IFC in general should lead users to Chapter 1 which would, in

Section 102 should explain how the reference is intended to be applied but this is sometimes misinterpreted. This proposal is important in that it carves out the applicable provisions that this reference intends.

Currently, the general reference to the IFC as in Section 1401.3.2 is sometimes interpreted as meaning the entire fire code thus negating the scoring methods benefits. Compliance in full with the new construction requirements of IFC Chapters 9 and 10 would require most aspects of fire protection and egress to be upgraded regardless of the score the current building would obtain. This was not the intent of the reference to the IFC.

The other aspect of the need for this reference is that often the retroactive requirements of the IFC are overlooked. Having a specific emphasis on the existing building provisions of the IFC will help clarify the need to comply with these minimum construction requirements in Chapter 11 and to a certain extent Chapter 8.

The committee was concerned with the terms used of "retroactive and maintenance provisions" as being misleading as to which requirements were intended. Instead the public comments make this a more universal reference to the provisions of the IFC that apply to existing buildings. Section 102 of the IFC provides specific guidance as to the applicability to existing buildings.

Another concern by the committee was that not all jurisdictions use Chapter 11 of the IFC. With a more general reference to "provisions applicable to existing buildings" applicability can be determined based upon their particular adopted regulations.

Section 301.1.2 was reverted back to the 2015 language which did not have a current reference to the IFC. This is related to the understanding of the original intent of the work area method which was intended to be all inclusive. In other words, when applying the work area method a reference to the IFC was specifically not included for this reason.

### Proposed Change as Submitted

**Proponent :** Maureen Traxler, City of Seattle, representing City of Seattle Dept of Planning & Development  
(maureen.traxler@seattle.gov)

## 2015 International Existing Building Code

Revise as follows:

**[A] 104.2.1 Determination of substantially improved or substantially damaged existing buildings and structures in flood hazard areas.** For applications for reconstruction, rehabilitation, repair, alteration, addition or other improvement of existing buildings or structures located in flood hazard areas, the building official shall determine where the proposed work constitutes substantial improvement or repair of substantial damage. Where the building official determines that the proposed work constitutes substantial improvement or repair of substantial damage, and where required by this code, the ~~building code~~ official shall require the building to meet the requirements of Section 1612 of the *International Building Code*.

**302.3 Existing materials.** Materials already in use in a building in compliance with requirements or approvals in effect at the time of their erection or installation shall be permitted to remain in use unless determined by the ~~building code~~ official to be unsafe.

**401.2.1 Existing materials.** Materials already in use in a building in compliance with requirements or approvals in effect at the time of their erection or installation shall be permitted to remain in use unless determined by the ~~building code~~ official to be unsafe per Section 115.

**401.3 Dangerous conditions.** The ~~building code~~ official shall have the authority to require the elimination of conditions deemed *dangerous*.

**[BS] 404.2.1 Evaluation.** The building shall be evaluated by a *registered design professional*, and the evaluation findings shall be submitted to the ~~building official~~code official. The evaluation shall establish whether the damaged building, if repaired to its predamage state, would comply with the provisions of the *International Building Code* for wind and earthquake loads.

Wind loads for this evaluation shall be those prescribed in Section 1609 of the *International Building Code*. Earthquake loads for this evaluation, if required, shall be permitted to be 75 percent of those prescribed in Section 1613 of the *International Building Code*. Alternatively, compliance with ASCE 41, using the performance objective in Table 301.1.4.2 for the applicable risk category, shall be deemed to meet the earthquake evaluation requirement.

**407.1 Conformance.** No change shall be made in the use or occupancy of any building unless such building is made to comply with the requirements

of the *International Building Code* for the use or occupancy. Changes in use or occupancy in a building or portion thereof shall be such that the existing building is no less complying with the provisions of this code than the existing building or structure was prior to the change. Subject to the approval of the ~~building code~~ official, the use or occupancy of *existing buildings* shall be permitted to be changed and the building is allowed to be occupied for purposes in other groups without conforming to all of the requirements of this code for those groups, provided the new or proposed use is less hazardous, based on life and fire risk, than the existing use.

**Exception:** The building need not be made to comply with the seismic requirements for a new structure unless required by Section 407.4.

**407.1.1 Change in the character of use.** A change in occupancy with no change of occupancy classification shall not be made to any structure that will subject the structure to any special provisions of the applicable *International Codes*, without approval of the ~~building official~~ code official. Compliance shall be only as necessary to meet the specific provisions and is not intended to require the entire building be brought into compliance.

**408.2 Life safety hazards.** The provisions of this code shall apply to historic buildings judged by the ~~building code~~ official to constitute a distinct life safety hazard.

**[BS] A106.2 Existing materials.** Existing materials used as part of the required vertical load-carrying or lateral forceresisting system shall be in sound condition, or shall be repaired or removed and replaced with new materials. All other unreinforced masonry materials shall comply with the following requirements:

1. The lay-up of the masonry units shall comply with Section A106.3.2, and the quality of bond between the units has been verified to the satisfaction of the building official;
2. Concrete masonry units are verified to be load-bearing units complying with ASTM C 90 or such other standard as is acceptable to the ~~building code~~ official; and
3. The compressive strength of plain concrete walls shall be determined based on cores taken from each class of concrete wall. The location and number of tests shall be the same as those prescribed for tensile-splitting strength tests in Sections A106.3.3.3 and A106.3.3.4, or in Section A108.1.

The use of materials not specified herein or in Section A108.1 shall be based on substantiating research data or engineering judgment, with the approval of the ~~building~~ code official.

**[BS] A107.1 Pointing.** Preparation and mortar pointing shall be performed with special inspection.

**Exception:** At the discretion of the ~~building code~~ official, incidental pointing may be performed without special inspection.

**[BS] A108.1 Values.**

1. Strength values for existing materials are given in Table A1-D and

- for new materials in Table A1-E.
2. Capacity reduction factors need not be used.
  3. The use of new materials not specified herein shall be based on substantiating research data or engineering judgment, with the approval of the ~~building code~~ official.

### **[BS] A113.7 Veneer.**

1. Veneer shall be anchored with approved anchor ties conforming to the required design capacity specified in the building code and shall be placed at a maximum spacing of 24 inches (610 mm) with a maximum supported area of 4 square feet (0.372 m<sup>2</sup>).

**Exception:** Existing anchor ties for attaching brick veneer to brick backing may be acceptable, provided the ties are in good condition and conform to the following minimum size and material requirements.

Existing veneer anchor ties may be considered adequate if they are of corrugated galvanized iron strips not less than 1 inch (25 mm) in width, 8 inches (203 mm) in length and  $\frac{1}{16}$  inch (1.6 mm) in thickness, or the equivalent.

2. The location and condition of existing veneer anchor ties shall be verified as follows:
  - 2.1. An approved testing laboratory shall verify the location and spacing of the ties and shall submit a report to the ~~building code~~ official for approval as part of the structural analysis.
  - 2.2. The veneer in a selected area shall be removed to expose a representative sample of ties (not less than four) for inspection by the ~~building code~~ official.

### **[BS] A206.2 Special requirements for wall anchorage**

**systems.** The steel elements of the wall anchorage system shall be designed in accordance with the building code without the use of the 1.33 short duration allowable stress increase when using allowable stress design.

Wall anchors shall be provided to resist out-of-plane forces, independent of existing shear anchors.

**Exception:** Existing cast-in-place shear anchors are allowed to be used as wall anchors if the tie element can be readily attached to the anchors, and if the engineer or architect can establish tension values for the existing anchors through the use of approved as-built plans or testing and through analysis showing that the bolts are capable of resisting the total shear load (including dead load) while being acted upon by the maximum tension force due to an earthquake. Criteria for analysis and testing shall be determined by the ~~building code~~ official.

Expansion anchors are only allowed with special inspection and approved testing for seismic loading.

Attaching the edge of plywood sheathing to steel ledgers is not considered compliant with the positive anchoring requirements of this chapter. Attaching the edge of steel decks to steel ledgers is not considered as providing the positive anchorage of this chapter unless testing and/or analysis are performed to establish shear values for the attachment

perpendicular to the edge of the deck. Where steel decking is used as a wall anchor system, the existing connections shall be subject to field verification and the new connections shall be subject to special inspection.

**[BS] A505.1 General.** Structures conforming to the requirements of the ASCE 41 Chapter 4, Screening Phase, are permitted to be shown to be in conformance to this chapter by submission of a report to the ~~building-code~~ official, as described in this section.

**Reason:** The IEBC defines the term "code official" but it then uses both "building official" and "code official." Both terms are used in other International codes, but none of the codes uses both. "Code official" is more appropriate for the IEBC because the IEBC addresses more than Building Code issues. It includes mechanical sections—the IMC uses the term "code official." It includes plumbing sections—the IPC uses the term "code official." The term "code official" is defined in Chapter 2, and is the more general term.

Note that Figure A3-1 and A3-2 also contain the term "building official" and should also be revised to "code official." The figures could not be added to the proposal.

**Cost Impact:** Will not increase the cost of construction  
This is an editorial change that will not affect the cost of construction.

EB2-15 : 302.3-  
TRAXLER3299

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** There was concern that a reference to other than the "building official" would cause confusion. A building official is the most appropriate enforcement entity for an existing building code.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : David Bonowitz, David Bonowitz, S.E., representing Existing Buildings Committee, National Council of Structural Engineers Associations (dbonowitz@att.net) requests Approve as Submitted.**

**Commenter's Reason:** The committee's reason for disapproval -- that "building official" is a better and less confusing term than "code official" -- is simply false. In fact, code official is the more common term in the IEBC, and NOT to clean up the few remnant uses of building official is more confusing. Consider:

1. The IEBC and IBC use the term "code official" right in the first line of the Introduction to each code. This is hardly a non-standard term.
2. The IEBC defines only Code Official, with essentially the same definition as the IBC's Building Official.
3. The IEBC already uses "code official" throughout. EB 2 would merely clean up the relatively few remaining uses of "building official," especially in Chapter 4 where they are left over from borrowing text from IBC Chapter 34 that no longer exists there.

## *Public Comment 2:*

**Proponent : Kathleen Petrie, representing City of Seattle, Department of Planning and Development (kathleen.petrie@seattle.gov) requests Approve as Submitted.**

**Commenter's Reason:** "Code Official", not "Building Official", is the defined term in the IEBC, IECC, and IMC. The term "Code Official" is used 174 times throughout the IEBC; "Building Official" is currently only used 22 times. Additional preference is demonstrated in Section 104 entitled "Duties and Powers of Code Official" where the first sentence states: "The *code official* is hereby authorized and directed to enforce the provisions of this code."

Contrary to the message at the Committee Action Hearings, "Building Official" actually causes more confusion because it is not the primary term in the IEBC, so this and future proposals should work to replace the few remaining "Building Official" terms to "Code Official".

---

**EB2-15**

# EB5-15

## 301.1

### **Proposed Change as Submitted**

**Proponent :** David Bonowitz, David Bonowitz, S.E., representing Existing Buildings Subcommittee, National Council of Structural Engineers Associations (dbonowitz@att.net)

## **2015 International Existing Building Code**

### **Revise as follows:**

**301.1 General.** The *repair, alteration, change of occupancy, addition* or relocation of all *existing buildings* shall comply with one of the methods listed in Sections 301.1.1 through 301.1.3 as selected by the applicant. Sections 301.1.1 through 301.1.3 shall not be applied in combination with each other. Where this code requires consideration of the seismic force-resisting system of an *existing building* subject to *repair, alteration, change of occupancy, addition* or relocation of *existing buildings*, the seismic evaluation and design shall be based on Section 301.1.4 regardless of which compliance method is used.

**Exception:** Other than in flood hazard areas or regarding structural provisions, and Subject to the approval of the *code official*, alterations complying with the laws in existence at the time the building or the affected portion of the building was built shall be considered in compliance with the provisions of this code ~~unless the building is undergoing more than a limited structural alteration as defined in Section 907.4.4. New structural members added as part of the alteration shall comply with the International Building Code. Alterations of existing buildings in flood hazard areas shall comply with Section 701.3.~~

**Reason:** This proposal retains the exception that allows the code official to waive certain architectural and other requirements that the IEBC would normally trigger in alteration projects. It removes that exception, however, regarding structural provisions that would have been triggered by alterations.

The current exception already does not apply to alterations in flood hazard areas (which sometimes trigger structural improvements) or to substantial structural alterations. So the proposal does not change those cases at all.

The proposal eliminates the potential that the IEBC's basic structural requirements might be undermined by a code official's discretion, or, more likely, by a permit applicant who reads this exception as a way to demand a discretionary waiver. Since very few code officials would be comfortable waiving these structural safety provisions, the proposal actually helps them enforce the code as intended.

Further, the existing exception is unclear. It refers to "laws in existence at the time the building ... was built." But if the intent is to waive requirements triggered by alterations, this language ignores, or forgets, the fact that older codes for a long time had alteration provisions that triggered structural upgrade -- often with requirements more onerous than those in the current IEBC. So does a permit applicant claiming compliance with the "laws in existence" a generation ago also intend to comply with those outdated triggers? This proposal removes that potential confusion.

Since the existing structural provisions for alterations are already measured, already allow reduced loads and alternative criteria in many cases, and already trigger

structural improvements only in rare and severe cases, the proposed change to this exception should have little impact except to affirm that structural safety is fundamental to the code's intent.

**Cost Impact:** Will not increase the cost of construction

This proposal will not increase the cost of construction, but it could, hypothetically, limit the cases in which the code official could effectively reduce the cost of construction by waiving structural safety requirements. In practice, no increase in the cost of construction should be expected, however, since the proposal does not change any of the code's provisions, but only changes what was a discretionary waiver.

EB5-15 : 301.1 -  
BONOWITZ5196

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The proposal was disapproved as it will create more confusion in the application of the exception. There were suggestions that a different format was needed.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : David Bonowitz, David Bonowitz, S.E., representing Existing Buildings Committee, National Council of Structural Engineers Associations (dbonowitz@att.net) requests Approve as Modified by this Public Comment.**

**Replace Proposal as Follows:**

### **2015 International Existing Building Code**

**301.1 General.** The *repair, alteration, change of occupancy, addition or relocation of all existing buildings* shall comply with one of the methods listed in Sections 301.1.1 through 301.1.3 as selected by the applicant. Sections 301.1.1 through 301.1.3 shall not be applied in combination with each other. Where this code requires consideration of the seismic forces resisting system of an *existing building* subject to *repair, alteration, change of occupancy, addition or relocation of existing buildings*, the seismic evaluation and design shall be based on Section 301.1.4 regardless of which compliance method is used.

**Exception:** Subject to the approval of the *code official*, alterations complying with the laws in existence at the time the building or the affected portion of the building was built shall be considered in compliance with the provisions of this code ~~unless the building is undergoing more than a limited structural alteration as defined in Section 907.4.4.~~ New structural members added as part of the

alteration shall comply with the International Building Code. Alterations of existing buildings. This exception shall not apply to alterations that constitute substantial improvement in flood hazard areas, which shall comply with Section 701.3. This exception shall not apply to the structural provisions of Chapter 4 or to the structural provisions of Sections 707, 807, and 907.

**Commenter's Reason:** This comment responds to the committee's suggestion, in its reason statement, that a clearer presentation of the idea is needed. In fact, the proposal we submitted to ICC had that clearer presentation, but it was modified by ICC and by CDPAccess, making the proposal, which is rather simple, much harder to follow. NONE OF THE COMMITTEE MEMBERS VOICED OPPOSITION TO THE MAIN SUBSTANTIVE IDEA OF THE PROPOSAL, in point 3 below.

This public comment restores the basic proposal in an easier-to-follow format -- though it must be said that CDPAccess STILL MAKES IT UNNECESSARILY CONFUSING!

Here is the idea (really, it's so simple):

1. There's a discretionary exception to 301.1 for certain alterations. Proposal EB5 and this comment keep that exception as is. No problem.
2. The exception already does not apply to substantial improvements in flood hazard areas. Proposal EB5 and this comment keep that limitation as is, but add a few words to clarify that the limit is only for substantial improvements. No substantive change, so no problem.
3. The exception already does not apply to any structural alteration that is "more than a limited structural alteration." Proposal EB5 and this comment merely extend that limit to other structural work. The reason, as given in the original reason statement for EB5, is that the IEBC structural provisions for alteration projects are already quite measured, already allow reduced loads and alternative criteria in most cases, and already trigger structural improvements only in rare and severe cases. Thus, EB5 should have little impact except to affirm that structural safety is fundamental to the IEBC's intent. (By making this change, EB5 also solves some implementation problems and confusion inherent in the existing exception; see the original EB5 reason statement for details.)

Again, at the hearings, the ONLY concerns expressed by the committee were about the confusing nature of the EXISTING exception, and whether proposal EB5 could be written in a clearer way.

---

## **Proposed Change as Submitted**

**Proponent:** Edward Kulik, Chair, representing Building Code Action Committee(bcac@iccsafe.org)

## **2015 International Existing Building Code**

**Revise as follows:**

### **SECTION 301 ADMINISTRATION**

**301.1 General.** The *repair, alteration, change of occupancy, addition* or relocation of all *existing buildings* shall comply with one of the methods listed in Sections 301.1.1 through 301.1.3 as selected by the applicant. Sections 301.1.1 through 301.1.3 shall not be applied in combination with each other. Where this code requires consideration of the seismic forceresisting system of an *existing building* subject to *repair, alteration, change of occupancy, addition* or relocation of *existing buildings*, the seismic evaluation and design shall be based on Section ~~301.1.4~~ 303.1 regardless of which compliance method is used.

**Exception:** Subject to the approval of the *code official*, *alterations* complying with the laws in existence at the time the building or the affected portion of the building was built shall be considered in compliance with the provisions of this code unless the building is undergoing more than a limited structural *alteration* as defined in Section 907.4.4. New structural members added as part of the *alteration* shall comply with the *International BuildingCode*. *Alterations of existing buildings in flood hazardareas* shall comply with Section 701.3.

**301.1.1 Prescriptive compliance method.** *Repairs, alterations, additions* and *changes of occupancy* complying with Chapter 4 of this code in buildings complying with the *International Fire Code* shall be considered in compliance with the provisions of this code.

**301.1.2 Work area compliance method.** *Repairs, alterations, additions, changes in occupancy and relocated buildings* complying with the *applicable requirements of Chapters 5 through 13* of this code shall be considered in compliance with the provisions of this code.

**301.1.3 Performance compliance method.** *Repairs, alterations, additions, changes in occupancy and relocated buildings* complying with Chapter 14 of this code shall be considered in compliance with the provisions of this code.

**Add new section as follows:**

## **SECTION 303 SEISMIC EVALUATION AND DESIGN PROCEDURES**

**Renumber subsequent sections:**

**[BS] ~~301.1.4~~ 303.1 Seismic evaluation and design procedures General.** (No change to text)

**[BS] ~~301.1.4.1~~ 303.1.1 Compliance with International Building Code-level seismic forces.** (No change to text)

**TABLE [BS] ~~301.1.4.1~~ 303.1.1  
PERFORMANCE OBJECTIVES FOR USE IN ASCE 41 FOR COMPLIANCE  
WITH INTERNATIONAL BUILDING CODE-LEVEL SEISMIC FORCES**  
(No change to Table)

**[BS] ~~301.1.4.2~~ 303.1.2 Compliance with reduced International Building Code-level seismic forces.** (No change to text)

**TABLE [BS] ~~301.1.4.2~~ 303.1.2  
PERFORMANCE OBJECTIVES FOR USE IN ASCE 41 FOR  
COMPLIANCE WITH REDUCED INTERNATIONAL BUILDING CODE-  
LEVEL SEISMIC FORCES**  
(No change to Table)

**Reason:** The code change proposal is to move the seismic evaluation and design procedures out of the same section and code hierarchy as the three compliance methods and places it in its own section. With the location of the seismic evaluation and design procedure reference in 301.1, it can potentially confuse the code user since two items need to happen in the current 301; choose a method and do a seismic evaluation.

Since the topic is separate and distinct, the proposal moves it to a separate section to ensure it is independent of the compliance method choice by the applicant.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: <http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

**Cost Impact:** Will not increase the cost of construction

Cost impact: Code proposal is only to clarify the existing code requirements through a relocation (reorganization) of code sections, so there is no intended increase or decrease expected by approving this proposal.

**EB8-15 : 301.1-  
KULIK4888**

---

### **Public Hearing Results**

**Committee Action:**

**Approved as Submitted**

**Committee Reason:** This proposal was approved as the format of the chapter will be clearer. Section 301 is intended to describe the three compliance methods. The seismic criteria are to be applied to all three methods where referenced and need to be located in a standalone section.

---

**Individual Consideration Agenda****Public Comment 1:**

**Proponent : David Bonowitz, David Bonowitz, S.E., representing Existing Buildings Committee, National Council of Structural Engineers Associations (dbonowitz@att.net) requests Approve as Modified by this Public Comment.**

**Modify as Follows:****2015 International Existing Building Code**

**301.1 General.** The *repair, alteration, change of occupancy, addition* or relocation of all *existing buildings* shall comply with one of the methods listed in Sections 301.1.1 through 301.1.3 as selected by the applicant. Sections 301.1.1 through 301.1.3 shall not be applied in combination with each other. ~~Where this code requires consideration of the seismic force-resisting system of an existing building subject to repair, alteration, change of occupancy, addition or relocation of existing buildings, the seismic evaluation and design shall be based on Section 303.1 regardless of which compliance method is used.~~

**Exception:** Subject to the approval of the *code official*, alterations complying with the laws in existence at the time the building or the affected portion of the building was built shall be considered in compliance with the provisions of this code unless the building is undergoing more than a limited structural *alteration* as defined in Section 907.4.4. New structural members added as part of the *alteration* shall comply with the *International Building Code*. *Alterations of existing buildings in flood hazard areas* shall comply with Section 701.3.

**303.1 General** Where required, seismic evaluation or design shall be based on the procedures and criteria in this section, regardless of which compliance method is used.

~~**[BS] 303.1 General.** The seismic evaluation and design shall be based on the procedures specified in the *International Building Code* or ASCE 41. The procedures contained in Appendix A of this code shall be permitted to be used as specified in Section 303.1.2.~~

**Commenter's Reason:** The basic idea of EB 8 is good, and we support it: For clarity and usability, move the seismic criteria from section 301.1.4 into their own new section 303. However, in doing so, EB 8 missed two important cleanups to go with the move. This comment completes the intent of EB 8:

1. Move the last sentence of 301.1 into the new section 303 where it belongs, just before the seismic criteria sections themselves. With the move, the sentence can also be editorially simplified, clarified, and corrected as shown. This move is also important because it removes the confusion about whether the exception to 301.1 applies to the seismic criteria -- it obviously does not, as was pointed out at the hearings by several committee members, and as any quick read will show. If there is any doubt remaining about whether this sentence is meant to go with the seismic criteria and is not subject to the exception, we point out that the sentence was first added to the IEBC -- without any exception -- in 2009, when it and the seismic criteria

were still in section 101.5. Only in 2012 were both the sentence and the criteria moved into section 301.

2. By moving this sentence into new 303.1, replace the now redundant language of current 301.1.4 (new 303.1). This language is redundant because it merely names the documents that are going to be named and specified in greater detail in the sections to come (new 303.1.1 and 303.1.2).

301.1, 301.1.1, Chapter 4, 1401.2.5, [BS] B101.3, [BS] B101.4

## Proposed Change as Submitted

**Proponent :** David Bonowitz, David Bonowitz, S.E., representing Existing Buildings Subcommittee, National Council of Structural Engineers Associations (dbonowitz@att.net)

### 2015 International Existing Building Code

**Delete without substitution:**

~~CHAPTER 4 PRESCRIPTIVE COMPLIANCE METHOD~~

*(Delete entire chapter)*

*(Renumber subsequent chapters)*

**Revise as follows:**

**301.1 General.** The *repair, alteration, change of occupancy, addition* or relocation of all *existing buildings* shall comply with one of the methods listed in Sections 301.1.1 ~~through 301.1.3~~ or 301.1.2 as selected by the applicant. Sections 301.1.1 ~~through 301.1.3~~ and 301.1.2 shall not be applied in combination with each other. Where this code requires consideration of the seismic forceresisting system of an *existing building* subject to *repair, alteration, change of occupancy, addition* or relocation of *existing buildings*, the seismic evaluation and design shall be based on Section 301.1.4 regardless of which compliance method is used.

**Exception:** Subject to the approval of the *code official*, *alterations* complying with the laws in existence at the time the building or the affected portion of the building was built shall be considered in compliance with the provisions of this code unless the building is undergoing more than a limited structural *alteration* as defined in Section 907.4.4. New structural members added as part of the *alteration* shall comply with the *International BuildingCode*. *Alterations of existing buildings in flood hazardareas* shall comply with Section 701.3.

**Delete without substitution:**

~~**301.1.1 Prescriptive compliance method.** *Repairs, alterations, additions and changes of occupancy* complying with Chapter 4 of this code in buildings complying with the *International Fire Code* shall be considered in compliance with the provisions of this code.~~

**Revise as follows:**

~~**301.1.2**~~**301.1.1 Work area compliance method.** *Repairs, alterations, additions, changes in occupancy and relocated buildings* complying with the applicable requirements of Chapters 5 through 13 of this code shall be considered in compliance with the provisions of this code.

~~301.1.3~~ **301.1.2 Performance compliance method.** *Repairs, alterations, additions, changes in occupancy and relocated buildings complying with Chapter 14 of this code shall be considered in compliance with the provisions of this code.*

*(Renumber subsequent sections)*

**1401.2.5 Accessibility requirements.** Accessibility shall be provided in accordance with Section ~~410-605~~ 705.

**[BS] B101.3 Qualified historic buildings and facilities subject to Section 106 of the National Historic Preservation Act.** Where an *alteration or change of occupancy* is undertaken to a qualified *historic building* or facility that is subject to Section 106 of the National Historic Preservation Act, the federal agency with jurisdiction over the undertaking shall follow the Section 106 process. Where the state historic preservation officer or Advisory Council on Historic Preservation determines that compliance with the requirements for accessible routes, ramps, entrances, or toilet facilities would threaten or destroy the historic significance of the building or facility, the alternative requirements of Section ~~410.9-~~ 1204.1 for that element are permitted.

**[BS] B101.4 Qualified historic buildings and facilities not subject to Section 106 of the National Historic Preservation Act.** Where an *alteration or change of occupancy* is undertaken to a qualified *historic building* or facility that is not subject to Section 106 of the National Historic Preservation Act, and the entity undertaking the alterations believes that compliance with the requirements for accessible routes, ramps, entrances, or toilet facilities would threaten or destroy the historic significance of the building or facility, the entity shall consult with the state historic preservation officer. Where the state historic preservation officer determines that compliance with the accessibility requirements for accessible routes, ramps, entrances, or toilet facilities would threaten or destroy the historical significance of the building or facility, the alternative requirements of Section ~~410.9-~~ 1204.1 for that element are permitted.

**Reason:** The intent of this proposal is to consider removing the Prescriptive compliance method from the IEBC, leaving the Wbrk Area compliance method and the Performance compliance method in place.

Note: For purposes of brevity, the balance of Chapter 4 is not shown, but the intent is that Chapter 4 would be removed in its entirety, with corresponding changes to chapter and section numbers and related cross-referencing throughout the code.

The IEBC was created to implement the Wbrk Area method. For continuity purposes, the two methods already in IBC Chapter 34 -- the Prescriptive and Performance methods -- were added to the IEBC upon its initial publication over a decade ago. The idea was that having three broad options would aid transition to the new code. Since then, the IEBC has enjoyed wide adoption, the Wbrk Area method has become known and used, and revisions have been made to all three methods to reconcile many of the differences among them. Indeed, over the last three cycles, the structural provisions of the Prescriptive and Wbrk Area methods have been made nearly identical.

Meanwhile, and especially because the IBC now refers to the IEBC in lieu of its own Chapter 34, many are questioning why the IEBC still needs multiple methods. It makes implementation confusing, and it puts a burden on jurisdiction adoption committees, code officials, design professionals, and permit applicants to weigh the advantages and disadvantages of each method. In some cases it leads to gaming. Some jurisdictions have simply not adopted one or another method, to facilitate consistent enforcement. Unfortunately, some proposals to solve the problem of

multiple methods would link or cross-reference them, just to minimize duplication of text. While well-intentioned, this will only make using the IEBC more confusing and difficult (and will violate the intent of Section 301.1 that the methods should remain distinct and not used in a mix-and-match fashion). The better approach is to reconcile differences between the methods, and then eliminate the older, less accommodating Prescriptive method.

Perhaps the time for that is now. Perhaps it is time, after four code cycles, to reconsider the initial intent of the IEBC: To regulate work on existing buildings by project type, with nuances and considerations that require more than a single code chapter.

If the code's users, writers, and stakeholders agree that the Prescriptive and Work Area methods are by now sufficiently similar, we can eliminate the older Prescriptive method with little or no impact, using the public comment period and the time between now and 2018 to iron out the necessary editorial, administrative and coordination changes. If not -- that is, if there is even a significant minority in rational opposition -- then we can approve the proposal at the hearings, use the public comment period to identify irreconcilable differences, disapprove or withdraw the proposal if necessary as a final action, and work on reconciliation for the 2021 IEBC. At the very least, however, this proposal represents an opportunity to hear from the IEBC committee and the code's users about whether and when the Prescriptive method ought to be retired.

**Cost Impact:** Will not increase the cost of construction

If the Prescriptive Method and the Work Area Method are similar enough to justify approval of this proposal, then removal of the Prescriptive method cannot result in a significant cost increase.

EB9-15 : 301.1-  
BONOWITZ5264

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The prescriptive method was felt to be a viable option for many projects and would reduce the flexibility of the document if deleted. There was concern with how the deletion of Chapter 4 would integrate with the other major format changes being proposed in this cycle.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : David Bonowitz, David Bonowitz, S.E., representing Existing Buildings Committee, National Council of Structural Engineers Associations (dbonowitz@att.net) requests Approve as Submitted.**

**Commenter's Reason:** This Public Comment is intended to ensure that the idea of removing the Prescriptive method from the IEBC gets a full hearing from ICC members and users so as to better inform the ICC Board. Even if EB 9 is approved by members and desired by IEBC users, removal of Chapter 4 from the IEBC will surely require ICC Board approval -- just as ICC Board approval was needed in the last cycle when Chapter 34 was removed from the IBC. Thus, THERE IS NO DANGER

that in voting to approve EB 9 we will be prematurely pulling Chapter 4 from the IEBC. Rather, we will be telling the ICC Board that this is the direction to go in. If we can get there in this cycle, great. If not, let's put all of our fellow code wonks on notice to start working for that goal in 2021.

Please see the original full reason statement for EB 9, which explains the history of why the Prescriptive method was intended only as a transitional option, and why it is now time to embrace the Work Area method.

In addition, we respond to the IEBC committee's reasons for initial -- and NOT unanimous! -- disapproval.

The committee said that the Prescriptive method remains a viable option and provides flexibility. That might have been true in 2003, when few people had heard of the Work Area method, but that benefit is far smaller today. The IEBC is much more widely adopted and recognized today. Also, over the last several cycles, most differences between the two methods have been eliminated -- in many cases the methods now represent mere duplication. But worse than that, rather than provide "flexibility," the multiple methods create a burdensome game in which the permit applicant tries each method (and must pay design professionals to go through the exercise) to see which one is cheapest. It's a hassle for everyone. Some jurisdictions adopt only one method, either Prescriptive or Work Area, just to avoid this gaming, so there's no "flexibility" there. Those jurisdictions are telling us something about where the IEBC should be headed.

The committee also wondered how EB 9 would mesh with the other big re-organizing proposals, EB 10, 11, and 33. Good question, easy answer: It would make them unnecessary! The very reasons for those proposals are to eliminate duplication and (in the case of EB 11), to outright select the Work Area method over the Prescriptive method. It turns out that the easiest and most effective way to remove duplication from the IEBC and improve its usability is NOT to reorganize and rearrange the chapters (per EB 10, 11, and 33), but to just remove one of the multiple methods. EB 10, 11, and 33 are all half-measures. But whether you like them or not, it is clear that the committee and the members approve of their overall intent -- to remove duplication and improve usability. Those are precisely the intent and the effect of EB 9.

But there are other reasons to urge the ICC Board to commit to removing Chapter 4. Doing so, through EB 9 or other means, will also eliminate the confusion, the cross-referencing, the cycle by cycle changes to chapter and section numbers, the MISTAKES and OVERSIGHTS, and the general flips and twists made necessary by interim measures like EB 10, 11, and 33. It turns out that EB 10 and EB 11, despite their good intent, COMPLETELY MISSED the necessary coordination for historic buildings in Chapter 12. And it turns out that EB 33, though it claims to be entirely editorial, will actually result in unintended substantive changes to accessibility requirements. Yet all three were approved, because it's just really hard to simplify half of something and still have the other half work smoothly. Trying to do this piece by piece is bound to make mistakes and will ultimately make the code even harder to untangle.

By voting for EB 9, you can tell the ICC Board that it's time for the IEBC to live up to its mission. The Prescriptive method had a good run, but we're ready, finally, to move on to something better.

## *Public Comment 2:*

**Proponent : Steven McDaniel, representing New York State Building Officials Conference requests Approve as Submitted.**

**Commenter's Reason:** Chapter 4 of the IEBC was moved from IBC Chapter 34 (the Prescriptive and Performance methods). The IBC only had Chapter 34, however when it was moved to the IEBC it became two separate compliance methods (Chapter 4

and Chapter 14 of IEBC). These two chapters used to be linked together for compliance when they were in the IBC. In the IEBC, that link is no longer there. Chapter 4 contains provisions for project type but then also has separate provisions for Fire Escapes and Glass Replacement and Replacement Windows mixed in in the middle of the section.

The provisions in 402 for additions are found in Chapter 11. The provisions for Alterations in Chapter 4 send you to the Building Code for compliance with no guidance of what needs to be complied with. There are no provisions for the different classifications of levels of alterations. The more you read and try to apply the provisions found in Chapter 4, the more problems you encounter.

Chapter 14 is a valuable compliance method, however Chapter 4 is a messy "Go to the Building Code and be no less conforming" chapter that needs to be removed because the connection to Chapter 14 is no longer there.

---

**EB9-15**

# EB11-15

**301.1, 301.2 (New), 301.1.2, 301.1.3, 301.3 (New), 401.1, 401.1.1, 409, Chapter 13, 1401.1**

## **Proposed Change as Submitted**

**Proponent:** Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

## **2015 International Existing Building Code**

**Relocate Chapter 13 as follows:**

### **13 14 RELOCATED OR MOVED BUILDINGS**

*(Renumber all subsequent sections in this chapter)*

*(Renumber Chapter 14 Prescriptive Method to be Chapter 13)*

### **SECTION 301 ADMINISTRATION**

**301.1 General.** The *repair, alteration, change of occupancy, addition* or relocation of all *existing buildings* shall comply with ~~one 301.2 or 301.3~~ of the methods listed in Sections ~~301.1.1 through 301.1.3~~ as selected by the applicant. Sections ~~301.1.1 through 301.1.3~~ shall not be applied in combination with each other this section. Where this code requires consideration of the seismic ~~force-resisting~~ force resisting system of an *existing building* subject to *repair, alteration, change of occupancy, addition* or relocation of *existing buildings*, the seismic evaluation and design shall be based on Section ~~301.1.4~~ 301.2.4 regardless of which compliance method is used.

**Exception:** Subject to the approval of the *code official*, *alterations* complying with the laws in existence at the time the building or the affected portion of the building was built shall be considered in compliance with the provisions of this code unless the building is undergoing more than a limited structural *alteration* as defined in Section 907.4.4. New structural members added as part of the *alteration* shall comply with the *International Building Code*. *Alterations of existing buildings in flood hazard areas* shall comply with Section 701.3.

**Add new text as follows:**

**301.2 Repairs, alterations, change of occupancy, and additions.** The *repair, alteration, change of occupancy, or addition* of all *existing buildings* shall comply with one of the methods listed in Sections 301.1.1 through 301.1.3 as selected by the applicant. Sections 301.2.1 through 301.2.3 shall not be applied in combination with each other.

**Revise as follows:**

**~~301.1.1~~ 301.2.1 Prescriptive compliance method.** *Repairs, alterations, additions* and *changes of occupancy* complying with Chapter 4 of this code in buildings complying with the *International Fire Code* shall be

considered in compliance with the provisions of this code.

~~301.1.2~~ **301.2.2 Work area compliance method.** *Repairs, alterations, additions, and changes in occupancy and relocated buildings complying with the applicable requirements of Chapters 5 through ~~13~~ 12 of this code shall be considered in compliance with the provisions of this code.*

~~301.1.3~~ **301.2.3 Performance compliance method.** *Repairs, alterations, additions, and changes in occupancy and relocated buildings complying with Chapter ~~14~~ 13 of this code shall be considered in compliance with the provisions of this code.*

*(Renumber subsequent sections)*

**Add new text as follows:**

**301.3 Relocated Buildings** Relocated buildings shall comply with the requirements of Chapter 14.

**Revise as follows:**

**401.1 Scope.** The provisions of this chapter shall control the *alteration, repair, addition and change of occupancy or relocation of existing buildings* and structures, including *historic buildings* and structures as referenced in Section ~~301.1.1~~ 301.2.1.

**Exception:** Existing bleachers, grandstands and folding and telescopic seating shall comply with ICC 300.

**401.1.1 Compliance with other methods.** *Alterations, repairs, additions and changes of occupancy to or relocation of existing buildings* and structures shall comply with the provisions of this chapter or with one of the methods provided in Section ~~301.1~~ 301.2.

~~**SECTION 409 MOVED STRUCTURES**~~

~~**409.1 Conformance.** Structures moved into or within the jurisdiction shall comply with the provisions of this code for new structures.~~

*(Renumber subsequent sections)*

**1401.1 Scope.** The provisions of this chapter shall apply to the *alteration, repair, addition and change of occupancy* of existing structures, including historic and moved structures, as referenced in Section ~~301.1.3~~ 301.2.3. The provisions of this chapter are intended to maintain or increase the current degree of public safety, health and general welfare in *existing buildings* while permitting *repair, alteration, addition and change of occupancy* without requiring full compliance with Chapters 5 through ~~13~~ 12, except where compliance with other provisions of this code is specifically required in this chapter.

*(Renumber subsequent sections)*

**Reason:** The purpose of this code change is to adequately address relocated or moved buildings in the IEBC. Currently, the three compliance methods address relocated/moved buildings in their respective scopes. This change will relocate Chapter 13, Relocated or Moved Buildings, and make it generally applicable for all three methods.

The topic is currently handled the following way:

Prescriptive Method- "Meet this code for new structures" [IEBC doesn't deal with new structures]

Work Area Method- Specific chapter that is not based upon the hierarchy of the work area method

Performance Method- No requirements provided

In short, the only method that has technical requirements is Chapter 13. Since the IBC covers relocated buildings in its scope, the use of new structure requirements for relocated or moved buildings is always an option anyway.

The IEBC has three different methods to give choices in the design of existing buildings. The reason for the choice to the applicant is to give options since every existing building is different, using legacy materials and having legacy code requirements. This is not the case for relocated buildings as the intent is to reuse an existing building in a different location rather than complete other rehabilitation work.

The Chapter layout would look like this:

1-Admin

2-Definitions

3-Prescriptive

4-General Requirements for all compliance methods

5-Work Area Classification of Work

6-Repairs

7-Alt. 1

8- Alt. 2

9- Alt. 3

10- Change of Occupancy

11-Additions

12- Historic Buildings

13- Performance Method

14- Relocated Buildings

15- Safeguards

16- Referenced Standards

In the alternative, a code change could be to modify the prescriptive method to have an appropriate reference to the IBC as well as the performance method to have some direction on the issue within it.

As a correlation note; if this proposal is denied by either the BCAC or the code development committee, a proposal has to go forward to repair IEBC 409.1 to reference the IBC.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: <http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

**Cost Impact:** Will not increase the cost of construction

Code proposal is only to clarify the existing code requirements through a relocation (reorganization) of code sections, so there is no intended increase or decrease expected by approving this proposal.

## **Public Hearing Results**

**Committee Action:**

**Approved as Submitted**

**Committee Reason:** Relocated or moved buildings do not require various compliance methods. Currently, Chapter 4 does a poor job of addressing such buildings. Chapter 13 is more comprehensive and should apply in all cases. Chapter 13 Relocated or Moved Buildings will simply be renumbered as Chapter 14 and the performance method will become Chapter 13. It should be noted that Section 509 should be deleted.

**Assembly Action :**

**None**

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Vickie Lovell, InterCode Incorporated, representing Modular Building Institute (vickie@intercodeinc.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Existing Building Code**

**1202.3 Relocated buildings.** ~~Foundations of relocated historic buildings and structures shall comply with the *International Building Code*. Relocated historic buildings shall otherwise be considered an historic building for the purposes comply with Chapter 14 of this code. Relocated historic buildings and structures shall be sited so that exterior wall and opening requirements comply with the *International Building Code* or with the compliance alternatives of this code.~~

**Commenter's Reason:** This change to 1202.3 was inadvertently omitted from the list of code sections identified in EB 11-15 that needed to be modified in the IEBC to address moved or relocated structures and buildings, including historic buildings. This public comment is a cleanup that correlates numerous code sections in the IEBC that deal with relocated existing buildings. The purpose of this public comment is to point the code user to the appropriate code section of the IEBC for historic buildings when they are moved from one jurisdiction to another. The current text, if left unchanged, incorrectly directs the code user to the IBC. The newly renumbered Chapter 14 in the IEBC handles these issues.

**COST IMPACT:** Will not increase the cost of construction.

There is no cost impact with this proposal since the IEBC already addresses moved and relocated structures.

### *Public Comment 2:*

**Proponent : Maureen Traxler, representing Seattle Dept of Planning & Development (maureen.traxler@seattle.gov) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

## **2015 International Existing Building Code**

**301.3 Relocated Buildings** Relocated buildings shall comply with the requirements of Chapter ~~14~~ 5.

### **~~14~~ 5 RELOCATED OR MOVED BUILDINGS**

**Commenter's Reason:** We are proposing that the new chapter on relocated buildings be Chapter 5 instead of Chapter 14. This location makes sense because the chapters that apply to all existing building projects would be located together-- Chapter 3 "Provisions for All Compliance Methods", the new Chapter 4 "Repairs" created by EB10-15, followed by this Chapter 5 "Relocated or Moved Buildings." All three chapters will apply regardless of which compliance method is chosen for the project. The intent of this proposal is that all sections in the chapter would be renumbered, as would subsequent chapters.

---

**EB11-15**

# EB13-15

## 301.1.5 (New)

### **Proposed Change as Submitted**

**Proponent:** David Collins, representing The American Institute of Architects (dcollins@preview-group.com); Ronald Nickson (rnickson@nmhc.org), representing National Multi-housing Council; Kevin Fry, BOMA International (Kfry@BOMA.org), representing BOMA International; Dan Buuck (dbuuck@nahb.org), representing NAHB

## 2015 International Existing Building Code

### **Add new text as follows:**

**301.1.5 Compliance with accessibility** Accessible requirements for existing buildings shall comply with the 2009 edition of ICC A117.1.

**Reason:** Dramatic changes are being proposed in the next edition of the ICC A117.1 standard that will accommodate a higher number of individuals. For example, the turning radius is being changed from 60" diameter to a 67" diameter, and clear floor space from 30"x48" to 30"x52" and related access to features. While these changes are able to be incorporated into new construction relatively easily, existing buildings that have been designed to conform with earlier standards or were modified to meet those earlier standards are likely to find that full compliance will create problems. Even using provisions based on the technical infeasibility for compliance will still require compliance in some circumstances that aren't justifiable financially and physically.

The Department of Justice in development of the 2010 ADA Standard allows for "grandfathering" of elements in an existing building that have already been made to conform and are found to comply with the earlier ADA standard. The 2009 edition of A117.1 provides the most comprehensively structured provisions for compliance with the original ADA and HUD standard, which is why a specific reference to that edition of the Standard for determining whether areas outside the specific alterations or change of occupancy must be modified.

**Cost Impact:** Will not increase the cost of construction

This change will reduce the cost of construction where changes have already been made to features of a building to conform to older accessibility standards. Under the proposed changes to A117.1 significant cost would be required to conform to these requirements often in areas where upgrades have already been performed in areas such as toilet rooms to meet the barrier removal requirements of the ADA or because of alterations and change of occupancy under the I-Codes when that work had been done prior to the adoption of this new standard.

EB13-15 : 301.1.5 (New)-  
COLLINS4462

---

### **Public Hearing Results**

**Committee Action:**

**Approved as Submitted**

**Committee Reason:** This proposal which specifies the 2009 edition of A117.1 was

felt necessary to avoid difficulties in achieving compliance for existing buildings. The newer edition of A117.1 which is currently being developed is likely to have much more rigid requirements that will cause costly compliance issues. There was concern that the adoption of a specific edition should be revisited in future editions as these concerns may lessen. Also, it was suggested that a more precise application of A117.1 could be provided to avoid application of overly restrictive requirements to certain features without losing the reference to the most recent standard once it becomes available.

**Assembly Motion:**

**Disapprove**

**Online Vote Results:**

**Failed**

Support: 40.46% (70) Oppose: 59.54% (103)

**Assembly Action :**

**None**

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : Jonathan Siu, City of Seattle, Dept of Planning & Development, representing City of Seattle Department of Planning & Development (jon.siu@seattle.gov) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

#### **2015 International Existing Building Code**

**301.1.5 Compliance with accessibility** Accessible Repairs, alterations, additions and changes of occupancy complying with the accessibility requirements for existing buildings in this code shall ~~comply~~ be constructed in accordance with the 2009 edition of the ICC A117.1 or the edition of the ICC A117.1 that was referenced when the building was originally constructed, whichever is later.

**Commenter's Reason:** While we agree it would be onerous in many cases to require older existing buildings to comply with the updated ICC A117.1 standard currently under development, the text as proposed opens a big loophole for buildings that would be required to comply with newer editions of ICC A117.1. We do not believe this was the intent of the proponent, so this proposed modification would close that loophole.

Recall that the definition of an existing building in the IEBC includes buildings "for which a legal building permit has been issued." This means that even before a spade of dirt is turned to start construction, the building is "existing." This then opens up a scenario where an applicant applies for and receives a building permit that would be required to comply with a new edition of ICC A117.1. The day after the permit is issued, the applicant submits a new permit application to alter the "existing building" to comply with the 2009 version of ICC A117.1. This subterfuge would be allowed under the current language, as approved by the Committee.

This proposed modification will limit the application of the 2009 ICC A117.1 only to those buildings that were not required to comply with a newer standard when they were constructed. Thus, those that were supposed to comply with a new standard will still be required to comply with it into the future. Those that were designed to comply with the 2009 version of the standard would be permitted to continue to use that standard as the basis for their designs and approvals into the future.

We are aware that ICC has a committee that is working to update ICC A117.1, and we

assume their intent is to have it adopted into the 2018 I-codes. However, this proposed modification does not tie the allowed use of 2009 ICC A117.1 to adoption of the 2018 IBC for the following reasons:

- The adoption of the ICC A117.1 version under development would be a proposal for next year's Group B code development cycle, and,
- Neither the completion of the latest version, nor its adoption into the 2018 IBC through the Group B cycle is a certainty at this point in time.

## *Public Comment 2:*

**Proponent : Marsha Mazz, representing U.S. Access Board (mazz@access-board.gov) requests Disapprove.**

**Commenter's Reason:** This proposal assumes that the next edition of the ICC/ANSI A117.1 will include changes that, if implemented, would have significant impact on existing buildings subject to the code. The proponents cited increases in the size of turning space and clear floor space as the reason for this action. While it is possible that these new requirements will have an impact on existing spaces, it is not reasonable to set aside in its entirety a new accessibility standard that is even more harmonized with ADA in order to address concerns regarding these few provisions. In our testimony against this proposal, we suggested that the proponents should act more strategically by including exceptions only for those provisions that cause them concern. Absent such limited exceptions, we believe that the existing provisions in the IEBC allowing for compliance to the "maximum extent technically feasible" where "technical infeasibility" can be demonstrated sufficiently addresses the concern that some existing buildings cannot accommodate the new requirements. In fact, some buildings cannot accommodate the older requirements and must depend on technical infeasibility.

The proponent's reason statement compared their proposed retention of a dated accessibility standard to the Department of Justice (DOJ) safe harbor for existing buildings in compliance with the 1991 ADA Standard. This comparison fails in one significant way. The DOJ safe harbor does not apply where a building or facility is altered or added to. The DOJ safe harbor applies only where state or local governments and public accommodations have an affirmative duty to remove barriers in existing buildings and facilities that predate the effective date of the ADA Standards. These requirements are known as program accessibility (28 CFR 35.149 and 35.150) and removal of barriers (28 CFR 36.304). There is no corollary to program accessibility or barrier removal in the IBC or the IEBC because, unlike the building code, the ADA often requires the accessibility of a building to be upgraded regardless of whether an alteration or addition is undertaken. Under the ADA, alterations and additions must comply with the accessibility standards in effect at the time of construction unless compliance is technically infeasible (28 CFR 35.151 and 28 CFR 36.406).

---

**EB13-15**

# EB20-15

## 402.1.1 (New), 410.6, 705.1, 1105.2 (New)

### Proposed Change as Submitted

**Proponent :** Gene Boecker (geneb@codeconsultants.com)

## 2015 International Existing Building Code

### Add new text as follows:

**402.1.1 Accessible Means of Egress** Additions shall provide accessible means of egress in accordance with Section 1009 of the *International Building Code*. Where the accessible means of egress from the addition leads through the existing building, the associated accessible means of egress path in the existing building shall be altered to be in accordance with Section 1009 of the *International Building Code*. Means of egress in the addition and existing building that are not accessible shall be provided with directional signage in accordance with Section 1009 of the *International Building Code* at the non-accessible portion of the means of egress.

### Revise as follows:

**410.6 Alterations.** A facility that is altered shall comply with the applicable provisions in Chapter 11 of the *International Building Code*, unless *technically infeasible*. Where compliance with this section is *technically infeasible*, the alteration shall provide access to the maximum extent technically feasible.

#### Exceptions:

1. The altered element or space is not required to be on an accessible route, unless required by Section 410.7.
2. Accessible means of egress required by Chapter 10 of the *International Building Code* are not required to be provided in existing facilities except as required by Section 402.1.1.
3. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall be permitted to meet the provision for a Type B dwelling unit.
4. Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in *existing buildings* and facilities undergoing a *change of occupancy* in conjunction with *alterations* where the *work area* is 50 percent or less of the aggregate area of the building.

**705.1 General.** A facility that is altered shall comply with the applicable provisions in Sections 705.1.1 through 705.1.14, and Chapter 11 of the *International Building Code* unless it is *technically infeasible*. Where compliance with this section is *technically infeasible*, the alteration shall provide access to the maximum extent that is technically feasible.

A facility that is constructed or altered to be accessible shall be maintained accessible during occupancy.

#### Exceptions:

1. The altered element or space is not required to be on an

- accessible route unless required by Section 705.2.
2. Accessible means of egress required by Chapter 10 of the *International Building Code* are not required to be provided in existing *facilities* except as required by Section 1101.1.1.
  3. Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing *facilities* undergoing less than a Level 3 *alteration*.
  4. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provisions for Type B dwelling units.

**Add new text as follows:**

**1105.2 Accessible means of egress** Additions shall provide accessible means of egress in accordance with Section 1009 of the International Building Code. Where the accessible means of egress from the addition leads through the existing building, the associated accessible means of egress path in the existing building shall be altered to be in accordance with Section 1009 of the International Building Code. Means of egress in the addition and existing building that are not accessible shall be provided with directional signage in accordance with Section 1009 of the International Building Code at the non-accessible portion of the means of egress.

**Reason:** The proposal clarifies the application of the requirement for accessible means of egress (AMOE) in additions. The concept is the same for both the Prescriptive Compliance Method and Work Area Compliance Method. No proposal is made for Chapter 14 because Section 1401.2.5 already refers back to Sections 410 and 705 for accessibility compliance when using the Performance Compliance Method.

**402.1.1 and 1101.1.1** - Because Section 410.6 of the IEBC (and Section 1009.1 of the IBC) contains an exception that states that the AMOE is not required in existing buildings, it creates confusion regarding what needs to be done when the AMOE from the addition leads through the existing building; whether it must continue through the existing building and require modification to the existing building as is implied in Section 402.1 or whether it can stop at the existing building due the explicit language in exception 2 of Section 410.6.

The proposed language makes it clear that if the path of egress within the existing building cannot be made to comply with the requirements for an accessible means of egress, then the addition will need to provide all the AMOE requirements for the addition. This is the only option.

Finally, signage is required at the means of egress for both the addition and the existing building where those egress elements do not comply with the AMOE provisions of the IBC. If the means of egress in either the addition or existing building cannot meet the requirements as an AMOE then the directional signage must be provided so that the occupants can find the AMOE.

**410.6 and 705.1** - It is clear that the blanket exception that the existing building is not required to have any accessible means of egress is not completely true. The requirements for the addition may force that upon the existing building. The text of these two sections should recognize and reflect that.

**Cost Impact:** Will not increase the cost of construction  
The text is a clarification of the current interpretation.

## Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** There was concern that this proposal added unnecessary wording to an issue that is technically already addressed. Also, the cost implication of this new section is unclear. The 20% cost limit provided for the accessible route requirements does not appear to be applicable.

**Assembly Motion:**

**As Submitted**

**Online Vote Results:**

**Failed**

Support: 37.87% (64) Oppose: 62.13% (105)

**Assembly Action :**

**None**

## Individual Consideration Agenda

### *Public Comment 1:*

**Proponent : Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Existing Building Code**

**402.1.1 Accessible Means of Egress** Additions shall provide accessible means of egress in accordance with Section 1009 of the *International Building Code*. Where the accessible means of egress from the addition leads through the existing building, the associated accessible means of egress path in the existing building shall be altered to be in accordance with Section 1009 of the *International Building Code*. Means of egress in the addition and existing building that are not accessible shall be provided with directional signage in accordance with Section 1009 of the *International Building Code* at the non-accessible portion of the means of egress. Alterations to provide an accessible means of egress in the existing building shall provide access to the maximum extent technically feasible.

**Exception:** The cost of providing the accessible means of egress through the existing building shall not be required to exceed five percent (5%) of the costs of the addition.

**Commenter's Reason:** By the committee's own discussion, it is clear that this issue needs to be further addressed. Some felt that it was already implied by the current text that to provide an accessible means of egress from the addition, the existing building needed to be modified as necessary. Others felt that the cost would be too great if the proposal went through as is because they would not infer that the existing building needed any work as a result of an addition. The additional language provides a cut-off on the cost to address the accessible means of egress in the existing building. For very small projects, the cost may include only the replacement of a threshold. This addresses the cost concern expressed. Without some language on this issue it will remain unclear and be enforced differently throughout the country. If we cannot address this comprehensively, at least let us take a start at clarifying the need to do something.

The other sections of the original proposal were not addressed in this public comment because Code Change EB33 reshuffles the sections of the IEBC. If

this public comment is approved it will need to be inserted and referenced properly based on the action on EB 33.

**EB20-15**

# EB21-15

**402.6 (New), 403.11 (New), 804.4.4 (New), 1105 (New), 1105.1 (New)**

## **Proposed Change as Submitted**

**Proponent :** Adolf Zubia, representing IAFC Fire & Life Safety Section

### **2015 International Existing Building Code**

**Add new text as follows:**

**402.6 Carbon monoxide alarms in existing portions of a building.** Where an addition is made to a building or structure of a Group I-1, I-2, I-4 or R occupancy, the existing building shall be provided with carbon monoxide alarms in accordance with Section 1103.9 of the *International Fire Code* or Section R315 of the *International Residential Code*, as applicable.

**403.11 Carbon monoxide alarms.** Carbon monoxide alarms shall be provided to protect sleeping units and dwelling units in Group I-1, I-2, I-4 and R occupancies in accordance with Section 1103.9 of the *International Fire Code*.

**804.4.4 Carbon monoxide alarms.** Sleeping units and dwelling units in any work area in Group I-1, I-2, I-4 and R occupancies shall be equipped with carbon monoxide alarms in accordance with Section 1103.9 of the *International Fire Code*.

### **SECTION 1105 CARBON MONOXIDE ALARMS IN GROUPS I-1, I-2, I-4 AND R**

**1105.1 Carbon monoxide alarms in existing portions of a building** Where an addition is made to a building or structure of a Group I-1, I-2, I-4 or R occupancy, the existing building shall be equipped with carbon monoxide alarms in accordance with Section 1103.9 of the *International Fire Code* or Section R315 of the *International Residential Code*, as applicable.

**Reason:** This proposal is submitted by the Fire and Life Safety Section of the International Association of Fire Chiefs.

IFC Section 1103.8 contains requirements for installing smoke alarms in existing occupancies. Those requirements are reflected in the IEBC Sections 402.5, 403.10, 804.4.3 and 1104.1. IFC Section 1103.9 contains requirements for installing carbon monoxide alarms in existing occupancies; however, those requirements are currently not reflected in the IEBC.

This proposal corrects this oversight with the new proposed code sections.

This proposal will provide consistency between the IFC, IRC and the IEBC with regard to the installation and requirements of carbon monoxide alarms.

**Cost Impact:** Will not increase the cost of construction

The cost of construction will not increase since the existing buildings should already be in compliance with the requirements in IFC Section 1103.9. This proposal simply provides correlation between the I-Codes.

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The proposal was disapproved as it was not felt necessary to add these requirements to the IEBC already addressed by the IFC. In addition, there was concern that the cost impact was not addressed in enough detail and education is a better way to encourage the use of such detection.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : Edward Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

#### **2015 International Existing Building Code**

##### **402.6 Carbon monoxide alarms in existing portions of a building.**

Where an addition is made to a building or structure of a Group I-1, I-2, I-4 or R occupancy, the existing building shall be provided with carbon monoxide alarms in accordance with Section 1103.9 of the *International Fire Code* or Section R315 of the *International Residential Code*, as applicable.

##### **Exceptions:**

1. Work involving the exterior surfaces of buildings, such as the replacement of roofing or siding, or the addition or replacement of windows or doors, or the addition of porches or decks, is exempt from the requirements of this section.
2. Installation, alteration or repairs of plumbing or mechanical systems, other than fuel-burning appliances, are exempt from the requirements of this section.

-

**403.11 Carbon monoxide alarms.** Carbon monoxide alarms shall be provided to protect sleeping units and dwelling units in Group I-1, I-2, I-4 and R occupancies in accordance with Section 1103.9 of the *International Fire Code*.

##### **Exceptions:**

1. Work involving the exterior surfaces of buildings, such as the replacement of roofing or siding, or the addition or replacement of windows or doors, or the addition of porches or decks, is exempt from the requirements of this section.
2. Installation, alteration or repairs of plumbing or mechanical systems, other than fuel-burning appliances, are exempt from the requirements of this section.

-

## **SECTION 805 CARBON MONOXIDE DETECTION**

~~804.4.4~~ **805.1 Carbon monoxide alarms.** ~~Sleeping units and dwelling units in any~~ Any work area in Group I-1, I-2, I-4 and R occupancies shall be equipped with carbon monoxide alarms in accordance with Section 1103.9 of the International Fire Code.

### **Exceptions:**

1. Work involving the exterior surfaces of buildings, such as the replacement of roofing or siding, or the addition or replacement of windows or doors, or the addition of porches or decks, is exempt from the requirements of this section.
2. Installation, alteration or repairs of plumbing or mechanical systems, other than fuel-burning appliances, are exempt from the requirements of this section.

**Commenter's Reason:** The proposal was disapproved as it was not felt necessary to add these requirements to the IEBC already addressed by the IFC. Response: The CO alarm requirements replicate smoke alarm requirements that were judged to be necessary.

This Public Comment (PC) will provide consistency between the IFC, IRC and the IEBC with regard to the installation requirements of carbon monoxide detection in existing buildings. Section 1103.9 of the IFC and Section R315 of the IRC contain requirements for installation of CO detection in existing occupancies. However there are no such requirements in the IEBC.

The ICC membership has already determined that CO poisoning as a distinct hazard and has placed specific provisions in the IFC and IRC for CO detection in existing occupancies. Since the determination of a hazard is already identified in the aforementioned Codes similar requirements need to be added to the IEBC.

Also, in the absence of a model building code for the installation of CO detection in existing occupancies many jurisdictions are passing laws for CO detection in existing buildings with varying installation requirements.

---

# EB23-15

403.2 (New), 704.1, 704.2 (New)

## Proposed Change as Submitted

**Proponent :** Adolf Zubia, representing IAFC Fire & Life Safety Section

### 2015 International Existing Building Code

**Add new text as follows:**

**403.2 Locking arrangements in Group E occupancies.** Where approved by the code official, egress doors from classrooms, offices and other occupied rooms in Group E occupancies shall be allowed to be provided with locking arrangements designed to keep intruders from entering the room that require a key, special knowledge or effort when all of the following conditions are met:

1. The door shall be capable of being unlocked from outside the room with a key or other approved means.
2. Modifications shall not be made to existing listed panic hardware, fire door hardware or door closers.
3. Modifications to fire door assemblies shall be in accordance with NFPA 80.
4. The unlatching of the door or leaf shall be allowed to require two operations.

**Revise as follows:**

**704.1 General.** *Alterations* shall be done in a manner that maintains the level of protection provided for the means of egress, except as allowed in Section 704.2.

**Add new text as follows:**

**704.2 Locking arrangements in Group E occupancies.**

Where approved by the code official, egress doors from classrooms, offices and other occupied rooms in Group E occupancies shall be allowed to be provided with locking arrangements designed to keep intruders from entering the room that require a key, special knowledge or effort when all of the following conditions are met:

1. The door shall be capable of being unlocked from outside the room with a key or other approved means.
2. Modifications shall not be made to existing listed panic hardware, fire door hardware or door closers.
3. Modifications to fire door assemblies shall be in accordance with NFPA 80.
4. The unlatching of the door or leaf shall be allowed to require two operations.

**Reason:** This proposal is submitted by Fire and Life Safety Section of the International Association of Fire Chiefs.

Unfortunately active shooter incidents in schools are a threat in modern society that have resulted in the need to quickly secure classrooms and other occupied areas to

keep unwanted intruders from entering.

Many unlisted devices are being used to secure the doors from being opened. Many of these devices have not been evaluated to insure they operate properly and do not impair door operation. These devices are being deployed in periodic lockdown drills, and present the potential to for students or unauthorized personnel to secure the doors so the rooms cannot be entered.

This proposal allows key actuated deadbolts or other locks to be provided on classroom doors, where the teacher can choose to lock the door and provide shelter-in-place in the classroom. The proposed change also requires the door to be able to be unlocked from the opposite side in cases where the school administrator or responders wish to enter the room without having to make a forcible entry.

Door hardware is currently available that allows classroom to be provided with lockdown capabilities that comply with applicable IBC Chapter 10 requirements. However the costs of retrofitting doors with that hardware far exceed the cost of retrofitting with a simple deadbolt lock. This is a significant issue for school systems who are continually facing budget restrictions.

This code change limits this optional locking method only when the building is undergoing alternations. This allowance is intentionally not provided for buildings undergoing additions or a change of occupancy.

It is not necessary to add new language to the Chapter 9 alteration provisions since Section 905.1 references Section 805 means of egress requirements.

**Cost Impact:** Will not increase the cost of construction

This proposal allows an option that may result in lower costs than retrofitting egress doors with locking hardware that complies with IBC Chapter 10 requirements.

EB23-15 : 704.1-  
ZUBIA4731

---

## **Public Hearing Results**

**Committee Action:**

**Approved as Modified**

**Modification:**

### **403.2 Locking arrangements in Group E occupancies.**

Where approved by the code official, egress doors from classrooms, offices and other occupied rooms in Group E occupancies shall be allowed to be provided with locking arrangements designed to keep intruders from entering the room ~~that require a key, special knowledge or effort~~ when all of the following conditions are met:

1. The door shall be capable of being unlocked from outside the room with a key or other approved means.
2. Modifications shall not be made to existing listed panic hardware, fire door hardware or door closers.
3. Modifications to fire door assemblies shall be in accordance with NFPA 80.
4. ~~The unlatching of the door or leaf shall be allowed to require two operations.~~

## **704.2 Locking arrangements in Group E occupancies.**

Where approved by the code official, egress doors from classrooms, offices and other occupied rooms in Group E occupancies shall be allowed to be provided with locking arrangements designed to keep intruders from entering the room ~~that require a key, special knowledge or effort~~ when all of the following conditions are met:

1. The door shall be capable of being unlocked from outside the room with a key or other approved means.
2. Modifications shall not be made to existing listed panic hardware, fire door hardware or door closers.
3. Modifications to fire door assemblies shall be in accordance with NFPA 80. .
4. ~~The unlatching of the door or leaf shall be allowed to require two operations.~~

**Committee Reason:** The committee preferred this proposal over E57-15 Part II with the inclusion of the modification. Note that E57-15 Part II was approved. This proposal provides special locking arrangements if they are necessary versus mandating the use of such arrangements. The modification deletes the language from each proposed section that states "that require a key, special knowledge and effort" as the verbiage would limit the provisions only to those types of locks. Item 4 was deleted from each section as it conflicts with accessibility requirements.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : Edward Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org); Adolf Zubia, representing International Association of Fire Chiefs, Fire & Life Safety Section , representing International Assoc of Fire Chiefs, Fire & Life Safety Section (azubiamia@yahoo.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Existing Building Code**

**403.2 Locking arrangements in ~~Group E educational occupancies.~~ In Group E and Group B educational occupancies,** egress doors from classrooms, offices and other occupied rooms ~~in Group E occupancies shall be allowed~~ permitted to be provided with locking arrangements designed to keep intruders from entering the room ~~when~~ where all of the following conditions are met:

1. The door shall be capable of being unlocked from outside the room with a key or other approved means.

2. The door shall be openable from within the room in accordance with Section 1010.1.9 of the International Building Code.
3. Modifications shall not be made to existing listed panic hardware, fire door hardware or door closers.
4. Modifications to fire door assemblies shall be in accordance with NFPA 80.

#### **704.2 Locking arrangements in ~~Group E~~ educational**

**occupancies.** ~~Where approved by the code official, egress~~ Egress doors from classrooms, offices and other occupied rooms in Group E and Group B educational occupancies shall be allowed to be provided with locking arrangements designed to keep intruders from entering the room when all of the following conditions are met:

1. The door shall be capable of being unlocked from outside the room with a key or other approved means.
2. The door shall be openable from within the room in accordance with Section 1010.1.9 of the International Building Code.
3. Modifications shall not be made to existing listed panic hardware, fire door hardware or door closers.
4. Modifications to fire door assemblies shall be in accordance with NFPA 80. .

**Commenter's Reason:** At the Memphis hearings the committee voted unanimously to approve this proposal, with a floor modification. This public comment makes a few additional modifications to the proposal as follows:

1. Testimony was provided at the CAH suggesting these requirements be expanded to cover college classrooms, offices, and other occupied rooms (such as teacher lounges, central office areas, and similar rooms where locking out potential intruders is judged appropriate). Revisions to expand the section to cover Group B educational occupancies addresses this concern.
2. The original proposal allowed unlatching of the door from inside the room to require two operations, where approved by the code official. The provision allowing two operations to unlatch the door was removed with a floor amendment at the hearings. With that removed there is no need to retain "Where required by the code official" in this section.
3. New item 2 clarifies that the door must be openable from within the room in accordance with 1010.19 of the IBC. This will ensure that (1) egress doors are readily openable from the inside without use of a tool or special knowledge, (2) unlatching of the door will not require more than one operation, (3) door handles will meet accessibility requirements, and (4) hardware height is appropriate.

### *Public Comment 2:*

**Proponent : Region VII, representing ICC Region VII (admin@iccregionvii.org) requests Disapprove.**

**Commenter's Reason:** Current modified language adds nothing new to the existing requirements additionally this may not allow the AHJ to have oversight in regards to the locking system of egress doors.

# EB28-15

405.5

## Proposed Change as Submitted

**Proponent :** Jeff Hugo, National Fire Sprinkler Association, representing National Fire Sprinkler Association (hugo@nfsa.org)

## 2015 International Existing Building Code

**Revise as follows:**

**405.5 Opening protectives.** Doors and windows ~~along the~~ within 10 feet of fire escape stairways shall be protected with <sup>3</sup> /4 -hour opening protectives.

**Exception:** Opening protection shall not be required in buildings equipped throughout with an automatic sprinkler system.

**Reason:** Section 805.3.1.2.1 permits this exception for Level 2 Alterations. This proposal would provide the same exception for fire doors and windows along the fire escape when using the prescriptive compliance method.

**Cost Impact:** Will not increase the cost of construction  
When fire sprinkler systems are installed there would be no need to install new opening protectives.

EB28-15 : 405.5-  
HUGO4696

## Public Hearing Results

**Committee Action:**

**Approved as Submitted**

**Committee Reason:** This proposal was approved for consistency with the current provisions in Section 805.3.1.2.1 Item 4.

**Assembly Action :**

**None**

---

## Individual Consideration Agenda

*Public Comment 1:*

**Proponent : Tom Zaremba, Roetzel & Andress, representing Alliance of Primary Fire Rated Manufacturers (tzaremba@ralaw.com) requests Disapprove.**

**Commenter's Reason:** EB28-15 should be disapproved. The Committee's and the Proponent's only support for adopting EB28-15 is "consistency" with an exception found in IEBC Section 805.3.1.2.1. However, that "consistency" can only be achieved by creating an inconsistency with IFC Section 1103.1 and by giving EC28-15 a "free pass" to circumvent changes made to the 2015 IEBC and IFC that are now being carried forward into Ch. 4 of the IEBC by EB16-15. These IEBC and IFC changes specify exactly **how** changes to fire protection features in existing buildings **may** be allowed if automatic sprinklers are added.

The analysis begins with Section 1103.1 of the IFC. It provides: "The provisions of this chapter shall not be construed to allow the elimination of *fire protection systems* or a reduction in the level of fire safety provided in buildings constructed in accordance with previously adopted codes." This is significant to EB28-15 since IEBC Chapter 4 compliance depends on compliance with the IFC. IEBC Section 301.1.1 provides that: "*Repairs, alterations, additions and changes of occupancy* complying with Chapter 4 of this code **in buildings complying with the International Fire Code** shall be considered in compliance with the provisions of this code." (Emphasis added.)

In 2015, the IEBC and IFC were both changed to specify exactly what is required to change fire protection features in an existing building when automatic sprinklers are added throughout.

Section 803.6 was added to the IEBC in 2015 and provides:

**Fire-resistance ratings.** Where approved by the code official, buildings where an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2 of the *International Building Code* has been added, and the building is now sprinklered throughout, the required fire-resistance rating ratings of building elements and materials shall be permitted to meet the requirements of the current building code.

Plans, investigation and evaluation reports, and other data **shall be submitted** indicating which building elements and materials the applicant is requesting the code official to review and approve for determination of applying the current building code fire-resistance ratings. Any special construction features, including fire-resistance-rated assemblies and smoke-resistive assemblies, conditions of occupancy, means-of-egress conditions, fire code deficiencies, approved modifications or approved alternative materials, design or methods of construction, and equipment applying to the building that impact required fire-resistance ratings shall be identified in the evaluation reports. (Emphasis added).

A corresponding change was made to the IFC in 2015, allowing changes made pursuant to IEBC Section 803.6 as an exception to IFC Section 1103.1. However, no change to coordinate EB28-15 with IFC Section 1103.1 has been proposed. As indicated earlier, use of IEBC Chapter 4 depends on compliance with the IFC.

Earlier this year, EB16-15 was unanimously approved by the Technical Committee. It would add language identical to IEBC 803.6 to IEBC Chapter 4. As set out in the statement supporting EB16-15:

The suggested language ... requires ... any special construction features, conditions of occupancy, approved modifications or approved alternative materials, design and methods of construction, and equipment applying to the building that impact required fire-resistance ratings shall be identified in the evaluation reports submitted. This is to ensure [that] special conditions are identified that may [result in] a reduction in fire-resistance ratings.

If approved, EB28-15 will put the IEBC in conflict with IFC Section 1103.1 since there is no exception for EB28-15 in IFC Section 1103.1. Second, if adopted, EB28-15 will give a "free pass" to circumvent the analysis, review and approval requirements of IEBC Section 803.6, soon to be a part of the prescriptive provisions of Chapter 4 of the IEBC by reason of EB16-15.

We urge you to vote against the standing motion to approve EB28-15 and to vote in favor of a motion to disapprove EB28-15. If adopted, EB28-15 would automatically reduce the fire protection features of existing buildings without benefit of the analysis already found in IEBC Section 803.6 and proposed for Chapter 4 of the IEBC by EB16-15. It would also create an unnecessary conflict with the IFC.

## **Proposed Change as Submitted**

**Proponent:** David Collins, representing The American Institute of Architects (dcollins@preview-group.com); Maureen Traxler, City of Seattle (maureen.traxler@seattle.gov) representing City of Seattle Dept of Planning and Development; Steven Winkel (swinkel@preview-group.com) representing the Preview Group

## **2015 International Existing Building Code**

### **Revise as follows:**

**410.1 303.1 Scope.** The provisions of Sections ~~410.1~~ 303.1 through ~~410.9~~ 303.9 apply to maintenance, *change of occupancy*, *additions* and *alterations* to existing buildings, including those identified as *historic buildings*.

**410.2 303.2 Maintenance of facilities.** *No change to text.*

**410.3 303.3 Extent of application.** *No change to text.*

**410.4 303.4 Change of occupancy.** *No change to text.*

**410.4.1 303.4.1 Partial change in occupancy.** Where a portion of the building is changed to a new occupancy classification, any *alterations* shall comply with Sections ~~410.6~~ 303.6, ~~410.7~~ 303.7 and ~~410.8~~ 303.8.

**410.4.2 303.4.2 Complete change of occupancy.** Where an entire building undergoes a *change of occupancy*, it shall comply with Section ~~410.4.1~~ 303.4.1 and shall have all of the following accessible features:

1. At least one accessible building entrance.
2. At least one accessible route from an accessible building entrance to *primary function* areas.
3. Signage complying with Section 1111 of the *International Building Code*.
4. Accessible parking, where parking is being provided.
5. At least one accessible passenger loading zone, when loading zones are provided.
6. At least one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.

Where it is *technically infeasible* to comply with the new construction standards for any of these requirements for a change of group or occupancy, the above items shall conform to the requirements to the maximum extent technically feasible.

**Exception:** The accessible features listed in Items 1 through 6 are not required for an accessible route to Type B units.

**410.5 303.5 Additions.** Provisions for new construction shall apply to *additions*. An *addition* that affects the accessibility to, or contains an area of, a *primary function* shall comply with the requirements in Section ~~410.7~~ 303.7.

**410.6 303.6 Alterations.** A *facility* that is altered shall comply with the applicable provisions in Chapter 11 of the *International Building Code*, unless *technically infeasible*. Where compliance with this section is *technically infeasible*, the *alteration* shall provide access to the maximum extent technically feasible.

**Exceptions:**

1. The altered element or space is not required to be on an accessible route, unless required by Section ~~410.7~~ 303.7.
2. Accessible means of egress required by Chapter 10 of the *International Building Code* are not required to be provided in existing facilities.
3. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall be permitted to meet the provision for a Type B dwelling unit.
4. Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in *existing buildings* and facilities undergoing a *change of occupancy* in conjunction with *alterations* where the *work area* is 50 percent or less of the aggregate area of the building.

**410.7 303.7 Alterations affecting an area containing a primary function.** *No change to text.*

**410.8 303.8 Scoping for alterations.** The provisions of Sections ~~410.8.1~~ 303.8.1 through ~~410.8.14~~ 303.8.15 shall apply to *alterations* to *existing buildings* and *facilities*.

**410.8.1 303.8.1 Entrances.** *No change to text.*

**410.8.2 303.8.2 Elevators.** *No change to text.*

**410.8.3 303.8.3 Platform lifts.** *No change to text.*

**410.8.4 303.8.4 Stairways and escalators in existing buildings.** *No change to text.*

**410.8.5 303.8.5 Ramps.** Where slopes steeper than allowed by Section 1012.2 of the *International Building Code* are necessitated by space limitations, the slope of ramps in or providing access to existing facilities shall comply with Table ~~410.8.5~~ 303.8.5.

**TABLE 303.8.5  
RAMPS**

SLOPE	MAXIMUM RISE
-------	-----------------

Steeper than 1:10 but not steeper than 1:8	3 inches
Steeper than 1:12 but not steeper than 1:10	6 inches

For SI: 1 inch = 25.4 mm.

**410.8.6 303.8.6 Accessible dwelling or sleeping units.** *No change to text.*

**410.8.7 303.8.7 Type A dwelling or sleeping units.** *No change to text.*

**410.8.8 303.8.8 Type B dwelling or sleeping units.** *No change to text.*

**303.8.9 Dining areas** An accessible route to raised or sunken dining areas or to outdoor seating areas is not required provided that the same services and decor are provided in an accessible space usable by any occupant and not restricted to use by people with a disability.

**410.8.9 303.8.10 Jury boxes and witness stands.** *No change to text.*

**410.8.10 303.8.11 Toilet rooms.** *No change to text.*

**410.8.11 303.8.12 Dressing, fitting and locker rooms.** *No change to text.*

**410.8.12 303.8.13 Fuel dispensers.** *No change to text.*

**410.8.13 303.8.14 Thresholds.** *No change to text.*

**410.8.14 303.8.15 Amusement rides.** *No change to text.*

**410.9 303.9 Historic buildings.** These provisions shall apply to *facilities* designated as historic structures that undergo *alterations* or a *change of occupancy*, unless *technically infeasible*. Where compliance with the requirements for accessible routes, entrances or toilet rooms would threaten or destroy the historic significance of the *facility*, as determined by the applicable governing authority, the alternative requirements of Sections ~~410.9.1 303.9.1~~ through ~~410.9.4 303.9.4~~ for that element shall be permitted.

**Exception:** Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in historical buildings.

**410.9.1 303.9.1 Site arrival points.** *No change to text.*

**410.9.2 303.9.2 Multilevel buildings and facilities.** *No change to text.*

**410.9.3 303.9.3 Entrances.** *No change to text.*

**410.9.4 303.9.4 Toilet and bathing facilities.** *No change to text.*

**801.1 Scope.** Level 2 *alterations* as described in Section 504 shall comply with the requirements of this chapter.

**Exception:** Buildings in which the reconfiguration is exclusively the result of compliance with the accessibility requirements of Section ~~705.2~~ 303.7 shall be permitted to comply with Chapter 7.

**901.2 Compliance.** In addition to the provisions of this chapter, work shall comply with all of the requirements of Chapters 7 and 8. The requirements of Sections 803, 804 and 805 shall apply within all *work areas* whether or not they include exits and corridors shared by more than one tenant and regardless of the occupant load.

**Exception:** Buildings in which the reconfiguration of space affecting exits or shared egress access is exclusively the result of compliance with the accessibility requirements of Section ~~705.2~~ 303.7 shall not be required to comply with this chapter.

**~~[BS]~~B101.3 Qualified historic buildings and facilities subject to Section 106 of the National Historic Preservation Act.** Where an *alteration or change of occupancy* is undertaken to a qualified *historic building* or facility that is subject to Section 106 of the National Historic Preservation Act, the federal agency with jurisdiction over the undertaking shall follow the Section 106 process. Where the state historic preservation officer or Advisory Council on Historic Preservation determines that compliance with the requirements for accessible routes, ramps, entrances, or toilet facilities would threaten or destroy the historic significance of the building or facility, the alternative requirements of Section ~~410.9~~ 303.9 for that element are permitted.

**~~[BS]~~B101.4 Qualified historic buildings and facilities not subject to Section 106 of the National Historic Preservation Act.** Where an *alteration or change of occupancy* is undertaken to a qualified *historic building* or facility that is not subject to Section 106 of the National Historic Preservation Act, and the entity undertaking the alterations believes that compliance with the requirements for accessible routes, ramps, entrances, or toilet facilities would threaten or destroy the historic significance of the building or facility, the entity shall consult with the state historic preservation officer. Where the state historic preservation officer determines that compliance with the accessibility requirements for accessible routes, ramps, entrances, or toilet facilities would threaten or destroy the historical significance of the building or facility, the alternative requirements of Section ~~410.9~~ 303.9 for that element are permitted.

**~~[BS]~~B102.2.3 Direct connections.** New direct connections to commercial, retail, or residential facilities shall, to the maximum extent feasible, have an accessible route complying with Section ~~705.2~~ 303.7 from the point of connection to boarding platforms and transportation system elements used by the public. Any elements provided to facilitate future direct connections shall be on an accessible route connecting boarding platforms and transportation system elements used by the public.

**Delete without substitution:**

## ~~SECTION 705 ACCESSIBILITY~~

~~**705.1 General.** A facility that is altered shall comply with the applicable provisions in Sections 705.1.1 through 705.1.14, and Chapter 11 of the *International Building Code* unless it is *technically infeasible*. Where compliance with this section is *technically infeasible*, the alteration shall provide access to the maximum extent that is technically feasible.~~

~~A facility that is constructed or altered to be accessible shall be maintained accessible during occupancy.~~

**Exceptions:**

- ~~1. The altered element or space is not required to be on an accessible route unless required by Section 705.2.~~
- ~~2. Accessible means of egress required by Chapter 10 of the *International Building Code* are not required to be provided in existing facilities.~~
- ~~3. Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing facilities undergoing less than a Level 3 alteration.~~
- ~~4. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provisions for Type B dwelling units.~~

~~**705.1.1 Entrances.** Where an alteration includes alterations to an entrance, and the facility has an accessible entrance on an accessible route, the altered entrance is not required to be accessible unless required by Section 705.2. Signs complying with Section 1111 of the *International Building Code* shall be provided.~~

~~**705.1.2 Elevators.** Altered elements of existing elevators shall comply with ASME A17.1/CSA B44 and ICC A117.1. Such elements shall also be altered in elevators programmed to respond to the same hall call control as the altered elevator.~~

~~**705.1.3 Platform lifts.** Platform (wheelchair) lifts complying with ICC A117.1 and installed in accordance with ASME A18.1 shall be permitted as a component of an accessible route.~~

~~**705.1.4 Ramps.** Where steeper slopes than allowed by Section 1012.2 of the *International Building Code* are necessitated by space limitations, the slope of ramps in or providing access to existing facilities shall comply with Table 705.1.4.~~

**RAMPS**

SLOPE	MAXIMUM RISE
Steeper than 1:10 but not steeper than 1:8	3 inches
Steeper than 1:12 but not steeper than 1:10	6 inches

For SI: 1 inch = 25.4 mm.

~~**705.1.5 Dining areas.** An accessible route to raised or sunken dining areas or to outdoor seating areas is not required provided that the same services and decor are provided in an accessible space usable by any occupant and not restricted to use by people with a disability.~~

~~**705.1.6 Jury boxes and witness stands.** In *alterations*, accessible wheelchair spaces are not required to be located within the defined area of raised jury boxes or witness stands and shall be permitted to be located outside these spaces where ramp or lift access poses a hazard by restricting or projecting into a required means of egress.~~

~~**705.1.7 Accessible dwelling or sleeping units.** Where Group I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being altered, the requirements of Section 1107 of the *International Building Code* for Accessible units apply only to the quantity of the spaces being altered.~~

~~**705.1.8 Type A dwelling or sleeping units.** Where more than 20 Group R-2 dwelling or sleeping units are being altered, the requirements of Section 1107 of the *International Building Code* for Type A units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being altered.~~

~~**705.1.9 Toilet rooms.** Where it is technically infeasible to alter existing toilet and bathing rooms to be accessible, an accessible family or assisted-use toilet or bathing room constructed in accordance with Section 1109.2.1 of the *International Building Code* is permitted. The family or assisted-use toilet or bathing room shall be located on the same floor and in the same area as the existing toilet or bathing rooms. At the inaccessible toilet and bathing rooms, directional signs indicating the location of the nearest family or assisted-use toilet room or bathing room shall be provided. These directional signs shall include the International Symbol of Accessibility and sign characters shall meet the visual character requirements in accordance with ICC A117.1.~~

~~**705.1.10 Dressing, fitting and locker rooms.** Where it is *technically infeasible* to provide accessible dressing, fitting, or locker rooms at the same location as similar types of rooms, one accessible room on the same level shall be provided. Where separate sex facilities are provided, accessible rooms for each sex shall be provided. Separate sex facilities are not required where only unisex rooms are provided.~~

~~**705.1.11 Fuel dispensers.** Operable parts of replacement fuel dispensers shall be permitted to be 54 inches (1370 mm) maximum measured from the surface of the vehicular way where fuel dispensers are installed on existing curbs.~~

~~**705.1.12 Thresholds.** The maximum height of thresholds at doorways shall be  $\frac{3}{4}$  inch (19.1 mm). Such thresholds shall have beveled edges on each side.~~

~~**705.1.13 Extent of application.** An *alteration* of an existing element, space, or area of a *facility* shall not impose a requirement for greater accessibility than that which would be required for new construction. *Alterations* shall not reduce or have the effect of reducing accessibility of a~~

~~facility or portion of a facility.~~

~~**705.1.14 Amusement rides.** Where the structural or operational characteristics of an amusement ride are altered to the extent that the amusement ride's performance differs from that specified by the manufacturer or the original design, the amusement ride shall comply with requirements for new construction in accordance with Section 1110.4.8 of the *International Building Code*.~~

~~**705.2 Alterations affecting an area containing a primary function.** Where an *alteration* affects the accessibility to a, or contains an area of, *primary function*, the route to the primary function area shall be accessible. The accessible route to the *primary function* area shall include toilet facilities and drinking fountains serving the area of *primary function*.~~

**Exceptions:**

- ~~1. The costs of providing the accessible route are not required to exceed 20 percent of the costs of the alterations affecting the area of *primary function*.~~
- ~~2. This provision does not apply to *alterations* limited solely to windows, hardware, operating controls, electrical outlets and signs.~~
- ~~3. This provision does not apply to *alterations* limited solely to mechanical systems, electrical systems, installation or *alteration* of fire protection systems and abatement of hazardous materials.~~
- ~~4. This provision does not apply to *alterations* undertaken for the primary purpose of increasing the accessibility of a *facility*.~~
- ~~5. This provision does not apply to altered areas limited to Type B dwelling and sleeping units.~~

**~~SECTION 806 ACCESSIBILITY~~**

~~**806.1 General.** A building, *facility*, or element that is altered shall comply with this section and Section 705.~~

~~**806.2 Stairways and escalators in existing buildings.** In *alterations* where an escalator or stairway is added where none existed previously, an accessible route shall be provided in accordance with Sections 1104.4 and 1104.5 of the *International Building Code*.~~

**~~SECTION 906 ACCESSIBILITY~~**

~~**906.1 General.** A building, *facility* or element that is altered shall comply with this section and Sections 705 and 806.~~

~~**906.2 Type B dwelling or sleeping units.** Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered, the requirements of Section 1107 of the *International Building Code* for Type B units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being altered.~~

~~**Exception:** Group I-1, I-2, R-2, R-3 and R-4 dwelling or sleeping units where the first certificate of occupancy was issued before March 15, 1991 are not required to provide Type B dwelling or sleeping units.~~

## **~~SECTION 1006 ACCESSIBILITY~~**

**~~1006.1 General.~~** Accessibility in portions of buildings undergoing a *change of occupancy* shall comply with Section 1012.8.

**~~1012.1.4 Accessibility.~~** All buildings undergoing a change of occupancy classification shall comply with Section 1012.8.

**~~1012.8 Accessibility.~~** *Existing buildings* that undergo a change of group or occupancy classification shall comply with this section.

**~~Exception:~~** Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing buildings and facilities undergoing a *change of occupancy* in conjunction with less than a Level 3 *alteration*.

**~~1012.8.1 Partial change in occupancy.~~** Where a portion of the building is changed to a new occupancy classification, any *alteration* shall comply with Sections 705, 806 and 906, as applicable.

**~~1012.8.2 Complete change of occupancy.~~** Where an entire building undergoes a *change of occupancy*, it shall comply with Section 1012.8.1 and shall have all of the following accessible features:

- ~~1. At least one accessible building entrance.~~
- ~~2. At least one accessible route from an accessible building entrance to *primary function* areas.~~
- ~~3. Signage complying with Section 1111 of the *International Building Code*.~~
- ~~4. Accessible parking, where parking is provided.~~
- ~~5. At least one accessible passenger loading zone, where loading zones are provided.~~
- ~~6. At least one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.~~

Where it is *technically infeasible* to comply with the new construction standards for any of these requirements for a change of group or occupancy, the above items shall conform to the requirements to the maximum extent technically feasible.

**~~Exception:~~** The accessible features listed in Items 1 through 6 are not required for an accessible route to Type B units.

## **~~SECTION 1105 ACCESSIBILITY~~**

**~~1105.1 Minimum requirements.~~** Accessibility provisions for new construction shall apply to additions. An addition that affects the accessibility to, or contains an area of, *primary function* shall comply with the requirements of Sections 705, 806 and 906, as applicable.

**~~1105.2 Accessible dwelling units and sleeping units.~~** Where Group I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for accessible units apply only to the quantity of spaces being added.

**~~1105.3 Type A dwelling or sleeping units.~~** Where more than 20 Group R-2 dwelling or sleeping units are being added, the requirements of Section

~~1107 of the *International Building Code* for Type A units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being added.~~

~~**1105.4 Type B dwelling or sleeping units.** Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for Type B units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of spaces being added.~~

## ~~CHAPTER 12 HISTORIC BUILDINGS~~

### ~~SECTION 1204 ALTERATIONS~~

~~**1204.1 Accessibility requirements.** The provisions of Sections 705, 806 and 906, as applicable, shall apply to facilities designated as historic structures that undergo *alterations*, unless *technically infeasible*. Where compliance with the requirements for accessible routes, entrances or toilet rooms would threaten or destroy the historic significance of the building or *facility*, as determined by the *code official*, the alternative requirements of Sections 1204.1.1 through 1204.1.4 for that element shall be permitted.~~

~~**Exception:** Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in historical buildings.~~

~~**1204.1.1 Site arrival points.** At least one accessible route from a site arrival point to an *accessible* entrance shall be provided.~~

~~**1204.1.2 Multilevel buildings and facilities.** An accessible route from an accessible entrance to public spaces on the level of the accessible entrance shall be provided.~~

~~**1204.1.3 Entrances.** At least one main entrance shall be accessible.~~

~~**Exceptions:**~~

- ~~1. If a main entrance cannot be made accessible, an accessible nonpublic entrance that is unlocked while the building is occupied shall be provided; or~~
- ~~2. If a main entrance cannot be made accessible, a locked accessible entrance with a notification system or remote monitoring shall be provided.~~

~~**1204.1.4 Toilet and bathing facilities.** Where toilet rooms are provided, at least one accessible family or assisted use toilet room complying with Section 1109.2.1 of the *International Building Code* shall be provided.~~

~~**1205.15 Accessibility requirements.** The provisions of Section 1012.8 shall apply to facilities designated as historic structures that undergo a *change of occupancy*, unless *technically infeasible*. Where compliance with the requirements for accessible routes, ramps, entrances, or toilet rooms would threaten or destroy the historic significance of the building or *facility*, as determined by the authority having jurisdiction, the alternative requirements of Sections 1204.1.1 through 1204.1.4 for those elements shall be permitted~~

~~**Exception:** Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be~~

~~provided in historical buildings.~~

~~**1401.2.5 Accessibility requirements.** Accessibility shall be provided in accordance with Section 410 or 605.~~

## **SECTION 410 ACCESSIBILITY FOR EXISTING BUILDINGS**

**Reason:** This change is written to move all of the accessibility requirements into a single section in new IEBC Section 303. New 303 is editorial with no change in criteria or requirements and simply renumbers Section 410 to Section 303. All accessibility requirements for existing buildings are placed in one section (303) allowing a focused and clear set of requirements for users to understand. In the existing IEBC, two of the three compliance methods (prescriptive and work area methods) have provisions for accessibility that are virtually identical. In addition, the existing performance method refers to the accessibility provisions of the other compliance methods.

The intent of this change is a reorganization of accessibility provisions to avoid duplication of the same requirements in multiple code sections. The text of requirements is relocated, but the content of the moved sections is not changed. There is no intent to change code requirements, only to recognize them. Note that Section 303.8.9 addressing dining areas is included only because that section has not yet been deleted from Chapter 7 as it was in current Section 410.

The identical provisions in all subsequent sections have been deleted. We understand that there are several proposals from BCAC to coordinate the provisions between Chapter 4 and 7. Our intent is that those proposals would be incorporated into the change. This move is editorial only.

**Cost Impact:** Will not increase the cost of construction  
This change simply consolidate the various criteria in the IEBC, and should not change the cost of construction.

EB33-15 : 410-  
COLLINS4528

---

### **Public Hearing Results**

**Committee Action:**

**Approved as Submitted**

**Committee Reason:** Though this proposal was viewed as a shift from the format of the IEBC it was felt for consistency purposes that the accessibility provisions should be located in one location within Chapter 3. The provisions are meant to apply equally to all methods.

**Assembly Motion:**

**Disapprove**

**Online Vote Results:**

**Failed**

Support: 36.31% (61) Oppose: 63.69% (107)

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : David Bonowitz, David Bonowitz, S.E., representing Existing Buildings Committee, National Council of Structural Engineers Associations (dbonowitz@att.net) requests**

## **Disapprove.**

**Commenter's Reason:** It turns out that EB 33, contrary to the proponents' reason statement and testimony at the hearings, makes several unintended substantive changes to accessibility provisions. These points did not come up at the hearings. EB33 is quite complicated -- it deletes, it renumbers, it relocates, it recombines, it slices and dices -- so much so that in the little time available at the hearings the committee was forced to take the word of the proponents that the proposal is entirely editorial. Upon further review, at least three substantive provisions will be changed if EB33 is approved.

1. IEBC 806.2 requires an accessible route when a stair or escalator is added. EB 33 replaces this provision with 303.8.4 (current 410.8.4), which has an additional trigger for "major structural modifications," whatever those are. Thus EB 33 changes the code, contrary to its claim, replacing a clear, thoughtful provision with an unclear, obsolete, and unenforceable one.

2. IEBC 906.2 has an Exception, added in 2015. EB 33 replaces that section with the second half of 303.8.8 (current 410.8.8) which does not have the exception. Thus, EB 33 changes the content of the code and undoes a change just made in 2015.

3. IEBC 705.1.1 sensibly does not require a new accessible entrance for most Level 1 Alterations. EB 33, however, makes no distinction between alteration levels, thus dismissing one of the key features of the IEBC. As a result, it replaces this sensible provision with 303.8.1 (current 410.8.1) which requires that a new accessible entrance must be provided with almost ANY alteration. Under EB 33, if I just want to reroof my building, renovate part of the exterior cladding, or mitigate some seismic falling hazards, I will be required to provide a new accessible entrance that Chapter 7 did not require.

Are there more examples of things the proponents missed? Who knows. But even these basic examples make clear that the current accessibility provisions are NOT "virtually identical," as proponents claim.

Just as important, in consolidating the disability provisions, the proponents have decided to reject the clearer and better maintained language and organization of the Work Area method, and instead revert to the confusing and contradictory language remaining in the prescriptive method (current sections 410.7 and 410.8, for example).

The worst part is that EB 33 is not even necessary. The duplication cited by the proponents is actually duplication only in the eyes of an editor. Yes, some of the same or similar words occur in more than one place in the code, but the code user won't see them that way. Once you pick a compliance method, and identify your project type, you only use the applicable code chapter, so if the same words appear in another chapter, who cares?

Meanwhile, even while approving EB 33, the committee acknowledged that it fundamentally changes the organization and philosophy of the IEBC. If the problems EB 33 is meant to solve were real problems, a "shift" in the format (as the committee calls it) might be worthwhile. But as shown here, the problem is not real, the benefits are thus illusory, and the implementation ends up making surprising substantive changes and leaving the IEBC user with obsolete and confusing provisions.

**Staff Note:** A series of code changes were proposed for coordination of the accessibility requirements between the prescriptive method and work area method. Please consult the Code Change Monograph and the Report of Committee Action Hearing on this code change proposal and code change proposals EB35, EB40, EB41, EB42, EB43, EB44, EB45, EB47, EB56 and EB65.

## **Public Comment 2:**

**Proponent : Steven McDaniel, representing New York State**

## **Building Officials Conference requests Disapprove.**

**Commenter's Reason:** Because the IEBC contains several compliance methods there is a need to have a "Guidance" chapter. That chapter is Chapter 3, this is the chapter that directs you to where you need to go for the compliance path that you choose. This Chapter does not contain any regulatory language, so adding accessibility requirements here is problematic. The IEBC is set up in "Project Based" Chapters for compliance. This code change now adds "Discipline Based" language to this Chapter.

We Strongly urge Disapproval of this code change.

---

EB33-15

# EB35-15

410.2, 705.1, 1508.2 (New)

## Proposed Change as Submitted

**Proponent:** Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

### 2015 International Existing Building Code

#### Revise as follows:

**410.2 Maintenance of facilities.** A *facility* that is constructed or altered to be *accessible* shall be maintained *accessible* during occupancy to the maximum extent feasible.

**705.1 General.** A *facility* that is altered shall comply with the applicable provisions in Sections 705.1.1 through 705.1.14, and Chapter 11 of the *International Building Code* unless it is *technically infeasible*. Where compliance with this section is *technically infeasible*, the alteration shall provide access- comply with these requirements to the maximum extent that is technically feasible.

~~A *facility* that is constructed or altered to be accessible shall be maintained accessible during occupancy.~~

#### Exceptions:

1. The altered element or space is not required to be on an accessible route unless required by Section 705.2.
2. Accessible means of egress required by Chapter 10 of the *International Building Code* are not required to be provided in existing *facilities*.
3. Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing *facilities* undergoing less than a Level 3 *alteration*.
4. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provisions for Type B dwelling units.

#### Add new text as follows:

**1508.2 During construction.** A facility that is constructed or altered to be accessible shall be maintained accessible during occupancy to the maximum extent feasible.

**Reason:** There is a series of proposals intended to coordinate the provisions in the first and second options in the IEBC. Requirements for maintenance of facilities during construction in Sections 410.2 and 705.1 should match. However, it was also felt that maintenance of facilities during construction would be more appropriately located under Chapter 15, Construction Safeguards. Maintenance/repairs to maintain accessibility is already addressed in Section 605.1.

In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under

the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: <http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

**Cost Impact:** Will not increase the cost of construction  
The proposal is a clarification and coordination of current requirements; therefore, there is no impact on the cost.

EB35-15 : 410.2-  
KULIK3344

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** There was concern that the phrase "maximum extent feasible" would create too large of a loophole for compliance.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Edward Kulik, representing ICC Building Code Action Committee ([bcac@iccsafe.org](mailto:bcac@iccsafe.org)) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Existing Building Code**

**410.2 Maintenance of facilities.** A *facility* that is constructed or altered to be *accessible* shall be maintained *accessible* during occupancy to the maximum extent that is technically feasible.

**705.1 General.** A *facility* that is altered shall comply with the applicable provisions in Sections 705.1.1 through 705.1.14, and Chapter 11 of the *International Building Code* unless it is *technically infeasible*. Where compliance with this section is *technically infeasible*, the alteration shall comply with these requirements to the maximum extent that is technically feasible. A facility that is constructed or altered to be accessible shall be maintained accessible during occupancy to the maximum extent that is technically feasible.

**Exceptions:**

1. The altered element or space is not required to be on an accessible route unless required by Section 705.2.
2. Accessible means of egress required by Chapter 10 of the *International Building Code* are not required to be provided in existing *facilities*.
3. Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing *facilities* undergoing less than a Level 3 *alteration*.
4. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provisions for Type B dwelling units.

~~**1508.2 During construction.** A facility that is constructed or altered to be accessible shall be maintained accessible during occupancy to the maximum extent feasible.~~

**Commenter's Reason:** The ICC Building Code Action Committee requests approval of this public comment. The committee was concerned that the phrase "maximum extent feasible" could create a loophole. The revised proposal uses the term "technically infeasible" which is a defined term and consistent with the ADA Standards and places it in both Sections 410.2 and 705.1. The proposal will no longer contain the move of the language from 705.1 to new Section 1508.2, but will keep the existing language.

---

## 410.4.1, 410.4.2, 1012.8.1, 1012.8.2

### Proposed Change as Submitted

**Proponent:** Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

## 2015 International Existing Building Code

### Revise as follows:

**410.4 Change of occupancy.** *Existing buildings* that undergo a change of group or occupancy shall comply with this section.

**Exception:** Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in *existing buildings* and facilities undergoing a *change of occupancy* in conjunction with *alterations* where the *work area* is 50 percent or less of the aggregate area of the building.

**410.4.1 Partial change in occupancy.** Where a portion of the building is changed to a new occupancy classification or the building has an aggregate area of not more than 3,000 square feet (278.7 m<sup>2</sup>), any *alterations* shall comply with Sections 410.6, 410.7 and 410.8.

**410.4.2 Complete change of occupancy.** Where an entire building undergoes a *change of occupancy* and has an aggregate are of more than 3,000 square feet (278.7 m<sup>2</sup>), it shall comply with Section 410.4.1 and shall have all of the following accessible features:

1. At least one accessible building entrance.
2. At least one accessible route from an accessible building entrance to *primary function* areas.
3. Signage complying with Section 1111 of the *International Building Code*.
4. Accessible parking, where parking is being provided.
5. At least one accessible passenger loading zone, when loading zones are provided.
6. At least one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.

Where it is *technically infeasible* to comply with the new construction standards for any of these requirements for a change of group or occupancy, the above items shall conform to the requirements to the maximum extent technically feasible.

**Exception:** The accessible features listed in Items 1 through 6 are not required for an accessible route to Type B units.

**1012.8 Accessibility.** *Existing buildings* that undergo a change of group or occupancy classification shall comply with this section.

**Exception:** Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing buildings and facilities undergoing a *change of occupancy* in conjunction with less than a Level 3 *alteration*.

**1012.8.1 Partial change in occupancy.** Where a portion of the building is changed to a new occupancy classification or the building has an aggregate area of not more than 3,000 square feet (278.7 m<sup>2</sup>), any *alteration* shall comply with Sections 705, 806 and 906, as applicable.

**1012.8.2 Complete change of occupancy.** Where an entire building undergoes a *change of occupancy* and has an aggregate area of more than 3,000 square feet (278.7 m<sup>2</sup>), it shall comply with Section 1012.8.1 and shall have all of the following accessible features:

1. At least one accessible building entrance.
2. At least one accessible route from an accessible building entrance to *primary function* areas.
3. Signage complying with Section 1111 of the *International Building Code*.
4. Accessible parking, where parking is provided.
5. At least one accessible passenger loading zone, where loading zones are provided.
6. At least one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.

Where it is *technically infeasible* to comply with the new construction standards for any of these requirements for a change of group or occupancy, the above items shall conform to the requirements to the maximum extent technically feasible.

**Exception:** The accessible features listed in Items 1 through 6 are not required for an accessible route to Type B units.

**Reason:** The current provisions for a complete change of occupancy is sometimes very difficult or costly for small facilities undergoing a complete change of occupancy. The 3,000 sq.ft. limit proposed is consistent with Live/work units. These small facilities will have the same accessibility requirements, regardless if the alteration is a change of occupancy or not. Changes of occupancy are probably more likely to include alterations, so a small facility would be looking at improvements to the accessible route up to the 20% cost limitation. The larger facilities will still have to provide an accessible route when the entire facility undergoes a complete change of occupancy.

The current list of 6 items can be read to require an accessible route, including an elevator, regardless of the cost of the items and how much is spent on any alterations. For the small building, this can result in an existing building being so expensive to fix that it cannot be used for anything other than its original purpose.

What is currently proposed for small buildings is similar to what is allowed for historic buildings in Section 410.9, 1204.1 and 1205.15.

In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC).

The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: <http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

**Cost Impact:** Will not increase the cost of construction  
As indicated in the reason, this would be a possible reduction in cost for small buildings undergoing a complete change in occupancy.

EB37-15 : 410.4.1-  
KULIK3363

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** Though there was some merit to having a benchmark there was concern with origination of 3000 square feet. Additionally, the wording proposed was felt to be somewhat awkward.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Edward Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests Approve as Modified by this Public Comment.**

**Replace Proposal as Follows:**

### **2015 International Existing Building Code**

**410.4 Change of occupancy.** ~~Existing~~ *Where existing buildings that* undergo a change of group or occupancy any alterations shall comply with Sections 410.6, 410.7 and 410.8 as applicable. ~~this section.~~

~~**Exception:** Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in *existing buildings* and facilities undergoing a *change of occupancy* in conjunction with *alterations* where the *work area* is 50 percent or less of the aggregate area of the building.~~

~~**410.4.1 Partial change in occupancy.** Where a portion of the building is changed to a new occupancy classification, any *alterations* shall comply with Sections 410.6, 410.7 and 410.8.~~

~~**410.4.2 Complete change of occupancy.** Where an entire building undergoes a *change of occupancy*, it shall comply with Section 410.4.1 and shall have all of the following accessible features:~~

1. ~~At least one accessible building entrance.~~
2. ~~At least one accessible route from an accessible building entrance to *primary function* areas.~~
3. ~~Signage complying with Section 1111 of the *International Building Code*.~~
4. ~~Accessible parking, where parking is being provided.~~
5. ~~At least one accessible passenger loading zone, when loading zones are provided.~~
6. ~~At least one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.~~

~~Where it is *technically infeasible* to comply with the new construction standards for any of these requirements for a change of group or occupancy, the above items shall conform to the requirements to the maximum extent technically feasible.~~

~~**Exception:** The accessible features listed in Items 1 through 6 are not required for an accessible route to Type B units.~~

**1012.8 Accessibility. Existing** ~~*Where existing buildings* that undergo a change of group or occupancy classification any alterations shall comply with Sections 705, 806 and 906, as applicable.~~ ~~this section.~~

~~**Exception:** Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing buildings and facilities undergoing a *change of occupancy* in conjunction with less than a Level 3 alteration.~~

•

**1012.8.1 Partial change in occupancy.** ~~Where a portion of the building is changed to a new occupancy classification, any *alteration* shall comply with Sections 705, 806 and 906, as applicable.~~

**1012.8.2 Complete change of occupancy.** ~~Where an entire building undergoes a *change of occupancy*, it shall comply with Section 1012.8.1 and shall have all of the following accessible features:~~

1. ~~At least one accessible building entrance.~~
2. ~~At least one accessible route from an accessible building entrance to *primary function* areas.~~
3. ~~Signage complying with Section 1111 of the *International Building Code*.~~
4. ~~Accessible parking, where parking is provided.~~
5. ~~At least one accessible passenger loading zone, where loading zones are provided.~~
6. ~~At least one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.~~

~~Where it is *technically infeasible* to comply with the new construction standards for any of these requirements for a change of group or occupancy, the above items shall conform to the requirements to the maximum extent technically feasible.~~

~~**Exception:** The accessible features listed in Items 1 through 6 are not required for an accessible route to Type B units.~~

**Commenter's Reason:** The ICC Building Code Action Committee requests approval of this public comment.

The MOE Development Committee did not agree with the 3,000 sq.ft. limit for a change of occupancy. In the original proposal, the 3,000 sq.ft. was intended as a compromise limit between when the list of 6 items in Section 410.4.2 was mandatory. Since large building undergoing a change of occupancy typically include alteration, BCAC is suggesting that maybe a compromise limit is not needed. A change of occupancy should be handled the same as any alteration for an existing building. After all, there is no technical or logical justification to ask more from a business changing to a mercantile than you would ask from a business staying as a business.

The current list of 6 items can be read to require an accessible route, including a significant ramp, a platform lift, or an elevator, regardless of the cost of the items and how much is spent on any alterations. For the small building, this can result in an existing building being so expensive to fix that it cannot be used for anything other than its original purpose. It is logical to allow all buildings to improve accessibility as they alter. Existing buildings will become accessible over time. This is consistent with the provisions in the ADA which does not address changes in occupancy, just alterations.

The exceptions for Type B units are not needed because the same exceptions are included in the referenced sections (410.6, Exception 4, 410.7, Exception 5, 705.1, Exception 3 and 705.2, Exception 5).

Changes to Sections 410 and 1012 will create consistency between the different options in the IEBC

---

**EB37-15**

# EB38-15

## 410.4.2, 1012.8.2

### Proposed Change as Submitted

**Proponent:** Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

## 2015 International Existing Building Code

Revise as follows:

**410.4.2 Complete change of occupancy.** Where an entire building undergoes a *change of occupancy*, it shall comply with Section 410.4.1 and shall have at least one accessible route throughout the building.~~all of the following accessible features:~~

- ~~1. At least one accessible building entrance.~~
- ~~2. At least one accessible route from an accessible building entrance to primary function areas.~~
- ~~3. Signage complying with Section 1111 of the *International Building Code*.~~
- ~~4. Accessible parking, where parking is being provided.~~
- ~~5. At least one accessible passenger loading zone, when loading zones are provided.~~
- ~~6. At least one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.~~

Where it is *technically infeasible* to comply with the new construction standards for any of these requirements for a change of group or occupancy an accessible route, the above items accessible route shall conform to the requirements to the maximum extent technically feasible.

**Exception:** The accessible features listed in Items 1 through 6 are route is not required for an accessible route to Type B units required by Section 410.8.8.

**1012.8.2 Complete change of occupancy.** Where an entire building undergoes a *change of occupancy*, it shall comply with Section 1012.8.1 and shall have at least one accessible route throughout the building.~~all of the following accessible features:~~

- ~~1. At least one accessible building entrance.~~
- ~~2. At least one accessible route from an accessible building entrance to primary function areas.~~
- ~~3. Signage complying with Section 1111 of the *International Building Code*.~~
- ~~4. Accessible parking, where parking is being provided.~~
- ~~5. At least one accessible passenger loading zone, when loading zones are provided.~~
- ~~6. At least one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.~~

Where it is *technically infeasible* to comply with the new construction standards for ~~any of these requirements for a change of group or occupancy~~ an accessible route, the ~~above items~~ accessible route shall conform to the requirements to the maximum extent technically feasible.

**Exception:** The accessible features listed in ~~Items 1 through 6~~ route is not required for an accessible route to Type B units required by Section 906.2 and 1105.4.

**Reason:** The intent of this proposal is to clarify what is expected when a building undergoes a complete change of occupancy, regardless if it has alterations or not. The list of six items is basically describing the items on an accessible route. Stating it simply will increase understanding of the requirement. This should also eliminate the question as to if this list is intended to over ride new construction exceptions for percentages of accessible entrances or where an elevator is not required. It was never intended to ask for an existing building to exceed new construction requirements.

There is a wide variety of interpretations for the list of 6 items in Section 410.4.2 and 1202.8.2. This list was originally from a draft of the new ADAAG during development. This was a list of priority items for accessible routes that ended up not being included in ADA. It was decided that designers should be able to use the money where there was the best advantage with the goal of existing buildings become as accessible as feasible over time. In addition, ADA does not address a change in occupancy; the 2010 ADA standard treats alterations the same, change of occupancy or not.

Toilet rooms and drinking fountains are not in the current list. These items would require improvements for accessibility if the complete change of occupancy also included alterations to a primary function area in accordance with Sections 410.7 and 705.2.

In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: <http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

**Cost Impact:** Will not increase the cost of construction

The proposal is a clarification of current requirements; therefore, there is no impact on the cost.

EB38-15 : 410.4.2-  
KULIK3402

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The proposal was disapproved based upon concerns that the

revised language expands the requirements too broadly. In addition, it was felt that this expansion would significantly increase cost of construction

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Edward Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Existing Building Code**

#### **410.4.2 Complete change of occupancy.**

Where an entire building undergoes a *change of occupancy*, it shall comply with Section 410.4.1 and shall have at least one accessible route ~~throughout the building.~~ to primary function areas.

Where it is *technically infeasible* to comply with the new construction standards for an accessible route, the accessible route shall conform to the requirements to the maximum extent technically feasible.

**Exception:** The accessible route is not required to Type B units required by Section 410.8.8.

#### **1012.8.2 Complete change of occupancy.**

Where an entire building undergoes a *change of occupancy*, it shall comply with Section 1012.8.1 and shall have at least one accessible route ~~throughout the building.~~ to primary function areas.

Where it is *technically infeasible* to comply with the new construction standards for an accessible route, the accessible route shall conform to the requirements to the maximum extent technically feasible.

**Exception:** The accessible route is not required to Type B units required by Section 906.2 and 1105.4.

**Commenter's Reason:** The ICC Building Code Action Committee requests approval of this public comment. The list of 6 items was originally a priority list for accessible route requirements. While no longer a priority list, the requirements in the list are not interpreted or enforced consistently. Therefore, this language should be removed from the code.

The change to 'primary function areas' versus 'throughout the building' is to address concerns brought up during testimony. Testimony stated that bathrooms and drinking fountains were being added to the list, but since these elements are not referenced here as they are in Sections 410.7 and 705.2, this is not the case. Also, these elements are specifically excluded in the definition of 'primary function'. There was also concern that 'throughout the building' would include any closets and every corner. By changing the phrase to 'primary function areas' that would be consistent with alterations for where accessible routes would be required. Existing Sections 410.3 and 705.1.13 would allow for a building to not exceed new construction requirements.

This is meant as a clarification, not an expansion of scope so there should be no increase in the cost of construction.

# EB42-15

## 410.8.6, 410.8.7, 410.8.8

### Proposed Change as Submitted

**Proponent:** Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

## 2015 International Existing Building Code

### Revise as follows:

**410.8.6 Accessible dwelling or sleeping units.** Where Group I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being altered or added, the requirements of Section 1107 of the *International Building Code* for Accessible units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of spaces being altered or added.

**410.8.7 Type A dwelling or sleeping units.** Where more than 20 Group R-2 dwelling or sleeping units are being altered or added, the requirements of Section 1107 of the *International Building Code* for Type A units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being altered or added.

**410.8.8 Type B dwelling or sleeping units.** Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for Type B units apply only to the quantity of the spaces being added. Where Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered and where the work area is greater than 50 percent of the aggregate area of the building, the requirements of Section 1107 of the *International Building Code* for Type B units and Chapter 9 of the *Internatinoal Buidling Code* for visible alarms apply only to the quantity of the spaces being altered.

**Reason:** There is a series of proposals intended to coordinate the provisions in the first and second options in the IEBC. This phrase was deleted from Sections 410.8.7, 410.8.8 and 410.8.9 by code change G215-07/08. The reason given was that when visible alarms are required to be added or altered is addressed in IBC/IFC Chapter 9. However, in Chapter 9, if a system is touched, the whole building system needs to be upgraded. This would limit the change to just the units being altered.

ALTERATIONS - LEVEL 1

**705.1.8 Type A dwelling or sleeping units.** Where more than 20 Group R-2 dwelling or sleeping units are being altered, the requirements of Section 1107 of the *International Building Code* for Type A units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being altered.

ALTERATIONS - LEVEL 3

**906.2 Type B dwelling or sleeping units.** Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered, the requirements of Section 1107 of the *International Building Code* for Type B units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being altered.

**Exception:** Group I-1, I-2, R-2, R-3 and R-4 dwelling or sleeping units where the first certificate of occupancy was issued before March 15, 1991 are not

required to provide Type B dwelling or sleeping units.

#### ADDITION

**1105.3 Type A dwelling or sleeping units.** Where more than 20 Group R-2 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for Type A units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being added.

**1105.4 Type B dwelling or sleeping units.** Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for Type B units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of spaces being added.

In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: <http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

**Cost Impact:** Will not increase the cost of construction  
The proposal limits the revisions to the fire alarm system. Therefore, there will be no additional costs to construction.

EB42-15 : 410.8.6-  
KULIK3350

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** There was concern with how this proposal would work with the exception to Section 907.5.2.3 of the IBC and IFC. More specifically, the concern was that visible alarms would potentially be required by this proposal where not required by the IBC or IFC.

**Assembly Motion:**

**As Submitted**

**Online Vote Results:**

**Failed**

Support: 35.03% (55) Oppose: 64.97% (102)

**Assembly Action :**

### **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Edward Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests Approve as Modified by**

**this Public Comment.**

**Replace Proposal as Follows:**

**2015 International Existing Building Code**

**705.1.8 Type A dwelling or sleeping units.** Where more than 20 Group R-2 dwelling or sleeping units are being altered, the requirements of Section 1107 of the *International Building Code* for Type A units ~~and Chapter 9 of the *International Building Code* for visible alarms~~ apply only to the quantity of the spaces being altered.

**906.2 Type B dwelling or sleeping units.** Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered, the requirements of Section 1107 of the *International Building Code* for Type B units ~~and Chapter 9 of the *International Building Code* for visible alarms~~ apply only to the quantity of the spaces being altered.

**Exception:** Group I-1, I-2, R-2, R-3 and R-4 dwelling or sleeping units where the first certificate of occupancy was issued before March 15, 1991 are not required to provide Type B dwelling or sleeping units.

**1105.3 Type A dwelling or sleeping units.** Where more than 20 Group R-2 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for Type A units ~~and Chapter 9 of the *International Building Code* for visible alarms~~ apply only to the quantity of the spaces being added.

**1105.4 Type B dwelling or sleeping units.** Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for Type B units ~~and Chapter 9 of the *International Building Code* for visible alarms~~ apply only to the quantity of spaces being added.

**Commenter's Reason:** The ICC Building Code Action Committee is requesting approval of this public comment. The IEBC Development Committee felt that inserting this language would override the alarm requirements in the IFC. This was not the intent. The proposal was for coordination between the prescriptive and work area methods in the IEBC. This modification is to strike the same language from the work area method.

EB42-15

# EB43-15

## 410.8.8, 410.8.9 (New)

### Proposed Change as Submitted

**Proponent:** Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

## 2015 International Existing Building Code

### Revise as follows:

#### **410.8.8 Additions with Type B dwelling or sleeping units.**

Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for Type B units apply only to the quantity of the spaces being added.

**410.8.9 Alterations with Type B dwelling and sleeping units.** Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered and where the work area is greater than 50 percent of the aggregate area of the building, the requirements of Section 1107 of the International Building Code for Type B units apply only to the quantity of the spaces being altered.

**Reason:** There is a series of proposals intended to coordinate the provisions in the first and second options in the IEBC. Section 410.8.8 is being split to separate additions and alterations. This is a clarification that is consistent with Sections 906.2, 1012.8 and 1105.4.

In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: <http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

**Cost Impact:** Will not increase the cost of construction

The proposal is a clarification and coordination of current requirements; therefore, there is no impact on the cost.

EB43-15 : 410.8.8-  
KULIK3358

---

## Public Hearing Results

**Committee Action:****Disapproved**

**Committee Reason:** This proposal was disapproved based primarily on the preference to code change proposal EB44-15 and concern with the change to "four or more" where it had simply been based upon any number of units being altered. EB44-15 was also disapproved.

**Assembly Action :****None**

---

**Individual Consideration Agenda*****Public Comment 1:***

**Proponent : Edward Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests Approve as Submitted.**

**Commenter's Reason:** The ICC Building Code Action Committee requests approval of this proposal as submitted. The IEBC Development committee stated they preferred EB44, but then disapproved EB44. The issue between EB 44 and EB65 was regarding the difference in the exception between the prescriptive and work area methods. This issue was resolved by AS for EB65. The purpose of this proposal is just to split the requirements for Type B units in the prescriptive method to match the text as shown in the work area method (Section 906.2, 1012.8 and 1105.4). This is editorial only.

**EB43-15**

# EB44-15

## 410.8.8

### **Proposed Change as Submitted**

**Proponent :** Dan Buuck, National Association of Home Builders, representing National Association of Home Builders (dbuuck@nahb.org)

## **2015 International Existing Building Code**

**Revise as follows:**

**410.8.8 Additions with Type B dwelling or sleeping units.** Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for Type B units apply only to the quantity of the spaces being added.

**410.8.9 Alterations with Type B dwelling and sleeping units.** Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered and where the work area is greater than 50 percent of the aggregate area of the building, the requirements of Section 1107 of the International Building Code for Type B units apply only to the quantity of the spaces being altered.

**Exception:** Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units where the first certificate of occupancy was issued before March 15, 1991 are not required to provide Type B dwelling or sleeping units.

**Reason:** Section 410.8.8 is being split to separate additions and alterations (similar to Section 906.2 and 1105.4). The addition of the exception to Section 410.8.9 is to coordinate with Section 906.2. The intent is to coordinate the requirements for Type B dwelling units within the options available in the IEBC.

This same exception was added to Section 906.2 during the last code cycle to bring it in line with the provisions of FHA. It was approved by the committee and had no public comments. This proposal fixes the unintended omission of the same language in Section 410.8.9. These provisions need to include similar language, because they are parallel sections.

Having this language in the IEBC allows buildings that were previously occupied to be revitalized without triggering requirements that would exceed the federal legislation. Too often existing building owners who submit plans to alter an existing residential building which was built before the FHA guidelines went into effect are told that they must comply with the accessible requirements for new buildings. This exception brings the IEBC in line with the federal guidelines.

For reference, FHA regulations state "The design requirements apply to buildings built for first occupancy after March 13, 1991, which fall under the definition of "covered multifamily dwellings."

Sections 906.2 and 1105.4 are shown below for comparison:

**906.2 Type B dwelling or sleeping units.** Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered, the requirements of Section 1107 of the International Building Code for Type B units and Chapter 9 of the International Building Code for visible alarms apply only to the quantity of the spaces being altered.

**Exception:** Group I-1, I-2, R-2, R-3 and R-4 dwelling or sleeping units where the first certificate of occupancy was issued before March 15, 1991 are not required to provide Type B dwelling or sleeping units.

**1105.4 Type B dwelling or sleeping units.** Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements of

Section 1107 of the International Building Code for Type B units and Chapter 9 of the International Building Code for visible alarms apply only to the quantity of spaces being added.

**Cost Impact:** Will not increase the cost of construction

This proposal limits the Type B units requirements to only buildings that should have complied with the Fair Housing Act at the time of initial construction. Therefore, older institutional and residential buildings would not have the additional costs of upgrading for accessibility.

EB44-15 : 410.8.8-  
BUUCK4900

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The concern with this proposal is allowing the same exception in the prescriptive method as work area method. The change was seen as too significant. There was also concern with determining the dates when a change of occupancy was issued.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Dan Buuck, representing National Association of Home Builders (dbuuck@nahb.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Existing Building Code**

**410.8.8 Additions with Type B dwelling or sleeping units.** Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for Type B units apply only to the quantity of the spaces being added.

**410.8.9 Alterations with Type B dwelling and sleeping units.** Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered and where the work area is greater than 50 percent of the aggregate area of the building, the requirements of Section 1107 of the International Building Code for Type B units apply only to the quantity of the spaces being altered.

**Exception:** Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units where the first certificate of occupancy was issued before ~~March 15~~ March 14, 1991 are not required to provide Type B dwelling or sleeping units.

**Commenter's Reason:** The purpose of the proposed exception is to align the code with the Fair Housing Act. For reference, FHA regulations state "The design requirements apply to buildings built for first occupancy after March 13, 1991, which fall under the definition of "covered multifamily dwellings."

The committee reason states a concern that this exception would be included in the prescriptive method AND the work area method, as if that was problematic. Actually this exception should apply to both instances, because that would align both methods with the FHA and avoid confusion.

The second reason which the committee discussed was that determining when the certificate of occupancy was issued. This is not as big of a challenge as some made it out to be. The vast majority of counties have this information available if the Department of Building Safety doesn't. Most areas of a town or city fall into certain decades of construction anyway, making it clear that a house was occupied long before (or after) the cut-off date.

Note the only modification made to the original proposal was a minor adjustment to the date in order to bring it fully in line with the FHA provision. See the similar public comment for EB 65-15.

**EB44-15**

# EB46-15

410.8.10, 410.9.4, 705.1.9, 1204.1.4

## Proposed Change as Submitted

**Proponent :** Gene Boecker, representing Code Consultants, Inc.  
(geneb@codeconsultants.com)

### 2015 International Existing Building Code

Revise as follows:

**410.8.10 Toilet rooms.** Where it is *technically infeasible* to alter existing toilet and bathing rooms to be *accessible*, a unisex toilet room or bathing room shall be provided. The unisex toilet room or bathing room shall be constructed as an accessible family or assisted-use toilet or bathing room constructed in accordance with Section ~~1109.2.1~~ 1109.2.1.2, 1109.2.1.3, 1109.2.1.5, 1109.2.1.6 and 1109.2.1.7 of the *International Building Code*. A unisex toilet room shall be permitted to contain two water closets. ~~The family or assisted-use unisex toilet or bathing room shall be located on the same floor and in the same area as the existing toilet or bathing rooms. At the inaccessible toilet and bathing rooms, provide directional signs shall be provided indicating the location of the nearest family or assisted-use unisex toilet room or bathing room. These directional signs shall include the International Symbol of Accessibility and sign characters shall meet the visual character requirements in accordance with ICC A117.1.~~

**410.9.4 Toilet and bathing facilities.** Where toilet rooms are provided, at least one unisex toilet shall be provided. The unisex toilet room shall be constructed as an accessible family or assisted-use toilet room complying with Section ~~1109.2.1~~ Sections 1109.2.1.2, 1109.2.1.5, 1109.2.1.6 and 1109.2.1.7 of the *International Building Code*. A unisex toilet room shall be provided permitted to contain two water closets.

**705.1.9 Toilet rooms.** Where it is technically infeasible to alter existing toilet and bathing rooms to be accessible, a unisex toilet room or bathing room shall be provided. The unisex toilet room or bathing room shall be constructed as an accessible family or assisted-use toilet or bathing room constructed in accordance with Section ~~1109.2.1~~ 1109.2.1.2, 1109.2.1.3, 1109.2.1.5, 1109.2.1.6 and 1109.2.1.7 of the *International Building Code*. A unisex toilet room shall be permitted to contain two water closets. ~~The family or assisted-use unisex toilet or bathing room shall be located on the same floor and in the same area as the existing toilet or bathing rooms. At the inaccessible toilet and bathing rooms, directional signs indicating the location of the nearest family or assisted-use unisex toilet room or bathing room shall be provided. These directional signs shall include the International Symbol of Accessibility and sign characters shall meet the visual character requirements in accordance with ICC A117.1.~~

**1204.1.4 Toilet and bathing facilities.** Where toilet rooms are provided, at least one unisex toilet shall be provided. The unisex toilet room shall be constructed as an accessible family or assisted-use toilet room complying with Section ~~1109.2.1~~ Sections 1109.2.1.2, 1109.2.1.5, 1109.2.1.6 and 1109.2.1.7 of the *International Building Code*. A unisex toilet room shall be provided permitted to contain two water closets.

**Reason:** The proposals to Sections 410.9.4 and 705.1.9 are for altered buildings and are exactly the same. The proposals to Section 410.9.4 and 1204.1.4 are for historic buildings, and are the same. The code change seeks to address all in the same manner.

The concept of the alternative toilet/bathing room has been confused between the IBC's intent to provide additional access and usability in the family and assisted-use toilet and bathing rooms; and, the unisex toilet/bathing rooms intended to provide some accessibility where none would otherwise be available. The former is intended to be required only in mercantile and assembly occupancies where other accessible group toilet/bathing rooms are provided. The latter is intended to provide at least one accessible set of plumbing fixtures in an existing building where no other accessible plumbing fixtures are provided. One is for new construction and one is for existing construction. These are different needs and should be identified as such and given different names accordingly.

It would be easy to simply have a "one size fits all" approach to both of these. However, the federal 2010 ADA Standards for Accessible Design includes different fixtures within the room than what is included in the IBC. Both sets of rules allow two options for the toilet room fixture counts and two for the bathing room fixture counts:

	IBC Family or Assisted Use Toilet and Bathing Rooms (current)			
	Toilet Room A	Toilet Room B	Bathing Room A	Bathing Room B
Lavatory	1	1	1	1
Water Closet	1	1	1	1
Urinal	0	1	0	0
Shower	n/a	n/a	1	0
Bathtub	n/a	n/a	0	1

In some cases the two sets of rules align. In others they do not. These proposed changes would place the IBC unisex toilet/bathing rooms in line with the provisions of the 2010 Standards for unisex toilet/bathing rooms.

The 2010 ADA Standards for Accessible Design:

Section 213.2 identifies, in exceptions 1 and 2 when the unisex toilet room is required.

**213.2 Toilet Rooms and Bathing Rooms.** Where toilet rooms are provided, each toilet room shall comply with 603. Where bathing rooms are provided, each bathing room shall comply with 603.

**EXCEPTIONS:** 1. In alterations where it is technically infeasible to comply with 603, altering existing toilet or bathing rooms shall not be required where a single unisex toilet room or bathing room complying with 213.2.1 is provided and located in the same area and on the same floor as existing inaccessible toilet or bathing rooms.

2. Where exceptions for alterations to qualified historic buildings or facilities are permitted by 202.5, no fewer than one toilet room for each sex complying with 603 or one unisex toilet room complying with 213.2.1 shall be provided.

Section 213.2.1 of the 2010 Standards identifies what should be included in a unisex toilet room to meet the federal guidelines.

**213.2.1 Unisex (Single-Use or Family) Toilet and Unisex Bathing Rooms.** Unisex toilet rooms shall contain not more than one lavatory, and two water closets without urinals or one water closet and one urinal. Unisex bathing rooms shall contain one shower or one shower and one bathtub, one lavatory,

and one water closet. Doors to unisex toilet rooms and unisex bathing rooms shall have privacy latches.

**Cost Impact:** Will not increase the cost of construction  
The revision is a clarification. It should not increase or decrease costs of construction. It may reduce administration costs because it clarifies something.

EB46-15 : 410.8.10-  
BOECKER5781

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** There was concern that the proposal adds back in the use of the term "unisex" when it has previously been removed. The list of sections listed seems to have omitted certain subsections from Section 1109.2.1 and should be further reviewed. Finally, there was concern with the requirement for 2 water closets where previously only 1 was required.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Existing Building Code**

**1204.1.4 Toilet and bathing facilities.** Where toilet rooms are provided, either the men's and women's toilet rooms shall be accessible or at least one unisex toilet shall be provided. The unisex toilet room shall be constructed as an accessible family or assisted-use toilet room complying with Sections 1109.2.1.2, 1109.2.1.5, 1109.2.1.6 and 1109.2.1.7 of the *International Building Code*. A unisex toilet room shall be permitted to contain two water closets.

**Commenter's Reason:** This proposal uses the term unisex intentionally to differentiate it from the family assist toilet room. A family assist toilet room is intended to be provided to allow adults to assist a child of a different gender or for a person to assist a spouse. They are required only in specific conditions - assembly and mercantile occupancies. As proposed, a unisex toilet is a toilet in an existing building that can be used by a person because the main toilet rooms are not accessible. It can be used in any occupancy. It does not necessarily relate to the same function that a family assist toilet does. Therefore, the term is different as well. If the concern is about a definition that can be addressed later.

There was also an expressed concern about a second water closet in the room. I believe this was misunderstood. A single water closet is "required" but a second one is "permitted." This is for two reasons. First, it harmonizes with the federal 2010 ADA Standards (Section 213.2.1) which allows two water closets. Second, it is often desirable in many places to include a children's water closet in addition to an

adult water closet. The added allowance to have the second water closet (not a requirement to add it) would accommodate that design option and match with the federal standard.

The modification to the historical building requirement in Section 1204.1.4 is to further clarify that in a historic building you can either fix existing bathrooms to be accessible or provide a unisex toilet room. This is consistent with providing allowances for historic significance in registered buildings.

---

**EB46-15**

# EB50-15

## Chapters 5, 6, 7, 8, 9, 10, 11, 12, 13

### Proposed Change as Submitted

**Proponent :** Kathleen Petrie, representing Seattle Dept of Planning & Development (kathleen.petrie@seattle.gov)

## 2015 International Existing Building Code

Combine Chapters 5 through 12 and revise as follows:

### ~~CHAPTER 5 CLASSIFICATION OF WORK~~ WORK AREA METHOD

#### ~~SECTION 501 GENERAL CLASSIFICATION OF WORK~~

**501.1 Scope.** The provisions of this chapter shall be used in conjunction with Chapters 6 through 13 and shall apply to the *alteration, repair, addition and change of occupancy* of existing structures, including historic and moved structures, as referenced in Section 301.1.2. The work performed on an *existing building* shall be classified in accordance with this chapter.

**501.1.1 Compliance with other alternatives.** *Alterations, repairs, additions and changes of occupancy* to existing structures shall comply with the provisions of Chapters 6 through 13 this chapter or with one of the alternatives provided in Section 301.1.

~~501.2~~ **501.1.2 Work area.** The *work area*, as defined in Chapter 2, shall be identified on the construction documents.

#### ~~SECTION 502 REPAIRS~~

~~502.1~~ **501.2 Scope Repairs.** *Repairs*, as defined in Chapter 2, include the patching or restoration or replacement of damaged materials, elements, *equipment or fixtures* for the purpose of maintaining such components in good or sound condition with respect to existing loads or performance requirements.

~~502.2~~ **501.2.1 Application.** *Repairs* shall comply with the provisions of Chapter 6. Section 502.

~~502.3~~ **501.2.2 Related work.** Work on nondamaged components that is necessary for the required *repair* of damaged components shall be considered part of the *repair* and shall not be subject to the provisions of Chapter 7, 8, 9, 10 or 11 Sections 503, 504, 505, 506, or 507.

#### ~~SECTION 503 ALTERATIONS- LEVEL 1~~

~~503.1~~ **501.3 Scope Alteration - Level 1.** *No change to text.*

~~503.2~~ **501.3.1 Application.** Level 1 *alterations* shall comply with the provisions of Chapter 7. Section 503.

#### ~~SECTION 504 ALTERATIONS-LEVEL 2~~

~~504.1~~ **501.4 Scope Alteration - Level 2.** Level 2 *alterations* include the

reconfiguration of space, the addition or elimination of any door or window, the reconfiguration or extension of any system, or the installation of any additional equipment.

**~~504.2~~ 501.4.1 Application.** Level 2 *alterations* shall comply with the provisions of ~~Chapter 7~~ Section 503 for Level 1 *alterations* as well as the provisions of ~~Chapter 8~~ Section 504.

### **~~SECTION 505 ALTERATIONS-LEVEL 3~~**

**~~505.1~~ 501.5 Scope Alteration-Level 3.** Level 3 *alterations* apply where the work area exceeds 50 percent of the *building area*.

**~~505.2~~ 501.5.1 Application.** Level 3 *alterations* shall comply with the provisions of ~~Chapters 7~~ Sections 503 and ~~8~~ 504 for Level 1 and 2 *alterations*, respectively, as well as the provisions of ~~Chapter 9~~ Section 505.

### **~~SECTION 506 CHANGE OF OCCUPANCY~~**

**~~506.1~~ 501.6 Scope Change of occupancy.** *Change of occupancy* provisions apply where the activity is classified as a *change of occupancy* as defined in Chapter 2.

**~~506.2~~ 501.6.1 Application.** *Changes of occupancy* shall comply with the provisions of ~~Chapter 10~~ Section 506.

### **~~SECTION 507 ADDITIONS~~**

**~~507.1~~ 501.7 Scope Additions.** Provisions for *additions* shall apply where work is classified as an *addition* as defined in Chapter 2.

**~~507.2~~ 501.7.1 Application.** *Additions to existing buildings* shall comply with the provisions of ~~Chapter 11~~ Section 507.

### **~~SECTION 508 HISTORIC BUILDINGS~~**

**~~508.1~~ 501.8 Scope Historic Buildings.** *Historic building* provisions shall apply to buildings classified as historic as defined in Chapter 2.

**~~508.2~~ 501.8.1 Application.** Except as specifically provided for in ~~Chapter 12~~ Section 508, *historic buildings* shall comply with applicable provisions of this code for the type of work being performed.

### **~~SECTION 509 RELOCATED BUILDINGS~~**

**~~509.1~~ 501.9 Scope Relocated Buildings.** Relocated building provisions shall apply to relocated or moved buildings. Relocated buildings shall comply with the provisions of Section 509.

## **~~CHAPTER 6 REPAIRS~~**

### **~~SECTION 601~~502 GENERAL REPAIRS**

**~~601.1~~ 502.1 Scope.** Repairs as described in Section 502 shall comply with the requirements of this ~~chapter~~ section. Repairs to *historic buildings* need only comply with ~~Chapter 12~~ Section 508.

~~601.2~~ **502.2 Conformance.** The work shall not make the building less conforming than it was before the *repair* was undertaken.

~~[BS] 601.3~~ **502.3 Flood hazard areas.** In flood hazard areas, repairs that constitute *substantial improvement* shall require that the building comply with Section 1612 of the *International Building Code*, or Section R322 of the *International Residential Code*, as applicable,

## ~~SECTION 602 BUILDING ELEMENTS AND MATERIALS~~

~~602.2~~ **502.5 New and replacement materials.** Except as otherwise required or permitted by this code, materials permitted by the applicable code for new construction shall be used. Like materials shall be permitted for *repairs* and *alterations*, provided no *dangerous* or *unsafe* condition, as defined in Chapter 2, is created. Hazardous materials, such as asbestos and lead-based paint, shall not be used where the code for new construction would not permit their use in buildings of similar occupancy, purpose and location.

~~602.3~~ **502.6 Glazing in hazardous locations.** Replacement glazing in hazardous locations shall comply with the safety glazing requirements of the *International Building Code* or *International Residential Code* as applicable.

**Exception:** Glass block walls, louvered windows, and jalousies repaired with like materials.

## ~~SECTION 603 FIRE PROTECTION~~

~~603.1~~ **502.7 General Fire protection.** *No change to text.*

## ~~SECTION 604 MEANS OF EGRESS~~

~~604.1~~ **502.8 General Means of egress.** *No change to text.*

## ~~SECTION 605 ACCESSIBILITY~~

~~605.1~~ **502.9 General Accessibility.** *No change to text.*

## ~~SECTION 606 STRUCTURAL~~

~~[BS] 606.1~~ **502.10 General Structural.** Structural repairs shall be in compliance with this section and Section ~~601.2~~502.10.1. Regardless of the extent of structural or nonstructural damage, *dangerous* conditions shall be eliminated. Regardless of the scope of *repair*, new structural members and connections used for *repair* or *rehabilitation* shall comply with the detailing provisions of the *International Building Code* for new buildings of similar structure, purpose and location.

## ~~SECTION 607 ELECTRICAL~~

~~607.1~~ **502.11 Material Electrical.** Existing electrical wiring and equipment undergoing *repair* shall be allowed to be repaired or replaced with like material.

## ~~SECTION 608 MECHANICAL~~

~~608.1~~ **502.12 General Mechanical.** Existing mechanical systems undergoing *repair* shall not make the building less conforming than it was before the *repair* was undertaken.

## **~~SECTION 609 PLUMBING~~**

~~609.1~~ **502.13 Materials Plumbing.** Plumbing materials and supplies shall not be used for repairs that are prohibited in the *International Plumbing Code*.

## **~~CHAPTER 7 ALTERATIONS—LEVEL 1~~**

### **~~SECTION 701 503 GENERAL ALTERATIONS—LEVEL 1~~**

~~701.1~~ **503.1 Scope.** Level 1 *alterations* as described in Section 503 ~~501.3~~ shall comply with the requirements of this ~~chapter~~ section. Level 1 *alterations to historic buildings* shall comply with this ~~chapter~~ section, except as modified in ~~Chapter 12~~. Section 508.

~~701.2~~ **503.2 Conformance.** An *existing building* or portion thereof shall not be altered such that the building becomes less safe than its existing condition.

**Exception:** Where the current level of safety or sanitation is proposed to be reduced, the portion altered shall conform to the requirements of the *International Building Code*.

~~[BS]~~ ~~701.3~~ **503.3 Flood hazard areas.** In *flood hazard areas*, *alterations* that constitute *substantial improvement* shall require that the building comply with Section 1612 of the *International Building Code*, or Section R322 of the *International Residential Code*, as applicable,

## **~~SECTION 702 BUILDING ELEMENTS AND MATERIALS~~**

~~702.1~~ **503.4 Interior wall and ceiling finishes.** All newly installed interior wall and ceiling finishes shall comply with Chapter 8 of the *International Building Code*.

~~702.2~~ **503.5 Interior floor finish.** New interior floor finish, including new carpeting used as an interior floor finish material, shall comply with Section 804 of the *International Building Code*.

~~702.3~~ **503.6 Interior trim.** All newly installed interior trim materials shall comply with Section 806 of the *International Building Code*.

~~702.4~~ **503.7 Window opening control devices.** In Group R-2 or R-3 buildings containing dwelling units and one- and two-family dwellings and townhouses regulated by the *International Residential Code*, window opening control devices complying with ASTM F 2090 shall be installed where an existing window is replaced and where all of the following apply to the replacement window:

1. The window is operable;
2. The window replacement includes replacement of the sash and the frame;
3. One of the following applies:
  - 3.1. In Group R-2 or R-3 buildings containing dwelling units, the top of the sill of the window opening is at a height less than 36 inches (915 mm) above the finished floor;or

- 3.2. In one- and two-family dwellings and town-houses regulated by the *International Residential Code*, the top sill of the window opening is at a height less than 24 inches (610 mm) above the finished floor;
4. The window will permit openings that will allow passage of a 4-inch-diameter (102 mm) sphere when the window is in its largest opened position; and
5. The vertical distance from the top of the sill of the window opening to the finished grade or other surface below, on the exterior of the building, is greater than 72 inches (1829 mm).

The window opening control device, after operation to release the control device allowing the window to fully open, shall not reduce the minimum net clear opening area of the window unit to less than the area required by the *International Building Code*.

**Exceptions:**

- 5.1. Operable windows where the top of the sill of the window opening is located more than 75 feet (22 860 mm) above the finished grade or other surface below, on the exterior of the room, space or building, and that are provided with window fall prevention devices that comply with ASTM F 2006.
- 5.2. Operable windows with openings that are provided with window fall prevention devices that comply with ASTM F 2090.

**~~702.5~~ 503.8 Emergency escape and rescue openings.** Where windows are required to provide emergency escape and rescue openings in Group R-2 and R-3 occupancies and one- and two-family dwellings and townhouses regulated by the *International Residential Code*, replacement windows shall be exempt from the requirements of Sections 1030.2, 1030.3 and 1030.5 of the *International Building Code* and Sections R310.21 and R310.2.3 of the *International Residential Code* accordingly, provided the replacement window is the manufacturer's largest standard size window that will fit within the existing frame or existing rough opening. The replacement window shall be permitted to be of the same operating style as the existing window or a style that provides for an equal or greater window opening area than the existing window.

Window opening control devices complying with ASTM F 2090 shall be permitted for use on windows required to provide *emergency escape and rescue openings*.

**~~702.6~~ 503.9 Materials and methods.** All new work shall comply with the materials and methods requirements in the *International Building Code*, *International Energy Conservation Code*, *International Mechanical Code*, and *International Plumbing Code*, as applicable, that specify material standards, detail of installation and connection, joints, penetrations, and continuity of any element, component, or system in the building.

**~~SECTION 703 FIRE PROTECTION~~**

**~~703.1~~ 503.10 General Fire protection.** *Alterations* shall be done in a manner that maintains the level of fire protection provided.

**~~SECTION 704 MEANS OF EGRESS~~**

~~704.1~~ **503.11 General Means of egress.** Alterations shall be done in a manner that maintains the level of protection provided for the means of egress.

## ~~SECTION 705 ACCESSIBILITY~~

~~705.1~~ **503.12 General Accessibility.** A facility that is altered shall comply with the applicable provisions in Sections ~~705.1.1~~ **503.12.1** through ~~705.1.14~~ **503.12.14**, and Chapter 11 of the *International Building Code* unless it is *technically infeasible*. Where compliance with this section is *technically infeasible*, the alteration shall provide access to the maximum extent that is technically feasible.

A facility that is constructed or altered to be accessible shall be maintained accessible during occupancy.

### **Exceptions:**

1. The altered element or space is not required to be on an accessible route unless required by Section 705.2.
2. Accessible means of egress required by Chapter 10 of the *International Building Code* are not required to be provided in existing facilities.
3. Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing facilities undergoing less than a Level 3 alteration.
4. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provisions for Type B dwelling units.

## ~~SECTION 706 REROOFING~~

~~[BS]~~ ~~706.1~~ **503.13 General Reroofing.** Materials and methods of application used for recovering or replacing an existing roof covering shall comply with the requirements of Chapter 15 of the *International Building Code*.

**Exception:** Reroofing shall not be required to meet the minimum design slope requirement of one-quarter unit vertical in 12 units horizontal (2-percent slope) in Section 1507 of the *International Building Code* for roofs that provide positive roof drainage.

## ~~SECTION 707 STRUCTURAL~~

~~[BS]~~ ~~707.1~~ **503.14 General Structural.** Where alteration work includes replacement of equipment that is supported by the building or where a reroofing permit is required, the provisions of this section shall apply.

## ~~SECTION 708 ENERGY CONSERVATION~~

~~708.1~~ **503.15 Minimum requirements. Energy Conservation.** Level 1 alterations to existing buildings or structures are permitted without requiring the entire building or structure to comply with the energy requirements of the *International Energy Conservation Code* or *International Residential Code*. The alterations shall conform to the energy requirements of the *International Energy Conservation Code* or *International Residential Code* as they relate to new construction only.

## **~~CHAPTER 8 ALTERATIONS—LEVEL 2~~**

### **~~SECTION 801 504 GENERAL ALTERATIONS-LEVEL 2~~**

**~~801.1 504.1~~ Scope.** Level 2 *alterations* as described in Section ~~504~~ 501.4 shall comply with the requirements of this ~~chapter~~ section.

**Exception:** Buildings in which the reconfiguration is exclusively the result of compliance with the accessibility requirements of Section ~~705.2- 503.12.1~~ shall be permitted to comply with ~~Chapter 7~~ Section 503.

**~~801.2 504.1.1~~ Alteration Level 1 Additional compliance.** In addition to the requirements of this ~~chapter~~ section, all work shall comply with the requirements of ~~Chapter 7- Section 503~~.

**~~801.3 504.1.2~~ Compliance with International Building Code.** All new construction elements, components, systems, and spaces shall comply with the requirements of the *International Building Code*.

#### **Exceptions:**

1. Windows may be added without requiring compliance with the light and ventilation requirements of the *International Building Code*.
2. Newly installed electrical equipment shall comply with the requirements of Section 808.
3. The length of dead-end corridors in newly constructed spaces shall only be required to comply with the provisions of Section 805.6.
4. The minimum ceiling height of the newly created habitable and occupiable spaces and corridors shall be 7 feet (2134 mm).

### **~~SECTION 802 SPECIAL USE AND OCCUPANCY~~**

**~~802.1 504.2~~ General Special Use and Occupancy.** *Alteration* of buildings classified as special use and occupancy as described in the *International Building Code* shall comply with the requirements of Section 801.1 and the scoping provisions of Chapter 1 where applicable.

### **~~SECTION 803 BUILDING ELEMENTS AND MATERIALS~~**

**~~803.1 504.3~~ Scope Building Elements and materials.** *No change to text*.

### **~~SECTION 804 FIRE PROTECTION~~**

**~~804.1 504.4~~ Scope Fire protection.** The requirements of this section shall be limited to work areas in which Level 2 *alterations* are being performed, and where specified they shall apply throughout the floor on which the *work areas* are located or otherwise beyond the *work area*.

### **~~SECTION 805 MEANS OF EGRESS~~**

**~~805.1 504.5~~ Scope Means of egress.** The requirements of this section shall be limited to work areas that include exits or corridors shared by more

than one tenant within the *work area* in which Level 2 *alterations* are being performed, and where specified they shall apply throughout the floor on which the *work areas* are located or otherwise beyond the *work area*.

**805.2504.5.1 General.** The means of egress shall comply with the requirements of this section.

**Exceptions:**

1. Where the work area and the means of egress serving it complies with NFPA 101.
2. Means of egress conforming to the requirements of the building code under which the building was constructed shall be considered compliant means of egress if, in the opinion of the code official, they do not constitute a distinct hazard to life.

~~**805.3 Number of exits.** The number of exits shall be in accordance with Sections 805.3.1 through 805.3.3.~~

~~**805.3.1 504.5.2 Minimum number of exits.** Every story utilized for human occupancy on which there is a *work area* that includes exits or corridors shared by more than one tenant within the *work area* shall be provided with the minimum number of exits based on the occupancy and the occupant load in accordance with the *International Building Code*. In addition, the exits shall comply with Sections 805.3.1.1 and 805.3.1.2.~~

~~**805.4.1 Two egress doorways required.** Work areas shall be provided with two egress doorways in accordance with the requirements of Sections 805.4.1.1 and 805.4.1.2.~~

~~**805.8 504.5.10 Exit signs.** Exit signs Means of egress in all work areas shall be provided with exit signs in accordance with this section, as applicable. the requirements of the *International Building Code*.~~

~~**805.8.1 Work areas.** Means of egress in all work areas shall be provided with exit signs in accordance with the requirements of the *International Building Code*.~~

~~**805.10.1 Capacity.** The required capacity of refuge areas shall be in accordance with Sections 805.10.1.1 through 805.10.1.3.~~

~~**SECTION 806 ACCESSIBILITY**~~

~~**806.1 504.6 General Accessibility.** A building, *facility*, or element that is altered shall comply with this section and Section 705.~~~~**SECTION 807 STRUCTURAL**~~

~~**[BS] 807.1 504.7 General Structural.** Structural elements and systems within buildings undergoing Level 2 *alterations* shall comply with this section.~~

~~**SECTION 808 ELECTRICAL**~~

~~**504.8 Electrical.** Electrical equipment and wiring shall comply with section 504.8.1 through 504.8.3.7.~~

~~**808.1504.8.1 New installations.** All newly installed electrical equipment and wiring relating to work done in any work area shall comply with all~~

applicable requirements of NFPA 70 except as provided for in Section ~~808.3~~504.8.3.

~~808.2~~ **504.8.2 Existing installations.** Existing wiring in all work areas in Group A-1, A-2, A-5, H and I occupancies shall be upgraded to meet the materials and methods requirements of ~~Chapter 7~~. Section 503.

### ~~SECTION 809 MECHANICAL~~

**504.9 Mechanical.** Mechanical equipment shall comply with sections 504.9 through 504.9.3.

### ~~SECTION 810 PLUMBING~~

~~810.1~~ **504.10 Minimum plumbing fixtures.** Where the occupant load of the story is increased by more than 20 percent, plumbing fixtures for the story shall be provided in quantities specified in the *International Plumbing Code* based on the increased occupant load.

### ~~SECTION 811 ENERGY CONSERVATION~~

~~811.1~~ **504.11 Minimum energy conservation requirements.** Level 2 *alterations* to existing buildings or structures are permitted without requiring the entire building or structure to comply with the energy requirements of the *International Energy Conservation Code* or *International Residential Code*. The *alterations* shall conform to the energy requirements of the *International Energy Conservation Code* or *International Residential Code* as they relate to new construction only.

## ~~CHAPTER 9 ALTERATIONS—LEVEL 3~~

### ~~SECTION 901- 505 GENERAL ALTERATIONS-LEVEL 3~~

~~901.1~~ **505.1 Scope.** Level 3 *alterations* as described in Section ~~505~~ 501.5 shall comply with the requirements of this ~~chapter~~ section.

~~901.2~~ **505.2 Compliance.** In addition to the provisions of this ~~chapter~~ section, work shall comply with all of the requirements of ~~Chapters 7~~ Sections 503 and 504. The requirements of Sections 803, 804 and 805 shall apply within all *work areas* whether or not they include exits and corridors shared by more than one tenant and regardless of the occupant load.

**Exception:** Buildings in which the reconfiguration of space affecting exits or shared egress access is exclusively the result of compliance with the accessibility requirements of Section 705.2 shall not be required to comply with this ~~chapter~~ section.

### ~~SECTION 902 SPECIAL USE AND OCCUPANCY~~

~~902.1~~ **505.3 High-rise buildings.** *No change to text.*

~~902.2~~ **505.4 Boiler and furnace equipment rooms.** Boiler and furnace equipment rooms adjacent to or within Groups I-1, I-2, I-4, R-1, R-2 and R-4 occupancies shall be enclosed by 1-hour fire-resistance-rated

construction.

**Exceptions:**

1. Steam boiler equipment operating at pressures of 15 pounds per square inch gauge (psig) (103.4 KPa) or less is not required to be enclosed.
2. Hot water boilers operating at pressures of 170 psig (1171 KPa) or less are not required to be enclosed.
3. Furnace and boiler equipment with 400,000 British thermal units (Btu) ( $4.22 \times 10^8$  J) per hour input rating or less is not required to be enclosed.
4. Furnace rooms protected with an automatic sprinkler system are not required to be enclosed.

**~~SECTION 903 BUILDING ELEMENTS AND MATERIALS~~**

**~~903.1 505.5 Existing shafts and vertical openings.~~** Existing stairways that are part of the means of egress shall be enclosed in accordance with Section 803.2.1 from the highest *work area* floor to, and including, the level of exit discharge and all floors below.

**~~903.2 505.6 Fire partitions in Group R-3.~~** *No change to text.*

**~~903.3 505.7 Interior finish.~~** Interior finish in exits serving the *work area* shall comply with Section 803.4 between the highest floor on which there is a *work area* to the floor of exit discharge.

**~~SECTION 904 FIRE PROTECTION~~**

**~~904.1 505.8 Automatic sprinkler systems.~~** *No change to text.*

**~~904.2 505.9 Fire alarm and detection systems.~~** Fire alarm and detection shall be provided in accordance with Section 907 of the *International Building Code* as required for new construction.

**~~SECTION 905 MEANS OF EGRESS~~**

**~~905.1 505.10 General Means of egress.~~** *No change to text.*

**~~SECTION 906 ACCESSIBILITY~~**

**~~906.1 505.11 General Accessibility.~~** A building, *facility* or element that is altered shall comply with this section and Sections 705 and 806.

**~~SECTION 907 STRUCTURAL~~**

**~~[BS] 907.1 505.12 General Structural.~~** Where buildings are undergoing Level 3 *alterations* including structural *alterations*, the provisions of this section shall apply.

**~~[BS] 907.4 505.12.3 Existing structural elements resisting lateral loads.~~** All existing elements of the lateral force-resisting system shall comply with this section.

**Exceptions:**

1. Buildings of Group R occupancy with no more than five dwelling or sleeping units used solely for residential purposes that are altered based on the conventional light-

frame construction methods of the *International Building Code* or in compliance with the provisions of the *International Residential Code*.

2. Where such *alterations* involve only the lowest story of a building and the *change of occupancy* provisions of ~~Chapter 10~~ Section 506 do not apply, only the lateral force-resisting components in and below that story need comply with this section.

### ~~SECTION 908 ENERGY CONSERVATION~~

~~908.1~~ 505.13 **Minimum requirements. Energy conservation.** Level 3 *alterations to existing buildings* or structures are permitted without requiring the entire building or structure to comply with the energy requirements of the *International Energy Conservation Code* or *International Residential Code*. The *alterations* shall conform to the energy requirements of the *International Energy Conservation Code* or *International Residential Code* as they relate to new construction only.

## ~~CHAPTER 10 CHANGE OF OCCUPANCY~~

### ~~SECTION 1001 506 GENERAL CHANGE OF OCCUPANCY~~

~~1001.1~~ 506.1 **Scope.** The provisions of this ~~chapter~~ section shall apply where a *change of occupancy* occurs, as defined in Section 202.

~~1001.2~~ 506.2 **Certificate of occupancy.** A change of occupancy or a change of occupancy within a space where there is a different fire protection system threshold requirement in Chapter 9 of the *International Building Code* shall not be made to any structure without the approval of the *code official*. A certificate of occupancy shall be issued where it has been determined that the requirements for the change of occupancy have been met.

~~1001.3~~ 506.3 **Certificate of occupancy required.** A certificate of occupancy shall be issued where a *change of occupancy* occurs that results in a different occupancy classification as determined by the *International Building Code*.

### ~~SECTION 1002 SPECIAL USE AND OCCUPANCY~~

~~1002.1~~ 506.4 **Compliance with the building code. Special use and occupancy.** Where the character or use of an *existing building* or part of an *existing building* is changed to one of the following special use or occupancy categories as defined in the *International Building Code*, the building shall comply with all of the applicable requirements of the *International Building Code*:

1. Covered and open mall buildings.
2. Atriums.
3. Motor vehicle-related occupancies.
4. Aircraft-related occupancies.
5. Motion picture projection rooms.
6. Stages and platforms.
7. Special amusement buildings.

8. Incidental use areas.
9. Hazardous materials.
10. Ambulatory care facilities.
11. Group I-2 occupancies.

## ~~SECTION 1003 BUILDING ELEMENTS AND MATERIALS~~

~~1003.1~~ **506.5 General Building elements and materials.** Building elements and materials in portions of buildings undergoing a *change of occupancy* classification shall comply with Section 1012.

## ~~SECTION 1004 FIRE PROTECTION~~

~~1004.1~~ **506.6 General Fire protection.** Fire protection requirements of Section 1012 shall apply where a building or portions thereof undergo a *change of occupancy* classification or where there is a change of occupancy within a space where there is a different fire protection system threshold requirement in Chapter 9 of the *International Building Code*.

## ~~SECTION 1005 MEANS OF EGRESS~~

~~1005.1~~ **506.7 General Means of egress.** Means of egress in portions of buildings undergoing a *change of occupancy* classification shall comply with Section 1012.

## ~~SECTION 1006 ACCESSIBILITY~~

~~1006.1~~ **506.8 General Accessibility.** Accessibility in portions of buildings undergoing a *change of occupancy* classification shall comply with Section 1012.8.

## ~~SECTION 1007 STRUCTURAL~~

**506.9 Structural.** Buildings undergoing *change of occupancy* are subject to Section 506.9.

## ~~SECTION 1008 ELECTRICAL~~

**506.10 Electrical.** Electrical equipment and wiring shall comply with Sections 506.10.1 through 506.10.4

## ~~SECTION 1009 MECHANICAL~~

~~1009.1~~ **506.11 Mechanical requirements.** Where the occupancy of an *existing building* or part of an *existing building* is changed such that the new occupancy is subject to different kitchen exhaust requirements or to increased mechanical ventilation requirements in accordance with the *International Mechanical Code*, the new occupancy shall comply with the respective *International Mechanical Code* provisions.

## ~~SECTION 1010 PLUMBING~~

**506.12 Plumbing.** Plumbing equipment and systems shall comply with Section 506.12.

## ~~SECTION 1011 OTHER REQUIREMENTS~~

~~1011.1~~ **506.13 Light and ventilation.** Light and ventilation shall comply with the requirements of the *International Building Code* for the new occupancy.

## **~~SECTION 1012 CHANGE OF OCCUPANCY CLASSIFICATION~~**

**~~1012.1~~ 506.14 **General Change of occupancy classification.** The provisions of this section shall apply to buildings or portions thereof undergoing a change of occupancy classification. This includes a change of occupancy classification within a group as well as a change of occupancy classification from one group to a different group or where there is a change of occupancy within a space where there is a different fire protection system threshold requirement in Chapter 9 of the *International Building Code*. Such buildings shall also comply with Sections 1002 through 1011. The application of requirements for the change of occupancy shall be as set forth in Sections 1012.1.1 through 1012.1.4. A *change of occupancy*, as defined in Section 202, without a corresponding change of occupancy classification shall comply with Section 1001.2.**

**~~1012.1.1~~ 506.14.1 **Compliance with Chapter 9, Section 505.** The requirements of ~~Chapter 9, Section 505~~ shall be applicable throughout the building for the new occupancy classification based on the separation conditions set forth in Sections 1012.1.1.1 and 1012.1.1.2.**

**~~1012.2~~ **Fire protection systems.** Fire protection systems shall be provided in accordance with ~~Sections 1012.2.1 and 1012.2.2.~~**

**~~1012.2.1~~ 506.14.5 **Fire sprinkler system.** Where a change in occupancy classification occurs or where there is a change of occupancy within a space where there is a different fire protection system threshold requirement in Chapter 9 of the *International Building Code* that requires an automatic fire sprinkler system to be provided based on the new occupancy in accordance with Chapter 9 of the *International Building Code*, such system shall be provided throughout the area where the *change of occupancy* occurs.**

**~~1012.2.2~~ 506.14.6 **Fire alarm and detection system.** Where a change in occupancy classification occurs or where there is a change of occupancy within a space where there is a different fire protection system threshold requirement in Chapter 9 of the *International Building Code* that requires a fire alarm and detection system to be provided based on the new occupancy in accordance with Chapter 9 of the *International Building Code*, such system shall be provided throughout the area where the *change of occupancy* occurs. Existing alarm notification appliances shall be automatically activated throughout the building. Where the building is not equipped with a fire alarm system, alarm notification appliances shall be provided throughout the area where the *change of occupancy* occurs in accordance with Section 907 of the *International Building Code* as required for new construction.**

**~~1012.3~~ 506.14.7 **Interior finish.** In areas of the building undergoing the change of occupancy classification, the interior finish of walls and ceilings shall comply with the requirements of the *International Building Code* for the new occupancy classification.**

**~~1012.4~~ 506.14.8 **Means of egress, general.** Hazard categories in regard to life safety and means of egress shall be in accordance with Table ~~1012.4~~ 506.14.8.**

~~1012.5~~ **506.14.9 Heights and areas.** Hazard categories in regard to height and area shall be in accordance with Table ~~1012.5~~ 506.14.9.

~~1012.6~~ **506.14.10 Exterior wall fire-resistance ratings.** Hazard categories in regard to fire-resistance ratings of exterior walls shall be in accordance with Table ~~1012.6~~ 506.14.10.

~~1012.7~~ **506.14.11 Enclosure of vertical shafts.** Enclosure of vertical shafts shall be in accordance with Sections ~~1012.7.1~~ 506.14.11.1 through ~~1012.7.4~~ 506.14.11.4.

~~1012.8~~ **506.14.12 Accessibility.** *Existing buildings* that undergo a change of group or occupancy classification shall comply with this section.

**Exception:** Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing buildings and facilities undergoing a *change of occupancy* in conjunction with less than a Level 3 *alteration*.

## ~~CHAPTER 11~~ ADDITIONS

### ~~SECTION 1101~~ 507 GENERAL ADDITIONS

~~1101.1~~ **507.1 Scope.** An *addition* to a building or structure shall comply with the *International Codes* as adopted for new construction without requiring the *existing building* or structure to comply with any requirements of those codes or of these provisions, except as required by this ~~chapter~~ section. Where an *addition* impacts the *existing building* or structure, that portion shall comply with this code.

~~1101.2~~ **507.2 Creation or extension of nonconformity.** An *addition* shall not create or extend any nonconformity in the *existing building* to which the *addition* is being made with regard to accessibility, structural strength, fire safety, means of egress, or the capacity of mechanical, plumbing, or electrical systems.

~~1101.3~~ **507.3 Other work.** Any *repair* or *alteration* work within an *existing building* to which an *addition* is being made shall comply with the applicable requirements for the work as classified in ~~Chapter 5~~. Section 501.

### ~~SECTION 1102~~ HEIGHTS AND AREAS

~~1102.1~~ **507.4 Height limitations.** No *addition* shall increase the height of an *existing building* beyond that permitted under the applicable provisions of Chapter 5 of the *International Building Code* for new buildings.

~~1102.2~~ **507.5 Area limitations.** No *addition* shall increase the area of an *existing building* beyond that permitted under the applicable provisions of Chapter 5 of the *International Building Code* for new buildings unless fire separation as required by the *International Building Code* is provided.

**Exception:** In-filling of floor openings and nonoccupiable appendages such as elevator and exit stairway shafts shall be permitted beyond that permitted by the *International Building Code*.

~~1102.3~~ **507.6 Fire protection systems.** Existing fire areas increased by the *addition* shall comply with Chapter 9 of the *International Building Code*.

## ~~SECTION 1103 STRUCTURAL~~

~~[BS] 1103.1 507.7 Compliance with the International Building Code Structural.~~ Additions to existing buildings or structures are new construction and shall comply with the *International Building Code*.

~~[BS] 1103.2 507.7.1 Additional gravity loads.~~ Existing structural elements supporting any additional gravity loads as a result of additions shall comply with the *International Building Code*.

### **Exceptions:**

1. Structural elements whose stress is not increased by more than 5 percent.
2. Buildings of Group R occupancy with no more than five dwelling units or sleeping units used solely for residential purposes where the *existing building* and the *addition* comply with the conventional lightframe construction methods of the *International Building Code* or the provisions of the *International Residential Code*.

## ~~SECTION 1104 SMOKE ALARMS IN OCCUPANCY GROUPS R AND I-1~~

~~1104.1 507.8 Smoke alarms in existing portions of a building.~~ Where an *addition* is made to a building or structure of a Group R or I-1 occupancy, the *existing building* shall be provided with smoke alarms as required by Section 1103.8 of the *International Fire Code* or Section R314 of the *International Residential Code* as applicable.

## ~~SECTION 1105 ACCESSIBILITY~~

~~1105.1 507.9 Minimum requirements Accessibility.~~ Accessibility provisions for new construction shall apply to additions. An addition that affects the accessibility to, or contains an area of, *primary function* shall comply with the requirements of Sections 705, 806 and 906, as applicable.

~~1105.2 507.9.1 Accessible dwelling units and sleeping units.~~ Where Group I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for accessible units apply only to the quantity of spaces being added.

## ~~SECTION 1106 ENERGY CONSERVATION~~

~~1106.1 507.10 Minimum requirements. Energy Conservation.~~ Additions to existing buildings shall conform to the energy requirements of the *International Energy Conservation Code* or *International Residential Code* as they relate to new construction.

## ~~CHAPTER 12 HISTORIC BUILDINGS~~

### ~~SECTION 1201 508 GENERAL HISTORIC BUILDINGS~~

~~1201.1 508.1 Scope.~~ It is the intent of this ~~chapter section~~ to provide means for the preservation of *historic buildings*. Historical buildings shall comply with the provisions of this ~~chapter section~~ relating to their *repair, alteration, relocation and change of occupancy*.

~~[BS] 1201.2 508.2 Report.~~ A *historic building* undergoing *repair*,

*alteration, or change of occupancy* shall be investigated and evaluated. If it is intended that the building meet the requirements of this ~~chapter~~ section, a written report shall be prepared and filed with the *code official* by a registered design professional when such a report is necessary in the opinion of the *code official*. Such report shall be in accordance with Chapter 1 and shall identify each required safety feature that is in compliance with this ~~chapter~~ section and where compliance with other chapters of these provisions would be damaging to the contributing historic features. For buildings assigned to Seismic Design Category D, E or F, a structural evaluation describing, at a minimum, the vertical and horizontal elements of the lateral force-resisting system and any strengths or weaknesses therein shall be prepared. Additionally, the report shall describe each feature that is not in compliance with these provisions and shall demonstrate how the intent of these provisions is complied with in providing an equivalent level of safety.

**~~1201.3~~ 508.3 Special occupancy exceptions—museums.** When a building in Group R-3 is also used for Group A, B, or M purposes such as museum tours, exhibits, and other public assembly activities, or for museums less than 3,000 square feet (279 m<sup>2</sup>), the *code official* may determine that the occupancy is Group B when life-safety conditions can be demonstrated in accordance with Section 1201.2. Adequate means of egress in such buildings, which may include a means of maintaining doors in an open position to permit egress, a limit on building occupancy to an occupant load permitted by the means of egress capacity, a limit on occupancy of certain areas or floors, or supervision by a person knowledgeable in the emergency exiting procedures, shall be provided.

**~~[BS] 1201.4~~ 508.4 Flood hazard areas.** In *flood hazard areas*, if all proposed work, including repairs, work required because of a *change of occupancy*, and *alterations*, constitutes *substantial improvement*, then the *existing building* shall comply with Section 1612 of the *International Building Code*, or Section R322 of the *International Residential Code*, as applicable.

**Exception:** If an *historic building* will continue to be an *historic building* after the proposed work is completed, then the proposed work is not considered a *substantial improvement*. For the purposes of this exception, an *historic building* is:

1. Listed or preliminarily determined to be eligible for listing in the National Register of Historic Places;
2. Determined by the Secretary of the U.S. Department of Interior to contribute to the historical significance of a registered historic district or a district preliminarily determined to qualify as a historic district; or
3. Designated as historic under a state or local historic preservation program that is approved by the Department of Interior.

## **~~SECTION 1202~~ REPAIRS**

**~~1202.1~~ 508.5 General Repairs.** Repairs to any portion of an *historic building* or structure shall be permitted with original or like materials and original methods of construction, subject to the provisions of this ~~chapter~~ section. Hazardous materials, such as asbestos and lead-based paint, shall not be used where the code for new construction would not permit their use

in buildings of similar occupancy, purpose and location.

**~~1202.2~~ 508.5.1 Unsafe conditions.** Conditions determined by the *code official* to be *unsafe* shall be remedied. No work shall be required beyond what is required to remedy the *unsafe* conditions.

### **~~SECTION 1203 FIRE SAFETY~~**

**~~1203.1~~ 508.6 Scope Fire safety.** *Historic buildings* undergoing *alterations, changes of occupancy,* or that are moved shall comply with Section 1203.

**~~1203.2~~ 508.6.1 General.** Every *historic building* that does not conform to the construction requirements specified in this code for the occupancy or use and that constitutes a distinct fire hazard as defined herein shall be provided with an approved automatic fire-extinguishing system as determined appropriate by the *code official*. However, an automatic fire-extinguishing system shall not be used to substitute for, or act as an alternative to, the required number of exits from any *facility*.

### **~~SECTION 1204 ALTERATIONS~~**

**~~1204.1~~ 508.7 Accessibility requirements.** The provisions of Sections 705, 806 and 906, as applicable, shall apply to facilities designated as historic structures that undergo *alterations,* unless *technically infeasible*. Where compliance with the requirements for accessible routes, entrances or toilet rooms would threaten or destroy the historic significance of the building or *facility,* as determined by the *code official,* the alternative requirements of Sections 1204.1.1 through 1204.1.4 for that element shall be permitted.

**Exception:** Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in historical buildings.

### **~~SECTION 1205 CHANGE OF OCCUPANCY~~**

**~~1205.1~~ 508.8 General Change of occupancy.** *Historic buildings* undergoing a *change of occupancy* shall comply with the applicable provisions of ~~Chapter 10 Section 506,~~ except as specifically permitted in this ~~chapter section.~~ When ~~Chapter 10 Section 506~~ requires compliance with specific requirements of ~~Chapter 7 Section 503, Chapter 8 Section 504, or Chapter 9 Section 505~~ and when those requirements are subject to the exceptions in Section 1202, the same exceptions shall apply to this section.

### **~~SECTION 1206 STRUCTURAL~~**

**~~[BS] 1206.1~~ 508.9 General Structural.** *Historic buildings* shall comply with the applicable structural provisions for the work as classified in ~~Chapter 5- Section 501.~~

**Exception:** The *code official* shall be authorized to accept existing floors and approve operational controls that limit the live load on any such floor.

## **~~CHAPTER 13 RELOCATED OR MOVED BUILDINGS~~**

### **~~SECTION 1301- 509 GENERAL- RELOCATED OR MOVED BUILDINGS~~**

~~1301.1~~ **509.1 Scope.** This chapter section provides requirements for relocated or moved structures, including relocatable buildings as defined in Chapter 2.

~~509.2 Application.~~ Relocated buildings shall comply with the provisions of Chapter 13.

~~1301.2~~ **509.2 Conformance.** The building shall be safe for human occupancy as determined by the *International Fire Code* and the *International Property Maintenance Code*. Any repair, alteration, or change of occupancy undertaken within the moved structure shall comply with the requirements of this code applicable to the work being performed. Any field-fabricated elements shall comply with the requirements of the *International Building Code* or the *International Residential Code* as applicable.

## ~~SECTION 1302~~ REQUIREMENTS

~~1302.1~~ **509.3 Location on the lot.** The building shall be located on the lot in accordance with the requirements of the *International Building Code* or the *International Residential Code* as applicable.

~~[BS] 1302.2~~ **509.4 Foundation.** The foundation system of relocated buildings shall comply with the *International Building Code* or the *International Residential Code* as applicable.

~~[BS] 1302.3~~ **509.5 Wind loads.** Buildings shall comply with *International Building Code* or *International Residential Code* wind provisions as applicable.

### Exceptions:

1. Detached one- and two-family dwellings and Group U occupancies where wind loads at the new location are not higher than those at the previous location.
2. Structural elements whose stress is not increased by more than 10 percent.

~~[BS] 1302.4~~ **509.6 Seismic loads.** Buildings shall comply with *International Building Code* or *International Residential Code* seismic provisions at the new location as applicable.

### Exceptions:

1. Structures in Seismic Design Categories A and B and detached one- and two-family dwellings in Seismic Design Categories A, B and C where the seismic loads at the new location are not higher than those at the previous location.
2. Structural elements whose stress is not increased by more than 10 percent.

~~[BS] 1302.5~~ **509.7 Snow loads.** Structures shall comply with *International Building Code* or *International Residential Code* snow loads as applicable where snow loads at the new location are higher than those at the previous location.

**Exception:** Structural elements whose stress is not increased by more than 5 percent.

~~[BS] 1302.6~~ **509.8 Flood hazard areas.** If relocated or moved into a

flood hazard area, structures shall comply with Section 1612 of the *International Building Code*, or Section R322 of the *International Residential Code*, as applicable.

**[BS] 1302.7 509.9 Required inspection and repairs.** *No change to text.*

**Reason:** This proposal reorganizes the IEBC work area method into a single chapter without making any technical changes. For a complete version of this proposal we ask that you go to: [Work Area Chapter](#). This other document shows the intent of the proposal more clearly and accurately.

The IEBC includes 3 compliance methods--prescriptive (chapter 4), work area method (chapters 5-13), and the performance method (chapter 14). The basic premise of the IEBC is that the 3 methods are equivalent. A remodel project that uses the prescriptive method is equally as compliant as one that uses the work area method.

The format of the code doesn't reflect this equivalence. Two compliance methods are contained within a single chapter each. The work area method, however, is spread out over 9 chapters. This formatting can be misleading. It gives the appearance, for instance, that Chapter 11 applies to all additions and that Chapter 12 applies to all historic buildings, regardless of compliance method chosen for a particular project. It's misleading and confusing to designers who are trying to apply the IEBC to a building project. It's also misleading for code development. As an example, EB52-2012 was a very good code change proposal from the last code cycle that straightened out how changes of occupancy are treated in the IEBC. However, it only addressed Chapter 10 in the work area method, omitting the other 2 methods.

Each chapter of the work area method is assigned to a single section, all the sections in chapters 5-13 are renumbered, some are given different titles, and some redundant language is deleted. A few charging sections are added where the current code relies on a section title for charging. The order of the sections is not changed. The code change proposal does not show every section that would be renumbered. Sections that are not shown would be renumbered sequentially. The proposal also shows a small number of sections where we're proposing to change some language. Our intention with this proposal is that a comprehensive renumbering and correction of cross references would be done by staff and ICC's editors. An attachment to this proposal shows the details of how the renumbering could be done.

We'd like to point out that the maximum number of decimal points in section numbers is not increased in this proposal. The IEBC currently has some sections with 4 decimal points, and that is also the maximum number of decimal points in this proposal.

**Cost Impact:** Will not increase the cost of construction  
This proposal renumbers code sections without making any technical changes.

**Analysis:** As stated, this proposal reorganizes several chapters of the code into a single chapter. For clarity, the code change as depicted here shows only the major sections that are moved, renumbered, or both. To view the location and renumbering of all of the sections involved, the document entitled "Work Area Chapter" can be found by clicking the link at the beginning of the proponent's reason statement.

**Committee Action:****Disapproved**

**Committee Reason:** This proposal was disapproved as it would make the IEBC more difficult to use even though the intent was to simplify. The IEBC is already written differently than the IBC and this will cause further confusion with such a drastic change in format.

**Assembly Action :****None**

---

**Individual Consideration Agenda*****Public Comment 1:***

**Proponent : Kathleen Petrie, representing City of Seattle, Department of Planning and Development (kathleen.petrie@seattle.gov) requests Approve as Submitted.**

**Commenter's Reason:** Per Section 301.1, one of the three methods of compliance (Prescriptive, Work Area, and Performance) must be chosen to apply toward a project in order to comply with the IEBC. The Prescriptive and Performance methods are each compiled entirely within their individual chapter; however the Work Area method is spread across 9 chapters. This format makes the code organization inconsistent and confusing for the user.

If all components of the Work Area method are moved into one chapter, the user only has to go to one location. The IEBC will then be comprised of 3 chapters which address the 3 methods, and all remaining chapters have information and requirements which apply to all methods. It may appear odd to slightly modify the format of a code, but this change makes the IEBC much more intuitive for the user.

This proposal does not make technical changes. In order to clarify for the monograph, the code change as depicted here shows only the major sections that are moved, renumbered, or both. To view the location and renumbering of all of the sections involved, please see the complete Work Area Chapter document attached.

**EB50-15**

# EB56-15

## 705.1.13

### **Proposed Change as Submitted**

**Proponent:** Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

## **2015 International Existing Building Code**

### **Revise as follows:**

~~705.1.13~~ **705.1.1** **Extent of application.** An *alteration* of an existing element, space, or area of a *facility* shall not impose a requirement for greater accessibility than that which would be required for new construction. *Alterations* shall not reduce or have the effect of reducing accessibility of a *facility* or portion of a *facility*.

**Reason:** The intent of the verbiage change is coordination between Section 410.3 and 705.1.13. The struck words are covered in the definition of facility. The relocation to first in the list is to place this allowance in a more prominent position, similar to Chapter 4. If accessibility is not required in new construction, you would not need to go through any of the list following.

In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: <http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

**Cost Impact:** Will not increase the cost of construction

The proposal is a clarification of current requirements; therefore, there is no impact on the cost.

EB56-15 : 705.1.13-  
KULIK3405

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** This proposal was disapproved with concern with actions taken on the accessibility provisions in other code change proposals. More specifically, code change proposal EB33-15 moved all the accessibility provisions into Chapter 3 and the provisions of Section 705 were essentially deleted.

**Individual Consideration Agenda*****Public Comment 1:***

**Proponent : Edward Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests Approve as Submitted.**

**Commenter's Reason:** The ICC Building Code Action Committee requests approval of this proposal as submitted. This change got confused by the committee with the reorganization of accessibility provisions made by EB 33-15. If this relocation is approved, it will facilitate the merging of the accessibility provision in EB 33. This proposal could also stand on it's own.

The intent of the verbiage change is coordination between Section 410.3 and 705.1.13. The struck words are covered in the definition of facility. The relocation to first in the list is to place this allowance in a more prominent position, similar to Chapter 4. If accessibility is not required in new construction, you would not need to go through any of the list following.

## 804.2.2

### **Proposed Change as Submitted**

**Proponent :** Carl Baldassarra, P.E., FSFPA, P.E., FSFPE, Chair, Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org)

## **2015 International Existing Building Code**

### **Revise as follows:**

**804.2.2 Groups A, B, E, F-1, H, I, M, R-1, R-2, ~~R-4~~, S-1 and S-2.** In buildings with occupancies in Groups A, B, E, F-1, H, I, M, R-1, R-2, ~~R-4~~, S-1 and S-2, work areas that have exits or corridors shared by more than one tenant or that have exits or corridors serving an occupant load greater than 30 shall be provided with automatic sprinkler protection where all of the following conditions occur:

1. The *work area* is required to be provided with automatic sprinkler protection in accordance with the *International Building Code* as applicable to new construction; and
2. The *work area* exceeds 50 percent of the floor area.  
**Exception:** If the building does not have sufficient municipal water supply for design of a fire sprinkler system available to the floor without installation of a new fire pump, work areas shall be protected by an automatic smoke detection system throughout all occupiable spaces other than sleeping units or individual dwelling units that activates the occupant notification system in accordance with Sections 907.4, 907.5 and 907.6 of the *International Building Code*.

**Reason:** This is a single exit building, and given the limit on the number of residents in Group R-4, will not ever have more than 30, therefore, Group R-4 should not be included since the requirement would never be applicable.

The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at:

<http://www.iccsafe.org/cs/CTC/Pages/default.aspx>.

**Cost Impact:** Will not increase the cost of construction  
This eliminates a requirement that is never applicable.

EB58-15 : 804.2.2-  
BALDASSARRA4284

---

## **Public Hearing Results**

**Committee Action:****Disapproved**

**Committee Reason:** There were two main concerns with this proposal. First, mixed use buildings may contain Group R-4 occupancies and the total occupant load can easily surpass 30. Secondly, the reason statement refers to residents but the requirements refer to occupants. Though the residents may never exceed 30 the number of occupants may.

**Assembly Action :****None**

---

**Individual Consideration Agenda***Public Comment 1:*

**Proponent : Carl Baldassarra, P.E., FSFPA, representing Code Technologies Committee (CTC@iccsafe.org) requests Approve as Submitted.**

**Commenter's Reason:** The CTC did a review of the codes regarding where there were differences between Group R-3 and R-4 requirements. Where there was a difference, there was a review of the requirement to see if there was technical justification for the requirement. If there is no technical justification, this could be considered a violation of the Fair Housing Act since the code is asking for something more than asked for in a single family home.

Group R-4 is determined by the number of residents (not counting staff), not the occupant load, so this requirement could result in a requirement that was more restrictive in the IEBC than for new construction.

The IEBC development committee disapproved this proposal based on the possibility that a Group R-4 could have 30 occupants. Based on the occupant load table, that would be a group home with an area of large than 6,000 sq.ft. or larger all discharging through the same corridor or exit (per the base requirement in this section). In addition, the reference for occupant notification systems in the exception to Item 2 are to sections not applicable for Group R-4 facilities.

---

**EB58-15**

# EB59-15

## 804.2.2

### **Proposed Change as Submitted**

**Proponent :** Adolf Zubia, IAFC Fire & Life Safety Section, representing IAFC Fire & Life Safety Section

## **2015 International Existing Building Code**

**Revise as follows:**

**804.2.2 Groups A, B, E, F-1, H, I, M, R-1, R-2, R-4, S-1 and S-2.** In buildings with occupancies in Groups A, B, E, F-1, H, I, M, R-1, R-2, R-4, S-1 and S-2, work areas that have exits or corridors shared by more than one tenant or that have exits or corridors serving an occupant load greater than 30 shall be provided with automatic sprinkler protection where all of the following conditions occur:

1. The *work area* is required to be provided with automatic sprinkler protection in accordance with the *International Building Code* as applicable to new construction; and
2. The *work area* exceeds 50 percent of the floor area.

**Exception:** If the building does not have sufficient municipal water supply for design and installation of a fire an automatic sprinkler system available to at the floor ~~without installation of a new fire pump site~~, work areas shall be protected by an automatic smoke detection system throughout all occupiable spaces other than sleeping units or individual dwelling units that activates the occupant notification system in accordance with Sections 907.4, 907.5 and 907.6 of the *International Building Code*.

**Reason:** This proposal is submitted by Fire and Life Safety Section of the International Association of Fire Chiefs.

The intent of this code change is to address the concern that the municipal water supply must be available at the floor level where the work area is located without the installation of a fire pump. The determining factor for an automatic fire sprinkler system should be whether there is adequate water, not whether a fire pump may be required when achieving an acceptable level of public safety.

This code change revises the text so that the adequacy of a municipal water supply at the building site is the determining factor. When the work area exceeds 50% of the floor area and a fire sprinkler system would be required. The possible installation of a fire pump to supplement the water flow and pressure is not the deciding factor when providing fire safety to the work area.

The revision to this exception will allow existing buildings to comply with this section by installing a smoke detection system in lieu of the fire sprinkler system where the volume and quantity of water at the site is not adequate to fulfill the fire sprinkler system requirements.

**Cost Impact:** Will increase the cost of construction

This code change will increase the cost of construction. The cost of fire pump will most likely exceed the cost of a smoke detection system. However, the same fire pump should be adequate for future fire sprinkler system installations in the building. Therefore, the fire pump will be a one-time cost for the building whereas

future alterations would require the installation of additional smoke detection systems.

EB59-15 : 804.2.2-  
ZUBIA4330

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** This proposal was viewed as excessive for a level 2 alteration. In addition, it works against the intent of the IEBC to encourage the reuse of buildings. A particular example of this concern was a building with a large site that technically has access to a municipal water supply but would require extensive site work to gain access to the water.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Adolf Zubia, representing Fire and Life Safety Section of the International Association of Fire Chiefs requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Existing Building Code**

**804.2.2 Groups A, B, E, F-1, H, I, M, R-1, R-2, R-4, S-1 and S-2.** In buildings with occupancies in Groups A, B, E, F-1, H, I, M, R-1, R-2, R-4, S-1 and S-2, work areas that have exits or corridors shared by more than one tenant or that have exits or corridors serving an occupant load greater than 30 shall be provided with automatic sprinkler protection where all of the following conditions occur:

1. The *work area* is required to be provided with automatic sprinkler protection in accordance with the *International Building Code* as applicable to new construction; and
2. The *work area* exceeds 50 percent of the floor area.

**Exception:** If the building does not have sufficient municipal water supply for design and installation of an automatic sprinkler system available at to the site floor without installation of a new fire pump, work areas shall be protected by an automatic smoke detection system throughout all occupiable spaces other than sleeping units or individual dwelling units that activates the occupant notification system in accordance with Sections 907.4, 907.5 and 907.6 of the *International Building Code*.

**904.1.2 Groups A, B, E, F-1, H, I, M, R-1, R-2, S-1 and S-2.** In buildings with occupancies in Groups A, B, E, F-1, H, I, M, R-1, R-2, R-4, S-1 and S-2, work areas shall be provided with automatic sprinkler protection where the work area is required to be provided with automatic sprinkler

protection in accordance with the International Building Code as applicable to new construction.

**Exception:** If the building does not have sufficient municipal water supply for design and installation of an automatic sprinkler system available at the site, work areas shall be protected by an automatic smoke detection system throughout all occupiable spaces other than sleeping units or individual dwelling units that activates the occupant notification system in accordance with Sections 907.4, 907.5 and 907.6 of the International Building Code.

**Commenter's Reason:** This proposal is one of a group of three. During the Committee Action Hearing in Memphis, this proposal was Disapproved because it was felt to be too restrictive for Level 2 Alterations. At the same time, the Code Development Committee relocated a companion code change, EB61, from Chapter 8 to Chapter 9 agreeing that it is appropriate for Level 3 Alterations.

This Public Comment reinserts the current text into Section 804.2.2, so no change is made for Level 2 Alterations. The Public Comment also adds a new Section 904.1.2 to Chapter 9, which applies to Level 3 Alterations. The result is that for Level 3 Alterations, the fire sprinkler system is required as long as adequate water is available, whether or not a fire pump is needed, which is consistent with the action taken on EB61.

Section 804.2.2 Item 2 is not carried forward into the new Section 904.1.2. By definition, all Level 3 Alterations consist of a work area exceeding 50% of the building area, so Item 2 becomes unnecessary. Since only Item 1 is remaining, it is moved into the main requirement rather than being a numbered item.

The exception still applies which provides an alternate in situations where the water supply is inadequate for fire sprinkler design.

---

EB59-15

# EB60-15

## 804.2.3

### **Proposed Change as Submitted**

**Proponent :** Adolf Zubia, IAFC Fire & Life Safety Section, representing IAFC Fire & Life Safety Section

## **2015 International Existing Building Code**

**Revise as follows:**

**804.2.3 Windowless stories.** Work located in a windowless story, as determined in accordance with the *International Building Code*, shall be sprinklered where the work area is required to be sprinklered under the provisions of the *International Building Code* for newly constructed buildings and the building site has a sufficient municipal water supply ~~without~~ for the design and installation of a new fire pump. an automatic sprinkler system.

**Reason:** This proposal is submitted by Fire and Life Safety Section of the International Association of Fire Chiefs.

The intent of this code change is to address the concept that the municipal water supply must be available at the floor level where the work area is located without the installation of a fire pump. The determining factor for an automatic fire sprinkler system should be whether there is adequate water, not whether a fire pump may be required when achieving an acceptable level of public safety.

This code change revises the text so that the adequacy of a municipal water supply at the building site is the determining factor. When the work area exceeds 50% of the floor area and a fire sprinkler system would be required. The possible installation of a fire pump to supplement the water flow and pressure is not the deciding factor when providing fire safety to the work area.

**Cost Impact:** Will increase the cost of construction

The cost of fire pump will be added to the cost of the fire sprinkler system. However, the same fire pump should be adequate for future fire sprinkler system installations in the building, therefore, the fire pump will be a one-time cost for the building and future alterations can take advantage of the fire pump supply.

EB60-15 : 804.2.3-  
ZUBIA4554

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** This proposal was disapproved based upon the reason provided for disapproval on EB59-15. The proposal was seen as excessive.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Adolf Zubia, representing Fire and Life Safety**

**Section (azubiamia@yahoo.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

**2015 International Existing Building Code**

**804.2.3 Windowless stories.** Work located in a windowless story, as determined in accordance with the *International Building Code*, shall be sprinklered where the work area is required to be sprinklered under the provisions of the *International Building Code* for newly constructed buildings and the building site has a sufficient municipal water supply ~~for the design and~~ without installation of an automatic sprinkler system a new fire pump.

**904.1.3 Windowless stories.** Work located in a windowless story, as determined in accordance with the International Building Code, shall be sprinklered where the work area is required to be sprinklered under the provisions of the International Building Code for newly constructed buildings and the building site has a sufficient municipal water supply for the design and installation of an automatic sprinkler system.

**Commenter's Reason:** This proposal is one of a group of three. During the Committee Action Hearing in Memphis, this proposal was Disapproved because it was felt to be too restrictive for Level 2 Alterations. At the same time, the Code Development Committee relocated a companion code change, EB61, from Chapter 8 to Chapter 9 agreeing that it is appropriate for Level 3 Alterations. This Public Comment reinserts the current text into Section 804.2.3, so no change is made for Level 2 Alterations. The Public Comment also adds a new Section 904.1.3 to Chapter 9, which applies to Level 3 Alterations. The result is that for Level 3 Alterations, the fire sprinkler system is required as long as adequate water is available, whether or not a fire pump is needed, which is consistent with the action taken on EB61.

By definition, Level 3 Alterations consist of a work area exceeding 50% of the building area. Therefore, this fire sprinkler requirement will only apply when more than 50% of the building is undergoing alteration, and the IBC would require the installation of fire sprinkler for new construction.

---

EB60-15

# EB61-15

## 804.2.4

### **Proposed Change as Submitted**

**Proponent :** Adolf Zubia, IAFC Fire & Life Safety Section, representing IAFC Fire & Life Safety Section

## **2015 International Existing Building Code**

**Revise as follows:**

**804.2.4 Other required automatic sprinkler systems.** In buildings and areas listed in Table 903.2.11.6 of the *International Building Code*, *work areas* that have exits or corridors shared by more than one tenant or that have exits or corridors serving an occupant load greater than 30 shall be provided with an automatic sprinkler system under the following conditions:

1. The *work area* is required to be provided with an automatic sprinkler system in accordance with the *International Building Code* applicable to new construction; and
2. The building site has sufficient municipal water supply for design and installation of an automatic sprinkler system ~~available to the floor without installation of a new fire pump.~~

**Reason:** This proposal is submitted by Fire and Life Safety Section of the International Association of Fire Chiefs.

The intent of this code change is to address the concern that the municipal water supply must be available at the floor level where the work area is located without the installation of a fire pump. The determining factor for an automatic fire sprinkler system should be whether there is adequate water at the site, not whether a fire pump may be required when achieving an acceptable level of public safety.

This code change revises the text so that the adequacy of a municipal water supply at the building site is the determining factor. When the work area exceeds 50% of the floor area and a fire sprinkler system would be required. The possible installation of a fire pump to supplement the water flow and pressure would not be the deciding factor when providing fire safety to the work area.

**Cost Impact:** Will not increase the cost of construction

The cost of fire pump will be added to the cost of the fire sprinkler system. However, the same fire pump should be adequate for future fire sprinkler system installations in the building, therefore, the fire pump will be a one-time cost for the building and future alterations.

EB61-15 : 804.2.4-  
ZUBIA4550

---

### **Public Hearing Results**

**Committee Action:**

**Approved as Modified**

**Modification:**

~~804.2.4~~**904.1.4 Other required automatic sprinkler systems.***No change to text.*

**Committee Reason:** This proposal was seen as reasonable but only if moved to the Level 3 alterations provisions. The modification simply moved the section from Section 804.2.4 to Section 904.1.4 bringing the provisions into Level 3 alterations.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Steven Orlowski, representing Building Owners and Managers Association, International (sorlowski@boma.org) requests Disapprove.**

**Commenter's Reason:** Both the original proposal and the modification failed to provide any technical justification or need to remove the allowance of not requiring a suppression system to be installed in an existing building, if a fire pump must be installed to supplement inadequate water flow and pressure. This might be in part since according to the latest NFPA reports, non-residential structures fires have shown a continued decrease in the number of fires reported annually. The proposal also fails to accurately assess the cost increases that will occur with this proposed code change. According to the reason statement, the proposal states that there will be no increase to the cost of construction and that the cost of the fire pump will be included in the cost of the fire suppression system. How could this code change not increase the cost of construction, when the code would now require suppression systems to be installed in buildings that previously would have not been required to install the suppression system? Not to mention that there will undoubtedly be additional cost associated with making sure that the existing fire alarm system will be able to accommodate the connection of the new waterflow alarms, tamper switches and other monitoring equipment that will be installed with the automatic sprinkler system. Also, keep in mind that most existing buildings water systems were designed and sized to meet the domestic demand and these waterlines are inadequate to accommodate the design flow required for the suppression system. This change would require the existing waterline to either be replaced or provide a supplemental waterline to serve the fire suppression system. According to a 2012 "Fire Flow Water Consumption" report prepared for the Fire Protection Research Foundation, tap fees alone can range from \$15,000 to \$80,000 for a 4-inch connection and that doesn't include the physical cost of installing a new waterline or replacing an existing system connection. BOMA encourages the assembly to disapprove the action by the committee and continue to allow the existing building code to take into account that when the design and installation of an automatic suppression system would require a fire pump to reach the work areas of a level II alteration (in buildings other than high-rises), that a sprinkler system will not be required.

### *Public Comment 2:*

**Proponent : Adolf Zubia, representing Fire and Life Section of the International Association of Fire Chiefs requests Approve as Modified by this Public Comment.**

**Further Modify as Follows:**

## **2015 International Existing Building Code**

**804.2.4 Other required automatic sprinkler systems.** In buildings and areas listed in Table 903.2.11.6 of the International Building Code, work areas that have exits or corridors shared by more than one tenant or that

have exits or corridors serving an occupant load greater than 30 shall be provided with an automatic sprinkler system under the following conditions:

1. The work area is required to be provided with an automatic sprinkler system in accordance with the International Building Code applicable to new construction; and
2. The building has sufficient municipal water supply for design and installation of an automatic sprinkler system available to the floor without installation of a new fire pump.

**904.1.4 Other required automatic sprinkler systems.** In buildings and areas listed in Table 903.2.11.6 of the *International Building Code*, ~~work areas that have exits or corridors shared by more than one tenant or that have exits or corridors serving an occupant load greater than 30~~ shall be provided with an automatic sprinkler system under the following conditions:

1. The *work area* is required to be provided with an automatic sprinkler system in accordance with the *International Building Code* applicable to new construction; and
2. The building site has sufficient municipal water supply for design and installation of an automatic sprinkler system.

**Commenter's Reason:** This proposal is one of a group of three. During the Committee Action Hearing in Memphis, this proposal was Approved as Modified by relocating it to Chapter 9 for Level 3 Alterations. When the relocation occurred, the requirement for fire sprinklers in Chapter 8 was lost.

This Public Comment reinserts the text in Section 804.2.4 with no change in the language found in the 2015 IEBC. Section 804.2.4 will retain the exception for elimination of the fire sprinkler requirement when a fire pump would be needed in the Level 2 Alterations.

The new text in Section 904.1.4 is also revised. This is done to correlate with Section 901.2. IEBC Section 901.2 currently reads:

901.2 Compliance. In addition to the provisions of this chapter, work shall comply with all of the requirements of Chapters 7 and 8. The requirements of Section 803, 804 and 805 shall apply within all work areas whether or not they include exits and corridors shared by more than one tenant and regardless of the occupant load.

Exception: Buildings in which the reconfiguration of space affecting exits or shared egress access is exclusively the result of compliance with the accessibility requirements of Section 705.2 shall not be required to comply with this chapter.

The second sentence in Section 901.2 already states that the requirements apply regardless of occupant load, and regardless of shared exits or shared corridors.

Therefore, that phrase in Section 904.1.4 is deleted. For the Level 3 Alterations which consist of alteration of 50% or more of the floor, the issue is whether or not the site has enough water for the design of the fire sprinkler system.

The end result is that the language in IEBC Section 804.2.4 is retained, and the new Section 904.1.4 is added for Level 3 Alterations. For Level 3 Alterations, the fire sprinkler system is required as long as adequate water is available, whether or not a fire pump is needed, for Level 2 Alterations, Exception 2 would eliminate the requirement for the fire sprinkler system if a fire pump is required.

# EB65-15

## 906.2

### **Proposed Change as Submitted**

**Proponent:** Dominic Marinelli, representing United Spinal Association (dmarinelli@accessibility-services.com)

## **2015 International Existing Building Code**

### **Revise as follows:**

**906.2 Type B dwelling or sleeping units.** Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered, the requirements of Section 1107 of the *International Building Code* for Type B units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being altered.

~~**Exception:** Group I-1, I-2, R-2, R-3 and R-4 dwelling or sleeping units where the first certificate of occupancy was issued before March 15, 1991 are not required to provide Type B dwelling or sleeping units.~~

**Reason:** The purpose of this code change proposal is to eliminate a conflict in the IEBC between the requirements in the Prescriptive and Work Area methods. The deletion of the exception to Section 906.2 would coordinate with Section 410.8.8. The intent is to coordinate the requirements for Type B dwelling units within the options available in the IEBC.

In the prescriptive method, Section 906.2 requirement is found in the 2nd sentence of Section 410.8.8. (The first sentence matches IEBC Section 1105.4).

**410.8.8 Type B dwelling or sleeping units.** Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being added, the requirements of Section 1107 of the International Building Code for Type B units apply only to the quantity of the spaces being added.

Where Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered and where the work area is greater than 50 percent of the aggregate area of the building, the requirements of Section 1107 of the International Building Code for Type B units apply only to the quantity of the spaces being altered.

United Spinal does not support the exception to Section 906.2, and believes it should be deleted for several reasons.

The current exception to Section 906.2 includes a March 15, 1991 as a trigger date. This was inserted as a coordination item with Fair Housing Act (FHA) requirements. However, this is not quite correct. It will be extremely difficult for code officials to determine as the first certificate of occupancy date is different than the date of First Occupancy as defined by the Fair Housing Accessibility Guidelines (i.e., the date that tenants first occupied their apartments). Adding a trigger date would require additional research by the architect or code official to determine if these code requirements were applicable or not. While the jurisdiction does hold records of certificate of occupancy, they do not information on actual occupancy of a space.

In addition, even if this was a match, including the trigger date of the FHA could significantly reduce the number of buildings where these basic adaptability features are required. Remember that these are already major alterations, not minor fixes. In instances where existing structure would prevent compliance with Type B features, permit applicants can take advantage of the technical infeasibility exception offered in the IEBC. It should be noted that Section 410.7 Exception 5 and 705.2 Exception 5 already exempts the building from improving the accessible route, so this

requirement is only for the element being altered.

The intent of the original requirement was to require adaptable Type B features in Level III alterations. This requirement will allow for basic adaptations to be made in the Type B unit in the future (but will not require accessible turning spaces, removable base cabinets, maneuvering clearance at bedroom and bathroom doors, or the installation of grab bars).

**Cost Impact:** Will not increase the cost of construction  
This proposal as it will match current language in Section 410.8.8.

EB65-15 : 906.2-  
ROETHER5445

---

## **Public Hearing Results**

**Committee Action:** **Approved as Submitted**

**Committee Reason:** The committee approved the proposal for consistency on the action on EB44-15. In addition, determining the certificate of occupancy for existing buildings can be problematic in smaller jurisdictions.

**Assembly Action :** **None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Dan Buuck, representing National Association of Home Builders (dbuuck@nahb.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Existing Building Code**

**906.2 Type B dwelling or sleeping units.** Where four or more Group I-1, I-2, R-1, R-2, R-3 or R-4 dwelling or sleeping units are being altered, the requirements of Section 1107 of the *International Building Code* for Type B units and Chapter 9 of the *International Building Code* for visible alarms apply only to the quantity of the spaces being altered.

**Exception:** Group I-1, I-2, R-2, R-3 and R-4 dwelling or sleeping units where the first certificate of occupancy was issued before March 14, 1991 are not required to provide Type B dwelling or sleeping units.

**Commenter's Reason:** The purpose of the proposed exception is to align the code with the Fair Housing Act. For reference, FHA regulations state "The design requirements apply to buildings built for first occupancy after March 13, 1991, which fall under the definition of "covered multifamily dwellings."

The committee reason states a concern that this exception would be included in the prescriptive method AND the work area method, as if that was problematic. Actually this exception should apply to both instances, because that would align both methods with the FHA and avoid confusion.

The second reason which the committee discussed was that determining when the certificate of occupancy was issued. This is not as big of a challenge as some made

it out to be. The vast majority of counties have this information available if the Department of Building Safety doesn't. Most areas of a town or city fall into certain decades of construction anyway, making it clear that a house was occupied long before (or after) the cut-off date.

Note the only modification made to the original code text was a minor adjustment to the date in order to bring it fully in line with the FHA provision. See the similar public comment for EB 44-15.

---

**EB65-15**

# EB66-15

## 906.3 (New)

### **Proposed Change as Submitted**

**Proponent :** Gene Boecker, representing Code Consultants, Inc.  
(geneb@codeconsultants.com)

## **2015 International Existing Building Code**

**Add new text as follows:**

**906.3 Accessible means of egress** At least one accessible means of egress shall be provided from each story of each work area to the exit discharge in accordance with the requirements of Section 1009 of the International Building Code unless technically infeasible.

### **Exceptions:**

1. Historic Buildings.
2. Buildings three stories or less in height where the building does not require an automatic sprinkler system throughout in accordance with Section 903 of the International Building Code.

**Reason:** The proposal seeks to add a requirement for an accessible means of egress (AMOE) in existing buildings. Changes are being proposed only for buildings with a Level 3 alteration. This means that at least 50 percent of the building is involved in an alteration, based on the descriptions in Chapter 5. The proposal also includes language to exempt full compliance for the AMOE where it is technically infeasible. This might be the case where the elevator would normally be required as a part of the AMOE and the hoistway shaft would need to be modified on floors beyond the work area or where such an alteration could possibly leave the building structurally unsound. Section 906.1, within the same main Section where this new code language would be located, requires the alteration to comply with Section 705. Section 705.1 already addresses the concept of technically infeasible and how it works within existing buildings.

Two exceptions are offered to this new section. The first exempts historic buildings. The complexity with which these buildings must be addressed means that it is not practical to provide an AMOE in addition to the general requirements for accessibility in an historic building. The second exception recognizes the potential costs associated with trying to create an AMOE in smaller existing buildings. If the building is small enough that automatic fire sprinklers are not required, then the creation of fire rated areas of refuge could be a considerable cost imposition. However, if the smaller building is required to be protected throughout with an automatic fire sprinkler system, then areas of refuge are not required and the existing and/or new stairways can be used as part of the AMOE.

The ICC is responsible for establishing what the minimum level of safety is for new and existing buildings. The codes contain requirements for "access" for everyone, including the disabled, for both new and existing buildings. However, for existing buildings, the codes seem lacking in concern for the safety of those in the disabled community with regard to building "egress." With over 25 years of the ADA and many more years of accessibility provisions in the legacy codes, it is now time that the ICC recognize this need and include language regarding accessible means of egress for existing buildings. To do otherwise is to ignore the life safety of an entire group of the public, as well as employees, in existing buildings undergoing substantial renovation.

**Cost Impact:** Will increase the cost of construction

The degree of cost increase is variable. For some Level 3 alterations, the cost would be negligible if not nonexistent since a larger building will be protected throughout with an automatic fire sprinkler system, the elevator will be required to be on standby power and tactile exit signs would be required. In some instances the cost could be greater, depending on where the alteration work areas are located within the building. Therefore, it is not possible to offer a specific range of what the possible cost increase could be. The exceptions included in the proposal and the concept of "technically infeasible" are also options which will temper any substantial costs. Additionally, the question must be asked what the appropriate cost for the lives that can be saved if an accessible means of egress is provided.

EB66-15 : 906.3 (New)-  
BOECKER5665

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** This proposal was seen as excessive and would be costly even though it was located with the level 3 alteration provisions. There was concern that the cost limits typically used for accessible route would not be applicable to accessible means of egress as written. Finally, there was concern with the reference to Section 1009 of the IBC. Section 1009 has an exception for existing buildings. Note that E34-15 addresses that particular exception.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Existing Building Code**

**906.3 Accessible means of egress** At least one accessible means of egress shall be provided from each story of each work area to the exit discharge in accordance with the requirements of Section 1009 of the *International Building Code* unless technically infeasible.

Alterations to provide an accessible means of egress shall provide access to the maximum extent technically feasible.

#### **Exceptions:**

1. Historic Buildings.
2. Buildings three stories or less in height where the building does not require an automatic sprinkler system throughout in accordance with Section 903 of the *International Building Code*.
3. The cost of providing the accessible means of egress through the existing building shall not be required to exceed five percent (5%) of the costs of the addition.

**Commenter's Reason:** The opposition to the effort to provide an accessible means

of egress in an existing building seems to rest upon expense. To address this, additional language has been proposed in this public comment to include a small percentage as the cut-off. This would have the effect of requiring something but not mandating a huge expense, even for Level 3 Alterations.

Comments during the committee hearing also included a possible conflict with Section 1009.1. However, E34-15 was approved with a modification by the committee. The original E34 proposal was to refer the reader to the IEBC. The committee chose instead to delete the exception altogether since it must be understood that existing buildings are subject to the IEBC. Therefore, there is no conflict with any text in the IBC. The IEBC is the proper place to address this issue.

If we cannot commit wholly to the concept of retrofitting one accessible means of egress, then at least let us commit to taking baby steps in this direction.

.

---

**EB66-15**

# EB74-15

## 1401.2.4

### **Proposed Change as Submitted**

**Proponent:** Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

## **2015 International Existing Building Code**

### **Revise as follows:**

**1401.2.4 Alterations and repairs.** ~~An existing building or portion thereof that does not comply with the requirements of this code for new construction shall not be altered or repaired in such a manner that results in the building being less safe or sanitary than such building is currently. If, in the alteration or repair, the current level of safety or sanitation is to be reduced, the portion altered or repaired shall conform to the requirements of Chapters 2 through 12 and Chapters 14 through 33 of the *International Building Code*.~~

**Reason:** This section does not work within the IEBC as it did in the IBC. Generally we do not want an alteration or repair reducing the level of safety or sanitation. As currently written it says "this code" when in fact it was focused upon the IBC. Reference is not needed back to the IBC in this case. The last sentence is again sending the user of the code back to the IBC when we told them already that they could not reduce their level of safety or sanitation. As modified it will simply provide a baseline that the user of this chapter must meet. These revisions are needed to correlate with the 2015 IBC that deleted Chapter 34 on existing buildings. This is considered a clarification of the application of the IEBC as it applies to alterations and repairs and will not change anything that is now required by the I-Codes. This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: <http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

**Cost Impact:** Will not increase the cost of construction  
This proposal will not increase the cost of construction as this revision is only a clarification of the current provisions.

EB74-15 : 1401.2.4-  
KULIK4903

---

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The main concern with this proposal was the deletion of the last sentence. In some cases existing buildings may have more conservative construction features than new buildings. Eliminating this sentence would eliminate

the ability to simply comply with the IBC.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : Edward Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

#### **2015 International Existing Building Code**

**1401.2.4 Alterations and repairs.** An *existing building* or portion thereof shall not be altered or repaired in such a manner that results in the building being less safe or sanitary than such building is currently.

**Exception:** Where the current level of safety or sanitation is proposed to be reduced, the portion altered shall conform to the requirements of the International Building Code.

**Commenter's Reason:** The initial proposal was meant only as a clarification. Concerns were raised that by losing the last sentence the ability to allow a reduction that would meet the current building code would be lost. Therefore, the concept was borrowed from Section 701.2 which allows reductions if compliance with the IBC is achieved.

**701.2 Conformance.** An existing building or portion thereof shall not be altered such that the building becomes less safe than its existing condition.

**Exception:** Where the current level of safety or sanitation is proposed to be reduced, the portion altered shall conform to the requirements of the International Building Code.

---

**EB74-15**

# EB86-15

## 1401.6.17, Table 1401.6.17, 1401.6.17.1

### Proposed Change as Submitted

**Proponent :** Jeff Hugo, representing National Fire Sprinkler Association (hugo@nfsa.org)

## 2015 International Existing Building Code

### Revise as follows:

**1401.6.17 Automatic sprinklers.** Evaluate the ability to suppress or control a fire based on the installation of an automatic sprinkler system in accordance with Section ~~903.3.1.1~~ 903.3.1 of the *International Building Code*. "Required sprinklers" shall be based on the requirements of ~~this code.~~ the *International Building Code*. Under the categories and occupancies in Table 1401.6.17, determine the appropriate value and enter that value into Table 1401.7 under Safety Parameter 1401.6.17, Automatic Sprinklers, for fire safety, means of egress divided by 2, and general safety. High-rise buildings defined in Chapter 2 of the *International Building Code* that undergo a *change of occupancy* to Group R shall be equipped throughout with an automatic sprinkler system in accordance with Section 403 of the *International Building Code* and Chapter 9 of the *International Building Code*. Facilities in Group I-2 occupancies meeting Category a, b, c or f shall be considered to fail the evaluation.

**TABLE 1401.6.17  
SPRINKLER SYSTEM VALUES**

OCCUPANCY	CATEGORIES					
	a <sup>a</sup>	b <sup>a</sup>	c	d	e	f
A-1, A-3, F, M, R, S-1	-6	-3	0	<del>23</del>	<del>46</del>	6
A-2	-4	-2	0	<del>12</del>	<del>24</del>	4
A-4, B, E, S-2	-12	-6	0	<del>36</del>	<del>612</del>	12
I-2	NP	NP	NP	8	10	NP

NP = not permitted.

a. These options cannot be taken if Category a in Section 1401.6.18 is used.

-

**1401.6.17.1 Categories.** The categories for automatic sprinkler system protection are:

1. Category a—Sprinklers are required throughout the building; sprinkler protection is not provided. ~~or the sprinkler system design is not adequate for the hazard protected in accordance with Section 903 of the *International Building Code*.~~
2. Category b—Sprinklers are required in fire areas or compartments a portion of the building; sprinkler protection is not provided in fire areas or compartments, or the sprinkler system design is not adequate for the hazard protected in accordance with Section 903 of the *International Building Code*.
3. Category c—Sprinklers are not required; none are provided.
4. Category d—Sprinklers are required in ~~a portion of the building~~ fire areas or compartments; sprinklers are provided in fire areas or compartments ~~such portion~~; ~~the system is one that complied with the code at the time of installation and is maintained and supervised in accordance with Section 903 of the *International Building Code*.~~
5. Category e—Sprinklers are required throughout; sprinklers are provided throughout in accordance with Chapter 9 of the *International Building Code*.
6. Category f—Sprinklers are not required throughout; sprinklers are provided throughout in accordance with Chapter 9 of the *International Building Code*.

**Reason: History and Summary**

Fire sprinkler values was added to the BOCA version of Fire Safety Evaluation System (FSES) in the 1990 edition by code change number B270-89 (attached). This proposal created a table with two categories with the occupancy rows arranged the same as in the current IEBC. The first category (a) gave no credit for buildings without a sprinkler system and no credit for partial systems. The second category (b) provided values for fully sprinklered buildings according to the BOCA fire protection chapter (Article 10) which referenced NFPA 13 and NFPA 13R. Fully sprinklered buildings were given 4 points (A-2), 6 points (A-1, A-3, F, M, R, S-1) or 12 points (A-4, E, B, S-2). The values in the second category were established by other FSES processes (NFPA and NYC). These values were justified by the proponent as being equal to automatic alarm values.

In the 1996 BOCA, code change number B213-95 (attached), increased the two category value table to the current IEBC six category value table. The values in each of the six categories have been unchanged since this edition, with the exception of adding values for I-2 occupancies for the 2015 edition. The higher category values appear similar as the above version in 1990, with lower values in lower categories, however, this proposal discusses that the arrangement of the values do not do a fully sprinklered building justice as originally intended in the 1990 version.

Each proposed change is explained in detail below, however, to summarize, there was a significant and fundamental change on how these values were applied in the 1996 BOCA code. The 1990 values were for fully sprinklered buildings, but the 1996 values demoted these values for fully sprinklered buildings required to be sprinklered by the code (Category e). The full values, as intended by the 1990 text, was only given to buildings that were fully sprinklered voluntarily (Category f). The practice of constructing buildings as unsprinklered, (without any trade-offs) then adding a sprinkler system is virtually non-existent. The values in Category e and f of the 1996 BOCA to the 2015 IEBC are unjust and are not equal to the 1990 proponents' intent. This proposal adjusts the table accordingly.

Proposed Changes in Text

**"...or control..."**

This change correctly addresses automatic fire sprinkler systems for the majority of installations. Fire sprinkler systems designed according to NFPA 13, NFPA 13R and NFPA 13D are designed to control fires. There are a few instances in the NFPA 13 standard where the fire sprinkler is designed to suppress fires, such as in storage occupancies. It is appropriate to have "control" more than suppression in the code text, but this proposal leaves suppression in to accommodate the suppression in storage occupancies.

**" ...Section 903.3.1.1..."**

This change removes the limitation of the values to be used just on a NFPA 13 system. The values cannot be limited to just NFPA 13 systems. The intent of the proposal that expanded the values for 1996 BOCA did not prohibit NFPA 13R systems (B213-95), likewise, the values table has occupancies that are permitted to use NFPA 13R (R-1, R-2) and NFPA 13D (R-3, R-4) systems. When a building is sprinklered according to any of the sprinkler standards, they are considered fully sprinklered.

**" ...the International Building Code~~this code~~..."**

When this section was located in the IBC it also stated "this code". This section wasn't revised when it moved from the IBC to the IEBC. Every other section in Chapter 14 of the IEBC that has similar language refers to the IBC. For example, IEBC Section 1401.6.18 refers the requirements back to the IBC.

**" Category a - Sprinklers are required throughout the building; sprinkler protection is not provided, or the sprinkler system design is not adequate for the hazard protected in accordance with Section 903 of the International Building Code."**

This change updates and clarifies where sprinklers are throughout to make the user aware of the extent of sprinklers protection. The latter portion of the text is removed. The value assigned to this is extreme and is redundant with Category b. Having no sprinklers and an under-designed system is not equal. Both are detrimental, but one has no protection, the other has some form of protection. The penalty for an under-designed system should be a Category b and keep the unsprinklered building as the highest penalty.

**"Category b - Sprinklers are required in fire areas or compartments a portion of the building; sprinkler protection is not provided in fire areas or compartments..."**

This change provides a negative value when a fire area or compartment that is required to have sprinklers, but doesn't. Fire areas are defined in the IBC and "compartments" are used and qualified in Section 1401.6.3. These terms are concrete and have definite passive fire protection boundaries than the subjective term "portion". By using fire area and compartments, the code official and the user can be clear where sprinklers are supposed to be installed.

**"Category d - Sprinklers are required in fire areas or compartments a portion of the building; sprinklers are provided in fire areas or compartments, such as a portion of the building; the system is one that complied with the code at the time of installation and is maintained and supervised in accordance with Section 903 of the International Building Code."**

This change assigns the partial system for a fire area with a value. It also removes the undefined term "portion". Fire areas are defined in the IBC and "compartments" are used and qualified in Section 1401.6.3. These terms are concrete and have definite passive fire protection boundaries than the subjective term "portion" which will have differing boundaries by every user for every building that is evaluated. By using fire area and compartments, the code official and the user can be clear where sprinklers are supposed to be installed.

There are some occupancies, such as A-1, A-2, A-3 and A-4, that are only required to have sprinklers in the fire area. Other fire areas may not need fire sprinklers. This change would provide buildings with sprinklered fire areas some credit. The value would not apply to a partial systems for incidental uses or other partial or limited-area system installation. The value would only be applied when the fire areas that are supposed to have sprinklers are installed according to the appropriate standard, or when the compartment is sprinklered.

This proposal also removes the value that is assigned for the maintenance of the

system according to the edition of the standard when it was installed. The IBC and IFC along with NFPA 13 require the sprinkler system to be maintained according to NFPA 25. This may not have been clear when the proposal was drafted for the 1996 BOCA. NFPA 25 was a new standard in 1992 and while it was referenced by the BOCA Fire Prevention Code, the scope may not have been fully understood and enforcement was difficult if the BOCA Fire Prevention Code was not specifically adopted. Furthermore, a system that is currently maintained according to the NFPA 25 (as referenced by current IFC) should receive points in a higher category.

#### Changes to the Table

#### **Values in Category d**

The changes to Category d provide one half of the value for a (proposed) fully sprinklered building. These values would be applied when the required fire areas are sprinklered. As explained above, the term fire area is defined and have definite fire rated boundaries within the building.

#### **Values in Category e**

The changes to the values in Category e show a fully sprinklered building with the maximum value as it is in Category f. It should make no difference that a sprinkler system was required or voluntarily installed. A fully sprinklered building is installed with the same installation standards whether it was a required system or a non-required system. There are other values in Chapter 14 of the IEBC that gives "bonus" points when the code was exceeded. However, a fully sprinklered building can be "upgraded" beyond the minimum standard, but that is hard to quantify and justify when additional points are awarded. When a fire rating is increased it is easier to identify and view the upgrade.

When the sprinkler values were introduced in the 1990 BOCA they were for fully sprinklered buildings. There was no "bonus" points. The reduced values in the current IEBC Category e penalizes buildings that have required sprinkler systems.

**Cost Impact:** Will not increase the cost of construction  
Updating values may decrease the need to upgrade other construction features to meet the FSES.

EB86-15 : 1401.6.17-  
HUGO4760

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The proposal was disapproved with concern regarding the broadening of the application of these criteria to both NFPA 13R and 13D. In addition, the committee felt it was inappropriate for the scores for category e and f to be the same. One is for required systems (e) and the other if for non required systems (f). Generally, there was concern as to how these revisions will affect the mandatory safety scores.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Jeff Hugo, National Fire Sprinkler Association,  
representing National Fire Sprinkler Association (hugo@nfsa.org)**

requests Approve as Modified by this Public Comment.

Modify as Follows:

## 2015 International Existing Building Code

**TABLE 1401.6.17  
SPRINKLER SYSTEM VALUES**

OCCUPANCY	CATEGORIES					
	a <sup>a</sup>	b <sup>a</sup>	c	d	e	f
A-1, A-3, F, M, R, S-1	-6	-3	0	<del>2</del> -4	<del>4</del> 6	6
A-2	-4	-2	0	<del>1</del> 2	<del>2</del> -4	4
A-4, B, E, S-2	-12	-6	0	<del>3</del> 6	<del>6</del> 12	12
I-2	NP	NP	NP	8	10	NP

NP = not permitted.

a. These options cannot be taken if Category a in Section 1401.6.18 is used.

**Commenter's Reason:** This PC changes the table back to the original values. The remainder of the proposal is as originally proposed. The committee vote was close on this proposal (7-6). One of their concerns was that this proposal opens up to NFPA 13R and NFPA 13D. NFPA 13R and NFPA 13D are systems that permitted to be used by the IBC for new and existing construction. NFPA 13R is specifically referenced by the IEBC and is permitted for residential occupancies up to four stories and sixty feet in height. NFPA 13D is permitted by the IBC for R-3, R-4 Condition 1, and care facilities. Section 1401.1 of the IEBC states that Sections 1401.2.1 through 1401.2.5 applies to all R occupancies. If this is the case, then the sprinkler systems that are permitted for new and existing construction should be included.

This public comment removes the increases and modifications to the values in the table. The entire set of values, throughout Chapter 14, need to be updated and all of the values need to be adjusted across the board. As stated in the original reason statement, many of the values are 20-plus years old and do not consider many aspects and building practices that have evolved over the past 30 years.

The committee vote was 7-6 and the discussion on the changes to the text to current text was unopposed by the committee and those in attendance.

# EB88-15

## Table 1401.6.17

### Proposed Change as Submitted

**Proponent :** Jeff Hugo, National Fire Sprinkler Association, representing National Fire Sprinkler Association (hugo@nfsa.org)

## 2015 International Existing Building Code

Revise as follows:

**TABLE 1401.6.17  
SPRINKLER SYSTEM VALUES**

OCCUPANCY	CATEGORIES					
	a <sup>a</sup>	b <sup>a</sup>	c	d	e <sup>b</sup>	f <sup>b</sup>
A-1, A-3, F, M, R, S-1	-6	-3	0	2	4	6
A-2	-4	-2	0	1	2	4
A-4, B, E, S-2	-12	-6	0	3	6	12
I-2	NP	NP	NP	8	10	NP

NP = not permitted.

a. These options cannot be taken if Category a in Section 1401.6.18 is used.

b. Increase values by 2 when fast or quick response sprinklers are used throughout or 3 when these sprinklers are used as part of an early suppression design method.

**Reason:** This proposal increases the values in category e and f by two when quick response or fast response sprinklers are used. This section has not been updated for almost 20 years. Since then use of quick response sprinklers has increased and is required by the IBC and NFPA 13. This technology has reduced the sprinkler response time dramatically but may not have been as widely known or used today as it was when these sections were introduced over 25 years ago in the BOCA code. Increasing the values for these type of sprinklers is common and consistent with the other FSES used, such as NFPA 101A.

Fast response sprinklers are defined in NFPA 13. Sprinklers that are considered fast have a quick response thermal element. These sprinklers are as follows: Quick Response (QR), Extended Coverage Quick Response (QREC), Residential, Early Suppression Quick Response (ESFR), and Quick Response Early Suppression (QRES) sprinklers.

This proposal also proposes to increase the value by three when quick response or fast response sprinklers are used in a early suppression design method. Many

storage buildings today utilize fire sprinkler designs that use the ESFR (Early Suppression Fast Response) or QRES (Quick Response Early Suppression) sprinkler to extinguish building fires. These arrangements use large amounts of water to put out the fire rapidly.

The early suppression design method is also used in performance based designs that use fast response sprinklers to suppress fires rather than control fires. This option would be available to users who are using fire modeling and performance codes, such as ICC's Performance Code for Buildings and Facilities. In general, the area consumed by the fire is smaller in a suppression scenario than in a control mode scenario. Of course, both options apply water to a fire automatically, limiting the area of the fire.

**Cost Impact:** Will not increase the cost of construction  
 The cost of the fast or quick response sprinklers may cost more in the initial phase of construction but reduces the need for other construction features.

EB88-15 : T1401.6.17-  
 HUGO5104

### **Public Hearing Results**

**Committee Action:** **Disapproved**

**Committee Reason:** The concept of providing credit for the use of ESFR sprinkler systems was appropriate for non required systems but not for required systems. In terms of quick response sprinklers, there was concern that these are already required in residential occupancies and it did not seem appropriate to provide additional credit through reference to this footnote.

**Assembly Action :** **None**

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : Jeff Hugo, National Fire sprinkler Association, representing National Fire Sprinkler Association (hugo@nfsa.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

#### **2015 International Existing Building Code**

**TABLE 1401.6.17  
 SPRINKLER SYSTEM VALUES**

<b>OCCUPANCY</b>	<b>CATEGORIES</b>					
	<b>a<sup>a</sup></b>	<b>b<sup>a</sup></b>	<b>c</b>	<b>d</b>	<b>e<sup>b</sup></b>	<b>f<sup>b</sup></b>
A-1, A-3, F, M, R, S-1	-6	-3	0	2	4	6

A-2	-4	-2	0	1	2	4
A-4, B, E, S-2	-12	-6	0	3	6	12
I-2	NP	NP	NP	8	10	NP

NP = not permitted.

a. — These options cannot be taken if Category a in Section 1401.6.18 is used.

b. Increase values by 2 when ~~fast or quick response sprinklers are used throughout or 3 when these sprinklers are used as part of an early suppression design method-~~

**Commenter's Reason:** This public comment changes the original proposal to match the desire of the committee. The committee directed that the extra points in the values would only apply to Column F. The committee also wanted to limit the value increase by two for the early suppression fast response design method.

---

**EB88-15**

# EB93-15

## [BE] 1508.1

### **Proposed Change as Submitted**

**Proponent:** Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

## **2015 International Existing Building Code**

### **Revise as follows:**

**[BE] 1508.1 Construction sites.** Structures, sites, and equipment directly associated with the actual process of construction, including but not limited to scaffolding, bridging, material hoists, material storage, or construction trailers are not required to ~~be accessible.~~ comply with Chapter 11 of the IBC.

**Reason:** The intent is to coordinate IEBC Section 1508.1 with the new language in IBC Section 1103.2.5.

IBC Section 1103.2.5 reads as follows:

**1103.2.5 Construction sites.** Structures, sites and equipment directly associated with the actual processes of construction including, but not limited to, scaffolding, bridging, materials hoists, materials storage or construction trailers are not required to comply with this chapter.

In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled IBC Coordination with the New ADAAG. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website.

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: <http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

**Cost Impact:** Will not increase the cost of construction

The proposal is a clarification of current requirements; therefore, there is no impact on the cost.

EB93-15 : [BE] 1508.1-  
KULIK3356

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The reference back to Chapter 11 is not needed.

---

**Individual Consideration Agenda*****Public Comment 1:***

**Proponent : Edward Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests Approve as Submitted.**

**Commenter's Reason:** The ICC Building Code Action Committee requests approval of this proposal as submitted. The code committee felt that a pointer sending someone to the IBC to find out they did not have to do something was not needed. However, it should be noted that this is not a pointer, but an exception. We still believe the new language is more precise and clear. The intent is to coordinate IEBC Section 1508.1 with the new language in IBC Section 1103.2.5. IBC Section 1103.2.5 reads as follows:

1103.2.5 Construction sites. Structures, sites and equipment directly associated with the actual processes of construction including, but not limited to, scaffolding, bridging, materials hoists, materials storage or construction trailers are not required to comply with this chapter.

**EB93-15**

## E2-15

**202(New), 1003.4, 1011.5.4, 1011.7.1, 1012.7.1, 1029.11.1, Chapter 35; (IFC[BE] 1003.4, 1011.5.4, 1011.7.1, 1012.7.1, 1029.11.1)**

### **Proposed Change as Submitted**

**Proponent :** Russell Kendzior, The National Floor Safety Institute (NFSI), representing National Floor Safety Institute (russk@nfsi.org)

## **2015 International Building Code**

**Add new definition as follows:**

### **SECTION 202 DEFINITIONS**

**HIGH TRACTION.** The physical property of a floor or walkway surface that is designed to mitigate slipping during normal human ambulation by providing a reasonably sufficient level of available contact friction.

**Revise as follows:**

**1003.4 Floor surface.** Walking surfaces of the *means of egress* shall have a ~~slip-resistant~~ high-traction surface ~~and be that is~~ securely attached. Walking surfaces that are subject to wet conditions shall have a high-traction surface that complies with ANSI/NFSI B101.1 or ANSI/NFSI B101.3.

**1011.5.4.1 Nonuniform height risers.** Where the bottom or top riser adjoins a sloping *public way*, walkway or driveway having an established grade and serving as a landing, the bottom or top riser is permitted to be reduced along the slope to less than 4 inches (102 mm) in height, with the variation in height of the bottom or top riser not to exceed one unit vertical in 12 units horizontal (8-percent slope) of *stair* width. The *nosings* or leading edges of treads at such nonuniform height risers shall have a distinctive marking stripe, different from any other *nosing* marking provided on the *stair flight*. The distinctive marking stripe shall be visible in descent of the *stair* and shall have a ~~slip-resistant~~ high-traction surface. Marking stripes shall have a width of not less than 1 inch (25 mm) but not more than 2 inches (51 mm).

**1011.7.1 Stairway walking surface.** The walking surface of treads and landings of a *stairway* shall not be sloped steeper than one unit vertical in 48 units horizontal (2-percent slope) in any direction. *Stairway* treads and landings shall have a solid surface. ~~Finish floor~~ Walking surfaces shall be have a high-traction surface that is securely attached.

#### **Exceptions:**

1. Openings in *stair* walking surfaces shall be a size that does not permit the passage of <sup>1</sup>/<sub>2</sub>-inch-diameter (12.7 mm) sphere. Elongated openings shall be placed so that the long dimension is perpendicular to the direction of travel.
2. In Group F, H and S occupancies, other than areas of parking structures accessible to the public, openings in

treads and landings shall not be prohibited provided a sphere with a diameter of  $1\frac{1}{8}$  inches (29 mm) cannot pass through the opening.

**1012.7.1 Ramp surface.** The walking surface of ramps shall be of slip-resistant materials have a high-traction surface that are is securely attached.

**1029.11.1 Walking surface.** The surface of *aisles*, stepped *aisles* and ramped *aisles* shall ~~be of slip-resistant materials~~ have a high-traction surface that are is securely attached. The surface for stepped *aisles* shall comply with Section 1011.7.1.

**Add new standard(s) as follows:**

ANSI/NFSI B101.1-2009 "Test Method for Measuring Wet SCOF (static coefficient of friction) of Common Hard-Surface Floor Materials"

ANSI/NFSI B101.3-2012 "Test Method for Measuring Wet DCOF (dynamic coefficient of friction) of Common Hard-Surface Floor Materials"

**Reason: Ambiguous Terminology**

The term "Slip Resistant" is currently used in section 1003.4 "Floor Surface" as well as Section 1012.7.1 "Ramp surface" and applies to the list of sections named within this proposal to describe a safe walking surface however the term is not defined in the 2012 International Building Code nor is it defined by way of any nationally recognized industry consensus test standard (ie: ASTM, ANSI). Although commonly used in the past, the term Slip-Resistant is an ambiguous adjective which implies a safety benefit but is not defined by way of a measurable industry consensus test method and therefore is meaningless to those who seek to make their walkways safe (ie: property owners, architects, etc.). In short, because of the failure to properly define the term all walkways are by default perceived by property owners, architects, and end-users, etc., to be "Slip Resistant" even if they may not safe for pedestrian foot traffic.

The phrase Slip Resistant should, be omitted from all the relevant sections of the 2012 International Building Code and replaced with the term "High-Traction" which is defined by way of two nationally recognized consensus test methods/standards specifically the ANSI/NFSI B101.1-2009 "Test Method for Measuring Wet SCOF of Common Hard-Surface Floor Materials" and the ANSI/NFSI B101.3-2012 "Test Method for Measuring Wet DCOF of Common Hard-Surface Floor Materials" standards (attached). Both of these industry consensus test methods/standards speak directly to the subject of walkway safety and directly impacts the safety of all pedestrians especially those with disabilities. Therefore replacing the undefined term Slip Resistant with the well defined term High-Traction will better serve the general publics need for safe walking surfaces.

Furthermore, the term High-Traction should be added to Section 202 "Definitions" and should apply to the referenced sections included in this proposal. The definition of the term High-Traction should be listed in Section 202 and defined as it is defined in the ANSI/NFSI B101.1-2009 standard as: "The physical property of a floor or walkway surface that is designed to mitigate slipping during normal human ambulation by providing a reasonably sufficient level of available contact friction." Finally, a reference to the ANSI/NFSI B101.1-200 standard should be cited in Section 202 of the 2015 International Building Code.

**Reference to ANSI A137.1**

Historically the International Building Code has referenced the ANSI A137.1 "Specifications for Ceramic Tile" standard, which the most recent version cited, is that of the 2008 version. In 2012 the ANSI A137.1 standard was revised whereby they abandoned their long standing reference to the ASTM C-1028 dry SCOF test

method and now reference an industry specific, wet DCOF test method, one which was created by and for the ceramic tile industry. Subsequently, the ASTM C-1028 standard was withdrawn by the ASTM and is no longer a recognized test method.

Historically the subject of how to measure a floors slip resistance has been hotly debated to which there were two camps of thought, one, which supported SCOF "drag sled" testing as described in ASTM D-2047 (polishes) and ASTM C-1028 (withdrawn) standards and the other camp, which supported a dynamic version or DCOF testing. In 2006 the ANSI B101 committee on slip, trip and fall prevention was established and has since published five slip and fall prevention standards including an SCOF (ANSI/NFSI B101.1-2009) and a DCOF (ANSI/NFSI B101.3-2012) test method, both of which are not specific to any type of flooring material or industry but rather can be used on any type of hard surface walkway both in the laboratory (manufacturing) as well as in-situ.

### **NFSI vs. TCNA**

The NFSI is a 501(c)-3 non-for-profit organization and is an ANSI Standard Developing Organization (SDO) which in 2006 established the ANSI B101 committee on "slip, trip and fall prevention." The NFSI's mission is "to aid in the prevention of slips, trips, and falls through education, research, and standards development." The Tile Council of North America (TCNA) which serves as the SDO of the A108 committee which authored the A137.1 standard is a for-profit industry trade association which according to their website "... was created with the sole purpose of expanding the ceramic tile market in the United States." In-short, the ANSI B101 committee author's walkway safety standards while the ANSI A108 committee authors ceramic tile manufacturing specifications.

### **ANSI A137.1-2012**

According to Section 1.0 "Purpose" of the ANSI A137.1-2012 standard states that: "these specifications serve as a reference standard for buyers and specifiers of Standard Grade and Second Grade ceramic tile, Decorative Tile, and Specialty Tile. These specifications are also a guide to producers in maintaining quality control of the manufacture of such ceramic tile" therefore the standard is as it states "a guide to producers in maintaining quality control" of un-installed tile and does not purport to describe any safety specifically slip and fall prevention capabilities of ceramic tile.

Section 2.0 "Scope" of the ANSI A137.1-2012 further states that: "These Specifications describe the normally available sizes and shapes of ceramic tile: the physical properties of Standard Grade and Second Grade Ceramic Tile, Decorative Tile and Specialty Tile; the basis for acceptance and methods of testing prior to installation; the marking and certification of ceramic tile; and the definitions of terms employed in these specifications." The ANSI A137.1 standard only applies to un-installed ceramic tile and not installed floors. Uninstalled ceramic tile is not considered a floor until it's installed. By way of example, a wooden 2"x4" is simply that, a piece of wood measuring 2"x4" in size. Although commonly used to construct walls, a wooden 2"x4" is not a wall until it is installed as such. The same is true for uninstalled ceramic tile. It becomes a floor after its installed to which the A137.1 standard does not govern the characteristics of installed tile.

Safety managers, risk managers, property/facility managers, and all other parties whose responsibility is to insure the safety of their walkways are only concerned with installed floors and not uninstalled materials and require an in-situ test method to insure compliance. Therefore, because of the limitations of the ANSI A137.1 standard as a laboratory lab test for quality control purposes only that it should no longer be referenced within the International Building Code.

Furthermore, it is estimated that only 12.9% of all installed floorcoverings are ceramic tile and 1.1% is stone. In-fact, according to the most recent research\*, more vinyl sheet & floor tile is in use (16% of the total square footage sold), than that of ceramic tile, stone and laminate flooring combined! The A137.1-2012 standard only applies to ceramic tile and is not applicable to the remaining 87% of hard surface flooring materials used by property owners.

In contrast, the scope statements of the ANSI/NFSI B101.1 and B101.3 standards provide specific test methods and defined traction ranges for both laboratory (un-installed) as well as in-situ (installed) flooring materials and applies to all types of

hard surface flooring materials.

### **Financial Burden to Industry**

Although the ANSI A137.1 standard has been cited in previous versions of the International Building Code, with the recent development of the ANSI B101 walkway safety standards which have been widely embraced by the flooring, floor care, legal and insurance industries. Given the broad use and industry acceptance of the ANSI B101 standards we are requesting that any reference to the A137.1 standard as it relates to the measurement of slip resistance be removed and replaced with references to the ANSI B101.1-2009 and ANSI B101-3-2012 standards respectively.

Since the publication of the ANSI/NFSI B101.1 standard in 2009, hundreds of flooring manufacturers products have voluntarily submitted to the NFSI for certification. A wide range of industries have adopted the ANSI/NFSI B101 standards and have come to rely upon the NFSI to perform independent slip resistance testing, all of which are done in compliance with the ANSI/NFSI B101.1 or B101.3 standards.

One example is that of the polished concrete industry who shortly after the publication of the ANSI/NFSI B101.3 standard publicly announced their support. The polished concrete industry, through its representative trade association the Concrete Polishing Association of America (CPAA) openly adopted the ANSI/NFSI B101.3 standard (see enclosed CPAA press release) to which the NFSI has been awarding certificates of compliance (NFSI Certification) to manufacturers of polished concrete systems for many years. The economic burden to the floorcovering and floor care industries to abandon the tried and true published ANSI B101 walkway safety standards would be financially burdensome.

**Bibliography:** 2013 "Statistical Report 13" as published in Floor Covering Weekly magazine, July 21, 2014

**Cost Impact:** Will not increase the cost of construction  
There is no cost impact to this proposal since manufacturers of flooring materials are and have been measuring their products safety performance to the ANSI/NFSI B101.1-2005 and ANSI/NFSI B101.3-2012 standards for years.

**Analysis:** A review of the standard proposed for inclusion in the code, ANSI/NFSI B101.1-2009 and ANSI/NFSI B101.3-2012, with regard to the ICC criteria for referenced standards (Section 3.6 of CP#28) will be posted on the ICC website on or before April 2, 2015.

**E2-15 : 1003.4-  
KENDZIOR4911**

---

## **Public Hearing Results**

The edition of the ANSI/NFSI B101.1 referenced in the change was 2005, however, the 2009 edition was submitted for committee and staff review.

### **Committee Action:**

**Disapproved**

**Committee Reason:** The fact that this proposal was not limited to one type of flooring material is good. However, the definition of high traction does not contain any numerical value and has subjective language such as "reasonably sufficient". There would be confusion as to which floors are subject to wet conditions. There was testimony that some common flooring materials might not be able to meet the proposed standard. There will be an increase in construction cost because floor materials will need to be tested to this new standard.

There is question for maintenance of high traction materials in existing buildings over time – especially when floor products are used for cleaning or waxing.

The proposals could conflict with the intent of provisions for slip resistant in the accessibility provisions in the ICC A117.1 and the American's with Disabilities Act. Too much high traction might make some surfaces difficult to negotiate by persons with mobility issues.

## **Assembly Action :**

**None**

**Analysis.** For staff analysis of the content of ANSI/NFSI B101.1 relative to CP#28, Section 3.6, please visit: <http://www.iccsafe.org/wp-content/uploads/2015-Proposed-Standards-Group-A-Final.pdf>.

The edition of the ANSI/NFSI B101.1 referenced in the change was 2005, however, the 2009 edition was submitted for committee and staff review.

---

## **Individual Consideration Agenda**

### **Public Comment 1:**

**Proponent : Russell Kendzior, representing National Floor Safety Institute (rususk@nfsi.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Building Code**

**HIGH TRACTION.** ~~The physical property of a floor or walkway surface that is designed to mitigate slipping during normal human ambulation by providing a reasonably sufficient level of available contact friction. Walking surfaces tested per the ANSI/NFSI B101.1 and ANSI/NFSI B101.3 standards with the following coefficients offriction:~~

1. A wet Static Coefficient of Friction (SCOF) of 0.60 or greater,
2. A wet Dynamic Coefficient of Friction (DCOF) of 0.42 or greater for surfaces with less than a 1:20 incline.
3. A wet Dynamic Coefficient of Friction (DCOF) of 0.45 or greater for inclines of 1:20 or greater.

### **SECTION 202 DEFINITIONS**

**SLIP RESISTANT** Walking surfaces tested per the ANSI/NFSI B101.1 and ANSI/NFSI B101.3 standards with the following coefficients of friction:

1. A wet Static Coefficient of Friction (SCOF) of 0.40 or greater,
2. A wet Dynamic Coefficient of Friction (DCOF) of 0.30 or greater.

**1003.4 Floor surface.** Walking surfaces of the *means of egress* shall have a high traction slip resistant surface that is securely attached. ~~Walking surfaces that are subject to wet conditions shall have a high traction surface that complies with ANSI/NFSI B101.1 or ANSI/NFSI B101.3.~~

**1011.5.4.1 Nonuniform height risers.** Where the bottom or top riser adjoins a sloping *public way*, walkway or driveway having an established grade and serving as a landing, the bottom or top riser is permitted to be reduced along the slope to less than 4 inches (102 mm) in height, with the

variation in height of the bottom or top riser not to exceed one unit vertical in 12 units horizontal (8-percent slope) of *stair* width. The *nosings* or leading edges of treads at such nonuniform height risers shall have a distinctive marking stripe, different from any other *nosing* marking provided on the *stair flight*. The distinctive marking stripe shall be visible in descent of the *stair* and shall have a *high-traction* surface. Marking stripes shall have a width of not less than 1 inch (25 mm) but not more than 2 inches (51 mm).

**1011.7.1 Stairway walking surface.** The walking surface of treads and landings of a *stairway* shall not be sloped steeper than one unit vertical in 48 units horizontal (2-percent slope) in any direction. *Stairway* treads and landings shall have a solid surface. ~~Walking~~ Such walking surfaces shall have a *high-traction* surface that is securely attached.

**Exceptions:**

1. Openings in *stair* walking surfaces shall be a size that does not permit the passage of  $1\frac{1}{2}$ -inch-diameter (12.7 mm) sphere. Elongated openings shall be placed so that the long dimension is perpendicular to the direction of travel.
2. In Group F, H and S occupancies, other than areas of parking structures accessible to the public, openings in treads and landings shall not be prohibited provided a sphere with a diameter of  $1\frac{1}{8}$  inches (29 mm) cannot pass through the opening.

**1012.7.1 Ramp surface.** The walking surface of *ramps* shall have a *high-traction* surface that is securely attached.

**1029.11.1 Walking surface.** The walking surface of *aisles*, shall have a slip resistant surface that is securely attached. The walking surface of stepped *aisles* and ramped *aisles* shall have a *high-traction* surface that is securely attached. The surface for stepped *aisles* shall comply with Section 1011.7.1.

**Commenter's Reason:** The term slip-resistant as used within the IBC is an ambiguous term that implies a level of pedestrian safety but is not defined by way of any nationally recognized consensus standard. During the April 26, 2015 IBC hearing the Means of Egress committee agreed with our position that the term slip resistant as used in the IBC is ambiguous and in need of clarification. We propose to modify our petition to maintain the use of the term slip resistant where appropriate and to omit the term and replace it with the term "high-Traction" for stair treads and ramps (incline walking surfaces) which require a higher level of slip resistance than that of a level walkway. We propose to base the definition of the term slip resistant and high-traction on the Coefficient of Friction (COF) ranges as published in the ANSI/NFSI B101.1-2009 and ANSI/NFSI B101.3-2012. We believe that by defining the term slip resistant and high traction by way of two published ANSI walkway safety consensus standards will serve to protect the general public from the risk of a slip and fall event and will not represent a significant cost to property owners or flooring manufacturers.

Cost Impact: There is no cost impact to this proposal since manufacturers of flooring materials are and have been measuring their products Coefficient of Friction (COF) per the ANSI/NFSI B101.1-2009 and ANSI/NFSI B101.3-2012 standards for years. Representatives from the TCNA, Marble Institute of America, Concrete Polishing Association, and other flooring manufacturers and floor covering associations testified at the April 26, 2015 hearing and confirmed that their representative member companies currently use the BOT-3000, which is an NFSI approved tribometer for measuring COF per the above named ANSI B101 walkway safety standards and therefore there is no cost to the manufacturing industry to purchase additional testing equipment or any personnel expense for in-house laboratory

testing. Given that flooring manufacturers are already testing their products via the use of an NFSI approved tribometer and publish COF data in their specification sheets, property owners will only have to provide such publicly available documentation to the code official. If such documentation is unavailable, the code official may, at their discretion request that the property owner provide COF data via an independent third party accredited Walkway auditor.

## E3-15

### 1003.4.1 (New), (IFC[BE] 1003.4.1(New))

#### **Proposed Change as Submitted**

**Proponent :** Eric Astrachan, Tile Council of North America, representing Tile Council of North America (eastrachan@tileusa.com)

## 2015 International Building Code

### Add new text as follows:

**1003.4 Floor surface.** Walking surfaces of the *means of egress* shall have a slip-resistant surface and be securely attached.

**1003.4.1 Hard Surface Flooring.** Walking surfaces of the means of egress made of ceramic tiles, porcelain tiles, terrazzo, stone or polished concrete and subject to wet conditions shall have a slip-resistant surface complying with ANSI A137.1, Section 6.2.2.1.10 substituting the type of flooring where the word "tile" is used.

**Reason:** Currently, Section 1003.4 requires that walking surfaces of the means of egress be "slip resistant" with no method of measurement, quantitative threshold, or general principles to help the specifier, end-user, and code official. Given the Code's lack of criteria for "slip resistant," materials are sometimes being inappropriately specified, and accidents are occurring in areas of the means of egress. This can be especially dangerous for emergency responders who are entering a building for the first time, potentially under conditions with water and limited visibility (smoke).

The purpose of this revision is to provide slip resistance criteria for hard surface flooring used in interior walking surfaces of the means of egress. Section 6.2.2.1.10 of the ANSI A137.1-2012 standard for ceramic tile sets forth a quantitative minimum threshold, means of measurement, and general principles regarding slip resistance based on the consensus of a broad range of stakeholders, including the Construction Specifications Institute (CSI), Marble Institute of America (MIA), National Association of Homebuilders (NAHB), Underwriter Laboratories (UL), National Tile Contractors Association (NTCA), Tile Council of North America, and 52 additional stakeholders on the ASC-A108 Committee (for a total of 58). In addition to ceramic and porcelain tile, this Section of ANSI A137.1 is utilized and directly referenced within specifications for other types of hard surface flooring, including terrazzo, stone, and polished concrete.

This proposal to add the above language to the building code is supported by the Tile Council of North America (TCNA), executives of the Marble Institute of America (MIA - with a board vote to take place in the first quarter of 2015), the Executive Committee of the Concrete Polishing Association of America (CPAA) and their Subcommittee on slip resistance (with a board vote to take place in the first quarter of 2015), and the President of the National Terrazzo and Mosaic Association (NTMA - with a board vote to take place in the first quarter of 2015) and many other organizations.

When references to ANSI A137.1 Section 6.2.2.1.10 were proposed in 2012, the Means of Egress Code Committee spoke favorably regarding the criteria and encouraged the proponent to resubmit the proposal in 2015 when the referenced standard was more widely available in print.

Today, copies of ANSI A137.1 are easily accessible both in print and electronically, and all provisions pertinent to ANSI A137.1 Section 6.2.2.1.10 are available for free online via [www.TCNAtile.com](http://www.TCNAtile.com). Furthermore, these provisions are widely understood and specified throughout the architectural community with hard surface

manufacturers/suppliers/installers providing the information needed by code officials as part of standard product submittals and information.

The section proposed to be referenced reads as follows:

**6.2.2.1.10 Coefficient of Friction.**

*The coefficient of friction (COF) measurement provided in this standard is an evaluation of a tile surface under known conditions using a standardized sensor material prepared according to a specific protocol. As such it can provide a useful comparison of tile surfaces, but it does not predict the likelihood a person will or will not slip on a tile surface.*

*There are many factors that affect the possibility of a slip occurring on a tile surface including by way of example, but not in limitation, the following: the material of the shoe sole and the degree of its wear; the presence and nature of surface contaminants; the speed and length of stride at the time of a slip; the physical and mental condition of the individual at the time of a slip; whether the floor is flat or inclined, and how the tile surface is used and maintained; and the COF of the tile, how the tile is structured, and how drainage takes place if liquids are involved. Because many variables affect the risk of a slip occurring, the COF shall not be the only factor in determining the appropriateness of a tile for a particular application.*

*Unless otherwise specified, tiles suitable for level<sup>1</sup> interior spaces expected to be walked upon when wet shall have a wet DCOF of 0.42 or greater when tested using SLS solution as per the procedure in section 9.6.1. However, tiles with a DCOF of 0.42 or greater are not necessarily suitable for all projects. The specifier shall determine tiles appropriate for specific project conditions, considering by way of example, but not in limitation, type of use, traffic, expected contaminants, expected maintenance, expected wear<sup>2</sup>, and manufacturers' guidelines and recommendations.*

*Some specifiers find it useful to compare dry DCOF measurements to wet DCOF measurements to assess the risk of a slip when transitioning from dry to wet conditions. If dry DCOF measurements using the BOT 3000 are desired, the testing procedure found in section 9.6.2 shall be followed. Alternatively, a dry static coefficient of friction (SCOF) measurement can be made per the ASTM C1028 test method.*

*When wet SCOF measurements of tiles previously tested per ASTM C1028 are desired for direct comparison to historical values, the C1028 test method shall be followed. While BOT 3000 wet SCOF measurements with a Neolite sensor and distilled water generally correlate overall with ASTM C1028 measurements, results on individual tiles may not correlate and therefore cannot be directly compared.*

*The presence on installed tiles of water (including standing water as can exist on floors which are not properly sloped for drainage or on exterior tiles immediately after a rain storm or on which snow is melting), oil, grease, and/or any other elements which reduce traction, creates slippery conditions where the risk of a slip cannot be completely eliminated. Tile installations with exposure to such elements require extra caution in product selection, use, and maintenance. The risk of a slip can be diminished but not eliminated in these installations by installing tiles with a structured/textured surface, mosaic tiles, or certain extruded unglazed quarry tiles. The specifier shall follow manufacturers' guidelines and recommendations for these products.*

*When tested using SLS solution as per the procedure in section 9.6.1, tiles with a wet DCOF of less than 0.42 (including by way of example, but not in limitation, polished tiles), shall only be installed when the surface will be kept dry when walked upon and proper safety procedures will be followed when cleaning the tiles.*

1. Tiles appropriate for ramp applications shall be chosen for the specific properties and use of the ramp and require a wet DCOF greater than 0.42 if

*the ramp will be used under wet conditions. Specifier shall determine tiles appropriate for specific project conditions, considering by way of example, but not in limitation, type of use, traffic, grade of ramp, expected contaminants, expected maintenance, expected wear, and manufacturers' guidelines and recommendations.*

2. *The COF of installed tiles can change over time as a result of wear and surface contaminants. In addition to regular cleaning, deep cleaning and traction-enhancing maintenance may be needed periodically to maintain DCOF values.*

The proposed reference is in the 2012 edition of ANSI A137.1. An update to this edition will be proposed for the Group B Administrative changes. This language is not in the 2008 edition of ANSI A137.1 that is currently referenced in the code for the definition for Porcelain tile.

**Cost Impact:** Will not increase the cost of construction

Hard surface flooring that meets or exceeds the criteria of Section 6.2.2.1.10 of the ANSI A137.1-2012 standard is not different in price from hard surface flooring that is below the threshold criteria.

**E3-15 : 1003.4.1 (New)-  
ASTRACHAN5126**

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The referenced standard, ANSI A137.1 does not meet the criteria of CP28 for a referenced standard. The standard does has sections written in non-enforceable language. The scope of the standard is limited to ceramic tile; however, this proposal is for multiple materials. The only place the standard is currently referenced in the 2015 IBC code is the definition of ceramic tile.

There would be confusion as to which floors are subject to wet conditions. The proposal does not deal with all hard surface materials, and there seems to be confusion on which hard surfaces in the list would be able to comply.

There is question for maintenance of high traction materials in existing buildings over time - especially when floor products are used for cleaning or waxing.

**Assembly Action :**

**None**

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Eric Astrachan, representing Tile Council of North America (eastrachan@tileusa.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Building Code**

**1003.4.1 Hard Surface Flooring.** ~~Walking surfaces~~ Hard surface flooring of the means of egress made of ceramic tiles, porcelain tiles, terrazzo, stone or polished concrete and subject to wet conditions shall have a slip-resistant surface complying with minimum Dynamic Coefficient of Friction (DCOF) of 0.42 when tested per ANSI A137.1, Section 6.2.2.1.10 ~~substituting the type of flooring where the word "tile" is used~~ 9.6.

**Commenter's Reason:** This proposal has been modified to remove all references to non-mandatory language. Additionally, the threshold requirement has been inserted directly into the language within this Code section, removing the need to reference minimum criteria or qualifying considerations contained within any single product-specific normative scope. The result is simply a reference test method which conforms to the requirements of CP28 and is applicable to a variety of hard surface flooring materials.

Further, all references to wet conditions are removed to satisfy concerns expressed by the Means of Egress Committee regarding the lack of definition of "wet conditions" and potential resulting confusion around which products would be subject to the proposed requirement.

Any floor can be wet at any time. Following the advice of the Means of Egress Committee, this revised proposal alleviates the necessity for the specifier or Code Official to make wet/dry hard surface flooring determinations. It instead references a widely applicable test method which inherently involves a wet condition parameter, and establishes a clear minimum DCOF threshold which can be easily referenced and specified for all hard surface flooring of the means of egress at all times.

This proposal is about safety, first and foremost, and these revisions if approved would facilitate a clear, concise and conservative approach to slip-resistant product specification.

---

E3-15

## E4-15

### 1003.4.1 (New), (IFC[BE]1003.4.1 (New))

#### **Proposed Change as Submitted**

**Proponent :** Eric Astrachan, Tile Council of North America, representing Tile Council of North America (eastrachan@tileusa.com)

## 2015 International Building Code

### Add new text as follows:

**1003.4 Floor surface.** Walking surfaces of the *means of egress* shall have a slip-resistant surface and be securely attached.

**1003.4.1 Ceramic and Porcelain Tile.** Walking surfaces of the means of egress made of ceramic tiles or porcelain tiles and subject to wet conditions shall have a slip-resistant surface complying with ANSI A137.1, Section 6.2.2.1.10.

**Reason:** Currently, Section 1003.4 requires that walking surfaces of the means of egress be "slip resistant" with no method of measurement, quantitative threshold, or general principles to help the specifier, end-user, and code official. Given the Code's lack of criteria for "slip resistant," materials are sometimes being inappropriately specified, and accidents are occurring in areas of the means of egress. This can be especially dangerous for emergency responders who are entering a building for the first time, potentially under conditions with water and limited visibility (smoke).

The purpose of this revision is to provide slip resistance criteria for ceramic tiles used in interior walking surfaces of the means of egress. Section 6.2.2.1.10 of the ANSI A137.1-2012 standard for ceramic tile sets forth a quantitative minimum threshold, means of measurement, and general principles regarding slip resistance based on the consensus of a broad range of stakeholders, including the Construction Specifications Institute (CSI), Marble Institute of America (MIA), National Association of Homebuilders (NAHB), Underwriter Laboratories (UL), National Tile Contractors Association (NTCA), and many more.

When this same revision was proposed in 2012, the Means of Egress Code Committee spoke favorably regarding the criteria and encouraged the proponent to resubmit the proposal in 2015 when the referenced standard was more widely available in print. Today, copies of ANSI A137.1 are easily accessible both in print and electronically, and all provisions pertinent to ANSI A137.1 Section 6.2.2.1.10 are available for free online via [www.TCNAtile.com](http://www.TCNAtile.com). Furthermore, these provisions are referenced in their entirety in the "TCNA Handbook for Ceramic, Glass, and Stone Tile Installation" (commonly known as the "TCA Handbook" and referenced in Section 9300 specifications), and are widely understood and specified throughout the architectural community. Additionally, manufacturers provide the information needed by code officials as part of standard product information.

The section proposed to be referenced is as follows:

#### **6.2.2.1.10 Coefficient of Friction.**

*The coefficient of friction (COF) measurement provided in this standard is an evaluation of a tile surface under known conditions using a standardized sensor material prepared according to a specific protocol. As such it can provide a useful comparison of tile surfaces, but it does not predict the likelihood a person will or will not slip on a tile surface.*

*There are many factors that affect the possibility of a slip occurring on a tile surface including by way of example, but not in limitation, the following: the*

*material of the shoe sole and the degree of its wear; the presence and nature of surface contaminants; the speed and length of stride at the time of a slip; the physical and mental condition of the individual at the time of a slip; whether the floor is flat or inclined, and how the tile surface is used and maintained; and the COF of the tile, how the tile is structured, and how drainage takes place if liquids are involved. Because many variables affect the risk of a slip occurring, the COF shall not be the only factor in determining the appropriateness of a tile for a particular application.*

*Unless otherwise specified, tiles suitable for level<sup>1</sup> interior spaces expected to be walked upon when wet shall have a wet DCOF of 0.42 or greater when tested using SLS solution as per the procedure in section 9.6.1. However, tiles with a DCOF of 0.42 or greater are not necessarily suitable for all projects. The specifier shall determine tiles appropriate for specific project conditions, considering by way of example, but not in limitation, type of use, traffic, expected contaminants, expected maintenance, expected wear<sup>2</sup>, and manufacturers' guidelines and recommendations.*

*Some specifiers find it useful to compare dry DCOF measurements to wet DCOF measurements to assess the risk of a slip when transitioning from dry to wet conditions. If dry DCOF measurements using the BOT 3000 are desired, the testing procedure found in section 9.6.2 shall be followed. Alternatively, a dry static coefficient of friction (SCOF) measurement can be made per the ASTM C1028 test method.*

*When wet SCOF measurements of tiles previously tested per ASTM C1028 are desired for direct comparison to historical values, the C1028 test method shall be followed. While BOT 3000 wet SCOF measurements with a Neolite sensor and distilled water generally correlate overall with ASTM C1028 measurements, results on individual tiles may not correlate and therefore cannot be directly compared.*

*The presence on installed tiles of water (including standing water as can exist on floors which are not properly sloped for drainage or on exterior tiles immediately after a rain storm or on which snow is melting), oil, grease, and/or any other elements which reduce traction, creates slippery conditions where the risk of a slip cannot be completely eliminated. Tile installations with exposure to such elements require extra caution in product selection, use, and maintenance. The risk of a slip can be diminished but not eliminated in these installations by installing tiles with a structured/textured surface, mosaic tiles, or certain extruded unglazed quarry tiles. The specifier shall follow manufacturers' guidelines and recommendations for these products.*

*When tested using SLS solution as per the procedure in section 9.6.1, tiles with a wet DCOF of less than 0.42 (including by way of example, but not in limitation, polished tiles), shall only be installed when the surface will be kept dry when walked upon and proper safety procedures will be followed when cleaning the tiles.*

- 1. Tiles appropriate for ramp applications shall be chosen for the specific properties and use of the ramp and require a wet DCOF greater than 0.42 if the ramp will be used under wet conditions. Specifier shall determine tiles appropriate for specific project conditions, considering by way of example, but not in limitation, type of use, traffic, grade of ramp, expected contaminants, expected maintenance, expected wear, and manufacturers' guidelines and recommendations.*
- 2. The COF of installed tiles can change over time as a result of wear and surface contaminants. In addition to regular cleaning, deep cleaning and traction-enhancing maintenance may be needed periodically to maintain DCOF values.*

The proposed reference is in the 2012 edition of ANSI A137.1. An update to this edition will be proposed for the Group B Administrative changes. This language is not in the 2008 edition of ANSI A137.1 that is currently referenced in the code for the

definition for Porcelain tile.

**1003.4.1 Ceramic and Porcelain Tile.** Walking surfaces of the means of egress made of ceramic tiles or porcelain tiles ~~and subject to wet conditions~~ shall have a slip-resistant surface complying with minimum Dynamic Coefficient of Friction (DCOF) of 0.42 when tested per ANSI A137.1, Section 6.2.2.1.10 9.6.

**Commenter's Reason:** This proposal has been modified to remove all references to non-mandatory language in order that the referenced test method conforms to the

requirements of CP28. Additionally, all references to wet conditions are removed to satisfy concerns expressed by the Means of Egress Committee during testimony on E3 regarding the lack of definition of "wet conditions" and potential resulting confusion around which products would be subject to the proposed requirement.

# E5-15 Part I

## 1004.1 (IFC[BE]1004.1)

### **Proposed Change as Submitted**

**Proponent:** Edward Kulik, Chair representing the Building Code Action Committee (bcac@iccsafe.org)

## 2015 International Building Code

### Revise as follows:

**1004.1 Design occupant load.** In determining *means of egress* requirements, the number of occupants for whom *means of egress* facilities are provided shall be determined in accordance with this section. The determination of occupant loads for the purposes of means of egress design is based on the function of the area, room or space under consideration as listed in Table 1004.1.2. The assigned function of the space establishes an occupant load factor based on typical usage.

**Reason:** This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: <http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

Properly classifying the purpose of a given building or structure is the very important first step in the design or analysis process. The reason for this is that the various designations account for the inherent hazards and risks typically associated with the intended purpose. Based on those hazards and risks, appropriate limitations and controls are assigned to the building or structure. The International Building Code uses several specific terms to identify the purpose of the building or structure. Those are: occupancy classification, use and function. Occupancy classification and use are often confused and function is misunderstood.

The purpose of this code change is to simply formalize these terms and explain their relationship. This will assist code practitioners in properly establishing applicable code requirements and improve uniformity and continuity in the identification of appropriate provisions. Some of the current confusion is owed to the fact that the legacy codes used these terms, however, in different ways. For instance, BOCA used "use group" as the major designation with "occupancy" being the subordinate term. On the other hand, ICBO used "occupancy/division" as the major designation with "use" as the secondary term. The IBC was created using provisions from each of the legacy codes and the terms are often seen out of technical context.

This proposal will inform users of the IBC system of building classification and assist all concerned in the proper communication of applicable code requirements.

**Cost Impact:** Will not increase the cost of construction  
Provisions simply provide clarification of current requirements.

## **Public Hearing Results**

### **Part I**

**Committee Action:**

**Disapproved**

**Committee Reason:** What would be the 'typical usage' could not be uniformly enforced. This could be read to conflict with spaces used for multiple purposes being designed for those purposes as required in Section 302.1. The issue is already addressed in Section 1004.1.2. This is commentary language, not code requirements.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : Edward Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

#### **2015 International Building Code**

**1004.1 Design occupant load.** In determining *means of egress* requirements, the number of occupants for whom *means of egress* facilities are provided shall be determined in accordance with this section. The determination of occupant loads for the purposes of means of egress design is based on the function of the area, room or space under consideration as listed in Table 1004.1.2. ~~The assigned function of the space establishes an occupant load factor based on typical usage.~~

**Commenter's Reason:** The purpose of this public comment is to address the concerns of the IBC-Egress Committee with Part I of this proposal. It is noted that Part II was approved by the IBC-General Committee by a wide margin. The IBC-Egress Committee was primarily concerned about the last sentence, raising a specific question as to what constituted a "typical usage". The BCAC agrees with the Committee that this sentence is unnecessary and can be deleted, thus removing the term of concern. It is noted that removing this sentence will not create any conflicts with the already-approved Part II. The BCAC urges approval of Part I of this proposal, which will coordinate with the IBC-General Committee's action and bring useful clarifications to code users regarding the relationship between occupancy, use and function requirements in the code.

---

**E5-15 Part I**

# E5-15 Part II

## Chapter 3, 301, 301.1, 302, 302.1, 302.2 (New)

### Proposed Change as Submitted

**Proponent :** Edward Kulik, representing Building Code Action Committee (bcac@iccsafe.org)

## 2015 International Building Code

Revise as follows:

### CHAPTER 3

#### USE AND OCCUPANCY CLASSIFICATION AND USE

##### SECTION 301 GENERAL SCOPE

**301.1 Scope. General** ~~The provisions of this chapter shall control the classification of all buildings and structures as to use~~occupancy and use. Different classifications of occupancy and use represent varying levels of hazard and risk to building occupants and adjacent properties.

##### SECTION 302 OCCUPANCY CLASSIFICATION AND USE DESIGNATION

**302.1 Occupancy classification. General.** ~~Structures or portions of structures shall be classified with respect to occupancy in one or more of the groups listed in this section. Occupancy classification is the formal designation of the primary purpose of the building, structure or portion thereof. Structures shall be classified into one or more of the occupancy groups listed in this section based on the nature of the hazards and risks to building occupants generally associated with the intended purpose of the building or structure. An area, A room or space that is intended to be occupied at different times for different purposes shall comply with all of the applicable requirements that are applicable to each of the purposes for which the room or space will be occupied associated with such potential multi-purpose. Structures with containing multiple occupancy groups~~occupancies or uses shall comply with Section 508. Where a structure is proposed for a purpose that is not specifically provided for in this code listed in this section such structure shall be classified in the group that the occupancy most nearly resembles, according to based on the fire safety and relative hazard involved.

1. Assembly (see Section 303): Groups A-1, A-2, A-3, A-4 and A-5.
2. Business (see Section 304): Group B.
3. Educational (see Section 305): Group E.
4. Factory and Industrial (see Section 306): Groups F-1 and F-2.
5. High Hazard (see Section 307): Groups H-1, H-2, H-3, H-4 and H-5.
6. Institutional (see Section 308): Groups I-1, I-2, I-3 and I-4.
7. Mercantile (see Section 309): Group M.

8. Residential (see Section 310): Groups R-1, R-2, R-3 and R-4.
9. Storage (see Section 311): Groups S-1 and S-2.
10. Utility and Miscellaneous (see Section 312): Group U.

**Add new text as follows:**

**302.2 Use designation.** Occupancy groups contain subordinate uses having similar hazards and risks to building occupants. Uses include, but are not limited to, those functional designations listed within the occupancy group descriptions in this section. Certain uses require specific limitations and controls in accordance with the provisions of Chapter 4 and elsewhere in this code.

**Add new text as follows:**

**CHAPTER 4  
SPECIAL DETAILED REQUIREMENTS BASED ON USE OCCUPANCY  
AND OCCUPANCY USE**

**401.1 Detailed use occupancy and occupancy use requirements.** In addition to the occupancy and construction requirements in this code, the provisions of this chapter apply to the special uses occupancies and occupancies uses described herein.

**Reason:** This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at:  
<http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

Properly classifying the purpose of a given building or structure is the very important first step in the design or analysis process. The reason for this is that the various designations account for the inherent hazards and risks typically associated with the intended purpose. Based on those hazards and risks, appropriate limitations and controls are assigned to the building or structure. The International Building Code uses several specific terms to identify the purpose of the building or structure. Those are: occupancy classification, use and function. Occupancy classification and use are often confused and function is misunderstood.

The purpose of this code change is to simply formalize these terms and explain their relationship. This will assist code practitioners in properly establishing applicable code requirements and improve uniformity and continuity in the identification of appropriate provisions. Some of the current confusion is owed to the fact that the legacy codes used these terms, however, in different ways. For instance, BOCA used "use group" as the major designation with "occupancy" being the subordinate term. On the other hand, ICBO used "occupancy/division" as the major designation with "use" as the secondary term. The IBC was created using provisions from each of the legacy codes and the terms are often seen out of technical context.

This proposal will inform users of the IBC system of building classification and assist all concerned in the proper communication of applicable code requirements.

**Cost Impact:** Will not increase the cost of construction  
Provisions simply provide clarification of current requirements.

E5-15 Part II : 301-  
KULIK6059

---

## **Public Hearing Results**

### **Part II**

**Committee Action:**

**Approved as Modified**

**Modification:**

**301.1 General.** The provisions of this chapter shall control the classification of all buildings and structures as to occupancy and use. Different classifications of occupancy and use represent varying levels of hazard and risk to building occupants and adjacent properties.

### **CHAPTER 4**

#### **SPECIAL DETAILED REQUIREMENTS BASED ON ~~USE~~OCCUPANCY AND ~~OCCUPANCY~~USE**

**401.1 Detailed ~~use~~occupancy and ~~occupancy~~use requirements.** In addition to the occupancy and construction requirements in this code, the provisions of this chapter apply to the ~~special uses~~ occupancies and ~~occupancies~~ uses described herein.

**Committee Reason:** The committee approved 2 modifications. First the proposal was modified to make sure that the property surrounding each subject building is considered in conjunction with the activity in the building. The second amendment was to extend the clarification of the changes proposed for Chapter 3 into Chapter 4 where special provisions based on use and occupancy are located. Overall the committee found this proposal to be a good clarification between the terms of 'use' and 'occupancy'. Too often they are treated to be the same when they are really distinct terms. The proposal clarifies the difference.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : Jonathan Siu, City of Seattle Department of Planning & Development, representing Washington Association of Building Officials Technical Code Development Committee (jon.siu@seattle.gov) requests Approve as Modified by this Public Comment.**

**Further Modify as Follows:**

### **2015 International Building Code**

**301.1 General** The provisions of this chapter shall control the classification of all buildings and structures as to occupancy and use. ~~Different classifications of occupancy and use represent varying levels of hazard and risk to building occupants and adjacent properties.~~

**302.1 Occupancy classification.** ~~Occupancy classification is the formal designation of the primary purpose of the building, structure or portion thereof. Structures, or portions thereof, shall be classified into one or more of the occupancy groups listed in this section based on the nature of the hazards and risks to building occupants generally associated with the intended purpose of the building or structure. An area, room or space that is intended to be occupied at different times for different purposes shall comply with all applicable requirements associated with such potential multi-purpose. Structures containing multiple occupancy groups shall comply with Section 508. Where a structure is proposed for a purpose that is not specifically listed in this section, such structure shall be classified in the occupancy that it most nearly resembles based on the fire safety and relative hazard.~~

1. Assembly (see Section 303): Groups A-1, A-2, A-3, A-4 and A-5.
2. Business (see Section 304): Group B.
3. Educational (see Section 305): Group E.
4. Factory and Industrial (see Section 306): Groups F-1 and F-2.
5. High Hazard (see Section 307): Groups H-1, H-2, H-3, H-4 and H-5.
6. Institutional (see Section 308): Groups I-1, I-2, I-3 and I-4.
7. Mercantile (see Section 309): Group M.
8. Residential (see Section 310): Groups R-1, R-2, R-3 and R-4.
9. Storage (see Section 311): Groups S-1 and S-2.
10. Utility and Miscellaneous (see Section 312): Group U.

~~**302.2 Use designation.** Occupancy groups contain subordinate uses having similar hazards and risks to building occupants. Uses include, but are not limited to, those functional designations listed within the occupancy group descriptions in this section. Certain uses require specific limitations and controls in accordance with the provisions of Chapter 4 and elsewhere in this code.~~

**Commenter's Reason:** Section 302.2 and the second sentence in Section 301.1 are proposed to be deleted by this public comment because they are commentary, and do not belong in the body of the code. The first sentence in Section 302.1 might be appropriate in a definition of occupancy classification, but otherwise, is also commentary and is therefore proposed to be deleted. The last sentence of Section 301.1 is also deleted because it is redundant with Section 302.1.

## E8-15

### Table 1004.1.2, 1004.1.3 (New); (IFC[BE] Table 1004.1.2, 1004.1.3 (New))

#### Proposed Change as Submitted

**Proponent :** David Collins, representing The American Institute of Architects (dcollins@preview-group.com)

### 2015 International Building Code

**Add new text as follows:**

1004.1.3 Conference and meeting rooms in Group B. In Group B buildings, the occupant load factor for determining means of egress requirements for conference and meeting rooms with fewer than 50 occupants, shall be 100 gross square feet per person.

**Revise as follows:**

**TABLE 1004.1.2  
MAXIMUM FLOOR AREA ALLOWANCES PER OCCUPANT**

<b>FUNCTION OF SPACE</b>	<b>OCCUPANT LOAD FACTOR<sup>a</sup></b>
Business areas	100 gross
<u>Conference and meeting rooms in business areas</u>	<u>See Section 1004.1.3</u>

*(Portions of table not shown remain unchanged.)*

For SI: 1 square foot = 0.0929 m<sup>2</sup>, 1 foot = 304.8 mm.

a. Floor area in square feet per occupant.

**Reason:** This change is proposed for two reasons: 1) The cumulative occupant load for meeting rooms based on 15 square feet per person can far exceed a reasonable number of actual occupants in Group B, particularly without simultaneous use of work areas and meeting areas. The change will provide a more accurate reflection of the number of occupants for means of egress requirements only. 2) In consideration of the above, this code has been troublesome for tenant improvement projects for business areas when egress requirements are significantly more stringent than shell and core projects. The underlying basis of design for egress requirements in Group B shell and core projects is 100 square feet per occupant and the inclusion of meeting room areas at 15 square feet per occupant has triggered existing stairs to be widened and elevators added to meet the means of egress requirements. This is not necessary to meet the intent of use.

**Cost Impact:** Will not increase the cost of construction  
The impact should reduce the cost of construction. Under the current code

**Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The testimony was about simultaneous occupancy, however, there is no requirement in the text that this space could not be a conference room used by the public and not just the occupants on the floor. This could result in inadequate design for exit access doors from the assembly space; or with multiple conference rooms on a floor, cause a problem for adequate sizing of the exits for the floor. An option might be a limit on the room size to allow for a lower capacity rather than to calculate an occupant load first, and then reduce the occupant load.

**Assembly Action :**

**None**

**Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Dave Frable, representing US General Services Administration requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

**2015 International Building Code**

**1004.1.3 ~~Conference and meeting~~ Small assembly use rooms in Group B.** In Group B buildings, the occupant load factor for determining *means of egress* requirements for ~~conference and meeting~~ small assembly use rooms with fewer than 50 occupants 450 square feet or less, shall be ~~100 gross~~ 30 net square feet per person.

**TABLE 1004.1.2  
MAXIMUM FLOOR AREA ALLOWANCES PER OCCUPANT**

FUNCTION OF SPACE	OCCUPANT LOAD FACTOR <sup>a</sup>
Business areas	100 gross
<del>Conference and meeting</del> <u>Small assembly use rooms</u> in business areas	See Section 1004.1.3

*(Portions of table not shown remain unchanged.)*

For SI: 1 square foot = 0.0929 m<sup>2</sup>, 1 foot = 304.8 mm.

- a. Floor area in square feet per occupant.

**Commenter's Reason:** Over the past year, The US General Services Administration (GSA) has experienced many different interpretations among A/E firms and fire protection engineers regarding how specific rooms and spaces identified on drawings are to be utilized by building occupants. The terminology used for various types of rooms and spaces identified on design drawings also has been an issue since this terminology is not referenced or described in any national code or standard. For example, small assemble use rooms have been identified on design drawings as huddle rooms, quiet rooms, focus rooms, etc. Depending on the A/E firm or fire protection engineering consultant, the calculated occupant load factor for these small assembly use rooms could range from 15 ft<sup>2</sup>/person to 100 ft<sup>2</sup>/person. To address the concerns and questions regarding how the design team should calculate the occupant loads for these types of work environments and the appropriateness of using the current occupant load factors for these types of spaces in GSA facilities, we have re-evaluated the current occupant load factors in the IBC pertaining to these types of small assembly rooms.

The intent of this code change is to create a new occupant load factor for small assembly use rooms in business areas which we believe is not adequately addressed in IBC. Based on an evaluation of several recent projects in several GSA regional offices, it was determined that these specific small assembly use rooms are used by employees to transition temporarily from their regular work-station area in order to obtain privacy and/or to avoid disturbing other employees located in the open office environment or to meet with a few colleagues to discuss a work assignment. These rooms are typically not used for conference room settings and therefore should not be compelled to comply to conservative occupant load factors associated with assembly use areas. However, these rooms are considered simultaneous use since they may be used on a regular basis by the employees from other floors in the building thus increasing the floor's occupant load. However, based on the intended use of these rooms and engineering judgment, it was determined that an occupant load factor of 30 ft<sup>2</sup> (net area)/occupant is a reasonable factor to be used to calculate the occupant load of these rooms that are that are typically less than or equal to 450 square feet in area.

In summary, we believe these proposed new occupant load factors still provide a reasonable degree of safety for building occupants as it relates to a building's means of egress systems in commercial office buildings.

## *Public Comment 2:*

**Proponent : Steven Orłowski, representing Building Owners and Managers Association, International (sorłowski@boma.org); David Collins, representing The American Institute of Architects (dcollins@preview-group.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Building Code**

**1004.1.3 Conference and meeting rooms in Group B.** In Group B buildings, the occupant load factor ~~for determining means of egress requirements for conference and meeting rooms with fewer than 50 occupants, shall be 100 gross square feet per person~~ shall include conference and meeting rooms with a net area of less than 750 square feet that are within the tenant space.

**Commenter's Reason:** The purpose of the public comment is twofold. First, it addresses the concerns the committee had regarding the simultaneous use of the space, by limiting the provision to those meeting or conference rooms located within the tenant space. The second change implements a 750 square foot limitation on the size of the space, which is derived from using the 15 sf net factor used for unconcentrated assembly space.

# E10-15

## TABLE 1004.1.2; (IFC[BE] TABLE 1004.1.2)

### Proposed Change as Submitted

**Proponent :** Raymond Grill, Arup, representing Arup  
(ray.grill@arup.com)

## 2015 International Building Code

Revise as follows:

**TABLE 1004.1.2  
MAXIMUM FLOOR AREA ALLOWANCES PER OCCUPANT**

<b>FUNCTION OF SPACE</b>	<b>OCCUPANT LOAD FACTOR<sup>a</sup></b>
Business areas <sup>b</sup>	100 gross

*(Portions of table not shown remain unchanged)*

For SI: 1 square foot = 0.0929 m<sup>2</sup>, 1 foot = 304.8 mm.

a. Floor area in square feet per occupant.

b. Uses incidental to the business use, such as conference rooms or break rooms, shall be included in the gross area calculation.

**Reason:** Incidental uses such as break rooms and conference rooms that are intended to be used by the occupants of the business use should not be loaded as if they were standalone assembly areas. Speculative office developments have regularly been designed for egress and plumbing fixtures based on the gross area of the floor. The increase in build to suit office projects should not increase the occupant loads of a building and require increased egress width and more plumbing fixtures.

A independant study performed by the Univeristy of Maryland and published by NIST (Evaluation of Survey Procedures for Determining Occupant Load Factors in Contemporary Office Buildings, Issued September 1996) reported on the evaluation of a broad range of types of office buildings. Quoting from the study abstract, "Buildings that are primarily composed of open plan office designs are found to have greater occupant load factors than buildings composed of well-compartmented office designs. County government office buildings are found to be slightly greater occupant load factors than federal government buildings. Federal government buildings have lesser occupant load factors than private office buildings. The mean occupant load factor found in the study for all of the buildings is 248 ft<sup>2</sup>/person."

Designers and reviewers who are unfamiliar with the origin and history of the code often over design or require over design when designing build to suit projects by counting conference rooms and break rooms to be considered as assembly uses with simutaneous occupancy with the office areas. This significantly increases the occupant load. The model codes historically had never been applied in this fashion and the occupant load study referenced above reinforces that is should not be applied in a manner that inappropriately increases the occupant load of the building.

Over design results in a waste of resources when we are collectively trying to achieve sustainable designs.

**Cost Impact:** Will not increase the cost of construction

The code change proposal would decrease the required design occupant load in business offices and would therefore reduce the number of plumbing fixtures required as well as possibly reduce the required capacity of egress elements. A rough estimate of the installation of a commercial toilet with associated plumbing is at least \$1,500. The lost usable/rentable area due to oversizing egress elements could cost thousands of dollars per year. Overdesign is inefficient and not sustainable. Maintaining the unnecessary area would add annual operating costs to the building and waste energy.

E10-15 : T1004.1.2-  
GRILL5198

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** There are no qualifiers for size limits for the conference rooms. The testimony was about simultaneous occupancy, however, there is no requirement in the text that this space could not be a conference room used by the public and not just the occupants on the floor. This could result in inadequate design for exit access doors from the assembly space; or with multiple conference rooms on a floor, cause a problem for adequate sizing of the exits for the floor.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Raymond Grill, representing Arup- Self (ray.grill@arup.com) requests Approve as Submitted.**

**Commenter's Reason:** See the original reason for the code change.

*Public Comment 2:*

**Proponent : Gene Boecker, representing National Association of Theatre Owners (geneb@codeconsultants.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

## **2015 International Building Code**

### **TABLE 1004.1.2 MAXIMUM FLOOR AREA ALLOWANCES PER OCCUPANT**

For SI: 1 square foot = 0.0929 m<sup>2</sup>, 1 foot = 304.8 mm.

- a. Floor area in square feet per occupant.
- b. Uses incidental to the business use, such as conference rooms or break rooms not greater than 750 square feet per floor, shall be included in the gross area calculation.

**Commenter's Reason:** The concern during the committee hearings was that the size of the conference room or break room could be rather large. In its original form, it would not be unreasonable to think that someone would try to apply this provision with a 2500 square foot training center on the third floor of a four story office building that is only 3000 SF per floor - clearly outside the scope. However, by keeping the size per floor down to 750 SF, it makes sense to just "lump it in" with the rest of the business use. The difference in calculated occupant load is minimal and it makes both design and plan review simpler.

---

**E10-15**

# E11-15

## TABLE 1004.1.2; (IFC[BE] TABLE 1004.1.2)

### Proposed Change as Submitted

**Proponent :** Stephen Thomas, Colorado Code Consulting, LLC, representing International Association of Building Officials (sthomas@coloradocode.net)

## 2015 International Building Code

Revise as follows:

**TABLE 1004.1.2  
MAXIMUM FLOOR AREA ALLOWANCES PER OCCUPANT**

<b>FUNCTION OF SPACE</b>	<b>OCCUPANT LOAD FACTOR<sup>a</sup></b>
Industrial areas	<del>100</del> <u>300</u> gross

(Portions of table not shown remain unchanged.)

For SI: 1 square foot = 0.0929 m<sup>2</sup>, 1 foot = 304.8 mm.

a. Floor area in square feet per occupant.

**Reason:** The current occupant load factor for industrial areas has been around for decades. The Occupant load was appropriate for factories in the early 1900's. However, our factories are much different than they were back then. They have become more automated, requiring less factory workers. Therefore, I believe that the code should reflect how industrial areas are occupied today. Therefore, we have recommended that the occupant load factor be increased resulting in an overall lower occupant load for factories. The factor is based on storage areas and similar spaces.

**Cost Impact:** Will not increase the cost of construction  
This change will reduce cost of construction. It will reduce the number of plumbing fixtures and exit required for such occupancies.

E11-15 : T1004.1.2-  
THOMAS5294

## Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** Substantiation for the increase in square footage per occupant in all industrial areas was not provided. Some types of industrial occupancies do still rely on a large number of personnel. Allowing for a lower occupant load within a facility such as an airplane manufacture or or high pile automated storage is already permitted by the exception in Section 1004.1.2.

**Assembly Motion:  
Online Vote Results:**

**As Submitted  
Failed**

Support: 39.29% (156) Oppose: 60.71% (241)

**Assembly Action :**

**None**

---

**Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Stephen Thomas, Colorado Code Consulting, LLC, representing Colorado Chapter ICC (sthomas@coloradocode.net) requests Approve as Submitted.**

**Commenter's Reason:** The purpose of this proposal is to create a more reasonable occupant load factor for industrial areas. The number of occupants in these facilities has drastically changed over the years. Robotics and automation have reduced the need for large numbers of workers in factories. Therefore, the code should reflect the way buildings are being used now instead of how they were used in the 19th and early 20th Century. Many people have told me that our change has not gone far enough. They believe the occupant load factor should be 500 to 700 square feet per occupant. We selected the 300 square feet per occupant based on the current values for storage uses. We are working on getting additional information from the manufacturing industry to support our position. We will provide that documentation at the final action hearings.

Testimony at the committee hearings suggested that this would be a problem for third world countries that still have sweat shops. The fact is that the IBC is not being adopted in these countries. We should be looking at proposals that address problems in countries that actually adopt the code and not locations that have little or no chance of adopting the code.

The overall impact on the means of egress will not be adversely affected. Most large buildings have exits based on travel distance versus number of occupants. The major impact is on the number of plumbing fixtures that would be required in a building.

---

E11-15

# E12-15

## TABLE 1004.1.2; (IFC[BE] TABLE 1004.1.2)

### Proposed Change as Submitted

**Proponent :** Masoud Sabounchi, Representing Colorado Chapter of ICC , representing masoud sabounchi (masoud@acecode.com)

## 2015 International Building Code

Revise as follows:

**TABLE 1004.1.2  
MAXIMUM FLOOR AREA ALLOWANCES PER OCCUPANT**

<b>FUNCTION OF SPACE</b>	<b>OCCUPANT LOAD FACTOR<sup>a</sup></b>
Skating rinks, swimming pools	50 gross
Rink and pool	15 <sup>b</sup> gross
Decks	

*(Portions of table not shown remain unchanged.)*

For SI: 1 square foot = 0.0929 m<sup>2</sup>, 1 foot = 304.8 mm.

a. Floor area in square feet per occupant.

b. For swimming pools that serve Group R-2 and R-3 occupancies, the occupant load factor for the pool deck shall be 30 square feet gross.

**Reason:** Apartment buildings have swimming pools and decks that serve the apartment building only. Application of occupant load factor of 1:15 results in occupant loads that are very high and not reflecting the use of these decks as amenity spaces for the apartment buildings and unlike a public pool deck. In most cases the calculated occupant loads on these decks is much higher than considering all apartment residents using the decks. The proposed use of the 1:30 occupant load factor is in concert with other nationally recognized codes and more closely reflects the anticipated occupant loads on these decks.

**Cost Impact:** Will not increase the cost of construction

This proposal would reduce the cost for construction of swimming pool decks that serve R-2 and R-3 occupancies because it allows the occupant load factor to be revised from 1:15 to 1:30 SF gross resulting in reduction of the occupant load and possible reduction in egress width and number of plumbing facilities.

E12-15 : T1004.1.2-  
SABOUNCHI4396

## Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** There is a concern with this allowance applying to all Group R-2 and R-3 pool decks. Not all residential occupancies have large pool decks; there for the current occupant load could be appropriate. In addition, this occupant load may not be appropriate for large complexes with only one pool, especially time share vacation facilities that operate similarly to hotel/transient type occupancies.

**Assembly Motion:** **As Submitted**  
**Online Vote Results:** **Failed**  
 Support: 49.87% (189) Oppose: 50.13% (190)  
**Assembly Action :** **None**

**Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Masoud Sabounchi, representing Colorado Chapter of ICC (masoud@acecode.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

**2015 International Building Code**

**TABLE 1004.1.2  
 MAXIMUM FLOOR AREA ALLOWANCES PER OCCUPANT**

FUNCTION OF SPACE	OCCUPANT LOAD FACTOR <sup>a</sup>
Skating rinks, swimming pools	50 gross
Rink and pool Decks	15 <sup>b</sup> gross

*(Portions of table not shown remain unchanged.)*

For SI: 1 square foot = 0.0929 m<sup>2</sup>, 1 foot = 304.8 mm.

- a. Floor area in square feet per occupant.
- b. For swimming pools that serve Group R-2 ~~and R-3 occupancies~~ occupancy apartment buildings, the occupant load factor for the pool deck shall be 30 square feet gross.

**Commenter's Reason:** Residential R-2 apartment buildings have swimming pools and pool decks that serve the dwelling units. This proposal is not applicable to hotels (R-1 occupancy classification) as questioned by the committee members during the hearings. The revised footnote b, states "For swimming pools that serve Group R-2 occupancy apartment buildings, the occupant load factor for the pool deck shall be 30 square feet gross." The proposal is now limited to R-2 apartment buildings and not dormitories or other R-2 occupancies.

Application of the occupant load factor of 1:15 results in very high occupant loads not reflecting the intended use of these decks. These are not public pools and are used

by the building residents. In most cases the calculated occupant loads on the pool decks is much higher than all apartment occupants. A common application of this provision is where a pool and pool deck is located on second, third or other upper stories in an apartment building resulting in additional exits and exit capacities as well as additional plumbing facilities. Most building officials consider these decks as having Group A-3 Occupancy classification and requiring plumbing facilities based on this occupancy classification. The proposed use of the 1:30 occupant load factor is in concert with NFPA 101 and more closely reflects the anticipated occupant loads on these decks. This proposal allows reduction in number of plumbing facilities and reduction in exit capacities.

---

**E12-15**

# E18-15

## TABLE 1006.2.1; (IFC[BE] TABLE 1006.2.1)

### *Proposed Change as Submitted*

**Proponent :** Victor Cuevas, representing City of Los Angeles

## 2015 International Building Code

Revise as follows:

**TABLE 1006.2.1  
SPACES WITH ONE EXIT OR EXIT ACCESS DOORWAY**

OCCUPANCY	MAXIMUM OCCUPANT LOAD OF SPACE	MAXIMUM COMMON PATH OF EGRESS TRAVEL DISTANCE (feet)		
		Without Sprinkler System (feet)		With Sprinkler System (feet)
		Occupant Load		
		OL ≤ 30	OL > 30	
A <sup>c</sup> , E, M	49	75	75	75 <sup>a</sup>
B	49	100	75	100 <sup>a</sup>
F	49	75	75	100 <sup>a</sup>
H-1, H-2, H-3	3	NP	NP	25 <sup>b</sup>
H-4, H-5	10	NP	NP	75 <sup>b</sup>
I-1, I-2 <sup>d</sup> , I-4	10	NP	NP	75 <sup>a</sup>
I-3	10	NP	NP	100 <sup>a</sup>
R-1	10	<u>NP75</u>	<u>NP75</u>	75 <sup>a</sup>
R-2	10	<u>NP75</u>	<u>NP75</u>	125 <sup>a</sup>

R-3 <sup>e</sup>	10	<del>NP</del> 75	<del>NP</del> 75	125 <sup>a</sup>
R-4 <sup>e</sup>	10	75	75	125 <sup>a</sup>
S <sup>f</sup>	29	100	75	100 <sup>a</sup>
U	49	100	75	75 <sup>a</sup>

For SI: 1 foot = 304.8 mm.

NP = Not Permitted

- a. Buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2. See Section 903 for occupancies where *automatic sprinkler systems* are permitted in accordance with Section 903.3.1.2.
- b. Group H occupancies equipped throughout with an *automatic sprinkler system* in accordance with Section 903.2.5.
- c. For a room or space used for assembly purposes having *fixed seating*, see Section 1029.8.
- d. For the travel distance limitations in Group I-2, see Section 407.4.
- e. The length of *common path of egress travel* distance in a Group R-3 occupancy located in a mixed occupancy building or within a Group R-3 or R-4 *congregate living facility*.
- f. The length of *common path of egress travel* distance in a Group S-2 *open parking garage* shall be not more than 100 feet.

**Reason:** The purpose of this proposal is to allow a maximum common path of egress travel distance to be 75' for Group R-1, R-2 and R-3. Without this change, any addition to an existing non-sprinklered building would require two exits from any room without any allowance for the common path of egress travel distance. This travel distance is the same as what was permitted in the code before all Group R was required to be sprinklered.

**Cost Impact:** Will not increase the cost of construction  
There is not change in requirements.

E18-15 : T1006.2.1-  
CUEVAS4824

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** This table needs to be coordinated with the IEBC. Does IEBC send you back to the IBC for travel distance for alterations in existing buildings without sprinklers or additions to existing buildings where only the addition is sprinklered? If you take out the NP in the table for new construction, then the table could be read to allow non-sprinklered Group R occupancies.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

## *Public Comment 1:*

**Proponent : Victor Cuevas, representing City of Los Angeles (victor.cuevas@lacity.org) requests Approve as Submitted.**

**Commenter's Reason:** Would like to address the committee's reason. Section 101.2 of 2015 IBC states the scope of the IBC as follows:

*"The provisions of this code shall apply to construction, alteration, relocation, enlargement, replacement, repair, equipment, use and occupancy, location, maintenance, removal and demolition of every building or structure or any appurtenances connected or attached to such buildings or structures."*

Clearly, 2015 is not limited to new buildings only, and it applies to existing building are altered, enlarged or repaired. The 2015 IBC is not limited to new buildings only. The 2015 IBC applies to existing buildings being altered, enlarged or repaired. This proposed change will allow a travel distance of 75 feet for Group R Occupancy and will be consistent with Sections 805.3.1.1 and 805.4.1.1 of 2015 IEBC.

---

**E18-15**

## E20-15

**1006.2.2.1, 1006.2.2.2 (New), 1006.2.2.2, 1010.1.10;  
(IFC[BE] 1006.2.2.1, 1006.2.2.2 (New), 1006.2.2.2,  
1010.1.10)**

### **Proposed Change as Submitted**

**Proponent:** Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

## **2015 International Building Code**

### **Revise as follows:**

**1006.2.2.1 Boiler, incinerator and furnace rooms.** *Two exit access doorways* are required in boiler, incinerator and furnace rooms where the area is over 500 square feet (46 m<sup>2</sup>) and any fuel-fired equipment exceeds 400,000 British thermal units (Btu) (422 000 KJ) input capacity. Where two *exit access doorways* are required, one is permitted to be a fixed ladder or an *alternating tread device*. *Exit access doorways* shall be separated by a horizontal distance equal to one-half the length of the maximum overall diagonal dimension of the room.

Doors shall swing in the direction of egress travel, regardless of the occupancy load served. Doors shall be provided with panic hardware or fire exit hardware.

### **Add new text as follows:**

**1006.2.2.2 Electrical Equipment Space.** Entrance to and egress from the working space for electrical equipment shall be in compliance with the International Fire Code and Sections 110.26 and 110.33 of NFPA 70, as applicable.

Doors shall swing in the direction of egress travel, regardless of the occupancy load served. Doors shall be provided with panic hardware or fire exit hardware.

### **Revise as follows:**

~~1006.2.2.2~~ **1006.2.2.3 Refrigeration machinery rooms.** Machinery rooms larger than 1,000 square feet (93 m<sup>2</sup>) shall have not less than two *exits* or *exit access doorways*. Where two *exit access doorways* are required, one such doorway is permitted to be served by a fixed ladder or an *alternating tread device*. *Exit access doorways* shall be separated by a horizontal distance equal to one-half the maximum horizontal dimension of the room.

All portions of machinery rooms shall be within 150 feet (45 720 mm) of an *exit* or *exit access doorway*. An increase in *exit access* travel distance is permitted in accordance with Section 1017.1.

Doors shall swing in the direction of egress travel, regardless of the *occupant load* served. Doors shall be tight fitting and self-closing. Doors shall be provided with panic hardware or fire exit hardware.

**1010.1.10 Panic and fire exit hardware.** Doors serving a Group H occupancy and doors serving rooms or spaces with an *occupant load* of 50 or more in a Group A or E occupancy shall not be provided with a latch or lock other than *panic hardware* or *fire exit hardware*.

**Exceptions:**

1. A main *exit* of a Group A occupancy shall be permitted to be locking in accordance with Section 1010.1.9.3, Item 2.
2. Doors serving a Group A or E occupancy shall be permitted to be electromagnetically locked in accordance with Section 1010.1.9.9.

~~Electrical rooms with equipment rated 1,200 amperes or more and over 6 feet (1829 mm) wide, and that contain overcurrent devices, switching devices or control devices with exit or exit access doors, shall be equipped with *panic hardware* or *fire exit hardware*. The doors shall swing in the direction of egress travel.~~

**Reason:** This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at:

<http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

Requirements for access and working space to and about electrical equipment is covered in the National Electrical Code, NFPA 70, and the International Fire Code. The requirements for electrical equipment rated 600 volts or less are covered in Section 110.26 of NFPA 70. The requirements for electrical equipment rated more than 600 volts are covered in Sections 110.32 and 110.33 of NFPA 70. These requirements are more detailed than what is currently in the building code, and apply to electrical equipment in all occupancies.

Section 2701.1 of the IBC requires electrical components, equipment, and systems to be designed and constructed in accordance with NFPA 70. By including a specific reference in Chapter 10 of the building code to the access and working space requirements in NFPA 70, registered design professionals will be aware to incorporate these requirements into the design of the building before starting construction.

The door requirements are added to current Sections 1006.2.2.1 and 1006.2.2.2 for consistency with these types of mechanical spaces.

**Cost Impact:** Will not increase the cost of construction

This code change proposal will not increase the cost of construction. This code proposal may actually decrease the cost of construction, because the design of the building will include the requirements that are already required elsewhere in this code.

**E20-15 : 1006.2.2.2  
(NEW)-KULIK3668**

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The proposed text does not include the limit of equipment in

NFPA 70 Section 1110.26 and 1110.33. The proposal does not include transformers. NEC is egress from equipment spaces, which is not always a room. The proposal would literally require panic hardware and door swing in the direction of egress for electrical rooms no matter what sized. There was no justification provided for panic hardware in boiler, incinerator, furnace or refrigerator. The proposal is not totally coordinated with the requirements in NFPA 70. The proposed text does not include the limit of equipment size in NFPA 70 Sections 110.26 and 110.33. The proposal does not include transformers. NEC is egress from equipment spaces, which is not always a room. The proposal would literally require panic hardware and door swing in the direction of egress for electrical rooms no matter what size.

There was no justification provided for panic hardware in boiler, incinerator, furnace or refrigerator machinery rooms.

There were multiple modifications to this proposal. Proposals E20, E21 and E80 should be coordinated in the public comment phase. Machinery rooms. This proposal should be coordinated with E21 and E80.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Edward Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Building Code**

**1006.2.2.1 Boiler, incinerator and furnace rooms.** Two *exit access doorways* are required in boiler, incinerator and furnace rooms where the area is over 500 square feet (46 m<sup>2</sup>) and any fuel-fired equipment exceeds 400,000 British thermal units (Btu) (422 000 KJ) input capacity. Where two *exit access doorways* are required, one is permitted to be a fixed ladder or an *alternating tread device*. *Exit access doorways* shall be separated by a horizontal distance equal to one-half the length of the maximum overall diagonal dimension of the room.

~~Doors~~ Exit and exit access doorways shall swing in the direction of egress travel, regardless of the occupancy load served. Doors shall be provided with panic hardware or fire exit hardware.

**1006.2.2.2 Electrical Equipment Space.** Entrance to and egress from the working space for electrical equipment shall be in compliance with the *International Fire Code* and Sections 110.26 and 110.33 of NFPA 70, as applicable.

~~Doors shall swing in the direction of egress travel, regardless of the occupancy load served. Doors shall be provided with panic hardware or fire exit hardware.~~

**1006.2.2.3 Refrigeration machinery rooms.** Machinery rooms larger than 1,000 square feet (93 m<sup>2</sup>) shall have not less than two *exits* or *exit access doorways*. Where two *exit access doorways* are required, one such doorway is permitted to be served by a fixed ladder or an *alternating tread device*. *Exit access doorways* shall be separated by a horizontal distance

equal to one-half the maximum horizontal dimension of the room.

All portions of machinery rooms shall be within 150 feet (45 720 mm) of an *exit* or *exit access doorway*. An increase in *exit access* travel distance is permitted in accordance with Section 1017.1.

~~Doors~~ Exit and exit access doorways shall swing in the direction of egress travel, regardless of the *occupant load* served. Doors shall be tight fitting and self-closing. Doors shall be provided with panic hardware or fire exit hardware.

**Commenter's Reason:** The requirements for the number of exits, minimum size of the exits, and where fire exit hardware and panic hardware are required where electrical equipment is installed are more detailed in the National Electrical Code (NFPA 70) and the International Fire Code.

The limits of the electrical equipment are specifically covered in Sections 110.26 and 110.33 of the National Electrical Code. This proposal covers egress from working space for electrical equipment, regardless of whether the electrical equipment is in a room or not.

Directing to the specific requirements in Sections 110.26 and 110.33 of the National Electrical Code ensures there are no conflicts in the requirements. Locating the requirements for electrical equipment space with the requirements for boilers, furnaces, incinerators and refrigeration equipment helps to make sure these issues are addressed before starting construction.

A modification is proposed to clarify that only exit access and exit doorways, not auxiliary doors, have to swing in the direction of travel. This will correlate with the proposed change for the doors for refrigeration machinery rooms in the code proposal E 22-15.

Where exit and exit access doorways are used, the use of panic hardware and door swing in the direction of egress should be addressed for boiler, incinerator and furnace rooms, and electrical spaces.

---

**E20-15**

# E21-15

## 1006.2.2.2 (New); (IFC[BE] 1006.2.2.2 (New))

### Proposed Change as Submitted

**Proponent :** Lee Kranz, City of Bellevue, WA, representing Washington Association of Building Officials Technical Code Development Committee

## 2015 International Building Code

**Add new text as follows:**

**1006.2.2.2 Electrical equipment rooms.** Rooms containing electrical equipment shall be provided with the number of exit or exit access doorways in accordance with NFPA70 Article 110 where all of the following apply:

1. The electrical equipment is rated at 1,200 amperes or more.
2. The electrical equipment is over 6 feet (1829 mm) wide;
3. The electrical equipment contains overcurrent devices, switching devices or control devices.

**Reason:** This code change is needed to create consistency with the NEC. NEC Article 110.26 (C) (2) requires a 2nd exit when large electrical equipment (over 6 feet wide) exceeding 1,200 amperes where the equipment contains overcurrent devices, switching devices or control devices. Most building code reviewers are not aware of the need for the 2nd exit in the NEC and the requirement is often not identified until after construction begins when it is costly to modify the architectural design. Rather than requiring a second exit or exit access doorway, the proposal specifies that the number of exits or exit access doorways shall be in accordance with NEC Article 110. This approach was taken due to several exceptions contained in Article 110 exempting the second exit doorway and which would not be appropriate to duplicate in the IBC.

Similar provisions are located in Section 1010.1.10 to require panic hardware or fire exit hardware for electrical rooms with large electrical equipment.

**Cost Impact:** Will not increase the cost of construction

This code change will save money by reducing costly change orders when the NEC requirement for a 2nd exit is not caught during plan review.

E21-15 : 1006.2.2.2  
(New)-KRANZ4099

---

### Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** Not everyone has a copy of NFPA 70. The technical criteria needs to be included in the code. Proposals E20, E21 and E80 should be coordinated in the public comment phase.

**Assembly Action :**

**None**

---

### Individual Consideration Agenda

*Public Comment 1:*

**Proponent : Lee Kranz, City of Bellevue, WA , representing Washington Association of Building Officials Technical Code Development Committee (lkranz@bellevuewa.gov) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

## **2015 International Building Code**

**1006.2.2.2 Electrical equipment rooms.** Rooms containing electrical equipment shall be provided with the ~~number of a second exit or exit access doorways in accordance with~~ as required by NFPA70 Article 110 where all of the following apply:

1. The electrical equipment is rated at 1,200 amperes or more.
2. The electrical equipment is over 6 feet (1829 mm) wide;
3. The electrical equipment contains overcurrent devices, switching devices or control devices.

**1010.1.10 Panic and fire exit hardware.** Doors serving a Group H occupancy and doors serving rooms or spaces with an *occupant load* of 50 or more in a Group A or E occupancy shall not be provided with a latch or lock other than *panic hardware or fire exit hardware*.

### **Exceptions:**

1. A main *exit* of a Group A occupancy shall be permitted to be locking in accordance with Section 1010.1.9.3, Item 2.
2. Doors serving a Group A or E occupancy shall be permitted to be electromagnetically locked in accordance with Section 1010.1.9.9.

~~Electrical rooms with equipment rated 1,200 amperes or more and over 6 feet (1829 mm) wide, and that contain overcurrent devices, switching devices or control devices with exit or exit access doors, shall be equipped with *panic hardware or fire exit hardware*. The doors shall swing in the direction of egress travel.~~

**1010.1.10.1 Electrical rooms and working clearances** Exit and exit access doors serving electrical rooms and working spaces shall swing in the direction of egress travel and shall be equipped with panic hardware or fire exit hardware where such rooms or working spaces contain one or more of the following:

1. Equipment operating at more than 600 volts, nominal.
2. Equipment operating at 600 volts or less, nominal and rated at 800 amperes or more, and where the equipment contains overcurrent devices, switching devices or control devices.

**Exception:** Panic and fire exit hardware is not required on exit and exit access doors serving electrical equipment rooms and working spaces where such doors are not less than twenty-five feet (7.6 m) from the nearest edge of the electrical equipment.

**Commenter's Reason:** There were 3 separate proposals submitted that addressed egress from electrical rooms; E20, E21 and E80. The Egress Committee suggested

that all 3 proponents collaborate for consistency. All 3 proposals referenced applicable sections from NFPA 70 to alert building reviewers and fire code reviewers that there may be additional requirements in the NEC that should be considered. E21 is being submitted as a public comment and includes modifications suggested by the Committee for all 3 proposals.

E20, submitted by BCAC, included requirements for door swing and panic hardware. The Committee said there was no justification to require panic hardware in boiler, incinerator, furnace or refrigeration machinery rooms so those requirements have been removed in this public comment. Requirements related to door swing should be located in Section 1010 as submitted in E80 which are included in this public comment. Reference to NFPA 70 Article 110 has been maintained in this public comment.

E21, submitted by WABO TCD, addressed the need to check NFPA 70 Article 110 for the number of exits required from rooms containing electrical equipment exceeding certain limits. The Committee suggested that the technical criteria from NFPA 70 needed to be included in the proposal. However, lengthy and complex exception criteria, along with unfamiliar terms used in the NEC which are not easily understood or interpreted by building or fire code reviewers did not warrant bringing the text into the building code. Therefore, no changes in this respect have been made to this public comment. One modification to Section 1006.2.2.2 changes "in accordance with..." to read "required by...". This change clarifies that NFPA 70 Article 110 provides the scoping language to determine when a second means of egress is required from a room containing electrical equipment.

E80, submitted by Ross Barrick, also included reformatted text addressing door swing and panic hardware. E80 appropriately locates the revised text in Section 1010.1.10.1 related to door swing and the need for panic hardware and is well coordinated with NFPA 70 so the original text of E80 is maintained in this public comment.

---

**E21-15**

## E25-15

1006.3, 1006.3.1; (IFC[BE] 1006.3, 1006.3.1)

### Proposed Change as Submitted

**Proponent :** Gregory Keith, Professional heuristic Development, representing The Boeing Company (grkeith@mac.com)

## 2015 International Building Code

### Revise as follows:

**1006.3 Egress from stories or occupied roofs.** The *means of egress* system serving any *story* or occupied roof shall be provided with the number of separate and distinct exits or access to *exits* based on the aggregate *occupant load* served in accordance with this section. The *path of egress travel* to an *exit* shall not pass through more than one adjacent *story*.

**1006.3.1 Egress based on occupant load.** Each *story* and occupied roof shall have the minimum number of ~~independent~~ separate and distinct exits, or access to *exits*, as specified in Table 1006.3.1. A single *exit* or access to a single *exit* shall be permitted in accordance with Section 1006.3.2. The required number of *exits*, or *exit access stairways* or *ramps* providing access to *exits*, from any *story* or occupied roof shall be maintained until arrival at the *exit discharge* or a *public way*.

**Reason:** Section 1006.3.1 currently references "independent" exits. Independent can be a vague or judgemental term. The proposed "separate and distinct" language is more specific. Also, that terminology is currently used in the definition of common path of egress travel to identify a point where two exits or access to exits would be required.

Additionally, Section 1006.3 has been modified to include the qualifying requirement of "separate and distinct" as well. Conceivably, if both the entrance to an interior exit stairway at one story and the entrance to the same interior exit stairway at an adjacent story are both within the prescribed exit access travel distance limitations, it could be interpreted that the required number of exits requirement has been satisfied because the two entrances are "independent." To clarify the intent, a sentence has been added stating that a single interior exit stairway cannot serve as both exits from a given story. The separate and distinct terminology would require that there be a second formal exit available within established exit access travel limitations.

This proposal intends to amplify separate exit requirements. It is also intended to clarify that although required exits from a given story may be located at different building levels, the same interior exit stairway may not serve as satisfying multiple exit requirements. Obviously, if such interior exit stairway was compromised, the opportunity for a true alternate exit would be lost. Approval of this proposal increases occupant safety within the means of egress system.

**Cost Impact:** Will not increase the cost of construction  
This proposal is intended to clarify current numbers of exits provisions.

E25-15 : 1006.3-  
KEITH4704

---

## Public Hearing Results

**Committee Action:**

**Approved as Modified**

**Modification:**

**1006.3 Egress from stories or occupied roofs.** The means of egress system serving any story or occupied roof shall be provided with the number of separate and distinct exits or access to exits based on the aggregate occupant load served in accordance with this section. ~~Where an exit access stairway provides access to an exit at another story, a single interior or exterior exit stairway having entrances at each story shall not serve as both required exits for a single story.~~ The path of egress travel to an exit shall not pass through more than one adjacent story.

**Committee Reason:** The modification is to delete the new sentence. This new sentence is commentary language and is not needed in code text.

The term 'separate and distinct' will clarify that one exit stairway cannot serve as both exits from a floor. Moving down a floor via an exit access stairway does not alleviate the requirement for two exits.

**Assembly Action :**

**None**

---

**Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Jonathan Siu, City of Seattle Department of Planning & Development, representing Washington Association of Building Officials Technical Code Development Committee (jon.siu@seattle.gov) requests Approve as Submitted.**

**Commenter's Reason:** We agree with the intent of this proposed code change. However, we disagree that the text deleted by the Committee is commentary--one might consider it to be redundant, given the "separate and distinct" language, but it is not commentary. As to the whether the text proposed to be deleted is redundant, we believe it much more clearly states the requirement that a second egress path that leads back to the same exit is not allowed to count as a second exit, and should be retained.

---

**E25-15**

# E26-15

## 1006.3; (IFC[BE] 1006.3)

### Proposed Change as Submitted

**Proponent :** Rick Lupton, representing City of Seattle, Dept of Planning & Development (rick.lupton@seattle.gov)

## 2015 International Building Code

### Revise as follows:

**1006.3 Egress from stories or occupied roofs.** The *means of egress* system serving any *story* or occupied roof shall be provided with the number of *exits* or access to *exits* based on the aggregate *occupant load* served in accordance with this section. The *path of egress travel* to an *exit* shall not pass through more than one adjacent *story*. Where a story is required to have two or more exits or access to exits, the rooms, areas, or spaces within that story shall have access to no less that two exits, except as otherwise provided in this code.

**Reason:** The code is not clear that where a story requires two or more exits (or access to exits) that all the rooms on that story require access to at least two exits, even if the room only requires one exit access -unless the room meets a specific exception such as direct egress to grade. The code change proposal clarifies the intent, while still enabling the single means of egress provisions for a space in Chapter 10 or elsewhere in the code, such as Section 402.8.3.

**Cost Impact:** Will not increase the cost of construction  
No additional exits are required and so cost is not increased, though some designs may require further thought.

E26-15 : 1006.3-  
LUPTON5540

---

### Public Hearing Results

#### **Committee Action:**

**Disapproved**

**Committee Reason:** The proposed language is confusing. The proposed language could be read to require additional exits from the floor.

#### **Assembly Motion:**

### Individual Consideration Agenda

#### *Public Comment 1:*

**Proponent :** Rick Lupton, City of Seattle, Dept of Planning & Development, representing City of Seattle, Dept of Planning & Development (rick.lupton@seattle.gov) requests Approve as

**Modified by this Public Comment.**

**Modify as Follows:**

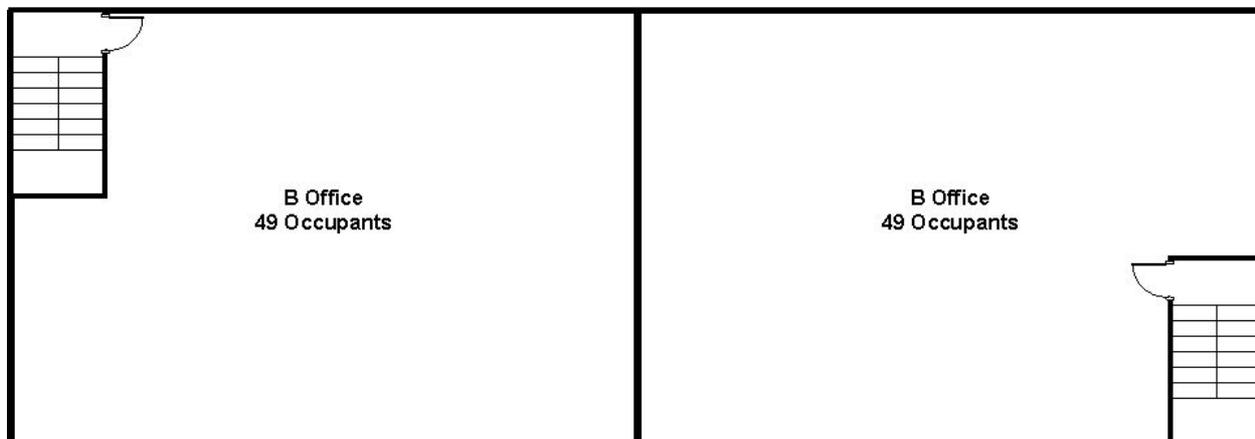

**2015 International Building Code**

**1006.3 Egress from stories or occupied roofs.** The *means of egress* system serving any *story* or occupied roof shall be provided with provide access to the number of exits ~~or access to exits~~ based on the aggregate *occupant load* served in accordance with this section. The *path of egress travel* to an *exit* shall not pass through more than one adjacent *story*. ~~Where a story is required to have two or more exits or access to exits, the rooms, areas, or spaces within that story shall have access to no less than two exits, except as otherwise provided in this code.~~

**Commenter's Reason:** The weakness in the 2015 IBC language is it addresses only the number of exits, or exit accesses, but does not clearly address access to those exits (or exit access stairs, ramps, doors, etc). The public comment clearly requires access to the number of exits required by the section, for each story or occupied roof deck.

This avoids confusion by a plan reviewer when confronted by a proposal (below) where a third story of an office building is renovated to house two tenants, each having 49 occupants and access to one exit, even though the story is provided with two exits. Both the tenant spaces need access to both exits on a third story, The public comment makes that clear.

The original code change proposal was thought to be confusing and might be read to require additional exits. The public comment simplifies the language, addressing access to the required number of exits. The omission of the phrase "or access to exits", by the public comment, in no way prevents use of an exit access stairway, ramp, or doorway, while eliminating awkward wording that causes confusion.

**3rd Story of an Office Building: Does the means of egress system meet the code?**

## E27-15

### 1006.3, 1006.3.1 (New); (IFC[BE] 1006.3, 1006.3.1 (New))

#### **Proposed Change as Submitted**

**Proponent:** Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

#### **Revise as follows:**

##### **1006.3 Egress from stories or occupied roofs.**

The *means of egress* system serving any *story* or occupied roof shall be provided with the number of *exits* or access to *exits* based on the aggregate *occupant load* served in accordance with this section. ~~The *path of egress travel* to an *exit* shall not pass through more than one adjacent *story*.~~

#### **Add new text as follows:**

**1006.3.1 Adjacent story.** The path of egress travel to an exit shall not pass through more than one adjacent story.

**Exception:** The path of egress travel to an exit shall be permitted to pass through more than one adjacent story in any of the following:

1. In Group R-1, R-2 or R-3 occupancies, exit access stairways and ramps connecting four stories or less serving and contained within an individual dwelling unit or sleeping unit or live/work unit.
2. Exit access stairways serving and contained within a Group R-3 congregate residence or a Group R-4 facility.
3. Exit access stairways and ramps in open parking garages that serve only the parking garage.
4. Exit access stairways and ramps serving open-air assembly seating complying with the exit access travel distance requirements of Section 1029.7.
5. Exit access stairways and ramps between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, places of religious worship, auditoriums and sports facilities.

**Reason:** The intent of this proposal is to coordinate Section 1006.3 and the allowance for exit access stairways in Section 1019.3. The 2nd sentence of Section 1006.3 currently says that the required number of exits must be available not more than one story above or below the exit you are on. The first part of this proposal is to put that requirement in its own section, Section 1006.3.1.

Section 1019.3 Exception 1, allows for open exit access stairways for two story buildings. However, there are several situations where the intent was for open exit access stairways to be utilized for more than one story, provided that the travel distance is met - within a 3 or 4 story dwelling, in atriums, in open air seating, and from balconies. It is also the intent to allow for open stairways for multiple stories

within open parking garages, per Section 1019.3 and Section 1017.3. Exceptions to new Section 1006.3.1 would clarify where this is permitted.

The exceptions here are direct copies of the exceptions in Section 1019.3. If there are revisions to those exceptions in this cycle, there will be a public comment to revise the language here to be consistent.

Alternatives also discussed where one exception to Section 1006.3.1 with a reference to specific exceptions in the open exit access stairway provisions in Section 1019.3; or removal of the sentence now in Section 1006.3.1.

In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under the CTC Area of Study entitled Unenclosed Exit Stairs. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website. <http://www.iccsafe.org/cs/CTC/Pages/default.aspx>

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: <http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

**Cost Impact:** Will not increase the cost of construction  
This is for clarification, therefore, there will be no additional requirements.

E27-15 : 1006.3-  
KULIK3645

---

## **Public Hearing Results**

**Committee Action:**

**Approved as Submitted**

**Committee Reason:** This proposal provides needed correlation with Section 1019.3 for single exit buildings that allow for open stairways to serve as the means of egress for more than one story.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

*Public Comment 1:*

**Proponent : Edward Kulik, ICC Building Code Action Committee (bcac@iccsafe.org); Gregory Keith, representing The Boeing Company (grkeith@mac.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

**2015 International Building Code  
1006.3.1 Adjacent story.**

The path of egress travel to an exit shall not pass through more than one adjacent story.

**Exception:** The path of egress travel to an exit shall be permitted to pass through more than one adjacent story in any of the following:

1. In Group R-1, R-2 or R-3 occupancies, exit access stairways and ramps connecting four stories or less serving and contained within an individual dwelling unit or sleeping unit or live/work unit.
2. Exit access stairways serving and contained within a Group R-3 congregate residence or a Group R-4 facility.
3. Exit access stairways and ramps in open parking garages that serve only the parking garage.
4. Exit access stairways and ramps in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, where the area of the vertical opening between stories does not exceed twice the horizontal projected area of the stairway or ramp and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. In other than Group B and M occupancies, this provision is limited to openings that do not connect more than four stories.
5. Exit access stairways and ramps within an atrium complying with the provisions of Section 404.
6. Exit access stairways and ramps serving open-air assembly seating complying with the exit access travel distance requirements of Section 1029.7.
7. Exit access stairways and ramps between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, places of religious worship, auditoriums and sports facilities.

**Commenter's Reason:** E 27-15 was proposed by the ICC Building Code Action Committee and approved as submitted by the Means of Egress Code Committee.

The published reason for the proposal stated, "The intent of this proposal is to coordinate Section 1006.3 and the allowance for exit access stairways in Section 1019.3. The 2nd sentence of Section 1006.3 currently says that the required number of exits must be available not more than one story above or below the exit you are on." The reason further states, "However, there are several situations where the intent was for open exit access stairways to be utilized for more than one story, provided that the travel distance is met--within a 3 or 4 story building, in atriums, in open air seating, and from balconies."

The reason statement emphasized that, "The exceptions are direct copies of the exceptions in Section 1019.3. If there are revisions to those exceptions in this cycle, there will be a public comment to revise the language here to be consistent."

Clearly, the intent of the proposal was to duplicate those permitted open exit access stairway conditions listed in Section 1019.3 as acceptable methods of accessing an exit at another building level within exit access travel distance limitations and the prescribed details of the various conditions. Unfortunately, two Section 1019.3 conditions (Conditions 4 and 5) have been omitted from the list of exceptions in the proposal. Although the atrium design condition was referenced in the published reason statement, that exception was not included in the proposal.

The Means of Egress Code Committee's published reason statement for approval as submitted for E 27-15 reinforces the intent; "This proposal provides needed correlation with Section 1019.3 for single exit buildings that allow for open stairways to serve as the means of egress for more than one story."

This public comment completes the intent of the ICC BCAC by including Section 1019.3, Conditions 4 and 5 verbatim as Exceptions 4 and 5 to Section 1006.3.1.

## *Public Comment 2:*

**Proponent : Sarah Rice, The Preview Group, representing The Preview Group requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Building Code**

#### **1006.3.1 Adjacent story.**

The path of egress travel to an exit shall not pass through more than one adjacent story.

**Exception:** The path of egress travel to an exit shall be permitted to pass through more than one adjacent story in any of the following:

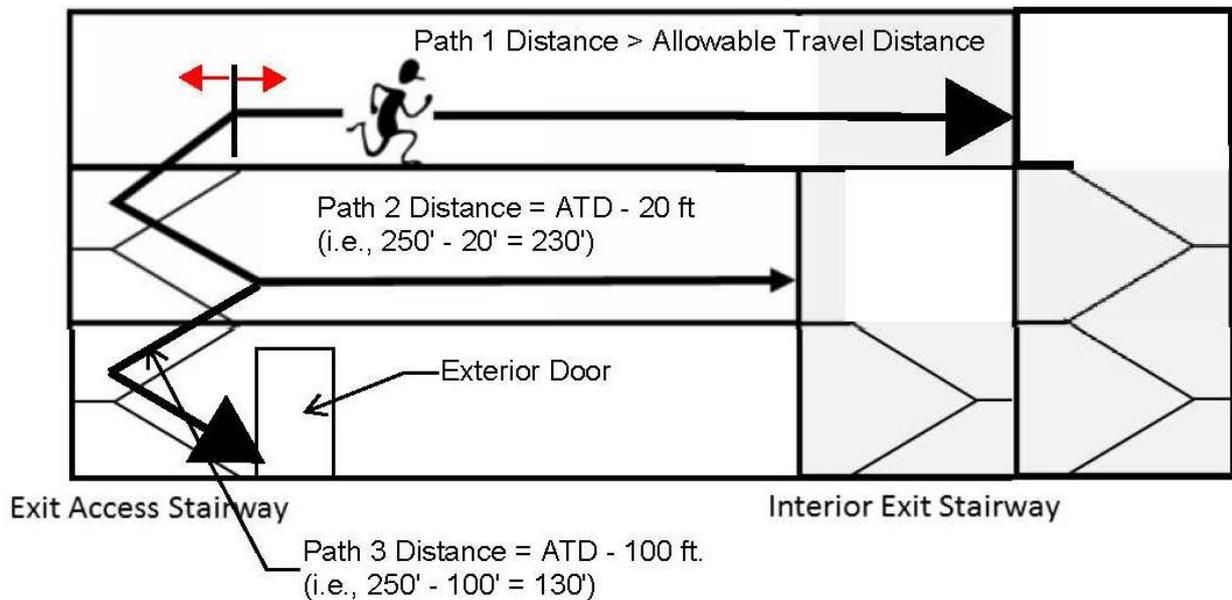

1. In Group R-1, R-2 or R-3 occupancies, exit access stairways and ramps connecting four stories or less serving and contained within an individual dwelling unit or sleeping unit or live/work unit.
2. Exit access stairways serving and contained within a Group R-3 congregate residence or a Group R-4 facility.
3. Exit access stairways and ramps in open parking garages that serve only the parking garage.
4. Exit access stairways and ramps serving open-air assembly seating complying with the exit access travel distance requirements of Section 1029.7.
5. Exit access stairways and ramps between the balcony, gallery or press box and the main assembly floor in occupancies such as theaters, places of religious worship, auditoriums and sports facilities.
6. Where the path of egress travel along the exit access stairway or ramp to an exit is within the allowable exit access travel distance in Section 1017.

**Commenter's Reason:** As has been brought to light by the proponent, by limiting the path of egress travel to one adjacent story Section 1006.3.1 severely and erroneously limited the configurations that could use an exit access stair. The Code Development Committee understood this dilemma and supported the addition of 5 exceptions to Section 1006.3.1, where none existed before.

This public comment seeks to add one more exception, one that is tied to a fundamental concept that from the beginning has been associated with the use of an exit access stair - exit access travel distance. From the beginning the CTC Open Stairway Study Group, which developed and brought forth Code Change E5-09/10 resulting in the concept of exit access stairs being an part of a required means of egress system. The Study Group always had the exit access travel distance limits in the IBC at the forefront of the discussions and imbedded in the language that was developed, and accepted by the membership.

In limiting the path of travel to one adjacent story fundamentally ignores the concept of exit access travel distance. What if the exit access travel distance of traversing 2 stories is less than that a person would go on an adjacent story as shown in the

diagram below?

Why should the path of egress not be allowed to go to the closest exit, regardless of the number of stories away from the point of origin? When a person could actually reach an exit located more than one story from where they started in a distance that is less than that if they have to go to the exit on the adjacent story seems so obvious, but without the proposed language the code forces the uses of the exit on the adjacent story, regardless of the travel distance to that exit. This application essentially flies in the face of a fundamental life safety - get people to the closest exit if you can.

We ask that the proposed language to add a new Exception #6 be accepted, thus allowing the exit access travel distance to drive the egress design, not an arbitrary limit of one adjacent story.

**1006.3.2, Table 1006.3.2(1) and Table 1006.3.2(2); (IFC[BE] 1006.3.2, Table 1006.3.2(1) and Table 1006.3.2(2))**

## **Proposed Change as Submitted**

**Proponent:** Wayne Jewell, Green Oak Charter Township, representing Green Oak Charter Township (wayne.jewell@twp.green-oak.mi.us); Dave Collins, representing the American Institute of Architects (dcollins@preview-group.com)

### **2015 International Building Code**

#### **Revise text as follows:**

**1006.3.2 Single exits.** A single exit or access to a single exit shall be permitted from any story or occupied roof where one of the following conditions exists:

1. The occupant load, number of dwelling units and ~~common path of egress exit access~~ travel distance does not exceed the values in Table 1006.3.2(1) or 1006.3.2(2).
2. Rooms, areas and spaces complying with Section 1006.2.1 with exits that discharge directly to the exterior at the level of exit discharge, are permitted to have one exit or access to a single exit.
3. Parking garages where vehicles are mechanically parked shall be permitted to have one exit or access to a single exit.
4. Group R-3 and R-4 occupancies shall be permitted to have one exit or access to a single exit.
5. Individual single-story or multistory dwelling units shall be permitted to have a single exit or access to a single exit from the dwelling unit provided that both of the following criteria are met:
  - 5.1. The dwelling unit complies with Section 1006.2.1 as a space with one means of egress.
  - 5.2. Either the exit from the dwelling unit discharges directly to the exterior at the level of exit discharge, or the exit access outside the dwelling unit's entrance door provides access to not less than two approved independent exits.

**TABLE 1006.3.2(1)  
STORIES WITH ONE EXIT OR ACCESS TO ONE EXIT FOR R-2  
OCCUPANCIES**

<b>STORY</b>	<b>OCCUPANCY</b>	<b>MAXIMUM NUMBER OF</b>	<b>MAXIMUM <del>COMMON PATH</del> <del>OF EGRESSEXIT</del></b>
--------------	------------------	------------------------------	--

		<b>DWELLING UNITS</b>	<b><u>ACCESS TRAVEL DISTANCE</u></b>
Basement, first, second or third story above grade plane	R-2 <sup>a, b</sup>	4 dwelling units	125 feet
Fourth story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 3048 mm.

NP = Not Permitted

NA = Not Applicable.

a. Buildings classified as Group R-2 equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with *emergency escape and rescue openings* in accordance with Section 1030.

b. This table is used for R-2 occupancies consisting of *dwelling units*. For R-2 occupancies consisting of *sleeping units*, use Table 1006.3.2(2).

**TABLE 1006.3.2(2)  
STORIES WITH ONE EXIT OR ACCESS TO ONE EXIT FOR OTHER  
OCCUPANCIES**

<b>STORY</b>	<b>OCCUPANCY</b>	<b>MAXIMUM OCCUPANT LOAD PER STORY</b>	<b>MAXIMUM <del>COMMON PATH OF EGRESS</del>EXIT <u>ACCESS TRAVEL</u> DISTANCE (feet)</b>
First story above or below grade plane	A, B <sup>b</sup> , E F <sup>b</sup> , M, U	49	75
	H-2, H-3	3	25
	H-4, H-5, I, R-1, R- 2 <sup>a,c</sup> , R-4	10	75
	S <sup>b,d</sup>	29	75
Second story above grade	B, F, M, S <sup>d</sup>	29	75

plane			
Third story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

- a. Buildings classified as Group R-2 equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with *emergency escape and rescue openings* in accordance with Section 1030.
- b. Group B, F and S occupancies in buildings equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 shall have a maximum *exit access* travel distance of 100 feet.
- c. This table is used for R-2 occupancies consisting of *sleeping units*. For R-2 occupancies consisting of *dwelling units*, use Table 1006.3.2(1).
- d. The length of *exit access* travel distance in a Group S-2 *open parking garage* shall be not more than 100 feet

**Reason:** Code change E127 from the last cycle had the last column heading of both tables as maximum exit access travel distance. Code Change E1 changed it to maximum common path of egress. Since using that terminology of common path of travel distances when dealing with a single exit building can create confusion, it is suggested to return the terminology back to exit access travel distance which removes confusion and is still technically correct for single exit buildings or those where common path of travel is applicable. This change would literally not change the intent of the requirement – which is to measure to the top of an exit stairway or down the stairway with an exit access stairway. In the definition of 'common path of egress travel' we state that the occupants have 'access to two exits or exit access doorways' - how does that occur in a single exit building? *Common Path of Travel* distances are discussed in Section 1006.2.1 and prescribed in Table 1006.2.1; which do differ from the distances in Tables 1006.3.2(2) for some occupancies.

**Cost Impact:** Will not increase the cost of construction  
 This change is an editorial change and eliminates confusion. If it works maybe that reduces the cost of construction as time will be saved (which has a cost) trying to figure out what the code is saying, therefore saves cost.

E28-15 : 1006.3.2-  
 JEWELL5394

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The change to exit access travel distance would be a much more restrictive requirement than measuring to the common path of egress travel. There should have been a correlative change to the title heading in Section 1006.2.1 to remove common path of egress travel distance.

**Assembly Motion:**

**As Submitted**

## Online Vote Results:

Successful

Assembly Action :

Approved as Submitted

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**This code change proposal received a successful action of Approve as Submitted.**

**Commenter's Reason:** This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. The assembly action for Approve as Submitted was successful by a vote of 63.05% (215) to 36.95% (126) by eligible members online during the period of May 14 - May 28, 2015.

#### *Public Comment 2:*

**Proponent : Wayne Jewell, Green Oak Charter Township, representing self (wayne.jewell@twp.green-oak.mi.us) requests Approve as Submitted.**

**Commenter's Reason:** This public comment is in support of the very successful floor motion. The application of the text in this proposal is for single exit buildings ONLY. The definition of common path of travel is only applicable when two paths of travel to two exits are required.

**COMMON PATH OF EGRESS TRAVEL.** That portion of the *exit access* travel distance measured from the most remote point within a *story* to that point where the occupants have **separate access to two exits** or *exit access* doorways.

The committee's reasoning statement is in error. Measuring to exit access versus common path isn't more restrictive. The distances in the table weren't changed. What was proposed was a change to the language in both the written text of Section 1006.3.2 and in the heading in Tables 1006.3.2(1) and 1006.3.2(2) to be consistent with the subject matter - distance to a single exit in a building with one exit. In a single exit building there is no location where this part of the definition of *Common Path of Travel* - "separate access to two exits" occurs. The building only has ONE exit - not two. Simply ask yourself - If there aren't two exits how does common path of travel by definition occur?

## Proposed Change as Submitted

**Proponent :** Charles Barlow (cvbarlow@everglow.us)

## 2015 International Building Code

Add new definitions as follows:

### SECTION 202 DEFINITIONS

**DAYLIGHT RESPONSIVE CONTROL.** A device or system that provides automatic control of electric light levels based on the amount of daylight in a space.

**GENERAL LIGHTING.** Lighting that provides a substantially uniform level of illumination throughout an area. General lighting shall not include decorative lighting or lighting that provides a dissimilar level of illumination to serve a specialized application or feature within such area.

**OCCUPANT SENSOR CONTROL.** An automatic control device or system that detects the presence or absence of people within an area and causes lighting, equipment or appliances to be regulated accordingly.

**TIME SWITCH CONTROL.** An automatic control device or system that controls lighting or other loads, including switching off, based on time schedules.

Revise as follows:

### SECTION 1008 MEANS OF EGRESS ILLUMINATION

**1008.1 Means of egress illumination.** Illumination shall be provided in the *means of egress* in accordance with Section 1008.2. Under emergency power, means of egress illumination shall comply with Section 1008.3.

**1008.2 Illumination required.** The *means of egress* serving a room or space shall be illuminated at all times that the room or space is occupied.

#### Exceptions:

1. Occupancies in Group U.
2. *Aisle accessways* in Group A.
3. *Dwelling units and sleeping units* in Groups R-1, R-2 and R-3.
4. *Sleeping units* of Group I occupancies.

~~**1008.3 1008.2.1 Emergency illumination power for illumination supply.**~~ The power supply for means of egress illumination shall normally be provided by the premises' electrical supply.

**Add new text as follows:**

**1008.2.1.1 Lighting controls.** General lighting in the means of egress shall be permitted to use daylight responsive controls, occupant sensor controls and time switch controls. In rooms and spaces where emergency lighting is required in Sections 1008.3, 1008.3.1 and 1008.3.2, the lighting controls for the general means of egress lighting shall comply with all of the following:

1. The daylight responsive controls, occupant sensor controls and time switch controls are listed and evaluated to automatically energize the controlled lights upon device failure or loss of normal power.
2. For occupant sensor controls, the control is activated by any occupant movement in the area served by the controlled lights and illumination timers are set for a durations of 15 minutes minimum.
3. A daylight responsive control or occupant sensor control does not control lights required as a charging source for photoluminescent egress path markings in accordance with Section 1025.
4. A daylight responsive controls, occupant sensor controls or time switch controls does not control electrical power to, or illumination for exit signs in accordance with Section 1013.
5. A daylight responsive controls, occupant sensor controls or time switch controls does not control emergency egress lighting required in Section 1008.3.

**Revise as follows:**

~~1008.2.1~~ **1008.2.2 Illumination level under normal power.** The means of egress illumination level shall be not less than 1 footcandle (11 lux) at the walking surface.

**Exception:** For auditoriums, theaters, concert or opera halls and similar assembly occupancies, the illumination at the walking surface is permitted to be reduced during performances by one of the following methods provided that the required illumination is automatically restored upon activation of a premises' fire alarm system:

1. Externally illuminated walking surfaces shall be permitted to be illuminated to not less than 0.2 footcandle (2.15 lux).
2. Steps, landings and the sides of ramps shall be permitted to be marked with self-luminous materials in accordance with Sections 1025.2.1, 1025.2.2 and 1025.2.4 by systems listed in accordance with UL 1994.

~~1008.2.2~~ **1008.2.3 Exit discharge.** In Group I-2 occupancies where two or more exits are required, on the exterior landings required by Section 1010.6.1, means of egress illumination levels for the exit discharge shall be provided such that failure of any single lighting unit shall not reduce the illumination level on that landing to less than 1 footcandle (11 lux).

~~1008.3.1~~ **1008.3 General Illumination of the means of egress under emergency power.** In the event of power supply failure in rooms and spaces that require two or more means of egress, an emergency electrical system shall automatically illuminate all of the following areas:

1. *Aisles.*
2. *Corridors.*
3. *Exit access stairways and ramps.*

**~~1008.3.2~~ 1008.3.1 Buildings.** In the event of power supply failure in buildings that require two or more *means of egress*, an emergency electrical system shall automatically illuminate all of the following areas:

1. *Interior exit access stairways and ramps.*
2. *Interior and exterior exit stairways and ramps.*
3. *Exit passageways.*
4. Vestibules and areas on the level of discharge used for *exit discharge* in accordance with Section 1028.1.
5. Exterior landings as required by Section 1010.1.6 for *exit doorways* that lead directly to the *exit discharge*.

**~~1008.3.3~~ 1008.3.2 Rooms and spaces.** In the event of power supply failure, an emergency electrical system shall automatically illuminate all of the following areas:

1. Electrical equipment rooms.
2. Fire command centers.
3. Fire pump rooms.
4. Generator rooms.
5. Public restrooms with an area greater than 300 square feet (27.87 m<sup>2</sup>).

**~~1008.3.4~~ 1008.3.3 Duration and controls.** The emergency power system shall provide power for a duration of not less than 90 minutes and shall consist of storage batteries, unit equipment or an on-site generator. Lights for the emergency illumination of the means of egress shall not be controlled by daylight responsive controls, occupant sensor controls or time switch controls. The installation of the emergency power system shall be in accordance with Section 2702.

**~~1008.3.5~~ 1008.3.4 Illumination level under emergency power.** Emergency lighting facilities shall be arranged to provide initial illumination that is not less than an average of 1 footcandle (11 lux) and a minimum at any point of 0.1 footcandle (1 lux) measured along the path of egress at floor level. Illumination levels shall be permitted to decline to 0.6 footcandle (6 lux) average and a minimum at any point of 0.06 footcandle (0.6 lux) at the end of the emergency lighting time duration. A maximum-to-minimum illumination uniformity ratio of 40 to 1 shall not be exceeded. In Group I-2 occupancies, failure of any single lighting unit shall not reduce the illumination level to less than 0.2 foot-candle (2.2 lux).

## **SECTION 1013 EXIT SIGNS**

**1013.6.3 Power source.** Exit signs shall be illuminated at all times. Lights for the illumination of exit signs and the electrical power to the exit signs shall not be controlled by daylight responsive controls, occupant sensor controls or time switch controls. To ensure continued illumination for a duration of not less than 90 minutes in case of primary power loss, the sign illumination means shall be connected to an emergency power system provided from storage batteries, unit equipment or an on-site generator.

The installation of the emergency power system shall be in accordance with Chapter 27.

**Exceptions:**

1. *Approved* exit sign illumination means that provide continuous illumination independent of external power sources for a duration of not less than 90 minutes, in case of primary power loss, are not required to be connected to an emergency electrical system.
2. Group I-2 Condition 2 exit sign illumination shall not be provided by unit equipment battery only.

**SECTION 1025 LUMINOUS EGRESS PATH MARKINGS**

**1025.5 Illumination.** Where *photoluminescent* exit path markings are installed, they shall be provided with not less than 1 footcandle (11 lux) of illumination for not less than 60 minutes prior to periods when the building is occupied and continuously during occupancy. Lighting that is the charging source for photoluminescent egress path markings shall not be controlled by daylight responsive controls or occupant sensor controls.

**Reason:** The entire Section 1008 is being shown so that the reorganization for means of egress lighting sections and references are clear. The four definitions match those currently in the IECC for these types of controls.

The proper operation of (electrical) general lighting used to provide minimum illumination in the means of egress must not be compromised when operated under normal electrical power. In areas where emergency lighting is installed - aisles, corridors, exit access stairways and ramps - the need for reliable (electrical) general lighting and electrical emergency lighting cannot be overestimated. This proposal seeks to impose minimum listing, testing and performance requirements on lighting controls if they are used in the means of egress in areas where electrical emergency lighting are required.

The overwhelming majority of emergency evacuations take place when the (electrical) general lighting is operating properly - providing a minimum of 1 ft-c of illumination when measured at floor level. In areas of the means of egress where (electrical) emergency lighting is required to be installed and maintained, these luminaires provide safe illumination during emergency evacuations. Proper illumination in exit stairs and exit access corridors has been shown to be so valuable to safe egress during emergency evacuations that code authorities now require (non-electrical) luminous egress path markings in the exit stairs of high rise buildings. Some local jurisdictions also require luminous egress path markings installed at the perimeter of exit passageways in public buildings, schools, healthcare facilities and hotels.

Lighting controls - daylight responsive controls, occupant sensor controls and time switch controls - currently installed in the areas of the means of egress of some buildings where electrical emergency lighting is required to be installed and maintained - are being used to reduce illumination levels below 1 footcandle at the walking surface when normal electrical power is available. If the egress capacity of a specific means of egress is required during periods of reduced or completely powered off illumination, the building owner is creating an unsafe condition. Worse, if the lighting controls fail to operate properly during an emergency evacuation, the remaining egress capacity may not be sufficient to safely and quickly evacuate the building.

To meet code requirements, the building owner should maintain minimum illumination levels where electrical emergency lighting is required to be installed and maintained at all times the specific means of egress is required, or he should use lighting control devices that meet the conditions above. The proper operation of emergency lighting must not be compromised when operated under normal power. Lighting controls and occupancy sensors currently installed in the means of egress of some buildings are causing the improper activation of emergency lighting when

normal electrical power is still available. Although these lighting controls are likely improperly installed, there should be specific language in the building and fire codes that this is not allowed. In other facilities, lighting controls on luminaires used for emergency illumination in the means of egress control illumination levels during operation with normal power. In these buildings, there should be emergency luminaires in the means of egress without lighting controls or occupancy sensors to provide the minimum illumination levels required under emergency power.

The Commercial Energy Chapter of the IEC 2015 specifies the use of various lighting controls and interior lighting power allowances for commercial buildings. Paragraph C405.2 Lighting Controls (Mandatory) states that lighting controls are not required in areas required to be continuously illuminated, interior exit stairways, interior exit ramps and exit passageways. Yet, lighting controls are increasingly installed in these areas. Additionally, it is commonly thought that the requirement for these lighting controls is to power off the general lighting in these areas. The IEC allows for the dimming of lights. Minimum illumination levels required by the IBC 2015 and IFC 2015 in the means of egress can be easily accomplished with dimming controls.

There is NO specific code requirement that prohibits the use of lighting controls on electrical emergency lighting or electrical exit signs. There is NO specific code requirement that prohibits the use of lighting controls on (electrical) general lighting - where electrical emergency lighting is required to be installed and maintained - that might affect the normal operation of electrical emergency lighting or electrical exit signs. There is NO specific code requirement in Section 1008 Means of Egress Illumination that qualifies the use of lighting controls used to control general lighting in the means of egress - areas such as rooms and spaces where emergency lighting is required. There is NO specific code requirement for the use of lighting controls used to control (electrical) general lighting where photoluminescent egress path markings are installed.

**Cost Impact:** Will not increase the cost of construction

There should be no additional cost to the building owner. This proposal suggests that lighting controls - daylight responsive controls, occupant sensor controls and time switch controls - should not be used to save energy and money at the expense of life safety.

Traditionally, building and fire codes have required continuous and minimum illumination in the means of egress, for reasons of life safety. During periods when normal electrical power operates properly, this minimum illumination level is 1 ft-candle when measured at the walking surface. For periods when normal electrical power fails and emergency electrical power sources ONLY are available, the average illumination is 1 ft-c with a minimum of 0.6 ft-c along the path of egress where electrical emergency lighting is required to be installed and maintained. Power for electrically powered emergency lighting and exit signs is required to maintain required illumination levels for at least 90 minutes after the failure of (electrical) general lighting.

**E31-15 : 1008.2.1.2  
(New)-BARLOW4492**

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The proposal removes the artificial lighting option currently permitted in the code. It is not known at this time if there are devices available that will meet the provisions proposed for daylight responsive and occupant sensor controls. The code already allows for lights to be turned off, so you don't need provisions for these controls.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Manny Muniz, representing Self (Mannymuniz.mm@gmail.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Building Code**

**1013.6.3 Power source.** Exit signs shall be illuminated at all times. Lights for the ~~illumination~~ illumination of exit signs ~~and~~ , the electrical power to the exit signs and the charging light source for photoluminescent exit signs shall not be controlled by daylight responsive controls, occupant sensor controls or time switch controls. To ensure continued illumination for a duration of not less than 90 minutes in case of primary power loss, the sign illumination means shall be connected to an emergency power system provided from storage batteries, unit equipment or an on-site generator. The installation of the emergency power system shall be in accordance with Chapter 27. \_

#### **Exceptions:**

1. *Approved* exit sign illumination means that provide continuous illumination independent of external power sources for a duration of not less than 90 minutes, in case of primary power loss, are not required to be connected to an emergency electrical system.
2. Group I-2 Condition 2 exit sign illumination shall not be provided by unit equipment battery only.

**Commenter's Reason:** The modification will clarify and ensure that exit signs are not turned off or their visibility reduced by the use of a lighting control device intended to conserve energy. This is consistent with the NFPA 101 Life Safety Code, Section 7.8.1.2.2 (6) which prohibits the use of lighting control devices when used to turn off any lights relied upon for activation of photoluminescent exit signs, and Section 7.8.1.2.2 (7) which prohibits lighting control devices from turning off any exit signs.

**Bibliography:** NFPA 101 Life Safety Code, 2015, Section 7.8.1.2.2 (6) & 7.8.1.2.2 (7)

### *Public Comment 2:*

**Proponent : Manny Muniz, representing Self (Mannymuniz.mm@gmail.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Building Code**

**1013.6.3 Power source.** Exit signs shall be illuminated at all times. Lights for the ~~illumination~~ illumination of exit signs and the electrical power to the exit signs shall not be controlled by daylight responsive controls, occupant sensor controls or time switch controls. To ensure continued

illumination for a duration of not less than 90 minutes in case of primary power loss, the sign illumination means shall be connected to an emergency power system provided from storage batteries, unit equipment or an on-site generator. The installation of the emergency power system shall be in accordance with Chapter 27. Storage batteries and unit equipment shall be listed in accordance with UL 924.

**Exceptions:**

1. *Approved* exit sign illumination means that provide continuous illumination independent of external power sources for a duration of not less than 90 minutes, in case of primary power loss, are not required to be connected to an emergency electrical system.
2. Group I-2 Condition 2 exit sign illumination shall not be provided by unit equipment battery only.

**Commenter's Reason:** While the intention of E31-15, as it pertains to 1013.6.3, is to ensure that the power source for exit signs is reliable and not compromised by the use of energy conserving lighting control devices, there is a discrepancy that of the three emergency power systems described in 1013.6.3, only an on-site generator is required to be listed in accordance with a standard. This minimum level of reliability and performance should also apply to storage batteries and unit equipment, which are both within the scope of UL 924. This is consistent with the NFPA 101 Life Safety Code, Section 7.9.2.5.

Lighting control devices used to control battery equipped emergency luminaires are also within the scope of UL 924 to ensure that they are designed and tested to override any "off" or "dim" settings on their controlled luminaires if there is a loss of normal power. This is consistent with NFPA 101, Section 7.8.1.2.2 (1).

Using UL 924 listed equipment will reduce uncertainty as to the acceptability of the equipment as installed. It also validates that the battery recharge times are as claimed by the equipment manufacturer and establishes minimum levels for equipment performance under emergency conditions. It also ensures that the normal risks for fire and electric shock injury are appropriately mitigated.

### *Public Comment 3:*

**Proponent : Manny Muniz, representing Self  
(Mannymuniz.mm@gmail.com) requests Approve as Modified by  
this Public Comment.**

**Modify as Follows:**

### **2015 International Building Code**

**1008.3.3 Duration and controls.** The emergency power system shall provide power for a duration of not less than 90 minutes and shall consist of storage batteries, unit equipment or an on-site generator. Lights for the emergency illumination of the means of egress shall not be controlled by daylight responsive controls, occupant sensor controls or time switch controls. The installation of the emergency power system shall be in accordance with Section 2702. Storage batteries, unit equipment and lighting control devices used to control battery equipment emergency luminaires shall be listed in accordance with UL924.

**Commenter's Reason:** While the intent of E31-15, as it pertains to 1008.3.3, is to ensure that the lights for the illumination of the means of egress is reliable and not compromised by the use of energy conserving lighting control devices, there is a discrepancy that of the three emergency power systems described in 1008.3.3, only an on-site generator is required to be listed in accordance with a standard. This minimum level of reliability and performance should also apply to storage batteries and unit equipment, which are both within the scope of UL 924. This is consistent with the NFPA 101 Life Safety Code, Section 7.9.2.5.

Using UL 924 listed equipment will reduce uncertainty as to the acceptability of the equipment as installed. It also validates that the battery recharge times are as claimed by the equipment manufacturer and establishes minimum levels for equipment performance under emergency conditions. It also ensures that the normal risks for fire and electric shock injury are appropriately mitigated.

**Bibliography:** UL 924, 9th Edition, Emergency Lighting and Power Equipment NFPA 101 Life Safety Code, 2015 Edition, Sec. 7.9.2.5 and 7.8.1.2.2(1)

### *Public Comment 4:*

**Proponent : Manny Muniz, representing Self (Mannymuniz.mm@gmail.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Building Code**

**1025.5 Illumination.** Where *photoluminescent* exit path markings are installed, they shall be provided with not less than 1 footcandle (11 lux) of illumination for not less than 60 minutes prior to periods when the building is occupied and continuously during occupancy. Lighting that is the charging source for photoluminescent egress path markings shall not be controlled by daylight responsive controls or occupant sensor controls. Time switch controls on a charging source shall be listed in accordance with UL924.

**Commenter's Reason:** The intent of E31-15, as it pertains to 1025.5, is to ensure that the required minimum 1 footcandle of illumination for photoluminescent exit path markings is not turned off or reduced by the use of a lighting control device. The modification will allow the use of a UL 924 listed time switch control to turn on the charging lights for photoluminescent egress path markings as an appropriate method for complying with the requirement in the first sentence and will ensure performance and reliability. It will also reduce uncertainty as to the acceptability of these devices as installed.

**Bibliography:** UL 924 Emergency Lighting and Power Equipment, 9th Edition NFPA 101, 2015 Edition, Sec. 7.8.1.2.2(6)

### *Public Comment 5:*

**Proponent : Manny Muniz, representing Self (Mannymuniz.mm@gmail.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

## 2015 International Building Code

**1013.6.3 Power source.** Exit signs shall be illuminated at all times. Lights for the illumination of exit signs and the electrical power to the exit signs shall not be controlled by daylight responsive controls, occupant sensor controls or time switch controls. To ensure continued illumination for a duration of not less than 90 minutes in case of primary power loss, the sign illumination means shall be connected to an emergency power system provided from storage batteries, unit equipment or an on-site generator. The installation of the emergency power system shall be in accordance with Chapter 27.

### Exceptions:

1. *Approved* exit sign illumination means that provide continuous illumination independent of external power sources for a duration of not less than 90 minutes, in case of primary power loss, are not required to be connected to an emergency electrical system.
2. Group I-2 Condition 2 exit sign illumination shall not be provided by unit equipment battery only.
3. The charging light source for photoluminescent exit signs shall not be prohibited from utilizing a control switch where the charging source for the photoluminescent exit signs is illuminated at all times the room or space is occupied.

**Commenter's Reason:** One of the intentions of E31-15 as it pertains to 1013.6.3 is to ensure that the lights used for the illumination of exit signs will be reliable. UL 924, Section SG5, which governs photoluminescent exit signs, requires that the exit signs be marked "Min 5 fc external light on sign face at all times of building occupancy." or " Min 5 fc fluorescent light on sign face at all times of building occupancy." as appropriate and that the instructions state that the external illumination source is to be energized at all times during building occupancy. This is also consistent with NFPA 101, Section 7.10.5.1 which requires that the exit signs be illuminated as required by the provisions of 7.8, Illumination of Means of Egress. The modification will prolong the life of the charging light source, require less frequent bulb replacement, and provide energy savings which is the intent of using non-electrical exit signs. Means of egress illumination and exit sign illumination should operate together so that a person can both see the egress path and then identify the exits.

In a typical office building where workers work from 9 AM to 6 PM Monday through Friday, and allowing for the building being opened at 8 AM and closed at 7 PM, the building is occupied less than one-third of the time. Two thirds of the time, the charging light source for a photoluminescent exit sign consumes electricity needlessly.

**Bibliography:** UL 924, Emergency Lighting and Power Equipment, 9th Edition  
NFPA 101 Life Safety Code, 2015 Edition, Sec. 7.10.5.1.

**1008.2.2, 1008.3.5; (IFC[BE] 1008.2.2, 1008.3.5)**

## **Proposed Change as Submitted**

**Proponent :** John Williams, CBO, CBO, Chair, Adhoc Healthcare Committee, representing Adhoc Health Care Committee (AHC@iccsafe.org); Carl Baldassarra, P.E., FSFPA, P.E., FSFPE, Chair, Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org)

## **2015 International Building Code**

### **Revise as follows:**

**1008.2.2 Exit discharge.** In Group I-2 occupancies where two or more exits are required, on the exterior landings required by Section 1010.6.1, means of egress illumination levels for the exit discharge shall be provided such that failure of any single ~~lighting unit~~ bulb or ballast shall not reduce the illumination level on that landing to less than 1 footcandle (11 lux).

**1008.3.5 Illumination level under emergency power.** Emergency lighting facilities shall be arranged to provide initial illumination that is not less than an average of 1 footcandle (11 lux) and a minimum at any point of 0.1 footcandle (1 lux) measured along the path of egress at floor level. Illumination levels shall be permitted to decline to 0.6 footcandle (6 lux) average and a minimum at any point of 0.06 footcandle (0.6 lux) at the end of the emergency lighting time duration. A maximum-to-minimum illumination uniformity ratio of 40 to 1 shall not be exceeded. In Group I-2 occupancies, failure of any single ~~lighting unit~~ bulb or ballast shall not reduce the illumination level to less than 0.2 foot-candle (2.2 lux).

**Reason:** The proposed language would better define what constitutes a failure of a lighting unit.

The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website at: <http://www.iccsafe.org/cs/AHC/Pages/default.aspx>.

The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: <http://www.iccsafe.org/cs/CTC/Pages/default.aspx>.

**Cost Impact:** Will not increase the cost of construction  
This is a clarification of requirements; therefore there is no change in construction cost.

E32-15 : 1008.2.2-  
WILLIAMS4242

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** The individual lighting mode of failure is what is important. Terminology that is across all types of fixtures is needed. Perhaps the language in NEC for lighting units would be appropriate.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : John Williams, CBO, representing Adhoc Healthcare Committee (AHC@iccsafe.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Building Code**

**1008.2.2 Exit discharge.** In Group I-2 occupancies where two or more exits are required, on the exterior landings required by Section 1010.6.1, means of egress illumination levels for the exit discharge shall be provided such that failure of any a single bulb or ballast lamp in a luminaire shall not reduce the illumination level on that landing to less than 1 footcandle (11 lux).

**1008.3.5 Illumination level under emergency power.** Emergency lighting facilities shall be arranged to provide initial illumination that is not less than an average of 1 footcandle (11 lux) and a minimum at any point of 0.1 footcandle (1 lux) measured along the path of egress at floor level. Illumination levels shall be permitted to decline to 0.6 footcandle (6 lux) average and a minimum at any point of 0.06 footcandle (0.6 lux) at the end of the emergency lighting time duration. A maximum-to-minimum illumination uniformity ratio of 40 to 1 shall not be exceeded. In Group I-2 occupancies, failure of any a single bulb or ballast lamp in a luminaire shall not reduce the illumination level to less than 0.2 foot-candle (2.2 lux).

**Commenter's Reason:** This public comment is primarily focused upon correcting the terminology that applies to all types of fixtures and aligns with new technologies. This revision coordinates with terminology used by the industry and terminology defined in the National Electrical Code. Luminaire is defined as a complete lighting unit that is comprised of light sources such as lamp(s). In addition, it focuses upon individual lamps versus an entire unit.

The ICC Ad Hoc Committee on Healthcare (AHC) has just completed its 4th year. The AHC was established by the ICC Board to evaluate and assess contemporary code issues relating to hospitals and ambulatory healthcare facilities. This is a joint effort between ICC and the American Society for Healthcare Engineering (ASHE), a subsidiary of the American Hospital Association, to eliminate duplication and conflicts

in healthcare regulation. Information on the AHC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the AHC effort can be downloaded from the AHC website at: [Adhoc Healthcare](#).

# E35-15

## 1009.1 (IFC[BE] 1009.1)

### Proposed Change as Submitted

**Proponent:** Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

## 2015 International Building Code

### Revise as follows:

**1009.1 Accessible means of egress required.** Accessible *means of egress* shall comply with this section. Accessible spaces shall be provided with not less than one accessible *means of egress*. Where more than one *means of egress* are required by Section 1006.2 or 1006.3 from any accessible space, each accessible portion of the space shall be served by not less than two accessible *means of egress*.

#### Exceptions:

1. Accessible *means of egress* are not required to be provided in existing buildings.
- ~~2. One accessible *means of egress* is required from an accessible mezzanine level in accordance with Section 1009.3, 1009.4 or 1009.5.~~
2. In assembly areas with ramped *aisles* or stepped *aisles*, one accessible *means of egress* is permitted where the *common path of egress travel* is accessible and meets the requirements in Section 1029.8.

**Reason:** Section 1009.1 Exception 2 should be deleted.

When originally proposed there was a conflict between accessible means of egress and mezzanine requirements. Accessible means of egress would have required mezzanines in non-sprinklered buildings to have two enclosed stairways with areas of refuge, wider stairways and two-way communication. Mezzanine requirements allowed for two open stairways. Requiring one enclosed stairway and one open stairway for an accessible mezzanine was considered a compromise.

The concept of where open stairways can serve as part of a means of egress has evolved. Mezzanine stairways are now specifically addressed in Section 1009.3 Exception 1. The proposed deletion in Section 1009.1 would make mezzanine requirements consistent with the accessible means of egress requirements for a two story building. For non-sprinklered buildings, both stairways would need to meet the 48" width provisions so that both stairways could be utilized for assisted rescue; but at the same time allow for both stairways to be open. For sprinklered buildings, due to the exceptions in Section 1009.3, the required stairway widths can remain 36" or 44" as applicable. The end result will be a clarification of the codes and an increase in options for assisted rescue; at the same time a decrease in construction costs from what would have been required under previous codes.

With Section 1009.1 Exception 2 removed, this will increase the level of safety for persons with disabilities and fire fighters because two options for accessible means of egress will be provided.

In July/2014 the ICC Board decided to sunset the activities of the Code Technology Committee (CTC). This is being accomplished by re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). This proposal falls under

the CTC Area of Study entitled Unenclosed Exit Stairs. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website. <http://www.iccsafe.org/cs/CTC/Pages/default.aspx>

This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: <http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

**Cost Impact:** Will not increase the cost of construction  
This proposal offers design options that can reduce overall costs.

E35-15 : 1009.1-  
KULIK3643

---

### **Public Hearing Results**

**Committee Action:** **Disapproved**

**Committee Reason:** Two accessible means of egress is a burden for small mezzanines. The current requirement for one accessible means of egress provides a sufficient level of safety.

**Assembly Motion:** **As Submitted**

**Online Vote Results:** **Failed**

Support: 38.57% (140) Oppose: 61.43% (223)

**Assembly Action :** **None**

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : Edward Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests Approve as Submitted.**

**Commenter's Reason:** The Building Code Action Committee (BCAC) is requesting approval of this proposal as submitted. The code committee felt that requiring two means of egress would be a burden to small mezzanines. The deletion of this exception would only affect mezzanines that were large enough that they would have to have two means of egress. In addition, the code committee overlooked the allowance in Section 1009.3 Exception 1 which allows open exit access stairways from mezzanines to be considered part of an accessible means of egress.

As stated in the original reason statement, this is an exception that was a compromise that was needed when only enclosed stairways could serve as part of an accessible means of egress. Deletion of this exception will be a clarification of the codes and an increase in options for assisted rescue. This will increase the level of safety for persons with disabilities and fire fighters because two options for

accessible means of egress will be provided from the larger mezzanines.

---

**E35-15**

# E37-15

## 1009.2

### **Proposed Change as Submitted**

**Proponent:** Edward Kulik, Chair, representing Building Code Action Committee (bcac@iccsafe.org)

#### **Revise as follows:**

##### **1009.2 Continuity and components.**

Each required accessible *means of egress* shall be continuous to a *public way*. The accessible means of egress shall provide a path of travel along an accessible route in accordance with Section 1009.2.1 through 1009.2.3. ~~and shall consist of one or more of the following components:~~

- ~~1. Accessible routes complying with Section 1104.~~
- ~~2. Interior exit stairways complying with Sections 1009.3 and 1023.~~
- ~~3. Exit access stairways complying with Sections 1009.3 and 1019.3 or 1019.4.~~
- ~~4. Exterior exit stairways complying with Sections 1009.3 and 1027 and serving levels other than the level of exit discharge.~~
- ~~5. Elevators complying with Section 1009.4.~~
- ~~6. Platform lifts complying with Section 1009.5.~~
- ~~7. Horizontal exits complying with Section 1026.~~
- ~~8. Ramps complying with Section 1012.~~
- ~~9. Areas of refuge complying with Section 1009.6.~~
- ~~10. Exterior areas for assisted rescue complying with Section 1009.7 serving exits at the level of exit discharge.~~

#### **Add new text as follows:**

**1009.2.1. Accessible exit access.** The path of travel for exit access shall be along an accessible route and shall consist of one or more of the following components:

1. Accessible routes complying with Section 1104
2. Platform lifts complying with Sections 1009.5 and 1109.7.
3. Exit access ramps complying with Section 1012.

**Exception:** Exit access stairways between stories and mezzanines and complying with Section 1009.3 and complying with either Section 1019.3 or 1019.4.

**1009.2.2 Accessible exits.** The path of travel within the exit shall be along an accessible route.

#### **Exceptions:**

1. Interior exit stairways complying with Sections 1009.3 and 1023.
2. Exterior exit stairways complying with Sections 1009.3 and 1027 and

- serving levels other than the level of exit discharge.
3. Elevators complying with Sections 1009.4 and 1109.6.
  4. Exterior areas of assisted rescue complying with Section 1009.7 serving exits at the level of exit discharge.

**1009.2.3 Accessible exit discharge.** At the level of exit discharge the path of travel for the exit discharge shall be along an accessible route connecting the exit to the public way.

**Exceptions:**

1. The accessible route connects to an exterior area for assisted rescue complying with Section 1009.7.
2. The accessible route connects to an area of refuge complying with Section 1009.6.
3. The accessible route connects to a safe dispersal area in accordance with the exception to Section 1028.5.

**Reason:** This public proposal is submitted by the ICC Building Code Action Committee (BCAC). The BCAC was established by the ICC Board of Directors to pursue opportunities to improve and enhance an assigned International Code or portion thereof. This includes both the technical aspects of the codes as well as the code content in terms of scope and application of referenced standards. Since its inception in July, 2011, the BCAC has held 13 open meetings and numerous workgroup calls which included members of the BCAC as well as any interested party to discuss and debate the proposed changes and the public comments. Related documentation and reports are posted on the BCAC website at: <http://www.iccsafe.org/cs/BCAC/Pages/default.aspx>.

It is not the intent of this proposal to change the requirements for accessible means of egress, but rather to clarify what is expected. This is also updated with new terminology for exit access stairways and ramps.

Ideally everyone should be able to self-evacuate to a public way. However, there are many situations where people who cannot use stairways are on upper floors of buildings; or situations where the slope and size of the site does not allow for an accessible route all the way to a road that is permanently deeded and dedicated to the public (i.e., public way). The primary safety focus is to allow for an accessible route to a location where persons needing assistance and emergency responders can connect. These locations are part of the fire and safety evacuation plans and on building signage so both occupants and emergency responders will be informed.

All the exceptions are in recognition that an accessible route is not possible in some situations. Where a person with mobility impairment gets to a stairway, an elevator that has gone to fire department recall, or an exit discharge that is not accessible, alternative means of rescue or protection must be available. Protection and/or assistance is provided at stairways, elevators with standby power, horizontal exits, areas of refuge and exterior areas for assisted rescue. This is not an exception for access to the public way. This is an exception for an accessible route along the stairway or from the exterior area of assisted rescue. Elevators will be used with fire-department assistance - and are not permitted for self-evacuation during a fire emergency. Horizontal exits also allow for a safe place to wait within a facility till the fire department or other emergency responders can assist.

The following is the purpose of each subsection.

1009.2 - All means of egress must be continuous to a public way. If this route is accessible, than this would constitute an accessible means of egress.

1009.2.1 - Exit access is defined as -

**EXIT ACCESS.** That portion of a *means of egress* system that leads from any

occupied portion of a building or structure to an *exit*.

The exit access is always required to be accessible. The three items listed are in the current text as Items 1, 6 and 8. If a platform lift is utilized, it has to have battery backup (1009.5) as well as meet the ASME A18.1 safety provisions (1109.7). This route can include exit access ramps. The exception, exit access stairways are listed in the current text as Item 3. The clarification of the exit access stairways only being allowed as part of the accessible means of egress when the serve changes in level of a story or from a mezzanine is consistent with Section 1009.3. Exit access steps within the same level are not permitted to serve as part of the accessible means of egress. Ramps or platform lifts would be required to provide an accessible means of egress.

1009.2.2 - Exit is defined as -

**EXIT.** That portion of a *means of egress* system between the *exit access* and the *exit discharge* or *public way*. Exit components include exterior exit doors at the *level of exit discharge*, *interior exit stairways* and *ramps*, *exit passageways*, *exterior exit stairways* and *ramps* and *horizontal exits*.

Accessible routes along exits could be exit passageways, exit ramps, exterior exit doorways at the level of exit discharge and horizontal exits (current item 7). Since this list is in the definition, it does not need to be repeated in the text. The exceptions are where people who cannot use the stairways to evacuation can wait for assistance; exit stairways (interior and exterior) and elevators with standby power. Areas of refuge (Item 9) are not listed because they are a requirement directly associated with the exit stairway or elevators in Sections 1009.3 and 1009.4. Depending on their location, they could be part of the exit access or exit. Listing them in both places would be confusing.

1009.2.3 - Exit discharge is defined as -

**EXIT DISCHARGE.** That portion of a *means of egress* system between the termination of an *exit* and a *public way*.

The accessible route at the level of exit discharge is along the exit discharge can include ramped or level surfaces outside the building. If an accessible route is not possible to the public way, the options are an area of refuge (current item 9), an exterior area of assisted rescue (current item 10) or a safe dispersal area (permitted in 1028.5).

This proposal was originally brought up as a point of discussion because the current language for exterior areas of assisted rescue has been incorrectly interpreted to say asking people to wait 10 feet away from the building is acceptable, and then a separation is not required. Since you are asking persons with mobility impairments to wait at that location for assistance rather than continually move to the public way, 10 feet is not an acceptable alternative. The 50 feet with safe dispersal area is a system that has worked for assembly facilities for a number of years.

**Cost Impact:** Will not increase the cost of construction

The proposal is a clarification of current requirements; therefore, there is no impact on the cost.

E37-15 : 1009.2-  
KULIK3333

---

## **Public Hearing Results**

## Committee Action:

**Disapproved**

**Committee Reason:** This was intended to be a cleanup but it seems to be unnecessarily long. The provisions for exit access ramps should include a reference to Section 1019 as well as Section 1012.

## Assembly Action :

**None**

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : Edward Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests Approve as Modified by this Public Comment.**

#### **Modify as Follows:**

### **2015 International Building Code**

**1009.2 Continuity and components.** Each required accessible *means of egress* shall be continuous to a *public way*. The *accessible means of egress* shall provide a path of travel along the *accessible route* in accordance with Section 1009.2.1 through 1009.2.3.

**1009.2.1 Accessible exit access.** The path of travel for exit access shall be along an accessible route and shall consist of one or more of the following components:

1. Accessible routes complying with Section 1104
2. Platform lifts complying with Sections 1009.5 and 1109.7.
3. Exit access ramps complying with Section 1012 and 1019.

**Exception:** ~~Exit~~ The accessible route for exit access shall be permitted to terminate at exit access stairways between stories and mezzanines and complying with Section 1009.3 and complying with either Section 1019.3 or 1019.4.

**1009.2.2 Accessible exits.** The path of travel within the exit shall be along an accessible route.

**Exceptions:** The accessible route within the exit shall be permitted to terminate at any of the following components:

1. Interior exit stairways complying with Sections 1009.3 and 1023.
2. Exterior exit stairways complying with Sections 1009.3 and 1027 and serving levels other than the level of exit discharge.
3. Elevators complying with Sections 1009.4 and 1109.6.
4. Exterior areas of assisted rescue complying with Section 1009.7 serving exits at the level of exit discharge.

**1009.2.3 Accessible exit discharge.** At the level of exit discharge the path of travel for the exit discharge shall be along an accessible route connecting the exit to the public way.

**Exceptions:**

1. The accessible route ~~connects~~ for exit discharge shall be

permitted to an terminate at any of the following components:

- 1.1. An exterior area for assisted rescue complying with Section 1009.7.
- 1.2. ~~The accessible route connects to an~~ An area of refuge complying with Section 1009.6.
- 1.3. ~~The accessible route connects to a~~ A safe dispersal area in accordance with the exception to Section 1028.5.

**Commenter's Reason:** The Building Code Action Committee (BCAC) is requesting approval of this public comment for as modified. The intent of the original proposal was to break up the larger list into elements into the three parts for means of egress - exit access, exit and exit discharge. The MOE development committee felt that more direction was needed. The proposed modification elaborates on the direction so that there is a clearer understanding of the requirements and makes the language consistent for each of the three parts. The modifications address specific concerns raised by the committee in their reason for disapproving the original proposal.

There was a comment from the MOE development committee that the ramp provisions in exit access should reference Section 1019. Since this section addresses exit access ramps, that reference has been added.

There were some other concerns raised that BCAC would like to respond to in this reason statement.

It was suggested that elevators should be allowed for exit access similar to platform lifts. -

At this time, elevators in low rise buildings do not have stand by power, there is no limit on the number of occupants they serve, and they are not intended to be used un assisted during a fire event. Platform lifts have standby power and only serve limited spaces.

It was suggested that new Section 1009.2.3 does not clarify what happens at the level of exit discharge for exits which originate at other floors. -

The general exit provisions require exit stairways and ramps to discharge to the outside or to an exit passageway. Persons on upper floors will be evacuating with assistance, so no special accessibility requirements are needed for the exit discharge serving just the upper floor exits. The intent of Section 1009.2.3 is only for when exit discharge is unassisted and at grade level.

---

(geneb@codeconsultants.com)

## 2015 International Building Code

### Revise as follows:

**1009.2.1 Elevators required.** In buildings where a required ~~accessible floor~~ story or occupied roof is four or more *stories* above or below a *level of exit discharge*, not less than one required accessible *means of egress* shall be an elevator complying with Section 1009.4.

#### Exceptions:

1. In buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors provided with a *horizontal exit* and located at or above the *levels of exit discharge*.
2. In buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors provided with a *ramp* conforming to the provisions of Section 1012.

**Reason:** The language is proposed to be changed to clarify that an occupiable roof must be included where determining the elevator requirement. The existing text is interpretive at best. The proposal makes it clear that if a four story building has a roof garden area which the occupants can use, then the elevator to that roof level must be a part of the accessible means of egress.

**Cost Impact:** Will not increase the cost of construction  
The proposal is a clarification. This is how it should be and should have been applied.

E38-15 : 1009.2.1-  
BOECKER5545

---

### Public Hearing Results

**Committee Action:**

**Disapproved**

**Committee Reason:** The provisions for accessible means of egress do not directly address open spaces such as occupied roofs. For example, how could someone do a horizontal exit? What would be the point of an area of refuge on an open roof. A roof is not a story, so would a 4 story building with an occupied roof need standby power?

**Assembly Action :**

**None**

---

### Individual Consideration Agenda

## Public Comment 1:

**Proponent : Gene Boecker, representing Code Consultants, Inc. (geneb@codeconsultants.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Building Code**

**1009.2.1 Elevators required.** In buildings where a required *accessible* story or occupied roof is four or more *stories* above or below a *level of exit discharge*, not less than one required *accessible means of egress* shall be an elevator complying with Section 1009.4.

#### **Exceptions:**

1. In buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors\_ provided with a *horizontal exit* and located at or above the *levels of exit discharge or occupied roofs where the building below is provided with horizontal exits.*
2. In buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required on floors or occupied roofs provided with a *ramp* conforming to the provisions of Section 1012.
3. In buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required at occupied roofs provided with two remote, enclosed exit stairways conforming to the provisions of Section 1023.

**Commenter's Reason:** As stated in the original proposal, it makes no sense to ignore people on a roof simply because it is a roof - especially if some of the people on the roof have disabilities. Just as many people could be there (or more) than the number of people on the floors below. For this reason the code already recognizes standard means of egress requirements for an occupied roof. The reason that this has a threshold at five stories has to do with the difficulties in an assisted descent down that many stairs. That issue doesn't go away simply because the place where people are located is an occupied roof rather than an enclosed story. However, as was pointed out during the committee hearings, the roof is open to the air which lends some additional benefits when it comes to assisted egress. By adding an exception for occupied roofs that includes enclosed exit stairways, much of the concern expressed at the committee hearings is removed. The approval of E 151 means that an elevator will be required for access to the occupied roof. Unless the elevator is recalled because something is threatening it, the elevator will remain functional and can be used for egress. If two enclosed exit stairways are also provided, then a reasonable measure of safety can be assumed. Therefore, the exception is a reasonable exchange for the required accessible egress elevator for these four story buildings with occupied roofs.

The other two existing exceptions had the words "occupied roof" added for consistency.

# E40-15

## 1009.7.2; (IFC[BE] 1009.7.2)

### Proposed Change as Submitted

**Proponent :** Lawrence Lincoln, representing Utah Chapter of ICC (larry.lincoln@slcgov.com)

## 2015 International Building Code

### Revise as follows:

**1009.7.2 Separation.** Exterior walls separating the exterior area of assisted rescue from the interior of the building shall have a minimum *fire-resistance rating* of 1 hour, rated for exposure to fire from the inside. The fire-resistance-rated exterior wall construction shall extend horizontally 10 feet (3048 mm) beyond the landing on either side of the landing or equivalent fire-resistance-rated construction is permitted to extend out perpendicular to the exterior wall 4 feet (1220 mm) minimum on the side of the landing. The *fire-resistance-rated* construction shall extend vertically from the ground to a point 10 feet (3048 mm) above the floor level of the area for assisted rescue or to the roof line, whichever is lower. Openings within such *fire-resistance-rated* exterior walls shall be protected in accordance with Section 716.

**Exception:** Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

**Reason:** It seems unreasonable for the IBC to mandate more passive fire protection for a mobility impaired occupant 'that is already located outside of the building' (at the area of assisted rescue) than it does for a mobility impaired occupant that is 'within a building'. IBC section 1009.3 exception #5 allows for the elimination of area of refuges in stairways and IBC section 1009.4 exception #2 allows for the elimination of area of refuges to access elevators when the building is equipped throughout with an automatic fire sprinkler system. On the other hand, a mobility impaired person located at the exterior area of assisted rescue stair landing (already located outside of the building) is afforded the protection of 1-HR fire-resistance rated exterior wall construction and protection of openings as put forth by section 1009.7.2 whether the building is equipped with an automatic sprinkler system or not. This fire sprinkler exception is both logical and reasonable.

**Cost Impact:** Will not increase the cost of construction  
The code change proposal would eliminate the cost of the passive fire resistance rated construction materials required for the exterior area of assisted rescue in buildings that are equipped throughout with an NFPA 13 or NFPA 13R fire sprinkler systems.

E40-15 : 1009.7.2-  
LINCOLN4114

---

## Public Hearing Results

### Committee Action:

### Approved as Submitted

**Committee Reason:** There is no requirement for areas of refuge in a sprinklered building on upper floors. Therefore, for consistency, in a sprinklered building on the level of exit discharge there should not be a requirement for a separation from the interior of the building for an exterior area for assisted rescue. The sprinkler system

provides adequate protection for a trade off. By being outside and protected a person would be protected from smoke and fumes. Therefore the passive protection of the exterior wall is not needed.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### ***Public Comment 1:***

**Proponent : Lawrence Lincoln, representing Utah Chapter of ICC (larry.lincoln@slcgov.com) requests Approve as Submitted.**

**Commenter's Reason:** As the proponent for E40-15, I would request that the code committee reaffirm its 'approved as submitted' (AAS) designation for this code change. I also stand behind my original reasoning statement and would invite the members of the code committee to reread that statement. The submitter for disapproval has indicated that the 2000 IBC and the 2003 IBC do not contain this sprinkler exception and that both of these editions of the IBC are mentioned in section 207 of the 2010 ADA standard. The submitter for disapproval then goes on to imply that approval of this code change may jeopardize the federal government designation of the 2018 edition of the IBC as a 'safe harbor' document. Our code change process 'silently mandates' that we write good/logical code language and that we 'not perpetuate' the contrary. It is my opinion that although this sprinkler exception was not contained within the 2000 and 2003 editions of the IBC, this does not make the 2018 edition of the IBC less safe in one fell swoop. To perpetuate bad/illogical code language/provisions would be a travesty.

### ***Public Comment 2:***

**Proponent : Adolf Zubia, representing International Association of Fire Chiefs, Fire & Life Safety Section (azubiamia@yahoo.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

## **2015 International Building Code**

**1009.7.2 Separation.** Exterior walls separating the exterior area of assisted rescue from the interior of the building shall have a minimum *fire-resistance rating* of 1 hour, rated for exposure to fire from the inside. The fire-resistance-rated exterior wall construction shall extend horizontally 10 feet (3048 mm) beyond the landing on either side of the landing or equivalent fire-resistance-rated construction is permitted to extend out perpendicular to the exterior wall 4 feet (1220 mm) minimum on the side of the landing. The *fire-resistance-rated* construction shall extend vertically from the ground to a point 10 feet (3048 mm) above the floor level of the area for assisted rescue or to the roof line, whichever is lower. Openings within such *fire-resistance-rated* exterior walls shall be protected in accordance with Section 716.

**Exception:** ~~Buildings~~ The fire-resistance rating and opening protectives are not required in the exterior wall where the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

**Commenter's Reason:** This Public Comment intends to clarify the exception. The exception itself is unclear since it does not indicate whether the 1 hour construction is not required, or whether the exterior area of assisted rescue is not required. This proposal clarifies that the sprinklers in the building eliminate the need to provide the 1-hour separation, by specifically stating that the 1 hour construction is not required, and the protected openings are not required.

### *Public Comment 3:*

**Proponent : Edward Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests Disapprove.**

**Commenter's Reason:** The ICC Building Code Action Committee requests disapproval. The code committee approved this change saying it was equivalent to upper floor requirements for accessible means of egress. The exterior area of assisted rescue is to be provided only when an exit cannot include an accessible route to a public way. Disabled persons must wait in this area for first responders to assist them to finish egress after an emergency forces them to leave the building. Exterior areas of assisted rescue are not the same as areas of refuge; they are exterior locations where the space is not protected by sprinklers since there are no overhead locations for mounting sprinklers. The requirements in Section 1027 for exterior exit ramps and stairways do not provide sprinkler exceptions for separations from the interior except for specific egress configurations that afford two ways of egress at certain exterior conditions and which are assumed to have a complete means of egress with exit discharge connected to a public way. The new exception will reduce the level of protection required for exterior areas of assisted rescue to be less than what would be required at exterior exit stairways or ramps. With this new exception a disabled person at an exterior area of assisted rescue would have a lower level of protection than a person walking down an exterior exit stair and lower than the protection provided for all occupants using an exterior exit ramp that is connected to a public way where occupants can finish their egress from the building.

In addition, the 2000 IBC (with 2001 Supplement) and the 2003 IBC are referenced by Section 207 of the 2010 ADA for criteria for accessible means of egress. The federal government is currently looking at referencing later editions of the IBC as 'equivalent'. Since the 2000 and 2003 IBC provisions for exterior areas of assisted rescue do not provide an exception for provision of sprinklers if this exception is accepted it could be seen as imposing a lesser requirement than currently in the codes referenced by the 2010 ADA. This could jeopardize the acceptance by the federal government of the 2018 code as equivalent to the older "I" codes.

### *Public Comment 4:*

**Proponent : Marsha Mazz, U.S. Access Board, representing U.S. Access Board (mazz@access-board.gov) requests Disapprove.**

**Commenter's Reason:** The committee approved this new exception to the separation requirements for exterior areas of assisted rescue stating that the resulting protection was equivalent to that provided on upper floors within buildings equipped throughout with an automatic sprinkler system. Accessible means of egress on the upper floors of a sprinklered building are not required to provide areas of refuge. However, there is still the option to move into the rated stairway enclosure for persons who cannot use the stairway to exit. A two-way communication system also is required on the upper floors.

Regardless of whether there is fire suppression within the building, smoke does not typically collect in an exterior area for assisted rescue. However, the passive

protection of an exterior wall with a 1 hour rating is still needed in the same way that separation is needed in a stairway. By removing the requirement for separation, a person who cannot continue to the public way by using the stair will potentially be sitting adjacent to the fire with no protection. With the proposed exception, the exterior area of assisted rescue could be located next to a large window or at a loading dock door. In addition, there is no two-way communication requirement for the exterior area for assisted rescue. Consequently, the person who is waiting there has to rely on line-of-sight and the fire and safety evacuation plans to be assisted by the emergency responders.

**Lacking justification:** The exterior area for assisted rescue is most commonly used at the back exit of a single story building. There were no technical justifications or fire studies, or problems identified with the current requirement in the reason for the original proposal.

**ADA Coordination:** The 2000 IBC (with 2001 Supplement) and the 2003 IBC are referenced by the 2010 ADA Standards for accessible means of egress. Retaining this exception as submitted would establish a lesser requirement than is currently required by ADA Standards. This could jeopardize the possibility that the Access Board will update its reference to the 2018 IBC.

---

E40-15

# E42-15

## 1009.8; (IFC[BE] 1009.8)

### **Proposed Change as Submitted**

**Proponent :** Stephen DiGiovanni, Clark County Building Department, representing Southern Nevada Chapter of ICC (sdigiovanni@clarkcountynv.gov)

## **2015 International Building Code**

**Revise as follows:**

### **1009.8 Two-way communication. A**

Where elevators are provided as part of an accessible means of egress, a two-way communication system complying with Sections 1009.8.1 and 1009.8.2 shall be provided at the landing serving each elevator or bank of elevators on each accessible floor that is one or more stories above or below the level of exit discharge.

#### **Exceptions:**

1. Two-way communication systems are not required at the landing serving each elevator or bank of elevators where the two-way communication system is provided within *areas of refuge* in accordance with Section 1009.6.5.
2. Two-way communication systems are not required on floors provided with *ramps* conforming to the provisions of Section 1012.
3. Two-way communication systems are not required at the landings serving only service elevators that are not designated as part of the accessible *means of egress* or serve as part of the required *accessible route* into a facility.
4. Two-way communication systems are not required at the landings serving only freight elevators.
5. Two-way communication systems are not required at the landing serving a private residence elevator.

**Reason:** Current code requires two-way communication for elevator landings in all buildings two stories or greater, regardless of the design for accessible means of egress. This proposal attempts to tie the requirement for two-way communication to only serve when elevators are provided as a part of the accessible egress.

Section 1009.2.1 only requires elevators to be part of the accessible means of egress when the building has a required accessible floor that is four or more stories above or below the level of exit discharge. In buildings that are less than these limits, the accessible means of egress may be provided by other means, such as stairs, ramps, and other components permitted by Section 1009.2, such that any elevators in such a building are not required to be constructed in accordance with Section 1009.4. Due to the standby requirements in Section 1009.4, designers may choose to not provide accessible egress via the elevator, when permitted to by Section 1009.2.1, instead designing the accessible egress via other components. There is concern that placing the two-way communication in every elevator will lead occupants away from the actual means of egress.

This change is intended to associate the elevator two-way communication system from 1009.8 to elevators that are constructed in accordance with Section 1009.4 to be a part of the accessible route, where such accessible elevators are either

required by Section 1009.2.1, and optioned by the designer in accordance with Section 1009.2.

**Cost Impact:** Will not increase the cost of construction  
This proposal will not increase the cost of construction as the proposal may lead to less installations of two-way communication systems.

E42-15 : 1009.8-  
DIGIOVANNI3845

---

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** A two way communication system is needed for persons with mobility impairments to be able to communicate with emergency responders on all levels that are accessed by an elevator. Loosing this two-way communication in two, three and four story buildings is a reduction in life safety for persons with mobility impairments who have difficulty or cannot use stairways for evacuation. The location at the elevator lobby is the best location for persons to see the two-way communication system when they enter the building. While the proponents talked about high cost, no cost information was provided.  
This is consistent with the committee action on E43-15.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Stephen DiGiovanni, representing Southern Nevada Chapter of ICC (sdigiovanni@clarkcountynv.gov) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Building Code**

**1009.8 Two-way communication.** Where elevators are provided as part of an *accessible means of egress* in accordance with Section 1009.2.1, a two-way communication system complying with Sections 1009.8.1 and 1009.8.2 shall be provided at the landing serving each elevator or bank of elevators on each accessible floor that is one or more stories above or below the *level of exit discharge*.

#### **Exceptions:**

1. Two-way communication systems are not required at the landing serving each elevator or bank of elevators where the two-way communication system is provided within *areas of refuge* in accordance with Section 1009.6.5.
2. Two-way communication systems are not required on floors provided with *ramps* conforming to the provisions of Section 1012.
3. Two-way communication systems are not required at the landings serving only service elevators that are not designated as part of the accessible *means of egress* or

- serve as part of the required *accessible route* into a facility.
4. Two-way communication systems are not required at the landings serving only freight elevators.
  5. Two-way communication systems are not required at the landing serving a private residence elevator.

**Commenter's Reason:** The purpose of this public comment is to clarify the proposed trigger of when a two-way communication system is required, by specifying the referenced code section that triggers elevators as part of the accessible route.

Current code requires two-way communication for elevator landings in all buildings two stories or greater, regardless of the design for accessible means of egress. This proposal attempts to tie the requirement for two-way communication to only serve when elevators are provided as a part of the accessible egress.

Section 1009.2.1 only requires elevators to be part of the accessible means of egress when the building has a required accessible floor that is four or more stories above or below the level of exit discharge. In buildings that are less than these limits, the accessible means of egress may be provided by other means, such as stairs, ramps, and other components permitted by Section 1009.2, such that any elevators in such a building are not required to be constructed in accordance with Section 1009.4. Due to the standby requirements in Section 1009.4, designers may choose to not provide accessible egress via the elevator, when permitted to by Section 1009.2.1, instead designing the accessible egress via other components. There is concern that placing the two-way communication in every elevator will lead occupants away from the actual means of egress.

This provision for two-way communication assumes that the floor area is not provided with land line telephones, or that the occupant does not carry a cell phone. The process to use the two-way communication system, as indicated in the code, requires that the call first go to a receiver within the building, and after timeout, the call is transferred to a central monitoring company or to 911. For smaller buildings, it may not be accurate to assume that the receiver will be manned. If the receiver is not manned, the call is then timed-out, and the caller is transferred. If the transfer occurs to a central station (which may be reasonable to assume) then that central station would have to place another call, in order to call the fire department. In other words, the two-way communication system could delay response to have three telephone connections, which is slower than if the occupant had been directed to use a land line or cell phone in the first place. In smaller buildings, such as addressed within this proposal, fire responders will likely be able to respond to all floor areas in such an expeditious manner that the benefit of this system would not be realized.

This change is intended to associate the elevator two-way communication system from 1009.8 to elevators that are constructed in accordance with Section 1009.4 to be a part of the accessible route, where such accessible elevators are either required by Section 1009.2.1, or optioned by the designer in accordance with Section 1009.2.

## **E56-15**

**202 (New), 1010.1.4.4 (New); (IFC[BE] 1010.1.4.4 (New))**

### **Proposed Change as Submitted**

**Proponent :** John Woestman, Kellen Company, representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

## **2015 International Building Code**

**Add new definition as follows:**

### **SECTION 202 DEFINITIONS**

**CONTROL VESTIBULE** A space with a door locking arrangement of two doors interconnected such that the first door must close or lock before the second door is openable and unlocked.

**Add new text as follows:**

**1010.1.4.4 Control vestibule.** Doors in the means of egress configured as a control vestibule shall provide for emergency egress and shall be subject to approval by the code official.

**Reason:** Control vestibules (interlocked doors) are being installed. The code currently is silent regarding requirements for doors in the means of egress configured as a control vestibule. The configuration of control vestibules which provide for ingress control (access control) is outside the scope of the IBC. However, egress **MUST** be provided for, and how egress is provided with control vestibules should be subject to approval by the AHJ.

**Cost Impact:** Will not increase the cost of construction  
No cost increase. Control vestibules are not required by the code.

**E56-15 : 1010.1.4.4  
(New)-WOESTMAN5535**

### **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** Requirements for control vestibules are needed because these types of systems are being provided. Sallyports are already addressed in Group I-3. Where these types of systems are provided should be limited. Perhaps the door system needs to have an over ride connected to the fire alarm system. The proposed text is currently too open ended and should be further defined so that enforcement is consistent.

**Assembly Action :**

**None**

### **Individual Consideration Agenda**

**Public Comment 1:**

**Proponent : John Woestman, Kellen, representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

## **2015 International Building Code**

### **SECTION 202 DEFINITIONS**

**CONTROL VESTIBULE** A space with a door locking arrangement of ~~two~~ interlocked doors interconnected such that ~~the first~~ while one door ~~must close or lock before of~~ the second door vestibule is openable and unlocked open all other doors are locked temporarily.

**1010.1.4.4 Control vestibule.** Doors in the means of egress configured as a control vestibule shall provide for emergency egress and shall be subject to approval by the code official. Control vestibules in the means of egress shall comply with all of the following.

1. Locking arrangements on each door of a control vestibule shall comply with Section 1010.1.9.
2. An approved override shall be provided on the egress side of each door of a control vestibule.
3. An approved override shall be provided on the ingress side of the outer door of a control vestibule.
4. Upon activation of the automatic sprinkler system or automatic fire alarm system on the egress side of the control vestibule, the interlock function of the two doors of the control vestibule shall deactivate.
5. Upon loss of power to the interlock function of the doors, the interlock function of the two doors of the control vestibule shall deactivate.

**Commenter's Reason:** Addressing the committee reasons for disapproval, we are proposing a revised definition for "control vestibule" and proposing detailed requirements for control vestibules. The significant difference between two doors in the means of egress in series (i.e. one after the other) and doors in the means of egress configured as a control vestibule is the doors of a control vestibule are interlocked such that when one door of a control vestibule is open, all other doors of the control vestibule are temporarily locked; and conversely, in the means of egress when all doors of a control vestibule are closed, any one door may be opened. Control vestibules are most commonly configured as a space with two doors (in series). But, some control vestibules are configured with more than one inner door and / or more than one outer door, with all doors opening into the vestibule. For example, where a control vestibule is required to help keep clean rooms clean, there may be inner doors from three different clean rooms opening into the control vestibule, and one outer door for leaving the control vestibule in the direction of egress.

Item 1: A needed requirement to address the potential situation where one of the doors on the control vestibule is propped open (example: a person faints at the outer door), other occupants may need to be able to egress through the control vestibule, especially in emergency situations. It is common the activation of an override would set off an alarm, and / or the activation of an override without a valid reason results in disciplinary action (i.e. employee gets fired).

Item 2: In the event the inner door of a control vestibule is propped open (example: a

person faints at the inner door), an override allows access into the control vestibule. The required override on the ingress side of the outer door allows for emergency access into the control vestibule, if needed. This override commonly requires a higher level of authorization for use and / or is provided for responding emergency crews.

Items 3 and 4: Requires the interlock function to be disabled in the event of fire, actuation of the fire detection system, or power loss to the interlock system.

Item 5 requires that egressing through the control vestibule involves no more than two doors, unless approved by the code official. While not common, there are situations where more than one control vestibule may be needed in the means of egress.

Item 6 requires the units of the control vestibule locking system to be listed in accordance with UL 294, the same standard required for units for other electrical locking system units.

Together, the revised definition and proposed requirements provide for egress and emergency egress where control vestibules are installed.

---

**E56-15**

# E57-15 Part I

**202 (New), 1010.1.4.4 (New), 1010.1.4.4.1 (New);  
(IFC[BE] 1010.1.4.4 (New), 1010.1.4.4.1 (New))**

## ***Proposed Change as Submitted***

**Proponent :** John Woestman, Kellen Company, representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

## **2015 International Building Code**

**Add new definition as follows:**

### **SECTION 202 DEFINITIONS**

**CREDENTIAL.** A tangible object, knowledge, or human physical characteristic required for locking and unlocking. A key to operate a lock cylinder; a magnetic card to swipe in a magnetic card reader; knowledge of a specific code for keypad operations; and a fingerprint for a fingerprint scanner; are examples of credentials, and their potential uses.

**Add new text as follows:**

**1010.1.4.4 Group E classrooms.** In Group E occupancies, classroom doors shall be lockable from within the classroom without opening the classroom door. All the following conditions shall apply:

1. The classroom door shall be unlockable and openable from within the classroom and shall comply with Section 1010.1.9.
2. The classroom door shall be unlockable and openable from outside the classroom by the use of a key or other credential.

**1010.1.4.4.1 Remote operation of locks.** Remote operation of locks complying with Section 1010.1.4.4 shall be permitted.

**Reason:** Many jurisdictions have taken measures to address the high priority concern of safety of occupants in K-12 classrooms in the event of a threatening situation. While well-intended and likely to have a degree of positive impact, these actions create disparate requirements from jurisdiction to jurisdiction, and some actions may inadvertently compromise certain aspects of life safety while attempting to address others.

This proposal for the IBC provides requirements which balance the challenges of providing protection for students and teachers in the classroom with that of free and immediate egress at all times without use of keys, tools, or special knowledge.

In addition to the security concerns, classroom doors are required to meet accessibility requirements which include door operating hardware configuration and location, door hardware operational forces, and a smooth surface of the bottom 10" of the push side of the door.

Door locksets with "classroom security function" are readily available today at the same cost as traditionally-used "classroom function" door locksets. The most common configuration of a classroom security function lockset is the ability to lock the door from inside the classroom with a key preventing entry to the classroom; and for egress, the door may be unlatched and opened from inside the classroom without a key by rotating the lever handle. On the outside of the classroom, consistent with tradition, the door may be locked with a key, and unlocked and

opened with a key.

This code change proposal will require all Group E classroom doors to be lockable from the inside of the classroom preventing entry to the classroom, without the need to open the door. This proposal does not prescribe specifically how the door is to be lockable from inside the classroom.

Additional requirements are the door is to be unlockable and readily openable inside the classroom without the use of a key or special knowledge or effort, as required in IBC Section 1010.1.9. Subsections of 1010.1.9 include requirements for hardware height (between 34 and 48 inches above the floor), and for hardware configuration (for doors required to be accessible, which would be almost all classroom doors, the door operating hardware shall not require tight grasping, tight pinching or twisting of the wrist to operate). An additional requirement of this proposal is the classroom door is to be unlockable and openable from outside the classroom by a key or other lock credential.

**Cost Impact:** Will not increase the cost of construction

No cost impact. Door locksets with the classroom security function are the same cost as traditionally specified door hardware locksets (with the classroom function).

E57-15 Part I :  
1010.1.4.4 (New)-  
WOESTMAN5537

---

## **Public Hearing Results**

### **Part I**

**Committee Action:**

**Disapproved**

**Committee Reason:** Criteria for Group E classrooms to lock down safely is needed. Types of devices that are blocking devices that do not allow for unlocking from the outside are currently being used and are a safety hazard. However, the committee strongly felt that this should be an option, not a requirement. There should be correlation with the signage requirement in Section 1010.1.9.3. The definitions in the IBC and IEBC should match - change 'and' to 'or' in the last sentence.

**Assembly Action :**

**None**

---

## **Individual Consideration Agenda**

### *Public Comment 1:*

**Proponent : Edward Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Building Code**

#### **SECTION 202 DEFINITIONS**

~~**CREDENTIAL.** A tangible object, knowledge, or human physical characteristic required for locking and unlocking. A key to operate a lock cylinder; a magnetic card to swipe in a magnetic card reader; knowledge of a specific code for keypad operations; and a fingerprint for a fingerprint~~

scanner; are examples of credentials, and their potential uses.

**1010.1.4.4 Group E classrooms. Locking arrangements in educational occupancies.** In Group E and Group B educational occupancies, egress doors from classrooms, offices and other occupied rooms shall be permitted to be provided with locking arrangements designed to keep intruders from entering the room where all of the following conditions are met: In Group E occupancies, classroom doors shall be lockable from within the classroom without opening the classroom door. All of the following conditions shall apply:

- ~~1. The classroom door shall be unlockable and openable from within the classroom and shall comply with Section 1010.1.9.~~
- ~~2. The classroom door shall be unlockable and openable from outside the classroom by the use of a key or other credential.~~
1. The door shall be capable of being unlocked from outside the room with a key or other approved means.
2. The door shall be openable from within the room in accordance with Section 1010.1.9.
3. Modifications shall not be made to listed panic hardware, fire door hardware or door closers.

**1010.1.4.4.1 Remote operation of locks.** Remote operation of locks complying with Section 1010.1.4.4 shall be permitted.

**Commenter's Reason:** This public comment addresses the committee comments as follows.

"Criteria for Group E classrooms to lock down safely is needed. Types of devices that are blocking devices that do not allow for unlocking from the outside are currently being used and are a safety hazard." Comment - We agree and this public comment addresses these concerns.

"However, the committee strongly felt that this should be an option, not a requirement." The original proposal mandated that locks had to be provided on all classroom doors, period. This decision should be the responsibility of the school administration in consultation with local security, law enforcement and emergency responders. This public comment does not mandate that locks be provided on classrooms, but describes the safety features they should have if provided for intruder protection.

"There should be correlation with the signage requirement in Section 1010.1.9.3." Addressed - A requirement was added that the door must be openable from within the room in accordance with Section 1010.1.9. the public comment does not allow locking arrangements to impede the egress aspects of the door, e.g. no double deadbolts.

"The definitions in the IBC and IEBC should match - change 'and' to 'or' in the last sentence." Accomplished, did not add a definition of "Credential" with the public comment, and the last sentence was not included in the public comment.

This public comment addresses a real danger facing schools today, addresses all of the concerns raised by the committee, and is consistent with the provisions in our EB 23-15 public comment.

---

**E57-15 Part I**

## **E57-15 Part II**

**202 (New), 406 (New), 406.1 (New), 406.2 (New),  
406.2.1 (New), 704.2 (New), 704.2.1 (New)**

### **Proposed Change as Submitted**

**Proponent :** John Woestman, Kellen Company, representing Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

## **2015 International Existing Building Code**

**Add new definition as follows:**

### **SECTION 202 DEFINITIONS**

**CREDENTIAL.** A tangible object, knowledge, or human physical characteristic required for locking or unlocking. A key to operate a lock cylinder; a magnetic card to swipe in a magnetic card reader; knowledge of a specific code for keypad operations; and a fingerprint for a fingerprint scanner; are examples of credentials, and their potential uses.

**Add new text as follows:**

### **SECTION 406 MEANS OF EGRESS**

**406.1 General.** Alterations shall be such that the existing building or structure is no less conforming to the provisions of the International Building Code than the existing building or structure was prior to the alteration.

**406.2 Existing occupancy Group E classrooms.** In Group E occupancies, existing classroom doors shall be lockable from within the classroom without opening the classroom door. All the following conditions shall apply:

1. The classroom door shall be unlockable and openable from within the classroom and shall comply with Section 1010.1.9. of the International Building Code.
2. The classroom door shall be unlockable and openable from outside the classroom by the use of a key or other credential.

**406.2.1 Remote operation of locks.** Remote operation of locks complying with 406.2 shall be permitted.

**704.2 Group E occupancy classroom.** In Group E occupancies, classroom doors shall be lockable from within the classroom without opening the classroom door. All the following conditions shall apply:

1. The classroom door shall be unlockable and openable from within the classroom and shall comply with Section 1010.1.9. of the International Building Code.
2. The classroom door shall be unlockable and openable from outside the classroom by the use of a key or other credential.

**704.2.1 Remote operation of locks.** Remote operation of locks

complying with 704.2 shall be permitted.

**Reason:** Many jurisdictions have taken measures to address the high priority concern of safety of occupants in K-12 classrooms in the event of a threatening situation. While well-intended and likely to have a degree of positive impact, these actions create disparate requirements from jurisdiction to jurisdiction, and some actions may inadvertently compromise certain aspects of life safety while attempting to address others.

This proposal for the IEBC provides guidance which balances the challenges of providing protection for students and teachers in the classroom with that of free and immediate egress at all times without use of keys, tools, or special knowledge.

In addition to the relatively recent demand to protect students and teachers from outside-the-classroom threats, many classroom doors are required to function as fire-rated doors (opening protectives); and fire-rated doors are required to be always self-latching when closed to ensure the doors perform its fire protection function in the event of a fire. Additionally, classroom doors are required to meet accessibility requirements which include door operating hardware configuration and location, door hardware operational forces, and a smooth surface of the bottom 10" of the push side of the door.

This code change proposal will not require existing Group E classroom doors to be lockable from the inside of the classroom without the need to open the door. This proposal does provide guidance if modifications are made to the door in an effort to control access to the classroom.

This proposal does not prescribe specifically how the door is to be lockable from inside the classroom.

Additional requirements are the door is to be unlockable and readily openable inside the classroom without the use of a key or special knowledge or effort, as required in IBC Section 1010.1.9. Subsections of IBC 1010.1.9 include requirements for hardware height (between 34 and 48 inches above the floor), and for hardware configuration (for doors required to be accessible, which would be almost all classroom doors, the door operating hardware shall not require tight grasping, tight pinching or twisting of the wrist to operate). An additional requirement of this proposal is the classroom door is to be unlockable and openable from outside the classroom by a key or other lock credential.

If the door locking hardware is under consideration for replacement, door locksets with "classroom security function" are readily available today at essentially the same cost as traditionally-used "classroom function" door locksets. The most common configuration of a classroom security function lockset is the ability to lock the door from inside the classroom with a key preventing entry to the classroom; and for egress, the door may be unlatched and opened from inside the classroom without a key by rotating the lever handle. On the outside of the classroom, consistent with tradition, the door may be locked with a key, and unlocked and opened with a key.

**Cost Impact:** Will not increase the cost of construction

This proposal does not require retrofitting of existing doors with new hardware. IF door locking hardware replacement is being considered, the requirements of this proposal provide guidance.

**E57-15 Part II : 406  
(New)-WOESTMAN5538**

---

## **Public Hearing Results**

### **Part II**

**Committee Action:**

**Approved as Submitted**

**Committee Reason:** Though there were some concerns with the mandatory verbiage used, provisions dealing with the ability to safely lockdown within a

classroom are needed. The committee suggested that this proposal should not be limited to Group E occupancies as these safety concerns exist in other occupancies. Note that proposal EB23-15 deals with a similar topic.

**Assembly Motion:**

**Disapprove**

**Online Vote Results:**

**Successful**

Support: 67.72% (235) Oppose: 32.28% (112)

**Assembly Action :**

**Disapproved**

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : Assembly Action requests Disapprove.**

**Commenter's Reason:** This code change proposal is on the agenda for individual consideration because the proposal received a successful assembly action. The assembly action for Disapprove was successful by a vote of 67.72% (235) to 32.28% (112) by eligible members online during the period of May 14 - May 28, 2015.

#### *Public Comment 2:*

**Proponent : Edward Kulik, representing ICC Building Code Action Committee (bcac@iccsafe.org) requests Disapprove.**

**Commenter's Reason:** We like what the proponent was trying to accomplish with this proposal but prefer the approach used in EB 23-15, with or without the clarification provided in our public comment. One reason for this preference is that E 57-15, part 2 mandates that classroom doors be provided with locks, which could be a significant expense for school districts, and may not be warranted based on other security measures adopted in individual schools. In comparison EB 23-15 does not require retrofitting of classroom doors with locks, but if the school district chooses to retrofit doors with locks it provides requirements on how it can be safely done.

#### *Public Comment 3:*

**Proponent : Region VII, representing ICC Region VII requests Disapprove.**

**Commenter's Reason:** The committee itself had concerns in regards to mandatory language and that it should not be limited to Group E occupancies. Note part 1 of this same change was not approved and a successful assembly motion for disapproval was overwhelmingly successful.

# E58-15

202(New), 1010.1.2, 1010.1.4.5 (New); (IFC[BE]  
1010.1.2, 1010.1.4.5 (New))

## Proposed Change as Submitted

**Proponent :** Joseph Hetzel, representing Door & Access Systems  
Manufacturers Association (jhetzel@thomasamc.com)

## 2015 International Building Code

Add new definition as follows:

### SECTION 202 DEFINITIONS

**HIGH SPEED DOOR.** A non-swinging door with a minimum opening rate of 32 inches per second, a minimum closing rate of 24 inches per second, and an automatic closing device.

Add new text as follows:

**1010.1.4.5 High speed doors** In other than Groups A, E and H occupancies, high speed door assemblies permitted to serve as a component of a means of egress in accordance with Exception 10 to Section 1010.1.2 shall comply with at least one of the following criteria:

1. The door shall be openable by a simple method from either side of the opening without special knowledge or effort. The force required to operate the door shall not exceed 30 pounds (133 N) to set the door in motion.
2. The door assembly shall have an integrated standby power supply, shall be electrically supervised, and shall open to a minimum height of 80 inches (2.03 m) within 10 seconds after activation of the operating device.
3. The door panels shall be capable of being broken out manually in the event of power failure by a simple method from both sides without special knowledge or effort. A minimum 32-inch (813 mm) wide by 80-inch (2.03 m) high opening shall be capable of being provided when the door panels are broken out. The force required to break out the door panels shall not exceed 30 pounds (133 N).

Revise as follows:

**1010.1.2 Door swing.** Egress doors shall be of the pivoted or side-hinged swinging type.

#### Exceptions:

1. Private garages, office areas, factory and storage areas with an *occupant load* of 10 or less.
2. Group I-3 occupancies used as a place of detention.
3. Critical or intensive care patient rooms within suites of health care facilities.
4. Doors within or serving a single *dwelling unit* in Groups R-2

- and R-3.
5. In other than Group H occupancies, revolving doors complying with Section 1010.1.4.1.
  6. In other than Group H occupancies, special purpose horizontal sliding, accordion or folding door assemblies complying with Section 1010.1.4.3.
  7. Power-operated doors in accordance with Section 1010.1.4.2.
  8. Doors serving a bathroom within an individual *sleeping unit* in Group R-1.
  9. In other than Group H occupancies, manually operated horizontal sliding doors are permitted in a *means of egress* from spaces with an *occupant load* of 10 or less.
  10. In other than Group A, E and H occupancies, high speed doors complying with Section 1010.1.4.5.

**Reason:** High speed doors, typically designed as nonswinging doors, have been successfully installed as egress doors. They are often used in locations where pivoted or side-hinged swinging doors are not present. In order to be found compliant with the IBC other than using the Alternative Methods provisions, high speed doors should be included as an Exception to side-hinged or swinging doors. The exclusion from Groups A, E and H is consistent with the limitation currently applied to using delayed egress locking systems.

The definition proposed for the term "high speed door" is similar in description of action to the definition of the term as contained in the International Energy Conservation Code.

The three options are commonly and successfully used by the high speed door industry where such doors are a component of a means of egress. The requirements in each option are similar to those listed in Section 1010.1.4.3 for special purpose horizontal sliding, accordion and folding door assemblies. Each option is viable in itself, but only one is needed from a cost/benefit standpoint.

**Cost Impact:** Will not increase the cost of construction  
 We believe the proposed change is consistent with common current practice and therefore only permits what is already being done. Since it is already being done, there is no effect on product or cost and therefore requires no further study.

E58-15 : 1010.1.2-  
 HETZEL4785

## **Public Hearing Results**

**Committee Action:**

**Disapproved**

**Committee Reason:** There are several terms that are undefined and unclear: such as 'openable by simple method', 'electrically supervised system', 'operating device'. These types of overhead doors are not appropriate as a means of egress door for a potentially large occupant loads in any occupancy. Regarding the 30 pounds force for opening, it is not clear on which direction this force would be applied.

**Assembly Action :**

**None**

## **Individual Consideration Agenda**

## Public Comment 1:

**Proponent : Joseph Hetzel, representing Door & Access Systems Manufacturers Association (Jhetzel@thomasamc.com) requests Approve as Modified by this Public Comment.**

**Replace Proposal as Follows:**

### **2015 International Building Code**

#### **SECTION 202 DEFINITIONS**

**HIGH SPEED FABRIC DOOR.** A non-swinging fabric door with a minimum opening rate of 32 inches per second, a minimum closing rate of 24 inches per second, and an automatic closing device.

**1010.1.4.2 Power-operated doors.** Where *means of egress* doors are operated or assisted by power, the design shall be such that in the event of power failure, the door is capable of being opened manually to permit *means of egress* travel or closed where necessary to safeguard *means of egress*. The forces required to open these doors manually shall not exceed those specified in Section 1010.1.3, except that the force to set the door in motion shall not exceed 50 pounds (220 N). The door shall be capable of swinging open from any position to the full width of the opening in which such door is installed when a force is applied to the door on the side from which egress is made. Power-operated swinging doors, power-operated sliding doors and power-operated folding doors shall comply with BHMA A156.10. Power-assisted swinging doors and low-energy power-operated swinging doors shall comply with BHMA A156.19.

#### **Exceptions:**

1. Occupancies in Group I-3.
2. Horizontal sliding doors complying with Section 1010.1.4.3.
3. For a biparting door in the emergency breakout mode, a door leaf located within a multiple-leaf opening shall be exempt from the minimum 32-inch (813 mm) single-leaf requirement of Section 1010.1.1, provided a minimum 32-inch (813 mm) clear opening is provided when the two biparting leaves meeting in the center are broken out.
4. In other than Group A, E or H occupancies, high speed fabric door assemblies shall be permitted to serve as as a component of a means of egress where the door is capable of being opened manually, or broken out, by a simple method from both sides without special knowledge or effort in the event of power failure. For manual operation, the force shall not exceed 30 pounds (133 N) to set the door in motion and 15 pounds (67 N) to open the door to the minimum required height and width. The force required to break out the door shall not exceed 50 pounds (220 N).

#### **Commenter's Reason:**

- An exception for high speed fabric doors should be in the category "power-operated doors" since this is the best fit in the code with respect to the other types of doors addressed in the Egress chapter.
- From a manual standpoint, either opening or breaking out a door should be

allowed for high speed fabric doors. In addition to the need for vertically "rolling up" the door, the need for breakout is common due to accommodating the risk of moving equipment making accidental contact with a door.

- A "break out" feature is also commonly provided in a high speed fabric door for the purpose of egress to create an adequate opening faster than the commonly designed upward motion of such door.
- Because of upward movement when opening a high speed fabric door, language addressing both the minimum required height and width is noted in the Exception.
- High speed fabric doors are installed in non-rated walls, so closing the opening after breakout or door opening is not needed from a fire protection/resistance standpoint.
- The maximum operating forces are consistent with those for special purpose horizontal sliding, accordion or folding doors as noted in Section 1010.1.4.3.
- The maximum breakout force proposed is consistent with the ANSI/BHMA A156 set of standards.

---

**E58-15**

# E63-15

## 1010.1.9.3; (IFC[BE] 1010.1.9.3)

### Proposed Change as Submitted

**Proponent :** Lee Kranz, City of Bellevue, WA, representing The City of Bellevue Washington

## 2015 International Building Code

### Revise as follows:

**1010.1.9.3 Locks and latches.** Locks and latches shall be permitted to prevent operation of doors where any of the following exist:

1. Places of detention or restraint.
2. In buildings in occupancy Group A having an *occupant load* of 300 or less, Groups B, F, M and S, and in *places of religious worship*, the main door or doors are permitted to be equipped with key-operated locking devices from the egress side provided:
  - 2.1. The locking device is readily distinguishable as locked.
  - 2.2. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN THIS SPACE IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background.
  - 2.3. The use of the key-operated locking device is revokable by the *building official* for due cause.
3. Where egress doors are used in pairs, *approved* automatic flush bolts shall be permitted to be used, provided that the door leaf having the automatic flush bolts does not have a doorknob or surface-mounted hardware.
4. Doors from individual *dwelling* or *sleeping units* of Group R occupancies having an *occupant load* of 10 or less are permitted to be equipped with a night latch, dead bolt or security chain, provided such devices are openable from the inside without the use of a key or tool.
5. *Fire doors* after the minimum elevated temperature has disabled the unlatching mechanism in accordance with *listed fire door* test procedures.
6. Required egress doors serving outdoor areas, other than egress courts, having an occupant load of 300 or less where occupants must use one or more exits or exit access doors to egress through the building are permitted to be equipped with key-operated or thumb-turn lever locking devices. The locking device shall be installed and operated in accordance with all of the following:
  - 6.1. For other than Group R occupancies, the locking device shall be readily distinguishable as locked.
  - 6.2. A clear window or glazed door opening, not less than 5 square feet (0.46 m<sup>2</sup>) in area, shall be provided in the wall separating the inside of the building from the outdoor area to allow visual confirmation to determine if there are occupants using the outdoor area. The

minimum net clear opening height dimension shall be 24 inches (610 mm). The minimum net clear opening width dimension shall be 20 inches (508 mm). The center of the glazed opening shall be located 48 inches (1220 mm) to 60 inches (1525 mm) above the finished floor level.

- 6.3. For other than Group R occupancies, a readily visible durable sign is posted on the interior side on or adjacent to the required egress door or doors serving the outdoor area stating: THIS DOOR TO REMAIN UNLOCKED WHEN THE OUTDOOR AREA IS OCCUPIED. The letters on the sign shall be not less than 1 inch (25 mm) high on a contrasting background.
- 6.4. The door hardware shall not be capable of locking or unlocking except by the use of a key or thumb-turn lever.
- 6.5. The use of key-operated or thumb-turn lever locking devices is revocable by the building official for due cause.

**Reason:** All outdoor areas that are accessible to and usable by the building occupants, where people must use one or more required exits or exit access doors to re-enter the building, are considered for means of egress purposes to be the same as any occupied room in the building and therefore be provided with free egress at all times. Doors serving outdoor areas must remain unlocked at all times to permit safe egress. To insure security for their building or tenant space, owners and tenants typically want to have locks to be installed on required egress doors serving outdoor areas, even on levels above and below the level of exit discharge. This proposal addresses the issue by allowing these required egress doors to be locked for security purposes as long as all of the listed conditions are met. The proposed code change will apply to all outdoor areas where occupants must egress through the building, including those located at the level of exit discharge and those above or below the level of exit discharge. Group R occupancies are not required to provide distinguishable locks or interior signage as required for all other occupancies.

Important required elements include:

1. a vision panel that would allow someone on the inside of the building to see if there are people using the outside area to reduce the potential for doors serving outdoor areas to be locked,
2. signage on the interior side indicating that the door(s) must remain unlocked when people are using the outdoor area, and
3. the requirement to use door hardware that will prevent the door from accidentally locking when someone goes outside.

**Cost Impact:** Will not increase the cost of construction

Locks are being placed on doors serving outdoor areas illegally. This proposal provides an avenue to install the locks legally as long as certain conditions are met. It should not impact the cost of construction.

E63-15 : 1010.1.9.3-  
KRANZ4469

---

## **Public Hearing Results**

## Committee Action:

Disapproved

**Committee Reason:** The scope of this seems to be all occupancies, but then Item 6.1 exempts Group R. Is this meant to imply that Group R cannot use this allowance? The new provisions in Item 6 seem to be the same as Item 2. Why the differences. This could be used to address outside pools or decks. Could Item 6.4 allowance for a thumb turn allow for someone to inadvertently locked outside? Perhaps that option needs to be limited to Group R private areas only? The mix of vision panel and door opening is confusing.

## Assembly Action :

None

---

### **Individual Consideration Agenda**

#### *Public Comment 1:*

**Proponent : Lee Kranz, City of Bellevue, WA , representing City of Bellevue, Washington (lkranz@bellevuewa.gov) requests Approve as Modified by this Public Comment.**

#### **Modify as Follows:**

### **2015 International Building Code**

**1010.1.9.3 Locks and latches.** Locks and latches shall be permitted to prevent operation of doors where any of the following exist:

1. Places of detention or restraint.
2. In buildings in occupancy Group A having an *occupant load* of 300 or less, Groups B, F, M and S, and in *places of religious worship*, the main door or doors are permitted to be equipped with key-operated locking devices from the egress side provided:
  - 2.1. The locking device is readily distinguishable as locked.
  - 2.2. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN THIS SPACE IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background.
  - 2.3. The use of the key-operated locking device is revokable by the *building official* for due cause.
3. Where egress doors are used in pairs, *approved* automatic flush bolts shall be permitted to be used, provided that the door leaf having the automatic flush bolts does not have a doorknob or surface-mounted hardware.
4. Doors from individual *dwelling or sleeping units* of Group R occupancies having an *occupant load* of 10 or less are permitted to be equipped with a night latch, dead bolt or security chain, provided such devices are openable from the inside without the use of a key or tool.
5. *Fire doors* after the minimum elevated temperature has disabled the unlatching mechanism in accordance with *listed fire door* test procedures.
6. ~~Required~~ For other than Group R occupancies, required egress doors serving outdoor areas, other than egress courts, having an

occupant load of 300 or less where occupants must use one or more exits or exit access doors to egress through the building are permitted to be equipped with key-operated or thumb-turn-lever-locking devices. The locking device shall be installed and operated in accordance with all of the following:

- 6.1. ~~For other than Group R occupancies, the~~ The locking device shall be readily distinguishable as locked.
- 6.2. ~~A clear window~~ Clear windows or glazed door opening, ~~not less than 5 square feet (0.46 m<sup>2</sup>) in area, openings shall be provided as needed~~ in the wall separating the inside of the building from the outdoor area to allow visual confirmation ~~to determine if there are~~ of occupants using the outdoor area. ~~The minimum net clear opening height dimension shall be 24 inches (610 mm). The minimum net clear opening width dimension shall be 20 inches (508 mm). The center of the glazed opening shall be located 48 inches (1220 mm) to 60 inches (1525 mm) above the finished floor level.~~
- 6.3. ~~For other than Group R occupancies, a~~ A readily visible durable sign is posted on the interior side on or adjacent to the required egress door or doors serving the outdoor area stating: THIS DOOR TO REMAIN UNLOCKED WHEN THE OUTDOOR AREA IS OCCUPIED. The letters on the sign shall be not less than 1 inch (25 mm) high on a contrasting background.
- 6.4. Door hardware shall not be permitted to automatically lock required egress doors when the door closes. The door hardware shall not be capable of locking or unlocking except by the use of a key or thumb-turn lever.
- 6.5. ~~The use of key-operated or thumb-turn-lever locking devices is revocable by~~ Doors required to have panic hardware are permitted to be locked from the building official for due cause egress side in accordance with Section 1010.1.9.3, Item 2.

-

**Commenter's Reason:** Section 1004.5 requires that outdoor areas accessible to and usable by the building occupants be provided with means of egress per Chapter 10. Section 1010.1.9 specifies that egress doors serving outdoor areas be readily openable from the egress side without the use of a key or any special knowledge or effort. Currently there is no exception to these requirements but yet there are many cases of these doors being locked for building security and to prevent intrusion. This public comment includes some changes recommended by the Egress Committee as well as those who testified in opposition to the original code change. One of the comments related to the application of these provisions to Group R occupancies. A proposal similar to this one was submitted in the previous Group A Code Cycle and was disapproved because it was felt that doors serving residential decks would be required to comply with all of the aspects of item 6. Therefore, doors serving outdoor areas in R-1, R-2 & R-3 occupancies are not required to comply with these provisions but must comply with Section 1010.1.9.3, item #4.

It was also suggested that since panic hardware is required if the occupant load of the outdoor area exceeds 50 that language be added to reference Section 1010.1.9.3, item 2 to allow the doors to be locked when the outdoor area is not in use. This issue has been resolved with new text in item 6.5.

# E64-15

## 1010.1.9.5.1 (IFC[BE] 1010.1.9.5.1)

### **Proposed Change as Submitted**

**Proponent :** Carl Baldassarra, P.E., FSFPA, P.E., FSFPE, Chair, ICC Code Technology Committee, representing Code Technology Committee (CTC@iccsafe.org)

## **2015 International Building Code**

### **Delete without substitution:**

~~**1010.1.9.5.1 (IFC[BE] 1010.1.9.5.1) Closet and bathroom doors in Group R-4 occupancies.** In Group R-4 occupancies, closet doors that latch in the closed position shall be openable from inside the closet, and bathroom doors that latch in the closed position shall be capable of being unlocked from the ingress side.~~

**Reason:** This is proposed to be deleted because it is an inconsistent requirement. If there is a concern that a person receiving custodial care might lock themselves in a bathroom or closet, this should be required in Group I-1, not just Group R-4. Also, this should not be a overall minimum code requirement, but more an option for a facility to provide where needed. Literally this would applied to storage closets that are not used by residents and closets that you would not walk into at all. The ICC Code Technology Committee (CTC) has just completed its 10th year. The ICC Board has decided to sunset the CTC. The sunset plan includes re-assigning many of the CTC Areas of Study to the applicable Code Action Committee (CAC). The two remaining CTC Areas of Study are Care Facilities and Elevator Lobbies/WTC Elevator issues. This proposal falls under the Care Facilities Area of Study. Information on the CTC, including: the sunset plan; meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the CTC website at: <http://www.iccsafe.org/cs/CTC/Pages/default.aspx>.

**Cost Impact:** Will not increase the cost of construction  
This is eliminating a requirement for locks.

E64-15 : 1010.1.9.5.1-  
BALDASSARRA4278

---

### **Public Hearing Results**

**Committee Action:**

**Approved as Submitted**

**Committee Reason:** While this might be a valid concern in some facilities for safety, the current provisions should not be applicable to just Group R-4. Free egress from occupied spaces is already required by the code. The current language could be read to apply to all closets, including reach-in closets.

**Assembly Action :**

**None**

---

### **Individual Consideration Agenda**

## *Public Comment 1:*

**Proponent : John Woestman, Kellen, representing Builders Hardware Manufacturers Association (jwoestman@kellencompany.com) requests Approve as Modified by this Public Comment.**

**Modify as Follows:**

### **2015 International Building Code**

**1010.1.9.5.1 Closet doors.** Closet doors that latch in the closed position shall be openable from inside the closet.
