1109.2.3 Lavatories. Where lavatories are provided, at least 5 percent, but not less than one shall be accessible. Where the total lavatories provided in a toilet room or bathing facility is six or more, at least one lavatory with enhanced reach ranges in accordance with ICC A117.1, ~~Section 606.5~~, shall be provided ~~in addition to the accessible lavatory~~.

Commenter's Reason: (Perry) This public comment seeks to modify the accepted proposal for 'enhanced reach range' lavatories. As approved, the proposal will require that enhanced reach range features be provided at a lavatory other than the accessible lavatory. There is no basis for mandating this restriction; nothing in the 'enhanced reach range' provisions makes a lavatory less accessible for other users. A117.1 enhanced reach range provisions (found at Section 606.5 of the 2003 edition) require only that manually-operated faucet controls and soap dispenser controls be within 11" of the front edge of the lavatory, automatic controls be activated within 11" of the front edge of the lavatory, and that both water flow and soap dispensing be within 11" of the front edge of the lavatory. An otherwise accessible lavatory can meet these criteria without having any negative impact on persons with disabilities. With the ever-increasing use of automatic faucets and soap dispensers, particularly in the larger toilet/bathing facilities (more than 6 lavatories) covered by this change, the 'enhanced reach' fixture may be identical to all the other fixtures. Deleting the mandate that the enhanced reach range be provided at an 'additional' lavatory provides maximum flexibility, and has no negative impact on users of the facility.

Commenter's Reason: (Thomas) In the committee's reason, it states "The proposal will not require an additional fixture in the bathroom, just that one of the lavatories provided within large bathrooms will have limited reach range faucets". The language at the end of the last sentence would contradict the committee's intent. The current language requires the enhanced reach range lavatory **in addition** to the accessible lavatory. So, if one accessible lavatory is required in a toilet room, then another lavatory would be required to be an enhanced reach range lavatory. I believe that one lavatory can serve as both the accessible and enhanced reach range lavatory and not require two different lavatories in a toilet room. The faucet of an enhanced reach range lavatory complies with the reach range requirements for accessible lavatories.

Final Hearing Results

E168-07/08, Part I AMPC2
E168-07/08, Part II D

Code Change No: E171-07/08

Original Proposal

Chapter 35

Proponent: Standards writing organizations as listed below.

Revise standard as follows:

BHMA	Builders Hardware Manufacturers Association 355 Lexington Avenue, 15 th Floor New York, NY 10017-6603
-------------	--

Standard reference number	Title
A 156.10- <u>2006</u> 2005	Power Operated Pedestrian Doors

Reason: The *CP 28 Code Development Policy*, Section 4.5* requires the updating of referenced standards to be accomplished administratively, and be processed as a Code Change Proposal. In May 2007, a letter was sent to each developer of standards that are referenced in the International Codes, asking them to provide the ICC with a list of their standards in order to update to the current edition. Above is the received list of the referenced standards that are under the maintenance responsibility of the IBC Means of Egress Committee.

***4.5 Updating Standards:** The updating of standards referenced by the Codes shall be accomplished administratively by the appropriate code development committee in accordance with these full procedures except that multiple standards to be updated may be included in a single proposal.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The 2006 edition of BHMA standard is available. The codes should reference the latest edition of the standard.

Assembly Action:

None

Final Hearing Results

E171-07/08 AS

IBC – STRUCTURAL

Code Change No: **S2-07/08**

Original Proposal

Section: 1502.1

Proponent: Mike Ennis, SPRI, Inc.

Revise as follows:

1502.1 General. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

BALLAST (Supp). ~~Ballast is any item having weight that is used to hold or steady an object.~~ In roofing, ballast comes in the form of large stones or paver systems or light-weight interlocking paver systems and is used to provide uplift resistance for roofing systems that are not adhered or mechanically attached to the roof deck.

Reason: This code change will remove unnecessary language in the definition of ballast

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The code change improves clarity by removing unnecessary text from the definition of the term ballast.

Assembly Action:

None

Final Hearing Results

S2-07/08

AS

Code Change No: **S4-07/08**

Original Proposal

Section: 1503.1

Proponent: Michael D. Fischer, The Kellen Company, representing the Asphalt Roofing Manufacturer's Association (ARMA)

Revise as follows:

1503.1 General. Roof decks shall be covered with approved roof coverings secured to the building or structure in accordance with the provisions of this chapter. Roof coverings shall be designed, and installed ~~and maintained~~ in accordance with this code and the approved manufacturer's instructions such that the roof covering shall serve to protect the building or structure.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

Reason: This proposal is an editorial change that removes a maintenance requirement that falls outside of the scope of the IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This rewording of Section 1503.1 is largely editorial and it appropriately removes the maintenance requirement from the building code.

Assembly Action:

None

Final Hearing Results

S4-07/08

Code Change No: S6-07/08

Original Proposal

Sections: 1504.1.1, 1507.2.7.1, Table 1507.2.7, (New), 1609.5.2; IRC R905.2.4.1, Table R905.2.4.1 (New), Table R905.2.4.2 (New)

Proponent: Michael D. Fischer, The Kellen Company, representing the Asphalt Roofing Manufacturer’s Association (ARMA)

THESE PROPOSALS ARE ON THE AGENDA OF THE IBC STRUCTURAL AND IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

1. Revise as follows:

1504.1.1 (Supp) Wind resistance of asphalt shingles. Asphalt shingles shall ~~be installed in accordance~~ comply with Section 1507.2.7.

1507.2.7.1 (Supp) Wind resistance. Asphalt shingles shall be tested in accordance with ~~either ASTM D 3161 or ASTM D 7158 for wind resistance.~~ Asphalt shingles shall meet the classification requirements of Table 1507.2.7.1(1) for the appropriate maximum basic wind speed. Asphalt shingle packaging shall bear a label to indicate compliance with ASTM D 7158 and the required classification in Table 1507.2.7.1(1).

Exception: Asphalt shingles not included in the scope of ASTM D 7158 shall be tested and labeled to indicate compliance with ASTM D 3161 and the required classification in Table 1507.2.7.1(2).

2. Delete and substitute as follows:

TABLE 1507.2.7 (Supp)
CLASSIFICATION OF ASPHALT ROOF SHINGLES^a

MAXIMUM BASIC WIND SPEED FROM FIGURE 1609	ASTM D 3161	ASTM D 7158^b
85	A, D, or F	D, G or H
90	A, D, or F	D, G or H
100	A, D, or F	G or H
110	F	G or H
120	F	G or H
130	F	H
140	F	H
150	F	H

For SI: 1 foot = 304.8 mm.

- a. Asphalt Shingles shall be tested in accordance with ASTM D 3161 or ASTM D 7158. Refer to this table for selection of the appropriate product classification(s).
- b. The standard calculations contained in ASTM D 7158 assume exposure category B or C and building height of 60 feet or less. Additional calculations are required for conditions outside of these assumptions.

TABLE 1507.2.7.1(1)^a
CLASSIFICATION OF ASPHALT SHINGLES PER ASTM D 7158

MAXIMUM BASIC WIND SPEED FROM FIGURE 1609	CLASSIFICATION REQUIREMENT
85	D, G or H

130	F
140	F
150	F

1609.5.2 (Supp) Roof coverings. Roof coverings shall comply with Section 1609.5.1.

Exception: Rigid tile roof coverings that are air permeable and installed over a roof deck complying with Section 1609.5.1 are permitted to be designed in accordance with Section 1609.5.3.

Asphalt shingles installed over a roof deck complying with 1609.5.1 shall be permitted to be designed using ASTM D 7158 to determine comply with the wind resistance requirements of Section 1507.2.7.1.

PART II – IRC BUILDING/ENERGY

1. Delete and substitute as follows:

R905.2.4.1 (Supp) Wind resistance of asphalt shingles. ~~Asphalt shingles shall be installed in accordance with Section R905.2.6. Asphalt shingles shall be tested for wind resistance in accordance with one of the following test standards:~~

- ~~1. ASTM D 3161~~
- ~~2. ASTM D 7158~~

~~Asphalt shingles shall meet the classification requirement of Table 905.2.4.1 for the applicable maximum basic wind speed. Asphalt shingle packaging shall bear a label to indicate compliance with one of the above ASTM test standards and the appropriate classification from Table 905.2.4.1.~~

R905.2.4.1 Wind resistance of asphalt shingles. Asphalt shingles shall be tested in accordance with ASTM D 7158. Asphalt shingles shall meet the classification requirements of Table R905.2.4.1(1) for the appropriate maximum basic wind speed. Asphalt shingle packaging shall bear a label to indicate compliance with ASTM D7158 and the required classification in Table R905.2.4.1(1).

Exception: Asphalt shingles not included in the scope of ASTM D 7158 shall be tested and labeled to indicate compliance with ASTM D 3161 and the required classification in Table R905.2.4.1(2).

TABLE R905.2.4.1 (Supp)
CLASSIFICATION OF ASPHALT ROOF SHINGLES^a

MAXIMUM BASIC WIND SPEED FROM FIGURE 1609	ASTM D 3161	ASTM D 7158^b

<u>140</u>	<u>H</u>
<u>150</u>	<u>H</u>

TABLE R905.2.4.1(2)
CLASSIFICATION OF ASPHALT SHINGLES PER ASTM D 3161

<u>MAXIMUM BASIC WIND SPEED FROM FIGURE R301.2(4)</u>	<u>CLASSIFICATION REQUIREMENT</u>
85	A, D or F
90	A, D or F
100	A, D or F
110	F
120	F
130	F
140	F
150	F

Reason: This proposal completes the introduction of ASTM D7158 into the ICC, providing clear scoping for the applicable test standard for wind resistance of asphalt shingles. The reference to shingle compliance in 1504.1.1 provides clear compliance direction and requires the product comply with the appropriate product standard. The new reference in 1507.2.7.1 provides a “default” to ASTM D7158 with an option for products outside the scope of ASTM D3161. This requirement also removes a “dual path” to compliance by testing to either standard. In 1609.5.2, the pointer from the design section to the roofing requirement is complete.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Errata: Add reference to footnote in heading of table as follows:

TABLE 1507.2.7.1(1)
CLASSIFICATION OF ASPHALT SHINGLES PER ASTM D 7158^a

Correct Figure number in first column heading as follows:

CLASSIFICATION OF ASPHALT SHINGLES PER ASTM D 3161

MAXIMUM BASIC WIND SPEED FROM FIGURE ~~R301.2(4)~~ 1609

PART I – IBC STRUCTURAL

Committee Action:

Approved as Submitted

Committee Reason: Agreement with the proponent’s reason which indicates that this code change provides clear scoping for the applicable test standard for wind resistance of asphalt shingles. This action will also be consistent with the IRC B & E committee’s action.

Assembly Action:

None

PART II – IRC B/E

Committee Action:

Approved as Submitted

Committee Reason: This change makes testing to ASTM D 7158 as the default for asphalt shingles.

Assembly Action:

None

Final Hearing Results

S6-07/08, Part I

AS

S6-07/08, Part II

AS

Code Change No: S7-07/08

Original Proposal

Section: 1504.2.1

Proponent: Michael D. Fischer, The Kellen Company, representing The Asphalt Roofing Manufacturer’s Association (ARMA)

1. Delete without substitution as follows:

~~**1504.2.1 Alternative test method.** Testing the acceptability of special fastening methods using the methodology in this section is permitted. The wind-induced uplift force on the shingle shall be determined using the method in UL 2390. The resistance of the shingle to the uplift force shall be determined using ASTM D 6381. Shingles passing this test shall be considered suitable for roofs located where the basic wind speed per Figure 1609 is as given in Table 1504.2.1.~~

~~Classification requires that the resistance of the shingle to wind uplift, measured using the method in ASTM D 6381, exceed the calculated load imposed by wind in the applicable zone as determined using UL 2390.~~

~~Classification by this method applies to buildings less than 60 feet (18 288 mm) high and with Wind Exposures B and C only in an Occupancy Category of I or II. Wrappers of shingle bundles that have been qualified using this alternative method shall be labeled with the tested wind classification and reference UL 2390/ASTM D 6381.~~

Reason: This section is incorrectly located; asphalt shingle requirements should not be located within the clay and concrete tile section. Moreover, this text should have been removed in the last cycle as part of FS 191 that added a reference to ASTM D7158, and also struck the Chapter 16 references to UL 2390 and ASTM D6381. Due to the incorrect location of this text in the 2006 IBC, this section was not included in the proposal. This proposal solves both issues. A companion proposal further clarifies the scoping of the wind standards for asphalt shingles.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This code change removes a misplaced section that is now redundant, due to a code change approved in the previous code development cycle.

Assembly Action:

None

Final Hearing Results

S7-07/08

AS

Code Change No: S9-07/08

Original Proposal

Section: 1504.3.1, Chapter 35 (New)

Proponent: Mark S. Graham, National Roofing Contractors Association, representing Technical Operations Committee of the National Roofing Contractors Association; Phillip J. Smith, FM Approvals

1. Revise as follows:

1504.3.1 Other roof systems. Roof systems with built-up, modified bitumen, fully adhered or mechanically attached single-ply through fastened metal panel roof systems, and other types of membrane roof coverings shall also be tested in accordance with FM 4450, FM 4470 FM 4474, UL 580 or UL 1897.

2. Add standard to Chapter 35 as follows:**FM****4474-04 Evaluating the Simulated Wind Uplift Resistance of Roof Assemblies Using Static Positive and/or Negative Differential Pressures**

Reason: (Graham) This code change proposal removes from the Code reference standards that do not comply with ICC's guidelines for reference standards and replaces them with a similar reference standard that appears to comply with ICC's guidelines.

FM 4450, "Approval Standard for Class 1 Insulated Steel Roof Decks—with Supplements through July 1992," and FM 4470, "Approval Standard for Class 1 Roof Covers," have been identified as not comply with ICC's guidelines for reference standards. Specifically, these standards have not been promulgated according by a consensus procedure and they prescribe a proprietary agency for quality control and testing. ICC acknowledged these shortcomings during testimony on FS193-06/07 and FS194-06/07 regarding this same issue; however, the code development committee was reluctant to withdraw these standards without substitution.

FM 4474, "Evaluating the Simulated Wind Uplift Resistance of Roof Assemblies Using Static Positive and/or Negative Differential Pressures," includes a similar wind test procedure to FM 4450 and FM 4470, but FM 4474 is promulgated through an ANSI process and it does not a proprietary agency for quality control and testing.

The addition of FM 4474 satisfies the code development committee's desire to provide an acceptable substitute for FM 4450 and FM 4470.

(Smith) The purpose of the change is to substitute an equivalent consensus standard for non consensus standards. FM 4450 and 4470 are not consensus documents. The wind uplift criteria of FM 4450 and FM 4470 is identical to that in ANSI/FM Approvals 4474. ANSI/FM Approvals 4474 is a consensus document meeting the ICC criteria for reference standards. A PDF copy of 4474 is attached.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Note: The following analysis was not in the Code Change Proposal book but was posted on the ICC website.

Analysis: Review of proposed new standard FM 4474-04 indicated that, in the opinion of ICC Staff, the standard did comply with ICC standards criteria.

Committee Action:

Approved as Submitted

Committee Reason: Agreement with the proponent's reason which indicates that the new FM 4474 standard provides an acceptable substitute for FM 4450 and FM 4470.

Assembly Action:

None

Final Hearing Results

S9-07/08

AS

Code Change No: S18-07/08

Original Proposal

Sections: 1505.2; IRC R902.1

Proponent: John C. Dean, National Association of State Fire Marshals (NASFM)

THESE PROPOSALS ARE ON THE AGENDA OF THE IBC FIRE SAFETY AND IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC FIRE SAFETY

Revise as follows:

1505.2 (Supp) Class A roof assemblies. Class A roof assemblies are those that are effective against severe fire test exposure. Class A roof assemblies and roof coverings shall be listed and identified as Class A by any approved testing agency. Class A roof assemblies shall be permitted for use in buildings or structures of all types of construction.

Exceptions:

1. Class A roof assemblies include those with coverings of brick, masonry, ~~slate, clay or concrete roof tile~~, or an exposed concrete roof deck.
2. Class A roof assemblies also include ferrous or copper shingles or sheets, metal sheets and shingles, clay and concrete roof tile, and slate installed on non-combustible decks.

PART II – IRC BUILDING/ENERGY

R902.1 (Supp) Roofing covering materials. Roofs shall be covered with materials as set forth in Sections R904 and R905. Class A, B or C roofing shall be installed in areas designated by law as requiring their use or when the edge of the roof is less than 3 feet (914 mm) from a property line. Classes A, B and C roofing required to be listed by this section shall be tested in accordance with UL 790 or ASTM E 108.

Exceptions:

1. Class A roof assemblies include those with coverings of brick, masonry, ~~slate, clay or concrete roof tile~~, and exposed concrete roof deck.
2. Class A roof assemblies also include ferrous or copper shingles or sheets, metal sheets and shingles, clay and concrete tile, installed on noncombustible decks.

Reason: (IBC/IRC) This is a follow-up proposal to code change FS199-06/07 that was submitted by the National Association of State Fire Marshals and approved as modified by their public comment at the ICC Final Action Hearings in Rochester, NY. The public comment cited some ASTM E108 (UL790) tests in UL Report file SV16680, Project 07CA03538 “Fact-Finding Investigation of Metal and Slate Prepared Roof Coverings” dated Jan 17, 2007.

It should be noted that during the prior code cycle the automatic Class A designation was removed for steel, copper, and slate. This proposal addresses the same problem and treats clay and concrete tile in the same manner.

This proposal only seeks to remove language and exceptions that automatically confer Class A status to certain materials. It does not eliminate the use of any product. The increasingly wide range of materials and configurations used as clay roofing now available in the market can no longer support a general exemption from fire testing these assemblies. All roof assemblies with clay or concrete tile roof covering should be tested in accordance with ASTM E108 or UL 790. The modification recognizes that clay and concrete tile roof coverings on non-combustible decks do not constitute a hazard.

Under brush fire conditions in the field, roof coverings can be exposed to burning brands that may break slate or clay or concrete roof tile, since they are brittle materials, and expose the roof deck to the fire; or the high winds caused by the brush fire can lift the butt ends of slate or concrete or clay roof tiles, allowing the entry of embers under the roof covering and igniting the combustible deck.

At the Rochester Final Action Hearing, the membership vote made it clear that fire resistance testing is favored over the exceptions based on field experience in past editions of the IBC. This change would also provide a level playing field for all of the roofing materials that would be included in exception 2.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I – IBC FIRE SAFETY

Committee Action:

Approved as Submitted

Committee Reason: The committee agreed that based on the wide range of materials and configurations of concrete and clay roofing products available, all roof assemblies with clay or concrete tile roof covering should be tested in accordance with ASTM E108 or UL 790 to substantiate a Class A roof assembly, unless these products are installed on a noncombustible deck.

Assembly Action:

None

PART II – IRC B/E

Committee Action:

Disapproved

Committee Reason: Based on proponent's request for disapproval in favor of S20-07/08, Part II.

Assembly Action:

None

Final Hearing Results

S18-07/08, Part II	D

Code Change No: **S19-07/08**

Original Proposal

Sections: 1505.2; IRC R902.1

Proponent: Kate Dargan, State Fire Marshal, CAL FIRE, representing California Office of the State Fire Marshal

THESE PROPOSALS ARE ON THE AGENDA OF THE IBC FIRE SAFETY AND IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC FIRE SAFETY

Revise as follows:

1505.2 (Supp) Class A roof assemblies. Class A roof assemblies are those that are effective against severe fire test exposure. Class A roof assemblies and roof coverings shall be listed and identified as Class A by any approved testing agency. Class A roof assemblies shall be permitted for use in buildings or structures of all types of construction.

Exceptions:

1. Class A roof assemblies include those with coverings of brick, masonry, slate, clay or concrete roof tile, or an exposed concrete roof deck.
2. Class A roof assemblies also include ferrous or copper shingles or sheets, metal sheets and shingles, installed on non-combustible decks or ferrous, copper or metal sheets installed without a roof deck.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R902.1 (Supp) Roofing covering materials. Roofs shall be covered with materials as set forth in Sections R904 and R905. Class A, B or C roofing shall be installed in areas designated by law as requiring their use or when the edge of the roof is less than 3 feet (914 mm) from a property line. Classes A, B and C roofing required to be listed by this section shall be tested in accordance with UL 790 or ASTM E 108.

Exceptions:

1. Class A roof assemblies include those with coverings of brick, masonry, slate, clay or concrete roof tile, and exposed concrete roof deck.
2. Class A roof assemblies also include ferrous or copper shingles or sheets, metal sheets and shingles, installed on noncombustible decks or ferrous, copper or metal sheets installed without a roof deck.

Reason: (IBC) The purpose of this proposal is to add “metal sheets and shingles” to Exception 2 for compatibility with the current text in Section R902.1 of the IRC and to address the condition where roof decking is not needed for support of the roof covering.

The phrase “metal sheets and shingles” is needed to include aluminum or other noncombustible metal roofing.

During the discussion of code change FS199-06/07 at the ICC Public Hearings in Rochester, NY, it was clear that the concern was the flaming of the combustible deck that could cause premature failure of the roofing assembly. Many ferrous, copper and metal roof panels can be installed without the need for a supporting roof deck.

(IRC) The purpose of this proposal is to address the condition where roof decking is not needed for support of the roof covering.

During the discussion of code change FS199-06/07 at the ICC Public Hearings in Rochester, NY, it was clear that the concern was the flaming of the combustible deck that could cause premature failure of the roofing assembly. Many ferrous, copper and metal roof panels can be installed without the need for a supporting roof deck.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I – IBC FIRE SAFETY
Committee Action:

Approved as Modified

Modify the proposal as follows:

1505.2 Class A roof assemblies. Class A roof assemblies are those that are effective against severe fire test exposure. Class A roof assemblies and roof coverings shall be listed and identified as Class A by any approved testing agency. Class A roof assemblies shall be permitted for use in buildings or structures of all types of construction.

Exceptions:

1. Class A roof assemblies include those with coverings of brick, masonry, slate, clay or concrete roof tile, or an exposed concrete roof deck.
2. Class A roof assemblies also include ferrous or copper shingles or sheets, metal sheets and shingles, installed on non-combustible decks or ferrous, copper or metal sheets installed without a roof deck on non-combustible framing.

Committee Reason: The committee agreed that metal sheets and shingles installed on a non-combustible deck and metal sheet roofing installed directly on non-combustible framing without a roof deck achieves a Class A roof assembly, based on data that indicated that flaming of combustible decks/framing caused premature failure of a roof assembly. The modification clarifies that metal sheet roofing that is installed without a roof deck still requires installation on framing that is non-combustible in order to qualify as a Class A roof covering.

Assembly Action:

None

PART II – IRC B/E
Committee Action:

Disapproved

Committee Reason: Based on proponent's request for disapproval in favor of S20-07/08, Part II. Also, ferrous, copper or metal sheets without a roof deck may not be a Class A roof. This issue needs to be reworked.

Assembly Action:

None

Final Hearing Results

S19-07/08, Part I	AM
S19-07/08, Part II	D

Code Change No: S20-07/08

Original Proposal

Sections: 1505.2, IRC R902.1

Proponent: Kate Dargan, State Fire Marshal, CAL FIRE, representing California Office of the State Fire Marshal

THESE PROPOSALS ARE ON THE AGENDA OF THE IBC FIRE SAFETY AND IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC FIRE SAFETY

Revise as follows:

1505.2 (Supp) Class A roof assemblies. Class A roof assemblies are those that are effective against severe fire test exposure. Class A roof assemblies and roof coverings shall be listed and identified as Class A by any approved testing agency. Class A roof assemblies shall be permitted for use in buildings or structures of all types of construction.

Exceptions:

1. Class A roof assemblies include those with coverings of brick, masonry, ~~slate, clay or concrete roof tile~~, or an exposed concrete roof deck.
2. Class A roof assemblies also include ferrous or copper shingles or sheets, clay or concrete roof tile, or slate installed on non-combustible decks.

PART II – IRC BUILDING/ENERGY**Revise as follows:**

R902.1 (Supp) Roofing covering materials. Roofs shall be covered with materials as set forth in Sections R904 and R905. Class A, B or C roofing shall be installed in areas designated by law as requiring their use or when the edge of the roof is less than 3 feet (914 mm) from a property line. Classes A, B and C roofing required to be listed by this section shall be tested in accordance with UL 790 or ASTM E 108.

1. Class A roof assemblies include those with coverings of brick, masonry, ~~slate, clay or concrete roof tile~~, and exposed concrete roof deck.
2. Class A roof assemblies also include ferrous or copper shingles or sheets, metal sheets and shingles, clay or concrete roof tile, or slate installed on noncombustible decks.

Reason: (IBC/IRC) This is a follow-up proposal to code change FS199-06/07 that was submitted by the National Association of State Fire Marshals and approved as modified by their public comment at the ICC Final Action Hearings in Rochester, NY. The public comment cited some ASTM E108 (UL790) tests in UL Report file SV16680, Project 07CA03538 “Fact-Finding Investigation of Metal and Slate Prepared Roof Coverings” dated January 17, 2007.

Slate failed the test in less than 15 minutes but is currently included in the exception for materials that are to be considered without testing. The purpose of this proposed change is to require that decks for slate roofing or clay or concrete roof tile be noncombustible or that the roofing assembly pass the ASTM E108 (UL790) external fire and burning brand test.

Under brush fire conditions in the field, roof coverings can be exposed to burning brands that may break slate or clay or concrete roof tile, since they are brittle materials, and expose the roof deck to the fire; or the high winds caused by the brush fire can lift the butt ends of slate or concrete or clay roof tiles, allowing the entry of embers under the roof covering and igniting the combustible deck.

At the Rochester Final Action Hearing, the membership vote made it clear that fire resistance testing is favored over the exceptions based on field experience in past editions of the IBC. This change would also provide a level playing field for all of the roofing materials that would be included in exception 2.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I – IBC FIRE SAFETY**Committee Action:****Approved as Submitted**

Committee Reason: Based on data indicating that certain thicknesses and styles of clay and concrete roofing tiles do not qualify as Class A roof assemblies when installed on combustible decks, the committee agreed that these products should be limited to Class A when installed only on non-combustible decks. When installed on combustible decks, these products need to be tested in accordance with ASTM E108 or UL 790 to substantiate a Class A roof assembly

Assembly Action:**None****PART II – IRC B/E****Committee Action:****Approved as Submitted**

Committee Reason: This change improves the code by requiring these roof materials to be installed on a non-combustible deck. If the materials meet the Class A test they can be installed without a non-combustible deck.

Assembly Action:**None**

Final Hearing Results

S20-07/08, Part I	AS
S20-07/08, Part II	AS

Code Change No: S25-07/08

Original Proposal

Sections: 1507.2.5; IRC R905.2.4

Proponent: Michael D. Fischer, The Kellen Company, representing the Asphalt Roofing Manufacturer’s Association (ARMA)

THESE PROPOSALS ARE ON THE AGENDA OF THE IBC STRUCTURAL AND IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Revise as follows:

1507.2.5 Asphalt shingles. Asphalt shingles shall ~~have self-seal strips or be interlocking and~~ comply with ASTM D 225 or ASTM D 3462. ~~Asphalt shingle packaging shall bear labeling indicating compliance with ASTM D3161 or a listing by an approved testing agency in accordance with the requirements of Section 1609.5.2.~~

PART II – IRC BUILDING/ENERGY

R905.2.4 Asphalt shingles. Asphalt shingles shall ~~have self-seal strips or be interlocking, and~~ comply with ASTM D 225 or D 3462.

Reason: This proposal provides a correlation fix, and removes redundant language. The prescriptive text regarding self seal strips is inappropriate. The labeling requirement already occurs within Chapter 15. The self-seal strip or interlocking terms are not defined, and are unnecessary with the introduction of requirements for testing to ASTM D7158 and ASTM D3161. Removing the terms defers appropriately to the test standards and the performance requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I – IBC STRUCTURAL

Committee Action:

Approved as Submitted

Committee Reason: This proposal clarifies the original intent of Section 1507.2.5 by removing unnecessary wording.

Assembly Action:

None

PART II – IRC B/E

Committee Action:

Approved as Submitted

Committee Reason: This change eliminates redundancy in the code. The self seal strips or interlocking are already addressed in the test standards referenced in other sections of the code.

Assembly Action:

None

Final Hearing Results

S25-07/08, Part I AS
S25-07/08, Part II AS

Code Change No: S27-07/08

Original Proposal

Section: 1507.2.9.2

Proponent: Michael D. Fischer, The Kellen Company, representing the Asphalt Roofing Manufacturer's Association (ARMA)

Revise as follows:

1507.2.9.2 (Supp) Valleys. Valley linings shall be installed in accordance with the manufacturer's instructions before applying shingles. Valley linings of the following types shall be permitted:

1. For open valleys (valley lining exposed) lined with metal, the valley lining shall be at least ~~46~~ 24 inches (~~406~~ 610 mm) wide and of any of the corrosion-resistant metals in Table 1507.2.9.2.
2. For open valleys, valley lining of two plies of mineral-surfaced roll roofing complying with ASTM D 3909 or ASTM D 6380 shall be permitted. The bottom layer shall be 18 inches (457 mm) and the top layer a minimum of 36 inches (914 mm) wide.
3. For closed valleys (valleys covered with shingles), valley lining of one ply of smooth roll roofing complying with ASTM D 6380, and at least 36 inches (914 mm) wide or types as described in Items 1 or 2 above shall be permitted. Self-adhering polymer modified bitumen underlayment complying with ASTM D 1970 shall be permitted in lieu of the lining material.

Reason: The IBC and IRC currently contain differing provisions for the width of exposed valley linings. This change to modify the minimum required width for exposed valley lining brings consistency between the codes and improve the weather protection performance of asphalt roofing. The 24" requirement is consistent with the Asphalt Roofing Manufacturing Association (ARMA) recommendation, reflects industry standard product widths, and will provide consistency between the IRC and IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Approved as Submitted**

Committee Reason: The increased valley lining width is consistent with current industry installation practices.

Assembly Action:**None**

Final Hearing Results

S27-07/08**AS**

Code Change No: **S30-07/08**

Original Proposal

Sections: 1507.4.4; IRC R905.10.4

Proponent: Craig Thompson, Copper Development Association

THESE PROPOSALS ARE ON THE AGENDA OF THE IBC STRUCTURAL AND IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Revise as follows:

1507.4.4 Attachment. Metal roof panels shall be secured to the supports in accordance with the approved manufacturer's fasteners. In the absence of manufacturer recommendations, the following fasteners shall be used:

1. Galvanized fasteners shall be used for steel roofs.
2. Copper, Brass, Bronze, copper alloy and 300 series stainless-steel fasteners shall be used for copper roofs.
3. Stainless-steel fasteners are acceptable for all types of metal roofs.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R905.10.4 Attachment. Metal roof panels shall be secured to the supports in accordance with this chapter and the manufacturer's installation instructions. In the absence of manufacturer's installation instructions, the following fasteners shall be used:

1. Galvanized fasteners shall be used for steel roofs.
2. Copper, Brass, Bronze, copper alloy and Three hundred series stainless steel fasteners shall be used for copper roofs.
3. Stainless steel fasteners are acceptable for metal roofs.

Reason: (IBC) This change is being submitted to overcome an omission in the code regarding industry recommended fastener materials for use with copper and copper alloy roof systems. Traditionally, copper and copper alloy roofs have been installed using only copper alloy fasteners (copper, brass, bronze, etc.) in order to avoid issues related to dissimilar metal or galvanic corrosion problems between the copper alloy roof material and the fastener. More recently, stainless steel fasteners have also been allowed, and are acceptable in addition to copper and copper alloy fasteners, not in exclusion of those fasteners. As currently written, this section of the code is unnecessarily restrictive. As shown in the three references listed below, copper and copper alloy fasteners remain the industry recommended materials in addition to stainless steel for installing copper and copper alloy roofs.

Reference Publications:

The following publications list the types of fasteners to be used with copper roofs:

- A. SMACNA's "Architectural Sheet Metal Manual"
- B. Revere's "Copper and Common Sense"
- C. Copper Development Association's "Copper in Architecture"

(IRC) This change is being submitted to overcome an omission in the code regarding industry recommended fastener materials for use with copper and copper alloy roof systems. Traditionally, copper and copper alloy roofs have been installed using only copper alloy fasteners (copper, brass, bronze, etc.) in order to avoid issues related to dissimilar metal or galvanic corrosion problems between the copper alloy roof material and the fastener. More recently, stainless steel fasteners have also been allowed, and are acceptable in addition to copper and copper alloy fasteners, not in exclusion of those fasteners. As currently written, this section of the code is unnecessarily restrictive. As shown in the three references listed below, copper and copper alloy fasteners remain the industry recommended materials in addition to stainless steel for installing copper and copper alloy roofs.

Reference Publications:

The following publications list the types of fasteners to be used with copper roofs:

- A. SMACNA's "Architectural Sheet Metal Manual"
- B. Revere's "Copper and Common Sense"
- C. Copper Development Association's "Copper in Architecture"

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

**PART I – IBC STRUCTURAL
Committee Action:**

Approved as Modified

Modify proposal as follows:

1507.4.4 Attachment. Metal roof panels shall be secured to the supports in accordance with the approved manufacturer's fasteners. In the absence of manufacturer recommendations, the following fasteners shall be used:

1. Galvanized fasteners shall be used for steel roofs.
2. Copper, Brass, Bronze, copper alloy ~~and~~ or 300 series stainless-steel fasteners shall be used for copper roofs.
3. Stainless-steel fasteners are acceptable for all types of metal roofs.

Committee Reason: The proposal allows fasteners for copper roofs that are possibly excluded by the current verbiage. The modification uses "or" in place of "and" since the fasteners listed are options.

Assembly Action:

None

**PART II – IRC B/E
Committee Action:**

Approved as Submitted

Committee Reason: This change adds acceptable fasteners for copper roofs in absence of manufacturer's recommendations.

Assembly Action:

None

Final Hearing Results

S30-07/08, Part I	AM
S30-07/08, Part II	AS

Code Change No: S33-07/08

Original Proposal

Section: 1507.11.2, Chapter 35 (New)

Proponent: Kenneth R. Hunt, Performance Roof Systems, Inc., representing himself

1. Revise as follows:

1507.11.2 Material standards. Modified bitumen roof coverings shall comply with CGSB 37-GP-56M, ASTM D 6162, ASTM D 6163, ASTM D 6164, ASTM D 6222, ASTM D 6223, or ASTM D 6298 and ASTM D 6509.

2. Add standard to Chapter 35 as follows:

ASTM

D 6509-00 Standard Specification for Atactic Polypropylene (APP) Modified Bituminous Base Sheet Materials Using Glass Fiber Reinforcements

Reason: 1) The inclusion of ASTM D 6509 is to revise the current material standards to include all current ASTM Modified Bitumen roof covers. 2) The current code does not include the approval of an ASTM D 6509 APP Modified Bitumen Membrane thus restricting the use of a modified base sheet/ply to SBS only. 3) See attached copy of ASTM 6509.

Cost Impact: The code change proposal will not increase the cost of construction. The inclusion of ASTM D 6509 into the code will not increase cost of construction.

Public Hearing Results

Note: The following analysis was not in the Code Change Proposal book but was posted on the ICC website.

Analysis: Review of proposed new standard ASTM D 6509-00 indicated that, in the opinion of ICC Staff, the standard did not comply with ICC standards criteria, Section 3.6.2.1.

Committee Action:

Approved as Modified

Modify proposal as follows:

1507.11.2 Material standards. Modified bitumen roof coverings shall comply with CGSB 37-GP-56M, ASTM D 6162, ASTM D 6163, ASTM D 6164, ASTM D 6222, ASTM D 6223, ASTM D 6298 ~~and~~ or ASTM D 6509.

(Portions of proposal not shown remain unchanged)

Committee Reason: Including a reference to ASTM D 6509 improves the code by providing access to another product. The modification is editorial to keep the intent of the code the same.

Assembly Action:

None

Final Hearing Results

S33-07/08

AM

Code Change No: S34-07/08

Original Proposal

Sections: 1507.12.3, 1507.13.3, Chapter 35 (New)

Proponent: Mark S. Graham, National Roofing Contractors Association, representing Technical Operations Committee of the National Roofing Contractors Association

1. Revise as follows:

1507.12.3 (Supp) Ballasted thermoset low slope roofs. Ballasted thermoset low slope roofs (<2:12) shall be installed in accordance with this section and Section 1504.4. Stone used as ballast shall comply with ASTM D448.

1507.13.3 (Supp) Ballasted thermoplastic low slope roofs. Ballasted thermoplastic low slope roofs (<2:12) shall be installed in accordance with this section and Section 1504.4. Stone used as ballast shall comply with ASTM D448.

2. Add standard to Chapter 35 as follows:

ASTM

D 448-03a Standard Classification for Sizes of Aggregate for Road and Bridge Construction

Reason: This proposed code change is intended to clarify the intent of the Code's current requirements for ballasted single-ply membrane roof systems by providing specific requirements for stone ballast. ASTM D448 is already included in ANSI/SPRI RP-4, which is referenced in Sec. 1504.4, as a requirement for the size gradation of stone used as ballast. The proposed code change does not change the Code's size gradation requirement. It only includes it within the Code's text for ease of compliance and enforcement.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASTM D488, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before January 15, 2008.

Public Hearing Results

Note: The following analysis was not in the Code Change Proposal book but was posted on the ICC website.

Analysis: Review of proposed new standard ASTM D 448 indicated that, in the opinion of ICC Staff, the standard did comply with ICC standards criteria.

Committee Action:

Approved as Submitted

Committee Reason: The proposal adds a needed clarification for stone that is used as ballast.**Assembly Action:**

None

Final Hearing Results

S34-07/08

AS

Code Change No: S35-07/08

Original Proposal

Sections: 1507.14.2; IRC R905.14.2**Proponent:** Mason Knowles, Mason Knowles Consulting LLC, representing himself

THESE PROPOSALS ARE ON THE AGENDA OF THE IBC STRUCTURAL AND IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL**Revise as follows:**

1507.14.2 Material standards. Spray-applied polyurethane foam insulation shall comply with Types III and IV as defined in ASTM C 1029.

PART II – IRC BUILDING/ENERGY**Revise as follows:**

R905.14.2 Material standards. Spray-applied polyurethane foam insulation shall comply with Types III and IV as defined in ASTM C 1029.

Reason: This code change corrects a mistake made a few years ago. Originally this code change referenced types III and IV as spray foams acceptable for SPF roofing applications but in the 2004 supplement, the reference to types III and IV were deleted.

ASTM C 1029 classifies spray polyurethane foam into 4 types based on minimum compressive strength. Types I & II compressive strengths are 15 and 25 respectively. Types I and II as defined by ASTM C 1029 are not suitable for spray polyurethane foam roofing systems. Types III and IV compressive strengths are 40 and 60 psi respectively.

ASTM D 5469, Standard Guideline for New Spray Polyurethane Foam Roofing Systems and technical documents SPFA list the minimum compressive strength for spray polyurethane roofing systems as 40 psi which would correspond to types III and IV in ASTM C 1029.

Cost Impact: The code change will not increase the cost of construction.

Public Hearing Results

PART I – IBC STRUCTURAL**Committee Action:**

Approved as Modified

Modify proposal as follows:

1507.14.2 Material standards. Spray-applied polyurethane foam insulation shall comply with Types III ~~and~~ or IV as defined in ASTM C 1029.

Committee Reason: This code change establishes product standards. The modification is editorial and makes it clear that the insulation should comply with one or the other rather than both.

Assembly Action:

None

**PART II – IRC B/E
Committee Action:**

Approved as Submitted

Committee Reason: This change provides the correct reference to the types of acceptable spray polyurethane insulation, as well as correcting an omission.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Mark S. Graham, National Roofing Contractors Association (NRCA), Technical Operations Committee of the National Roofing Contractors Association, requests Approval as Modified by this Public Comment for Part II.

Modify proposal as follows:

R905.14.2 Material standards. Spray-applied polyurethane foam insulation shall comply with Types III ~~and~~ or IV as defined in ASTM C 1029.

Commenter's Reason: This modification is intended to make the IRC language consistent with the action taken by the IBC Structural Committee on the same item (Part I) and maintain consistency between the IBC and IRC.

An "or" is appropriate here to permit the use of either Type III or Type IV. Type III provides for SPF with a minimum compressive strength of 40 psi, while Type IV provides for a minimum compressive strength of 60 psi. Both 40 PSI and 60 psi SPF are appropriate for roofing applications.

Final Hearing Results

S35-07/08, Part I
S35-07/08, Part II

AM
AMPC

Code Change No: **S37-07/08**

Original Proposal

Sections: 1507.15.2, Chapter 35 (New); IRC R905.15.2, Chapter 43 (New)

Proponent: Mason Knowles, Mason Knowles Consulting LLC, representing himself

THESE PROPOSALS ARE ON THE AGENDA OF THE IBC STRUCTURAL AND IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

1. Revise as follows:

1507.15 Liquid-applied coatings. The installation of liquid-applied coatings shall comply with the provisions of this section.

1507.15.1 Slope. Liquid-applied roofs shall have a design slope of a minimum of one-fourth unit vertical in 12 units horizontal (2-percent slope).

1507.15.2 Material standards. Liquid-applied roof coatings shall comply with ASTM C 836, ASTM C 957, ASTM D 1227 or ASTM D 3468, ASTM D 6083, ASTM D 6694, or ASTM D 6947.

2. Add standard to Chapter 35 as follows:**ASTM**

D 6947-07 Standard Specification for Liquid Applied Moisture Cured Polyurethane Coating Used in Spray Polyurethane Foam Roofing System

PART II – IRC BUILDING/ENERGY**1. Revise as follows:**

R905.15 Liquid-applied coatings. The installation of liquid applied coatings shall comply with the provisions of this section.

R905.15.1 Slope. Liquid-applied roofs shall have a design slope of a minimum of one-fourth unit vertical in 12 units horizontal (2-percent slope).

R905.15.2 Material standards. Liquid-applied roof coatings shall comply with ASTM C 836, C 957, D 1227, D 3468, D 6083, D 6694, or ASTM D 6947.

R905.15.3 Application. Liquid-applied roof coatings shall be installed according to this chapter and the manufacturer's installation instructions.

2. Add standard to Chapter 43 as follows:**ASTM**

D 6947-07 Standard Specification for Liquid Applied Moisture Cured Polyurethane Coating Used in Spray Polyurethane Foam Roofing System

Reason: Moisture cured polyurethane coatings are widely used in the SPF industry and this code change would specifically allow the use of a viable alternative to the coatings already referenced in IBC section 1507.15.2 and IRC section R905.15.2

The code change allows the use of moisture cured polyurethane coatings over spray polyurethane foam roof systems meeting the ASTM standard 6947.

ASTM D 6947, is a new ASTM standard adopted in 2006 to describe liquid-applied moisture cured polyurethane coatings that are used in spray polyurethane foam roofing.

Cost Impact: The code change will not increase the cost of construction.

Analysis: A review of the standard proposed for inclusion in the code, ASTM D6947, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before January 15, 2008.

Public Hearing Results

Note: The following analysis was not in the Code Change Proposal book but was posted on the ICC website.

Analysis: Review of proposed new standard ASTM D 6947-07 indicated that, in the opinion of ICC Staff, the standard did comply with ICC standards criteria.

PART I – IBC STRUCTURAL**Committee Action:****Approved as Submitted**

Committee Reason: The addition of ASTM D 6947 clarifies code requirements for liquid-applied coatings.

Assembly Action:**None****PART II – IRC B/E****Committee Action:****Approved as Submitted**

Committee Reason: This change allows more options for the roofing industry and provides more options for spray polyurethane foam.

Assembly Action:**None**

Final Hearing Results

S37-07/08, Part I	AS
S37-07/08, Part II	AS

Code Change No: **S42-07/08**

Original Proposal

Sections: 1502.1, 1509.2, 1509.2.1 through 1509.2.3, 1509.2.4 (New)

Proponent: Sarah A. Rice, CBO, Schirmer Engineering Corporation

THESE PROPOSALS ARE ON THE AGENDA OF THE IBC GENERAL AND IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEES AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC GENERAL

Revise as follows:

SECTION 1502 DEFINITIONS

PENTHOUSE. An enclosed, unoccupied structure above the roof of a building, other than a tank, tower, spire, dome cupola or bulkhead, ~~occupying not more than one-third of the roof area.~~

1509.2 Penthouses. A penthouse or penthouses in compliance with Section 1509.2 shall not be considered as a portion of the story below.

1509.2.1 Height above roof. A penthouse or other projection above the roof in structures of other than Type I construction shall not exceed 28 feet (8534 mm) above the roof where used as an enclosure for tanks or for elevators that run to the roof and in all other cases shall not extend more than 18 feet (5486 mm) above the roof.

1509.2.2 Area limitation. The aggregate area of penthouses and other rooftop structures shall not exceed one-third the area of the supporting roof. Such penthouses shall not contribute to either the building area or number of stories as regulated by Section 503.1. The area of the penthouse shall not be included in determining the fire area defined in Section 702.

1509.2.3 Use limitations. A penthouse, bulkhead or any other similar projection above the roof shall not be used for purposes other than shelter of mechanical equipment or shelter of vertical shaft openings in the roof. Provisions such as louvers, louver blades or flashing shall be made to protect the mechanical equipment and the building interior from the elements. Penthouses or bulkheads used for purposes other than permitted by this section shall conform to the requirements of this code for an additional story. The restrictions of this section shall not prohibit the placing of wood flagpoles or similar structures on the roof of any building.

PART II – IBC MEANS OF EGRESS

Add new text as follows:

1509.2.4 Egress. Each occupant of a penthouse shall have access to at least two independent means of egress where the common path of egress travel exceeds the limitations of Section 1014.3. Where a stairway provides a means of exit access from a penthouse, the maximum travel distance includes the distance traveled on the stairway measured in the plane of the tread nosing. Accessible means of egress shall be provided in accordance with Section 1007.

Exception: A single means of egress shall be permitted in accordance with Section 1015.1.

(Re-number subsequent sections)

Reason: This proposal seeks to clean up the provisions on penthouses so that among other things:

- code requirements are not in the definition,

- it is clear on what kind of means of egress is to be provided,
- it is clear what types of means of egress must be available.
- A penthouse is similar to a mezzanine in many ways, thus much of the proposed language is similar to what is found in the provisions for mezzanines in Section 505.

The only element that will vary for these tenant spaces is how they contribute to the design of the means of egress system of the covered mall building. All other elements remain the same, e.g., fire alarm, sprinkler, etc.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I – IBC GENERAL

Committee Action:

Approved as Modified

Modify the proposal as follows:

1509.2 Penthouses. A penthouse or penthouses in compliance with Sections ~~1509.2~~ 1509.2.1 through 1509.2.3 shall ~~not~~ be considered as a portion of the story below.

(Portions of proposal not shown remain unchanged)

Committee Reason: Clarifies application of the provisions for penthouses and removes requirements from the definition of penthouse. The modification simply revises the phrase “in compliance with section 1509.2” to “in compliance with Section 1509.2.1 through 1509.2.3” to clarify the applicability of the subsections and be consistent with code style. Additionally the term “not” in section 1509.2 was deleted as it would nullify the revisions the proponent intended.

Assembly Action:

None

PART II – IBC MEANS OF EGRESS

Committee Action:

Disapproved

Committee Reason: The proposal is too restrictive. The definition for means of egress deals with occupied spaces; therefore, since penthouses are considered unoccupied spaces, this could be a possible conflict. A penthouse typically has a very low or no occupants – the proposal would result in two means of egress being required for a penthouse. In addition, this requirement could result in at least two stairways to extend to the roof.

Assembly Action:

None

Final Hearing Results

S42-07/08, Part I
S42-07/08, Part II

AM
D

Code Change No: **S47-07/08**

Original Proposal

Sections: 1603.1, 1603.1.6 (New), 1802.6

Proponent: Edwin T. Huston, Smith & Huston, Inc., representing National Council of Structural Engineering Associations

1. Revise as follows:

1603.1 General. Construction documents shall show the size, section and relative locations of structural members with floor levels, column centers and offsets dimensioned. The design loads and other information pertinent to the structural design required by Sections 1603.1.1 through ~~1603.1.8~~ 1603.1.9 shall be indicated on the construction documents.

Exception: Construction documents for buildings constructed in accordance with the conventional light-frame construction provisions of Section 2308 shall indicate the following structural design information:

1. Floor and roof live loads.
2. Ground snow load, *P_g*.

3. Basic wind speed (3-second gust), miles per hour (mph) (km/hr) and wind exposure.
4. Seismic design category and site class.
5. Flood design data, if located in flood hazard areas established in Section 1612.3.
6. Design load-bearing values of soils.

2. Add new text as follows:

1603.1.6 Geotechnical information. The soil classification and design load-bearing values shall be shown on the construction documents.

(Renumber subsequent sections)

Revise as follows:

1802.6 Reports. ~~The soil classification and design load-bearing capacity shall be shown on the construction documents.~~ Where required by the building official, a written report of the investigation shall be submitted that includes, but need not be limited to, the following information:

1. A plot showing the location of test borings and/or excavations.
2. A complete record of the soil samples.
3. A record of the soil profile.
4. Elevation of the water table, if encountered.
5. Recommendations for foundation type and design criteria, including but not limited to: bearing capacity of natural or compacted soil; provisions to mitigate the effects of expansive soils; mitigation of the effects of liquefaction, differential settlement and varying soil strength; and the effects of adjacent loads.
6. Expected total and differential settlement.
7. Pile and pier foundation information in accordance with Section 1808.2.2.
8. Special design and construction provisions for footings or foundations founded on expansive soils, as necessary.
9. Compacted fill material properties and testing in accordance with Section 1803.5.

Reason: Code clarification. Moves the requirement to show “soil classification and design load-bearing capacity” on the construction documents to the appropriate section. Since the requirement presently exists for all structures, it must apply to both the general case and the conventional light-frame construction case. Even in the simplest case, where the presumptive load-bearing values are used, some classification and design load-bearing capacities are known. In the exceptional case where Section 2308 is being used, the soil classification may be irrelevant, so the requirement is relaxed to reduce the burden on designers.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1603.1.6 Geotechnical information. ~~The soil classification and design load-bearing values~~ of soils shall be shown on the construction documents.

(Portions of proposal not shown remain unchanged)

Committee Reason: This proposal relocates information that is already in the code to a more appropriate section in Chapter 16, resulting in a clarification of requirements for construction documents. The modification removes “soils classification” in recognition that in some instances the allowable soil pressure may be determined without borings. Where a soils report is performed it is still part of the submittals required by Chapter 1.

Assembly Action:

None

Final Hearing Results

AM

Code Change No: S48-07/08

Original Proposal

Sections: 1603.2, 1603.3, 1603.4, 106 (New)

Proponent: Philip Brazil, PE, SE, Reid Middleton, representing himself

Revise as follows:

SECTION 106
FLOOR AND ROOF DESIGN LOADS

1603.2 106.1 Restrictions on loading. It shall be unlawful to place, or cause or permit to be placed, on any floor or roof of a building, structure or portion thereof, a load greater than is permitted by these requirements.

1603.3 106.2 Live loads posted. Where the live loads for which each floor or portion thereof of a commercial or industrial building is or has been designed to exceed 50 psf (2.40 kN/m²), such design live loads shall be conspicuously posted by the owner in that part of each story in which they apply, using durable signs. It shall be unlawful to remove or deface such notices.

1603.4 106.3 Occupancy permits for changed loads. Occupancy permits for buildings hereafter erected shall not be issued until the floor load signs, required by Section ~~1603.3~~ 106.2, have been installed.

(Renumber subsequent sections)

Reason: Chapter 16 governs the structural design of buildings and structures and consists primarily of provisions for the determination of minimum structural design loads. Section 1603, in particular contains requirements for specifying in the construction documents design loads for each building or structure. Sections 1603.2 through 1603.4, however, are concerned with restrictions on the loads imposed on floors and roofs, the posting of live loads and withholding of the issuance of occupancy permits until live load signs are posted. These particular provisions are more related to the enforcement of codes and standards by building officials rather than the specification of structural design loads. They are better located in the administrative provisions of Chapter 1 rather than in the structural design provisions of Chapter 16.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The requirements for posting live loads do not belong in the structural design chapter. This proposal relocates them more appropriately to the administrative requirements in Chapter 1.

Assembly Action:

None

Code Change No: **S50-07/08**

Original Proposal

Table 1604.3; IRC Table R301.7

Proponent: Daniel J. Walker, PE, Thomas Associates, Inc., representing National Sunroom Association

THESE PROPOSALS ARE ON THE AGENDA OF THE IBC STRUCTURAL AND IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Revise table footnotes as follows:

**TABLE 1604.3
DEFLECTION LIMITS^{a, b, c, h, i}**

- h. For aluminum structural members or aluminum panels used in skylights and sloped glazing framing, roofs or walls of sunroom additions or patio covers, not supporting edge of glass or aluminum sandwich panels, the total load deflection shall not exceed $L/60$. For continuous aluminum structural members supporting edge of glass, the total load deflection shall not exceed $L/175$ for each glass lite or $L/60$ for the entire length of the member, whichever is more stringent. For aluminum sandwich panels used in roofs or walls of sunroom additions or patio covers, the total load deflection shall not exceed $L/120$.

(Portions of table and footnotes not shown remain unchanged)

PART II – IRC BUILDING/ENERGY

Revise table footnotes as follows:

**TABLE R301.7 (Supp)
ALLOWABLE DEFLECTION OF STRUCTURAL MEMBERS^{a,b,c}**

- c. For aluminum structural members or panels used in roofs or walls of sunroom covers, not supporting edge of glass or sandwich panels, the total load deflection additions or patio shall not exceed $L/60$. For continuous aluminum structural members supporting edge of glass, the total load deflection shall not exceed $L/175$ for each glass lite or $L/60$ for the entire length of the member, whichever is more stringent. For sandwich panels used in roofs or walls of sunroom additions or patio covers, the total load deflection shall not exceed $L/120$.

(Portions of table and footnotes not shown remain unchanged)

Reason: The proposed modification provides clarification that the deflection limit for any edge of glass application shall not exceed $L/175$. The way the code currently reads is ambiguous and does not specifically reference the $L/175$ limit from ASTM E 1300, "Standard Practice for Determining Load Resistance of Glass in Buildings", which is referenced in IBC Chapter 24 and is widely accepted in the glazing industry. The added language improves code enforcement by including this important deflection limit.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I – IBC STRUCTURAL

Committee Action:

Approved as Submitted

Committee Reason: This code change provides clarity because the deflection limit currently exists in ASTM E 1300. Adding the limitation to footnote "h" makes it more apparent to the code user.

Assembly Action:

None

**PART II – IRC B/E
Committee Action:**

Approved as Submitted

Committee Reason: The proposal provides clarification that the deflection limit for any edge of glass application shall not exceed L/175. The current code language does not specifically reference the L/175 limit from ASTM E 1300, “Standard Practice for Determining Load Resistance of Glass in Buildings”, which is referenced in IBC Chapter 24 and is widely accepted in the glazing industry.

Assembly Action:

None

Final Hearing Results

S50-07/08, Part I	AS
S50-07/08, Part II	AS

Code Change No: S51-07/08

Original Proposal

Section: 1604.3.3**Proponent:** Bonnie Manley, American Iron and Steel Institute, representing American Iron and Steel Institute**Revise as follows:**

1604.3.3 Steel. The deflection of steel structural members shall not exceed that permitted by AISC 360, AISI S100 ~~NAS, AISI General, AISI Truss~~, ASCE 3, ASCE 8, SJI JG-1.1, SJI K-1.1 or SJI LH/DLH-1.1, as applicable.

Reason: This code change proposal updates the reference to AISI's *North American Specification for the Design of Cold-Formed Steel Structural Members*, 2007 edition, which has been given the new number designation of AISI S100. It also deletes the references to AISI General and AISI Truss, since neither document addresses deflection of cold-formed steel light frame construction from a serviceability standpoint. AISI S100 handles deflection criteria for cold-formed steel members.

Please see companion change to IBC Section 2209.1 for a summary of changes to AISI S100-07.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal updates the steel deflection requirements for consistency with the current standards that are referenced for steel construction.

Assembly Action:

None

Final Hearing Results

S51-07/08	AS
------------------	-----------

Code Change No: **S52-07/08**

Original Proposal

Sections: 1604.5, 1604.5.1

Proponent: Philip Brazil, PE, SE, Reid Middleton, representing himself

Revise as follows:

1604.5 Occupancy category. Buildings and structures shall be assigned an occupancy ~~category~~ categories in accordance with Table 1604.5.

1604.5.1 Multiple occupancies. Where a building or structure is occupied by two or more occupancies not included in the same occupancy category, ~~the structure~~ it shall be assigned the classification of the highest occupancy category corresponding to the various occupancies. Where buildings or structures have two or more portions that are structurally separated, each portion shall be separately classified. Where a separated portion of a building or structure provides required access to, required egress from or shares life safety components with another portion having a higher occupancy category, both portions shall be assigned to the higher occupancy category.

Reason: Table 1604.5 consistently references buildings and structures in assigning occupancy categories. Section 1604.5, however, references buildings but not structures. Section 1604.5.1 references structures but not buildings. The purpose of this proposal is to correct these oversights so that Sections 1604.5 and 1604.5.1 are consistent with Table 1604.5.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1604.5 Occupancy category. Each buildings and structures shall be assigned an occupancy ~~category~~ category in accordance with Table 1604.5.

1604.5.1 Multiple occupancies. Where a building or structure is occupied by two or more occupancies not included in the same occupancy category, it shall be assigned the classification of the highest occupancy category corresponding to the various occupancies. Where buildings or structures have two or more portions that are structurally separated, each portion shall be separately classified. Where a separated portion of a building or structure provides required access to, required egress from or shares life safety components with another portion having a higher occupancy category, both portions shall be assigned to the higher occupancy category.

Committee Reason: This code change provides terminology that is more consistent with Table 1604.5 and thus improves understanding of this provision. The modification makes further adjustments that are consistent with that intent.

Assembly Action:

None

Final Hearing Results

AM

Code Change No: **S57-07/08**

Original Proposal

Section: 1604.8.2

Proponent: Joseph J. Messersmith, Jr., PE, Portland Cement Association, representing Portland Cement Association

Revise as follows:

1604.8.2 Concrete and masonry Walls. ~~Concrete and masonry Walls shall be anchored to floors, roofs and other structural elements that provide lateral support for the wall. Such anchorage shall provide a positive direct connection capable of resisting the horizontal forces specified in this chapter but not less than a the minimum strength design horizontal force of 280 plf (4.10 kN/m) of wall specified in Section 11.7.3 of ASCE 7, substituted for "E" in the load combinations of Section 1605.2 or 1605.3. Concrete and masonry walls shall be designed to resist bending between anchors where the anchor spacing exceeds 4 feet (1219 mm). Required anchors in masonry walls of hollow units or cavity walls shall be embedded in a reinforced grouted structural element of the wall. See Sections 1609 for wind design requirements and see Section 1613 for earthquake design requirements.~~

Reason: The requirement that anchors attaching concrete and masonry walls to supporting construction be designed for a lower bound value of 280 pounds per linear foot is excessive and discriminatory considering that anchorage of walls of other materials is required to be designed for a horizontal force of 5% of the weight of the wall tributary to the anchor by Section 11.7.3 of ASCE 7-05.

To illustrate the punitive nature of the provision, consider two 10-foot high walls that are representative of walls used in single family dwellings and small commercial buildings; one a 5.5-inch thick concrete wall, the other a light-framed wall with 4-inch thick nominal masonry veneer anchored to the wall framing. The weight of the light-framed wall, including veneer is estimated to be 45 psf; therefore, the weight tributary to an anchor at the top of the wall is 225 plf ($45 * (10/2) = 225$). The required design anchorage force for this wall is 11 plf ($225 * 0.05 = 11$). For the 5.5-inch concrete wall (weight 69 psf), the weight tributary to an anchor at the top of the wall is 345 plf ($69 * (10/2) = 345$). Based on the requirement that applies to walls of other than concrete or masonry, the required anchorage design force for the concrete wall should be 17 plf ($345 * 0.05 = 17$); however, 280 plf must be used to design the anchorage.

Let's examine how the 280 plf requirement compares to wind design. ASCE 7, Section 6.1.4.2 requires that components and cladding be designed for a minimum service level design wind pressure of 10 psf. For our example walls using this minimum design wind pressure, the strength level (factored) force at the top of the wall due to wind is 80 plf ($10 * (10/2) * 1.6 = 80$). Now let's determine what basic wind speed is required to result in a factored design force at the top of the wall of 280 plf (strength level). The service level (unfactored) force comparable to 280 plf is 175 plf ($280/1.6 = 175$). Since 175 plf is based on a tributary wall height of 5 feet, the design wind pressure is 35 psf ($175/5 = 35$). From ASCE 7, Figure 6-3, for a building in exposure B, height of 30 feet, K_{zt} of 1.0, and effective wind area of less than or equal to 10 square feet for wall area 4, the negative design pressure for a basic wind speed of 140 mph is 38.2 psf. Therefore, the requirement that the 5.5-inch, 10-foot high concrete wall be anchored against a force of 280 plf is the same as requiring that the connection be designed for a basic wind speed of approximately 135 mph in exposure B.

It is obvious that in a world that is rapidly embracing performance-based design, the requirement that anchorages for concrete and masonry walls be designed for a force of 280 plf is not necessary and discriminates against these products. In addition, by singling out walls of concrete and masonry, walls of other materials that could have comparable mass per unit area are exempt from the requirement. Based on the foregoing, the requirement that anchorages for concrete and masonry walls be designed for 280 plf should be deleted. In its place will be a reference to Section 11.7.3 of ASCE 7-05 which has attachments/anchorage requirements that apply to all buildings.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The minimum horizontal force of 280 pounds per foot that has been carried over from legacy codes is arbitrary and overly conservative.

Assembly Action:

None

Code Change No: S58-07/08

Original Proposal

Section: 1604.8.3

Proponent: Edwin Huston, National Council of Structural Engineers Association (NCSEA), representing NCSEA Code Advisory Committee – General Engineering Subcommittee

Revise as follows:

1604.8.3 Decks. Where supported by attachment to an exterior wall, decks shall be positively anchored to the primary structure and designed for both vertical and lateral loads as applicable. Such attachment shall not be accomplished by the use of toenails or nails subject to withdrawal. Where positive connection to the primary building structure cannot be verified during inspection, decks shall be self-supporting. ~~For~~ In addition to the normal downward acting dead and live load reactions, decks with cantilevered framing members, connections to exterior walls or other framing members shall be designed and constructed to resist uplift resulting from the full live load specified in Table 1607.1 or snow load specified in Section 1608, whichever is greater, acting on the cantilevered portion of the deck, and no live load or snow load on the remaining portion of the span.

Reason: The existing last sentence is attempting to address the situation where the load on the cantilevered portion of the span may result in uplift at the support remote from the support at the cantilever. It is accepted engineering practice that for a cantilever, the full live load (or snow load) is placed on the cantilever, with no live or snow load on the remaining portion of the span. This may or may not cause uplift at the support, depending upon many factors. The proposal will clarify the intent and is consistent with the intent of Section 1607.10. Also, see Section 4.6 of ASCE 7-05. In addition, the proposal adds snow load since it is conceivable that snow load could control the design of the deck, especially where snow sliding or drifting from a higher roof must be considered.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1604.8.3 Decks. Where supported by attachment to an exterior wall, decks shall be positively anchored to the primary structure and designed for both vertical and lateral loads as applicable. Such attachment shall not be accomplished by the use of toenails or nails subject to withdrawal. Where positive connection to the primary building structure cannot be verified during inspection, decks shall be self-supporting. In addition to the normal downward acting dead and live load reactions, ~~decks with cantilevered framing members,~~ connections to exterior walls or other framing members of decks with cantilevered framing members shall be designed and constructed to resist uplift resulting from the full live load specified in Table 1607.1 or snow load specified in Section 1608, whichever is greater, acting on the cantilevered portion of the deck, and no live load or snow load on the remaining portion of the ~~span~~ deck.

Committee Reason: This code change improves the code by clarifying the current required loading condition that affects the critical portion of the deck. The modification is editorial and further clarifies the intention of this code section.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Edwin Huston, National Council of Structural Engineers Association (NCSEA), representing NCSEA Code Advisory Committee General Engineering Subcommittee, requests Approval as Modified by this Public Comment.

Further modify proposal as follows:

1604.8.3 Decks. Where supported by attachment to an exterior wall, decks shall be positively anchored to the primary structure and designed for both vertical and lateral loads as applicable. Such attachment shall not be accomplished by the use of toenails or nails subject to withdrawal. Where positive connection to the primary building structure cannot be verified during inspection, decks shall be self-supporting. ~~In addition to the normal downward acting dead and live load reactions, Connections of decks with cantilevered framing members connections to exterior walls or other framing members of decks with cantilevered framing members shall be designed and constructed to resist uplift resulting from the full live load specified in Table 1607.1 or snow load specified in Section 1608, whichever is greater, acting on the cantilevered portion of the deck, and no live load or snow load on the remaining portion of the deck for both of the following:~~

1. The reactions resulting from the dead, live load specified in Table 1607.1, or the snow load specified in Section 1608, in accordance with Section 1605, acting on all portions of the deck.
2. The reactions resulting from the dead load and live load specified in Table 1607.1 or the snow load specified in Section 1608, in accordance with Section 1605, acting on the cantilevered portion of the deck, and no live load or snow load on the remaining portion of the deck.

Commenter's Reason: NCSEA has received the suggested Public Comment from WTCA. They indicated another possible way this section could be interpreted. We agree that the above language is an editorial improvement to section 1604.8.3

Final Hearing Results

S58-07/08

AMPC

Code Change No: S60-07/08

Original Proposal

Sections: 1605.1, 1808.2.23.1.1, 1808.2.23.2.1, 1808.2.23.2.2, 1808.2.23.2.3, 1908.1.12

Proponent: Edwin T. Huston, Smith & Huston, Inc., representing the National Council of Structural Engineering Associations

Revise as follows:

1605.1 (Supp) General. Buildings and other structures and portions thereof shall be designed to resist:

1. The load combinations specified in Section 1605.2, 1605.3.1 or 1605.3.2,
2. The load combinations specified in Chapters 18 through 23, and
3. The load combinations with overstrength factor specified in Section 12.4.3.2 of ASCE 7 where required by Section 12.2.5.2, 12.3.3.3 or 12.10.2.1 of ASCE 7. With the simplified procedure of ASCE 7 Section 12.14, the load combinations with overstrength factor of Section 12.14.3.2 of ASCE 7 shall be used.

~~With the simplified procedure of ASCE 7 Section 12.14, the overstrength factor load combinations of Section 12.14.3.2 of ASCE 7 shall be used.~~ Applicable loads shall be considered, including both earthquake and wind, in accordance with the specified load combinations. Each load combination shall also be investigated with one or more of the variable loads set to zero.

The load combinations with overstrength factor in Section 12.4.3.2 of ASCE 7 shall be used in lieu of the following as follows:

1. The ~~load~~ Basic Combinations for Strength Design with Overstrength Factor in lieu of Equations 16-5 and 16-7 in Section 1605.2.1.
2. The ~~load~~ Basic Combinations for Allowable Stress Design with Overstrength Factor in lieu of Equations 16-12, 16-13 and 16-15 in Section 1605.3.1.
3. The ~~load~~ Basic Combinations for Allowable Stress Design with Overstrength Factor in lieu of Equations 16-20 and 16-21 in Section 1605.3.2.

1808.2.23.1.1 Connection to pile cap. Concrete piles and concrete-filled steel pipe piles shall be connected to the pile cap by embedding the pile reinforcement or field-placed dowels anchored in the concrete pile in the pile cap for a distance equal to the development length. For deformed bars, the development length is the full development

length for compression or tension, in the case of uplift, without reduction in length for excess area. Alternative measures for laterally confining concrete and maintaining toughness and ductile-like behavior at the top of the pile will be permitted provided the design is such that any hinging occurs in the confined region.

Ends of hoops, spirals and ties shall be terminated with seismic hooks, as defined in Section 21.1 of ACI 318, turned into the confined concrete core. The minimum transverse steel ratio for confinement shall not be less than one-half of that required for columns.

For resistance to uplift forces, anchorage of steel pipe (round HSS sections), concrete-filled steel pipe or H-piles to the pile cap shall be made by means other than concrete bond to the bare steel section.

Exception: Anchorage of concrete-filled steel pipe piles is permitted to be accomplished using deformed bars developed into the concrete portion of the pile.

Splices of pile segments shall develop the full strength of the pile, but the splice need not develop the nominal strength of the pile in tension, shear and bending when it has been designed to resist axial and shear forces and moments from the load combinations of ~~Section 1605.4~~ with overstrength factor in Section 12.4.3.2 of ASCE 7.

1808.2.23.2.1 (Supp) Design details for piers, piles and grade beams. Piers or piles on Site Class E or F sites, as determined in Section 1613.5.2, shall be designed and constructed to withstand maximum imposed curvatures from earthquake ground motions and structure response. Curvatures shall include free-field soil strains modified for soil-pile structure interaction coupled with pier or pile deformations induced by lateral pier or pile resistance to structure seismic forces.

Exception: Piers or piles that satisfy the following additional detailing requirements shall be deemed to comply with the curvature capacity requirements of this section.

1. Precast prestressed concrete piles detailed in accordance with Section 1809.2.3.2.2.
2. Cast-in-place concrete piles with a minimum longitudinal reinforcement ratio of 0.005 extending the full length of the pile and detailed in accordance with Sections 21.4.4.1, 21.4.4.2 and 21.4.4.3 of ACI 318 as required by this section.

Where constructed of nonprestressed concrete such piers or piles shall be designed and detailed in accordance with Sections 21.4.4.1, 21.4.4.2 and 21.4.4.3 of ACI 318 within seven pile diameters of the pile cap and within seven pile diameters of the interfaces of strata that are hard or stiff and strata that are liquefiable or are composed of soft to medium stiff clay.

Grade beams shall comply with the provisions in Section 21.10.3 of ACI 318 for grade beams, except where they have the capacity to resist the forces from the load combinations in ~~Section 1605.4.4~~ with overstrength factor in Section 12.4.3.2 of ASCE 7.

1808.2.23.2.2 Connection to pile cap. For piles required to resist uplift forces or provide rotational restraint, design of anchorage of piles into the pile cap shall be provided considering the combined effect of axial forces due to uplift and bending moments due to fixity to the pile cap. Anchorage shall develop a minimum of 25 percent of the strength of the pile in tension. Anchorage into the pile cap shall be capable of developing the following:

1. In the case of uplift, the lesser of the nominal tensile strength of the longitudinal reinforcement in a concrete pile, or the nominal tensile strength of a steel pile, or the pile uplift soil nominal strength factored by 1.3 or the axial tension force resulting from the load combinations of ~~Section 1605.4~~ with overstrength factor in Section 12.4.3.2 of ASCE 7.
2. In the case of rotational restraint, the lesser of the axial and shear forces, and moments resulting from the load combinations of ~~Section 1605.4~~ with overstrength factor in Section 12.4.3.2 of ASCE 7 or development of the full axial, bending and shear nominal strength of the pile.

1808.2.23.2.3 Flexural strength. Where the vertical lateral-force-resisting elements are columns, the grade beam or pile cap flexural strengths shall exceed the column flexural strength.

The connection between batter piles and grade beams or pile caps shall be designed to resist the nominal strength of the pile acting as a short column. Batter piles and their connection shall be capable of resisting forces and moments from the load combinations of ~~Section 1605.4~~ with overstrength factor in Section 12.4.3.2 of ASCE 7.

1908.1.12 ACI 318, Section 21.12.5. Modify ACI 318, Section 21.12.5, by adding new Section 21.12.5.6 to read as follows:

21.12.5.6 – Columns supporting reactions from discontinuous stiff members, such as walls, shall be designed for the special load combinations with overstrength factor in Section 12.4.3.2 of ASCE 7 in Section 1605.4 of the International Building Code and shall be provided with transverse reinforcement at the spacing, s_o , as defined in 21.12.5.2 over their full height beneath the level at which the discontinuity occurs. This transverse reinforcement shall be extended above and below the column as required in 21.4.4.5.

Reason: Code clarification.

Removes vestigial references to the now absent Section 1605.4. Removes the incorrect “in lieu of” that introduces a series of items containing “in lieu of”. Revises the terminology to be consistent with ASCE Section 12.14.3.2. In the second numbered list, revises the terminology for load combinations (including capitalization) to be perfectly consistent with the designations in Section 12.4.3.2 of ASCE 7.

For three reasons, moves the first sentence of the second paragraph so that it appears in item 3 of the numbered list. First, items 1 and 2 apply where the simplified procedure is used. Second, the first sentence of the second paragraph specifies how overstrength comes into play where the simplified procedure is used. Third, the last two sentences of the second paragraph are meant to apply in all cases, not just where the simplified procedure is used.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1605.1 (Supp) General. Buildings and other structures and portions thereof shall be designed to resist:

1. The load combinations specified in Section 1605.2, 1605.3.1 or 1605.3.2,
2. The load combinations specified in Chapters 18 through 23, and
3. The load combinations with overstrength factor specified in Section 12.4.3.2 of ASCE 7 where required by Section 12.2.5.2, 12.3.3.3 or 12.10.2.1 of ASCE 7. With the simplified procedure of ASCE 7 Section 12.14, the load combinations with overstrength factor of Section 12.14.3.2 of ASCE 7 shall be used.

Applicable loads shall be considered, including both earthquake and wind, in accordance with the specified load combinations. Each load combination shall also be investigated with one or more of the variable loads set to zero.

Where the load combinations with overstrength factor in Section 12.4.3.2 of ASCE 7 apply, they shall be used as follows:

1. The Basic Combinations for Strength Design with Overstrength Factor in lieu of Equations 16-5 and 16-7 in Section 1605.2.1.
2. The Basic Combinations for Allowable Stress Design with Overstrength Factor in lieu of Equations 16-12, 16-13 and 16-15 in Section 1605.3.1.
3. The Basic Combinations for Allowable Stress Design with Overstrength Factor in lieu of Equations 16-20 and 16-21 in Section 1605.3.2.

(Portions of proposal not shown remain unchanged)

Committee Reason: The code change provides correlation with the ASCE 7 overstrength combinations. The modification clarifies when these load combinations are to be used.

Assembly Action:

None

Final Hearing Results

S60-07/08

AM

Code Change No: S61-07/08

Original Proposal

Section: 1605.1.1 (New)

Proponent: William Sherman, CH2M HILL, representing himself

Add new text as follows:

1605.1.1 Stability. Where overall structure stability (such as stability against overturning, sliding, or buoyancy) is checked using the load combinations in Section 1605.2, strength reduction factors applicable to soil resistance shall be provided by a qualified geotechnical engineer and consideration shall be given to acceptable behavior at service

loads. Where structural elements are designed for strength using the load combinations in 1605.2, it is permissible to check overall structure stability using the load combinations in 1605.3. Where the load combinations in 1605.3 are used to check overall structure stability, the dead load factor in each load combination shall be taken as 1.0 where the factors of safety in Section 1806.1 are applied.

Reason: Clarification of code provisions – existing code language implies that it applies to all design conditions but is not clear as to how load combinations are to be used when performing stability analysis of structures. Structure stability safety factors would be different using factored loads than using unfactored loads. Some factors applied to loads in the ASD provisions may duplicate the purpose of separately applied safety factors, such as the “safety factor of 1.5 against overturning or sliding” in Section 1806.1. If factored loads are used, soil resistance must consider strength reduction factors that are not provided by standard building codes.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

~~1605.1.1 Stability. Regardless of which load combinations are used to design for strength, where overall structure stability (such as stability against overturning, sliding, or buoyancy) is checked using being verified, use of the load combinations specified in Section 1605.2 or 1605.3 shall be permitted. Where the load combinations specified in Section 1605.2 are used, strength reduction factors applicable to soil resistance shall be provided by a registered design professional, qualified geotechnical engineer and consideration shall be given to acceptable behavior at service loads. Where structural elements are designed for strength using the load combinations in 1605.2, it is permissible to check overall structure stability using the load combinations in 1605.3. Where the load combinations in 1605.3 are used to check overall structure stability, the dead load factor in each load combination shall be taken as 1.0 where the factors of safety in Section 1806.1 are applied. The stability of retaining wall shall be verified in accordance with Section 1807.2.3.~~

Committee Reason: This proposal provides a clarification of the code with respect to stability. The modification improves the wording so that the intent is clearer and also coordinates with Chapter 18 requirements.

Assembly Action:

None

Final Hearing Results

S61-07/08

AM

Code Change No: S62-07/08

Original Proposal

Sections: 1602, 1605.2.2, 1605.3.1.2, 1612.4

Proponent: Rebecca C. Quinn, RC Quinn Consulting, Inc., representing U.S. Homeland Security, Federal Emergency Management Agency

Revise as follows:

**SECTION 1602
DEFINITIONS AND NOTATIONS**

F_a = Flood load in accordance with Chapter 5 of ASCE 7.

1605.2.2 Other Flood loads. Where flood loads F_a is are to be considered in the design, the load combinations of Section 2.3.3 of ASCE 7 shall be used.

1605.3.1.2 Other Flood loads. Where flood loads F_a is are to be considered in design, the load combinations of Section 2.4.2 of ASCE 7 shall be used.

1612.4 Design and construction. The design and construction of buildings and structures located in flood hazard areas, including flood hazard areas subject to high velocity wave action, shall be in accordance with Chapter 5 of ASCE 7 and with ASCE 24.

Reason: The purpose of the code changes in 1605 is to clarify use of the notation for flood loads. Section 1602 defines F_a to mean flood load (see under "Notations"). Sections 1605.2.2 and 1605.3.1.2 no longer contain provisions for loads other than flood loads, and IBC Section 1613 uses " F_a " to mean something other than flood loads. The proposed change makes it clear where F_a means flood loads.

The purpose of the code change in 1612 is to more clearly direct the user to Chapter 5 of ASCE 7, which is where flood loads are specified.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal clarifies the notation for flood loads and makes the appropriate reference to ASCE 7.

Assembly Action:

None

S62-07/08

AS

Code Change No: S63-07/08

Original Proposal

Section: 1605.3.1

Proponent: W. Lee Shoemaker, Ph.D., PE, Thomas Associates, Inc., representing Metal Building Manufacturers Association

Revise as follows:

1605.3.1 Basic load combinations. Where allowable stress design (working stress design), as permitted by this code, is used, structures and portions thereof shall resist the most critical effects resulting from the following combinations of loads:

$D + F$	(Equation 16-8)
$D + H + F + L + T$	(Equation 16-9)
$D + H + F + (L_r \text{ or } S \text{ or } R)$	(Equation 16-10)
$D + H + F + 0.75(L + T) + 0.75 (L_r \text{ or } S \text{ or } R)$	(Equation 16-11)
$D + H + F + (W \text{ or } 0.7E)$	(Equation 16-12)
$D + H + F + 0.75 (W \text{ or } 0.7E) + 0.75L + 0.75 (L_r \text{ or } S \text{ or } R)$	(Equation 16-13)
$0.6D + W + H$	(Equation 16-14)
$0.6D + 0.7E + H$	(Equation 16-15)

Exceptions:

1. Crane hook loads need not be combined with roof live load or with more than three-fourths of the snow load or one-half of the wind load.
2. Flat roof snow loads of 30 psf (1.44 kN/m²) or less and roof live loads need not be combined with seismic loads. Where flat roof snow loads exceed 30 psf (1.44 kN/m²), 20 percent shall be combined with seismic loads.

Reason: Equation 16-13 of the allowable stress design basic load combinations is not consistent with the LRFD and alternate basic load combinations because roof live loads are not additive with earthquake loads in those combinations (Equation 16-5 and Equation 16-20, respectively). The reason that roof live load is not considered in conjunction with earthquake loads is that roof live loads are produced during maintenance and are of low probability of occurring simultaneously with earthquake loads. This proposed change makes all three load

combination sets correct and consistent. An alternate change was considered to revise the load combinations directly and not put this in the exception, but it would require splitting Equation 16-13 into two equations because the case with wind should include the roof live load. It was felt that the addition to the exception was the cleanest solution and not requiring an additional load combination.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1605.3.1 Basic load combinations. Where allowable stress design (working stress design), as permitted by this code, is used, structures and portions thereof shall resist the most critical effects resulting from the following combinations of loads:

$D + F$	(Equation 16-8)
$D + H + F + L + T$	(Equation 16-9)
$D + H + F + (L_r \text{ or } S \text{ or } R)$	(Equation 16-10)
$D + H + F + 0.75(L + T) + 0.75(L_r \text{ or } S \text{ or } R)$	(Equation 16-11)
$D + H + F + (W \text{ or } 0.7E)$	(Equation 16-12)
$D + H + F + 0.75(W \text{ or } 0.7E) + 0.75L + 0.75(L_r \text{ or } S \text{ or } R)$	(Equation 16-13)
$0.6D + W + H$	(Equation 16-14)
$0.6D + 0.7E + H$	(Equation 16-15)

Exceptions:

1. Crane hook loads need not be combined with roof live load or with more than three-fourths of the snow load or one-half of the wind load.
2. Flat roof snow loads of 30 psf (1.44 kN/m²) or less and roof live loads of 30 psf or less need not be combined with seismic loads. Where flat roof snow loads exceed 30 psf (1.44 kN/m²), 20 percent shall be combined with seismic loads.

Add the following new item:

1605.3.2 Alternative basic load combinations. In lieu of the basic load combinations specified in Section 1605.3.1, structures and portions thereof shall be permitted to be designed for the most critical effects resulting from the following combinations. When using these alternative basic load combinations that include wind or seismic loads, allowable stresses are permitted to be increased or load combinations reduced where permitted by the material chapter of this code or the referenced standards. For load combinations that include the counteracting effects of dead and wind loads, only two-thirds of the minimum dead load likely to be in place during a design wind event shall be used. Where wind loads are calculated in accordance with Chapter 6 of ASCE 7, the coefficient ω in the following equations shall be taken as 1.3. For other wind loads, ω shall be taken as 1. When using these alternative load combinations to evaluate sliding, overturning and soil bearing at the soil-structure interface, the reduction of foundation overturning from Section 12.13.4 in ASCE 7 shall not be used. When using these alternative basic load combinations for proportioning foundations for loadings, which include seismic loads, the vertical seismic load effect, E_v , in Equation 12.4-4 of ASCE 7 is permitted to be taken equal to zero.

$D+ L + (L_r \text{ or } S \text{ or } R)$	(Equation 16-16)
$D+ L + (\omega W)$	(Equation 16-17)
$D+ L + \omega W + S/2$	(Equation 16-18)
$D+ L + S + \omega W/2$	(Equation 16-19)
$D+ L + S + E/1.4$	(Equation 16-20)
$0.9D + E/1.4$	(Equation 16-21)

Exceptions:

1. Crane hook loads need not be combined with roof live loads or with more than three-fourths of the snow load or one-half of the wind load.
2. Flat roof snow loads of 30 psf (1.44 kN/m²) or less and roof live loads of 30 psf or less need not be combined with seismic loads. Where flat roof snow loads exceed 30 psf (1.44 kN/m²), 20 percent shall be combined with seismic loads.

Committee Reason: This code changes brings consistency between strength load combinations and allowable stress load combinations. The modification limits applicability of the exception to roof live loads and also extends this allowance to the exception under the alternate basic allowable stress load combinations.

Assembly Action:

None

Code Change No: **S66-07/08**

Original Proposal

Sections: 406.3.3, Table 1607.1, 1607.7, 1607.7.1, 1607.7.1.1, 1607.7.2, 1607.7.3

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing himself

Revise as follows:

406.3.3 Construction. Open parking garages shall be of Type I, II or IV construction. Open parking garages shall meet the design requirements of Chapter 16. For vehicle barriers systems, see Section 406.2.4.

TABLE 1607.1 (Supp)
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS AND MINIMUM CONCENTRATED LIVE LOADS⁹

OCCUPANCY OR USE	UNIFORM (psf)	CONCENTRATED (lbs.)
Vehicle barriers <u>systems</u>	See Section	1607.7.3

(Portions of table not shown remain unchanged)

1607.7 Loads on handrails, guards, grab bars, seats and vehicle barriers systems. Handrails, guards, grab bars as ~~designed in ICC A117.1~~, accessible seats, accessible benches and vehicle barriers systems shall be designed and constructed to the structural loading conditions set forth in this section.

1607.7.1 Handrails and guards. Handrails ~~assemblies~~ and guards shall be designed to resist a load of 50 plf (0.73 kN/m) applied in any direction at the top and to transfer this load through the supports to the structure. Glass handrail assemblies and guards shall also comply with Section 2407.

Exceptions:

1. For one- and two-family dwellings, only the single concentrated load required by Section 1607.7.1.1 shall be applied.
2. In Group I-3, F, H and S occupancies, for areas that are not accessible to the general public and that have an occupant load less than 50, the minimum load shall be 20 pounds per foot (0.29 kNm).

1607.7.1.1 Concentrated load. Handrails ~~assemblies~~ and guards shall be able to resist a single concentrated load of 200 pounds (0.89 kN), applied in any direction at any point along the top, and have attachment devices and supporting structure to transfer this loading to appropriate structural elements of the building. This load need not be assumed to act concurrently with the loads specified in the preceding paragraph.

1607.7.2 Grab bars, shower seats and dressing room bench seats benches. Grab bars ~~in accessible toilet and bathing facilities, shower seats in accessible bathtubs and shower compartments and dressing room bench seat systems~~ accessible benches in accordance with ICC A117.1 shall be designed to resist a single concentrated load of 250 pounds (1.11 kN) applied in any direction at any point.

1607.7.3 Vehicle barriers systems. Vehicle barrier systems for passenger cars shall be designed to resist a single load of 6,000 pounds (26.70 kN) applied horizontally in any direction to the barrier system and shall have anchorage or attachment capable of transmitting this load to the structure. For design of the system, the load shall be assumed to act at a minimum height of 1 foot, 6 inches (457 mm) above the floor or ramp surface on an area not to exceed 1 square foot (305 mm²), and is not required to be assumed to act concurrently with any handrail or guard loadings specified in the preceding paragraphs of Section 1607.7.1. Garages accommodating trucks and buses shall be designed in accordance with an approved method that contains provision for traffic railings.

Reason: The purpose for this proposal is to align the provisions of the IBC on the structural design requirements for handrails, guards, grab bars, accessible seats and vehicle barrier systems with the corresponding provisions in ICC A117.1 and ASCE 7-05, and to update the charging language associated with the provisions.

In Sections 1607.7, “vehicle barriers” is changed to “vehicle barrier systems” for consistency with Section 1607.7.3, the definition for “vehicle barrier system” in Section 1602.1 and Chapter 4 of ASCE 7-05. Similar changes are proposed in Section 406.3.3 and Table 1607.1.

“Accessible seats and accessible benches” are added to the charging language of Section 1607.7 in conjunction with their technical requirements in Section 1607.7.2. The reference to ICC A117.1 is relocated to Section 1607.7.2 where it is more appropriately specified.

In Sections 1607.7.1 and 1607.1.1, “handrail assemblies” is changed to “handrails” for consistency with IBC Sections 1009.10 and 1010.8 on stairway handrails and ramp handrails, respectively. In Section 1607.7.1, “glass handrail assemblies” is retained for consistency with Section 2407.

The revisions to Section 1607.7.2 are proposed to align the provisions of Section 1607 with the applicable provisions of ICC A117.1. The current provisions of ICC A117.1-03 applicable to IBC Section 1607 consist of: (1) Section 609 on grab bars in accessible toilet and bathing facilities, which specifies requirements for structural strength in Section 609.8; (2) Section 610 on seats in accessible bathtubs and shower compartments, which specifies requirements for structural strength in Section 610.4; (3) Section 803 on benches in accessible dressing, fitting and locker rooms, which references Section 903 for structural strength in Section 803.4; (4) Section 806.2 on benches in holding cells and housing cells, which references Section 903 for structural strength in Section 806.2.2; and (5) Section 903 on accessible benches, which references Section 903.6 for structural strength. The provisions of Sections 609.8, 610.4 and 903.6 on structural strength each require the referenced component, its fastener mounting device and its supporting structure be designed to resist the application of a vertical or horizontal force of 250 pounds at any point. As can be seen by these provisions, the applicable provisions of ICC A117.1 are not limited to grab bars, shower seats and dressing room bench seats. They are also not intended to be applicable to grab bars, seats or benches other than those required to be accessible by ICC A117.1.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1607.7.1.1 Concentrated load. Handrails and guards shall be able to resist a single concentrated load of 200 pounds (0.89 kN), applied in any direction at any point along the top, and ~~have attachment devices and supporting structure to transfer this loading to appropriate structural elements of the building load through the supports to the structure.~~ This load need not be assumed to act concurrently with the loads specified in the preceding paragraph Section 1607.7.1.

1607.7.2 Grab bars, shower seats and dressing room bench seats benches. Grab bars in accessible toilet and bathing facilities, shower seats in accessible bathtubs and shower compartments and dressing room bench seat systems ~~accessible benches in accordance with ICC A117.1~~ shall be designed to resist a single concentrated load of 250 pounds (1.11 kN) applied in any direction at any point.

1607.7.3 Vehicle barriers systems. Vehicle barrier systems for passenger ~~cars~~ vehicles shall be designed to resist a single load of 6,000 pounds (26.70 kN) applied horizontally in any direction to the barrier system and shall have anchorage or attachment capable of transmitting this load to the structure. For design of the system, the load shall be assumed to act at a minimum height of 1 foot, 6 inches (457 mm) above the floor or ramp surface on an area not to exceed 1 square foot (305 mm²), and is not required to be assumed to act concurrently with any handrail or guard loadings specified in the preceding paragraphs of Section 1607.7.1. Garages accommodating trucks and buses shall be designed in accordance with an approved method that contains provision for traffic railings.

(Portions of proposal not shown remain unchanged)

Committee Reason: This is a clarification of the code, because it brings these revised sections into alignment with referenced standards. The modification also makes further improvements in the wording. The modification also retains the current wording of Section 1607.7.2 for grab bars because it was felt that grab bar design loads should apply to all grab bars regardless of the type of facility it is installed in.

Original Proposal

Table 1607.1

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing himself

Revise table as follows:

**TABLE 1607.1 (Supp)
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS AND MINIMUM CONCENTRATED LIVE LOADS⁹**

- a. Floors in garages or portions of buildings used for the storage of motor vehicles shall be designed for the uniformly distributed live loads of Table 1607.1 or the following concentrated loads: (1) for garages restricted to passenger vehicles accommodating not more than nine passengers, 3,000 pounds acting on an area of 4.5 inches by 4.5 inches; (2) for mechanical parking structures without slab or deck which are used for storing passenger vehicles only, 2,250 pounds per wheel.
- e. The concentrated wheel load shall be applied on an area of ~~20 square~~ 4.5 inches by 4.5 inches.

(Portions of table and footnotes not shown remain unchanged)

Reason: The revisions are proposed for consistency with the corresponding footnotes in Table 4-1 of ASCE 7-05. Compare Footnote (a) of Table 1607.1 with Footnote (a) of Table 4-1 and Footnote (e) of Table 1607.1 with Footnote (f) of Table 4-1.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The change to wheel load area is consistent with the same requirement in ASCE 7.

Assembly Action:

None

AS

Code Change No: **S70-07/08**

Original Proposal

Table 1607.1, Section: 1607.11.2.2

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing himself

Revise table as follows:

TABLE 1607.1 (Supp)
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS AND MINIMUM CONCENTRATED LIVE LOADS⁹

OCCUPANCY OR USE	UNIFORM (psf)	CONCENTRATED (lbs.)
30. Roofs		
All roof surfaces subject to maintenance workers		300
Awnings and canopies		
Fabric construction supported by a lightweight rigid skeleton structure	5	
All other construction	nonreduceable	
Ordinary flat, pitched, and curved roofs	20	
Primary roof members, exposed to a work floor	20	
Single panel point of lower chord of roof trusses or any point along primary structural members supporting roofs:		
Over manufacturing, storage warehouses, and repair garages		2,000
All other occupancies		300
Roofs used for other special purposes	Note I	Note I
Roofs used for promenade purposes	60	
Roofs used for roof gardens or assembly purposes	100	

(Portions of table and footnotes not shown remain unchanged)

1607.11.2.2 Special-purpose roofs. Roofs used for promenade purposes, roof gardens, assembly purposes or other special purposes shall be designed for a minimum live load as required in Table 1607.1. Such roof live loads are permitted to be reduced in accordance with 1607.9. Live loads of 100 psf (4.79 kN/m²) at areas of roofs classified as Group A occupancies shall not be reduced.

Reason: Section 1607.9.1.3 prohibits floor live loads of 100 psf or less in public assembly occupancies from being reduced. Section 1607.11.2.2 on special purpose roofs permits the live loads of roofs used for promenade purposes, roof gardens, assembly purposes or other special purposes to be reduced in accordance with the provisions of Section 1607.9 for floor live loads. Table 1607.1 lists a live load of 100 psf for roofs used for roof gardens or assembly purposes. This creates a potential conflict between Sections 1607.9.1.3 and 1607.11.2.2. The purpose for this proposal is to resolve the conflict by prohibiting live loads of 100 psf at areas of roofs classified as Group A occupancies from being reduced. Specifying roofs classified as Group A occupancies rather than roofs used for public assembly purposes avoids language that is vague and unenforceable in favor of a classification that is defined by the IBC (refer to Section 303). Roofs used for public assembly purposes can be interpreted as other than Group A occupancies but they would typically have an occupant load of less than 50 (i.e., Exception 1 to Section 303.1) and a prohibition on live load reduction is not judged to be warranted in such cases. Note that Section 303 classifies the use of a “building or structure, or a portion thereof, for the gathering of persons for purposes such as civic, social or religious functions recreation, food or drink consumption, or awaiting transportation, as a Group A occupancy.” Occupied roofs are not intended to be excluded from such a classification.

Item #30 of Table 1607.1 is changed for consistency with Table 4-1 of ASCE 7-05.

This proposal was prepared in conjunction with related proposals on reduction of floor live loads, reduction of roof live loads, and marquee live loads.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Approved as Modified****Modify proposal as follows:**

1607.11.2.2 Special-purpose roofs. Roofs used for promenade purposes, roof gardens, assembly purposes or other special purposes shall be designed for a minimum live load as required in Table 1607.1. Such roof live loads are permitted to be reduced in accordance with 1607.9. Live loads of 100 psf (4.79 kN/m²) or more at areas of roofs classified as Group A occupancies shall not be reduced.

(Portions of proposal not shown remain unchanged)

Committee Reason: This change clarifies the intent of the code's live load reduction for roofs with assembly occupancies. It is consistent with acceptance of code change S71-07/08. The modification covers areas where the live load happens to be greater than 100 psf.

Assembly Action:**None**

Final Hearing Results

S70-07/08

Code Change No: S71-07/08

Original Proposal

Table 1607.1, Sections: 1607.9.1.4, 1607.11.1, 1607.11.2.1, 1607.11.2.2**Proponent:** Philip Brazil, PE, SE, Reid Middleton, Inc., representing himself**Revise as follows:**

TABLE 1607.1 (Supp)
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS, L_o , AND MINIMUM CONCENTRATED LIVE LOADS⁹

(Portions of table and footnotes not shown remain unchanged)

1607.9.1.4 Special structural elements. Live loads shall not be reduced for one-way slabs except as permitted in Section 1607.9.1.1. ~~Live loads of 100 psf (4.79 kN/m²) or less shall not be reduced for roof members except as specified in Section 1607.11.2.~~

1607.11.1 Distribution of roof loads. Where uniform roof live loads are reduced to less than 20 psf (0.96 kN/m²) in accordance with Section 1607.11.2.1 and are ~~involved in~~ applied to the design of structural members arranged so as to create continuity, the ~~minimum applied loads~~ reduced roof live load shall be ~~the full dead loads on all spans in combination with the roof live loads on~~ applied to adjacent spans or ~~on~~ to alternate spans, whichever produces the greatest unfavorable effect. See Section 1607.11.2 for minimum roof live loads and Section 7.5 of ASCE 7 for partial snow loading.

1607.11.2.1 Flat, pitched and curved roofs. Ordinary flat, pitched and curved roofs are permitted to be designed for a reduced roof live load as specified in the following equations or other controlling combinations of loads in Section 1605, whichever produces the greater load. In structures such as greenhouses, where special scaffolding is used as a work surface for workers and materials during maintenance and repair operations, a lower roof load than specified in the following equations shall not be used unless approved by the building official. ~~Greenhouses~~ Such structures shall be designed for a minimum roof live load of 12 psf (0.58 kN/m²).

$$L_r = L_o R_1 R_2 \text{ (Equation 16-27)}$$

where: $12 \leq L_r \leq 20$ For SI: $L_r = L_o R_1 R_2$

where: $0.58 \leq L_r \leq 0.96$

L_r = Reduced live load per square foot (m^2) of horizontal projection in pounds per square foot (kN/m^2).

The reduction factors R_1 and R_2 shall be determined as follows:

R_1 = 1 for $A_t \leq 200$ square feet ($18.58 m^2$) (**Equation 16-28**)
 R_1 = $1.2 - 0.001 A_t$ for 200 square feet $< A_t < 600$ square feet (**Equation 16-29**)
 For SI: $1.2 - 0.011 A_t$ for 18.58 square meters $< A_t < 55.74$ square meters

R_1 = 0.6 for $A_t \geq 600$ square feet ($55.74 m^2$) (**Equation 16-30**)

where:

A_t = Tributary area (span length multiplied by effective width) in square feet (m^2) supported by any structural member, and

R_2 = 1 for $F \leq 4$ (**Equation 16-31**)
 R_2 = $1.2 - 0.05 F$ for $4 < F < 12$ (**Equation 16-32**)
 R_2 = 0.6 for $F \geq 12$ (**Equation 16-33**)

F = For a sloped roof, the number of inches of rise per foot (for SI: $F = 0.12 \times$ slope, with slope expressed as a percentage), or for an arch or dome, the rise-to-span ratio multiplied by 32.

1607.11.2.2 Special-purpose roofs. Roofs used for promenade purposes, roof gardens, assembly purposes or other special purposes shall be designed for a minimum live load, L_o , as ~~required~~ specified in Table 1607.1. Such roof live loads are permitted to be reduced in accordance with 1607.9.

Reason: The purpose of this proposal is to align IBC Section 1607.11 on roof live load reductions with similar provisions in Section 4.9 of ASCE 7-05 and to make related editorial revisions. Section 1607.11.1 on distribution of roof loads is revised for consistency with Footnote (h) of Table 4-1 in ASCE 7-05.

In Section 1607.11.2.1, "equation" is changed to "equations" in two places because the related provisions refer to Equations 16-27 through 16-33. A second paragraph is created to distinguish the general provisions from the specific provisions related to structures with special scaffolding. The reference to greenhouses is relocated for consistency with Section 4.9.1 of ASCE 7-05. Without this last revision, the last sentence of the section has no specific relationship to the second sentence, which is judged not to be the intent.

The notation, L_o , is added to Table 1607.1 for consistency with Table 4-1 of ASCE 7-05. Note that Sections 1607.9 and 1607.11 both reference minimum uniformly distributed live loads, L_o , in Table 1607.1, in the same manner as Sections 4.8 and 4.9, respectively, of ASCE 7-05. The notation is also added to Section 1607.11.2.2 on special purpose roofs. In the same section, "required" is changed to "specified" because tables don't require, they specify in conjunction with charging language that, in this case, is found in Section 1607.11.

In Section 1607.9.1.4, the second sentence on the limitations for the reduction of live loads is deleted for consistency with Section 4.9 of ASCE 7-05 and because it is judged to be archaic. The deletion eliminates a potential conflict with the charging language in Section 1607.9, which excludes roof live loads from the scope of Section 1607.9. The reduction of roof live loads is covered in Section 1607.11.2. Section 1607.9.1.4 prohibits reductions in roof live loads of 100 psf or less except as specified in Section 1607.11.2. It is silent, however, on reductions in roof live loads greater than 100 psf. Section 1607.11.2 is limited in scope to the roof live loads specified in Table 1607.1. All of the roof live loads listed in Table 1607.1 are 100 psf or less.

This proposal was prepared in conjunction with related proposals on reduction of floor live loads, live loads at marquees, and reduction of live loads at roofs used for assembly purposes.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1607.11.1 Distribution of roof loads. Where uniform roof live loads are reduced to less than 20 psf ($0.96 kN/m^2$) in accordance with Section 1607.11.2.1 and are applied to the design of structural members arranged so as to create continuity, the reduced roof live load shall be applied to adjacent spans or to alternate spans, whichever produces the ~~greatest most~~ greatest unfavorable load effect. See Section 1607.11.2 for minimum roof live loads and Section 7.5 of ASCE 7 for partial snow loading.

(Portions of proposal not shown remain unchanged)

Committee Reason: This proposal eliminates conflicts in the live load provisions and harmonizes them with the ASCE 7 standard. The modification is editorial to further clarify the required loading on continuous roof members.

Assembly Action:

None

AM

Code Change No: **S74-07/08**

Original Proposal

Section: 1607.9

Proponent: Edwin Huston, National Council of Structural Engineers Association (NCSEA), representing National NCSEA Code Advisory Committee – General Engineering Subcommittee

Revise as follows:

1607.9 Reduction in live loads. Except for roof uniform live loads, all other minimum uniformly distributed live loads, L_o , in Table 1607.1 are permitted to be reduced in accordance with Section 1607.9.1 or 1607.9.2. Roof uniform live loads, other than special purpose roofs of Section 1607.11.2.2 are permitted to be reduced in accordance with Section 1607.11.2. Roof uniform live loads of special purpose roofs are permitted to be reduced in accordance with Section 1607.9.1 or 1607.9.2.

Reason: There is a conflict between sections 1607.9, which says that roof live loads can not be reduced using the method of 1607.9 and 1607.9.1.4, which says that roof live loads can be reduced. This proposal eliminates that conflict and points the user to the roof live load reduction section.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal resolves a conflict in the live load reduction provision, by clearly stating the intention of these provisions.

Assembly Action:

None

Final Hearing Results

S74-07/08

AS

Code Change No: **S75-07/08**

Original Proposal

Sections: 1607.9.1, Table 1607.9.1, 1607.9.1.1, 1607.9.1.2, 1607.9.1.3, 1607.9.1.4, 1607.9.1.5 (New)

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing himself

Revise as follows:

1607.9.1 General. Subject to the limitations of Sections 1607.9.1.1 through 1607.9.1.4, members for which a value of $K_{LL}A_T$ is 400 square feet (37.16 m²) or more are permitted to be designed for a reduced live load in accordance with the following equation:

(No changes to equation 16-24)

where:

L = Reduced design live load per square foot (meter) of area supported by the member.

L_o = Unreduced design live load per square foot (meter) of area supported by the member (see Table 1607.1).

K_L = Live load element factor (see Table 1607.9.1).

A_T = Tributary area, in square feet (square meters).

~~L shall not be less than $0.50L_o$ for members supporting one floor and L shall not be less than $0.40L_o$ for members supporting two or more floors.~~

L shall not be less than $0.50 L_o$ for members supporting one floor and L shall not be less than $0.40 L_o$ for members supporting two or more floors.

**TABLE 1607.9.1
LIVE LOAD ELEMENT FACTOR, K_{LL}**

ELEMENT	K_{LL}
Interior columns	4
Exterior columns without cantilever slabs	4
Edge columns with cantilever slabs	3
Corner columns with cantilever slabs	2
Edge beams without cantilever slabs	2
Interior beams	2
All other members not identified above including: Edge beams with cantilever slabs Cantilever beams <u>One-way slabs</u> Two-way slabs Members without provisions for continuous shear transfer normal to their span	1

1607.9.1.4.1 1607.9.1.1 Special structural elements One-way slabs. ~~Live loads shall not be reduced for one-way slabs except as permitted in Section 1607.9.1.4. The tributary area, A_T , for one-way slabs shall not exceed an area defined by the slab span times a width normal to the span of 1.5 times the slab span. Live loads of 100 psf (4.79 kN/m²) or less shall not be reduced for roof members except as specified in Section 1607.11.2~~

1607.9.1.4.2 Heavy live loads. Live loads that exceed 100 psf (4.79 kN/m²) shall not be reduced.

Exceptions:

1. The live loads for members supporting two or more floors are permitted to be reduced by a maximum of 20 percent, but the live load shall not be less than L as calculated in Section 1607.9.1.
2. For uses other than storage, where approved, additional live load reductions shall be permitted where shown by the registered design professional that a rational approach has been used and that such reductions are warranted.

1607.9.1.2.3 Passenger vehicle garages. ~~The live loads shall not be reduced in passenger vehicle garages, except the live loads for members supporting two or more floors are permitted to be reduced by a maximum of 20 percent, but the live load shall not be less than L as calculated in Section 1607.9.1.~~

Exception: The live loads for members supporting two or more floors are permitted to be reduced by a maximum of 20 percent, but the live load shall not be less than L as calculated in Section 1607.9.1.

1607.9.1.3.4 Special-Group A occupancies. ~~Live loads of 100 psf (4.79 kN/m²) or less shall not be reduced in public assembly-Group A occupancies.~~

1607.9.1.5 Roofs members. Live loads of 100 psf (4.79 kN/m²) or less shall not be reduced for roof members except as specified in Section 1607.11.2.

Reason: The purpose of this proposal is to align IBC Section 1607.9.1 on the general method for floor live load reductions with similar provisions in Section 4.8 of ASCE 7-05 and to make related editorial revisions.

“One way slabs” is added to Table 1607.9.1 for consistency with Table 4-2 of ASCE 7.05. The second part of Section 1607.9.1.2 (Section 1607.9.1.3 in proposal) is reformatted into an exception for consistency with Section 4.8.3 of ASCE 7-05.

Section 1607.9.1.3 (Section 1607.9.1.4 in proposal) on public assembly occupancies is changed to Group A occupancies, thus, replacing language that is vague and unenforceable with a classification that is defined by the IBC (refer to Section 303). Public assembly occupancies could be interpreted as other than Group A occupancies but they would typically have an occupant load of less than 50 (i.e., Exception 1 to Section 303.1) and a prohibition on live load reduction is not judged to be warranted in such cases.

Also in Section 1607.9.1.3, “or less” is deleted, which reduces the scope of the section to live loads of 100 psf. Several items in Table 1607.1 list live loads for areas of public assembly that could be classified as a Group A occupancy, including Items #3 (armories and drill rooms), #4 (assembly areas and theaters), #6 (balconies), #8 (dance halls and ballrooms), #10 (dining rooms and restaurants), #19 (gymnasiums), #26 (lobbies of office buildings) and #28 (residential public rooms). A live load of at least 100 psf is specified for all but areas of fixed seats at Item #4. Prohibiting reductions in live loads at areas of fixed seats is not judged to be warranted. Live loads greater than 100 psf are currently covered by Section 1607.9.1.1 on heavy live loads.

Section 1607.9.1.4 is split into two parts. The first part on one-way slabs is relocated to a new Section 1607.9.1.1 and is changed from a general prohibition on live load reduction (except for heavy live loads) to a limit on the determination of tributary area, A_T , in the same manner as specified in Section 4.8.4 of ASCE 7-05. The relocation to Section 1607.9.1.1 is proposed because the subject matter of tributary area logically follows the calculation of reduced live load, which is based on tributary area. The sections that follow Section 1607.9.1.1 are largely prohibitions on live load reduction. The second part of Section 1607.9.1.4 is renumbered as Section 1607.9.1.5.

This proposal was prepared in conjunction with related proposals on reduction of roof live loads, live loads at marquees, and reduction of live loads at roofs used for assembly purposes.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1607.9.1.4 Group A occupancies. Live loads of 100 psf (4.79 kN/m²) and at areas where fixed seats are located shall not be reduced in Group A occupancies.

(Portions of proposal not shown remain unchanged)

Committee Reason: This code change makes adjustments in the live load requirements that further align the IBC with the ASCE 7 live load provisions. The modification clarifies that the restriction on live load reductions in Group A occupancies also includes areas with fixed seating.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Edwin Huston, National Council of Structural Engineers Association (NCSEA), representing NCSEA Code Advisory Committee – General Engineering Subcommittee, requests Approval as Modified by this public comment.

Further modify proposal as follows:

1607.9.1.1 One-way slabs. The tributary area, A_T , for use in Equation 16-24 for one-way slabs shall not exceed an area defined by the slab span times a width normal to the span of 1.5 times the slab span.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: There are two methods of live load reduction in the IBC, a Basic Method in Section 1607.9.1 which uses Equation 16-24 and an Alternate Method in Section 1607.9.2 which uses Equation 16-25. S75-07/08 defines A_T to agree with ASCE 7 to allow an area reduction for one-way slabs in the Basic Method. The Alternate Method does not have this definition. In the absence of guidance, NCSEA is concerned that Registered Design Professionals might misapply the definition of A_T in S75-07/08 for the Basic Method to the Alternate Method. In the Basic Method the maximum reduction occurs at a slab span of about 49 feet. If the definition of A_T in S75-07/08 for the Basic Method was applied to the Alternate Method the maximum reduction of 40% for the Alternate Method would occur at a slab span of less than 21 feet!! We consider this a possible life safety issue.

Given the potential life safety risks associated with this potential gap in the IBC, we urge you to approve this code change.

Public Comment 2:

Edwin Huston, National Council of Structural Engineers Association (NCSEA), representing NCSEA Code Advisory Committee, General Engineering Subcommittee requests Approval as Modified by this Public Comment.

Further modify proposal by adding new item as follows:

1607.9.2 Alternate floor live load reduction. As an alternative to Section 1607.9.1, floor live loads are permitted to be reduced in accordance with the following provisions. Such reductions shall apply to slab systems, beams, girders, columns, piers, walls and foundations.

1. A reduction shall not be permitted in Group A occupancies.
2. A reduction shall not be permitted where the live load exceeds 100 psf (4.79 kN/m²) except that the design live load for members supporting two or more floors is permitted to be reduced by 20 percent.
3. A reduction shall not be permitted in passenger vehicle parking garages except that the live loads for members supporting two or more floors are permitted to be reduced by a maximum of 20 percent.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

- 4. For live loads not exceeding 100 psf (4.79 kN/m²), the design live load for any structural member supporting 150 square feet (13.94 m²) or more is permitted to be reduced in accordance with the following equation:
- 5. For one-way slabs, the area, A, for use in Equation 16-25 shall not exceed the product of the slab span and a width normal to the span of 0.5 times the slab span.

R=0.08 (A-150) **(Equation 16-25)**

For SI: R = 0.861 (A -13.94)

Such reduction shall not exceed the smallest of:

- 1. 40 percent for horizontal members;
- 2. 60 percent for vertical members; or
- 3. R as determined by the following equation.

R= 23.1 (1 + D/Lo) **(Equation 16-26)**

where:

A = Area of floor supported by the member, square feet (m²).

D = Dead load per square foot (m²) of area supported.

Lo = Unreduced live load per square foot (m²) of area supported.

R = Reduction in percent.

Commenter's Reason: There are two methods of live load reduction in the IBC, a Basic Method in Section 1607.9.1 which uses Equation 16-24 and an Alternate Method in Section 1607.9.2 which uses Equation 16-25. S75-07/08 defines A_T to agree with ASCE 7 to allow an area reduction for one-way slabs in the Basic Method. The Alternate Method does not have this definition. In the absence of guidance, NCSEA is concerned that Registered Design Professionals might misapply the definition of A_T in S75-07/08 for the Basic Method to the Alternate Method. In the Basic Method the maximum reduction occurs at a slab span of about 49 feet. If the definition of A_T in S75-07/08 for the Basic Method was applied to the Alternate Method the maximum reduction of 40% for the Alternate Method would occur at a slab span of less than 21 feet!! We consider this a possible life safety issue. NCSEA submitted a Code Change Proposal on S77 which we are hereby modifying to address this issue.

NCSEA has looked at the relation ship between Equations 16-24 and 16-25 and finds that the best agreement between the two methods of live load reduction would be to use a definition of A in Equation 16-25 of the slab span times a width normal to the span of 0.5 times the slab span. A comparison table is shown below.

Summary % LL Reduction					
Span	Eq 16-24	Eq 16-25			
		0.5 span	.75 span	Span	1.5 Span
20	14	4	12	20	36
25	26	13	26	38	40 max
30	34	24	40 max	40 max	40 max
40	44	40 max	40 max	40 max	40 max
49	50 max	40 max	40 max	40 max	40 max

Given the potential life safety risks associated with this potential gap in the IBC, we urge you to approve this code change.

Final Hearing Results

S75-07/08

AMPC1, 2

Code Change No: S76-07/08

Original Proposal

Sections: 1607.9, 1607.11.1, 1607.11.2

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing himself

Revise as follows:

1607.9 Reduction in live loads. Except for ~~roof~~ uniform live loads at roofs and marquees, all other minimum uniformly distributed live loads, L_o, in Table 1607.1 are permitted to be reduced in accordance with Section 1607.9.1 or 1607.9.2.

1607.11.1 Distribution of roof loads. Where uniform roof live loads are reduced to less than 20 psf (0.96 kN/m²) in accordance with Section 1607.11.2.1 and are involved in the design of structural members arranged so as to create continuity, the minimum applied loads shall be the full dead loads on all spans in combination with the roof live loads on adjacent spans or on alternate spans, whichever produces the greatest effect. See Section 1607.11.2 for reductions in minimum roof live loads and Section 7.5 of ASCE 7 for partial snow loading.

1607.11.2 (Supp) Reduction in roof live loads. The minimum uniformly distributed ~~roof~~ live loads of roofs and marquees, L_o , in Table 1607.1 are permitted to be reduced in accordance with Section 1607.11.2.1 or 1607.11.2.2.

1607.11.2.1 Flat, pitched and curved roofs. Ordinary flat, pitched and curved roofs, and awnings and canopies other than of fabric construction supported by lightweight rigid skeleton structures, are permitted to be designed for a reduced roof live load as specified in the following equation or other controlling combinations of loads in Section 1605, whichever produces the greater load. In structures where special scaffolding is used as a work surface for workers and materials during maintenance and repair operations, a lower roof load than specified in the following equation shall not be used unless approved by the building official. Greenhouses shall be designed for a minimum roof live load of 12 psf (0.58 kN/m²).

(No changes to equations or to their notation)

1607.11.2.2 Special-purpose roofs. Roofs used for promenade purposes, roof gardens, assembly purposes or other special purposes, and marquees, shall be designed for a minimum live load as required in Table 1607.1. Such ~~roof~~ live loads are permitted to be reduced in accordance with 1607.9.

Reason: Section 1607.9 on reductions in live loads applies to all uniformly distributed live loads specified in Table 1607.1 except for roof uniform live loads. Item #30 of Table 1607.1 specifies uniformly distributed live loads for roofs but Item #24 specifies the same for marquees. Section 1607.11 on roof loads includes marquees in its charging language but the technical provisions in the remainder of the section are silent on marquees. The purpose of this proposal is to revise the charging language in Sections 1607.9 and 1607.11 to comprehensively account for marquees. Note that Section 1607.11.2.1 is limited in scope to a reduction in roof live load based on the slope of the roof. Section 1607.11.2.2 is limited in scope to specific types of special purpose roofs, each one of which is also specified in Item #30 of Table 1607.1. The proposal adds marquees to Section 1607.11.2.2.

The proposal also corrects an inadvertent omission of awnings and canopies other than of fabric construction supported by a lightweight rigid skeleton structure from qualifying for a reduction in roof live load due to roof slope. Section 1607.11.2.1 is limited in scope to ordinary flat, pitched and curved roofs, which are one of the listings in Item #30 of Table 1607.1 for roofs. The presence of this listing effectively eliminates awnings and canopies from qualifying for a reduction in roof live due to roof slope because their listing in Item #30 is separate and distinct from flat, pitched and curved roofs. The proposal corrects this oversight. This came about when the addition of Item #30 to Table 1607.1 was approved by Proposal S20-04/05-AM. Before that, Item #29 in Table 1607.1 of the 2003 IBC for roofs referenced Section 1607.11, which specified provisions for reductions of roof live loads at ordinary flat, pitched and curved roofs in Section 1607.11.2.1.

This proposal was prepared in conjunction with related proposals on reduction of floor live loads, reduction of roof live loads, and reduction of live loads at roofs used for assembly purposes.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1607.9 Reduction in live loads. Except for uniform live loads at roofs ~~and marquees~~, all other minimum uniformly distributed live loads, L_o , in Table 1607.1 are permitted to be reduced in accordance with Section 1607.9.1 or 1607.9.2.

(Portions of proposal not shown remain unchanged)

Committee Reason: This proposal makes the roof live load requirements clearer. The modification removes marquees from Section 1607.9 to eliminate any confusion between that provisions and Section 1607.11.2.2.

Assembly Action:

None

Final Hearing Results

S76-07/08

AM

Code Change No: S77-07/08

Original Proposal

Section: 1607.9.2

Proponent: Edwin Huston, National Council of Structural Engineers Association (NCSEA), representing National NCSEA Code Advisory Committee – General Engineering Subcommittee

Revise as follows:

1607.9.2 Alternate floor live load reduction. As an alternative to Section 1607.9.1, floor live loads are permitted to be reduced in accordance with the following provisions. Such reductions shall apply to slab systems, beams, girders, columns, piers, walls and foundations.

1. A reduction shall not be permitted in Group A occupancies.
2. A reduction shall not be permitted where the live load exceeds 100 psf (4.79 kN/m²) except that the design live load for members supporting two or more floors is permitted to be reduced by 20 percent.

Exception: For uses other than storage, where approved, additional live load reductions shall be permitted where shown by the registered design professional that a rational approach has been used and that such reductions are warranted.

3. A reduction shall not be permitted in passenger vehicle parking garages except that the live loads for members supporting two or more floors are permitted to be reduced by a maximum of 20 percent.
4. For live loads not exceeding 100 psf (4.79 kN/m²), the design live load for any structural member supporting 150 square feet (13.94 m²) or more is permitted to be reduced in accordance with the following equation:

Reason: This additional text will align the high live load reduction requirements when using Section 1607.9.2 "Alternate Floor Live Load Reduction" with text already in Section 1607.9.1.1 "Heavy Live Loads" when using the Basic Floor Live Load Reduction.

Cost Impact: The code change proposal will not increase the cost of construction (will possibly reduce construction cost in some instances).

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal makes the alternate live load reduction method more consistent with the basic method, by adding an exception which can allow the reduction of high live loads.

Assembly Action:

None

Final Hearing Results

S77-07/08

Code Change No: **S79-07/08**

Original Proposal

Sections: 1609.1.1, 1609.1.1.1, 2308.2.1, Chapter 35; IRC R301.2.1.1, Chapter 43

Proponent: Med Kopczynski, City of Keene, NH, representing ICC IS-HRC Standards Committee

THESE PROPOSALS ARE ON THE AGENDA OF THE IBC STRUCTURAL AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

1. Revise as follows:

1609.1.1 (Supp) Determination of wind loads. Wind loads on every building or structure shall be determined in accordance with Chapter 6 of ASCE 7. The type of opening protection required, the basic wind speed and the exposure category for a site is permitted to be determined in accordance with Section 1609 or ASCE 7. Wind shall be assumed to come from any horizontal direction and wind pressures shall be assumed to act normal to the surface considered.

Exceptions:

1. Subject to the limitations of Section 1609.1.1.1, the provisions of ~~SBCCI SSTD-10~~ ICC-600 shall be permitted for applicable Group R-2 and R-3 buildings.
2. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of the AF&PA WFCM.
3. Designs using NAAMM FP 1001.
4. Designs using TIA-222 for antenna-supporting structures and antennas.
5. Wind Tunnel tests in accordance with Section 6.6 of ASCE 7, subject to the limitations in Section 1609.1.1.2.

1609.1.1.1 Applicability. The provisions of ~~SSTD-10~~ ICC-600 are applicable only to buildings located within Exposure B or C as defined in Section 1609.4. The provisions of ~~SBCCI SSTD-10~~ ICC-600 and the AF&PA WFCM shall not apply to buildings sited on the upper half of an isolated hill, ridge or escarpment meeting the following conditions:

1. The hill, ridge or escarpment is 60 feet (18 288 mm) or higher if located in Exposure B or 30 feet (9144 mm) or higher if located in Exposure C;
2. The maximum average slope of the hill exceeds 10 percent; and
3. The hill, ridge or escarpment is unobstructed upwind by other such topographic features for a distance from the high point of 50 times the height of the hill or 1 mile (1.61 km), whichever is greater.

2308.2.1 Basic wind speed greater than 100 mph (3-second gust). Where the basic wind speed exceeds 100 mph (3-second gust), the provisions of either AF&PA WFCM, or the ~~SBCCI SSTD-10~~ ICC-600 are permitted to be used.

2. Revise standards as follows:

International Code Council (ICC)

~~SBCCI SSTD 10-99~~ — Standard for Hurricane Resistance Residential Construction
ICC-600 Standard for Residential Construction in High Wind Regions

PART II – IRC BUILDING/ENERGY

1. Revise as follows:

R301.2.1.1 (Supp) Design criteria. In regions where the basic wind speeds from Figure R301.2(4) equal or exceed 100 miles per hour (45 m/s) in hurricane-prone regions, or 110 miles per hour (49 m/s) elsewhere, the design of buildings shall be in accordance with one of the following methods. The elements of design not addressed by those documents in Items 1 through 4 shall be in accordance with this code.

1. American Forest and Paper Association (AF&PA) *Wood Frame Construction Manual for One- and Two-Family Dwellings* (WFCM); or
2. ~~Southern Building Code Congress International Standard for Hurricane Resistant Residential Construction (SSTD 10);~~ International Code Council (ICC) Standard for Residential Construction in High Wind Regions (ICC-600); or
3. *Minimum Design Loads for Buildings and Other Structures* (ASCE-7); or
4. American Iron and Steel Institute (AISI), *Standard for Cold-Formed Steel Framing—Prescriptive Method For One- and Two-Family Dwellings (COFS/PM) with Supplement to Standard for Cold-Formed Steel Framing—Prescriptive Method For One- and Two-Family Dwellings.*
5. Concrete construction shall be designed in accordance with the provisions of this code.
6. Structural insulated panels shall be designed in accordance with the provisions of this code.

2. Revise standards as follows:

International Code Council (ICC)

~~SBCCI SSTD 10-99 Standard for Hurricane Resistance Residential Construction~~
ICC-600 Standard for Residential Construction in High Wind Regions

Reason: This proposal is to delete the current ICC legacy Standard SSTD 10 – 99 and replace with the new ICC– 600 Standard for Residential Construction in High Wind Regions.

The ICC legacy standard SSTD 10 – 99 and its predecessors were the first US standards for high wind construction of residential structures. The SSTD 10 is based on the Standard Building Code wind loads and which used fastest-mile wind speeds. Although dated, the SSTD 10 is referenced by the IBC and IRC.

The new ICC– 600 standard provides a set of specifications that is consistent with the International Building Code and ASCE 7 wind loads, wind speed maps, and conventions. The primary focus of the update effort has been to provide a contemporary set of prescriptive requirements that supplement the International Residential Code provisions.

The ICC– 600 was developed by the ICC Consensus Committee on Hurricane Resistant Construction (IS-HRC) that operates under ANSI Approved ICC Consensus Procedures. A copy of a draft of the standard has been submitted to the ICC as allowed by ICC Council Policy; CP#28. ANSI certification of the standard is expected to be received prior to the ICC Final Action Hearings in September 2008.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I – IBC STRUCTURAL

Committee Action:

Disapproved

Committee Reason: While the new reference standard will replace an outdated standard, it is not yet complete. It is hoped that a public comment can be submitted to allow this standard to be referenced by the code.

Assembly Action:

None

PART II – IRC B/E

Committee Action:

Approved as Submitted

Committee Reason: This new standard, ICC-600 Standard for Residential Construction in High Wind Regions, will be a great improvement over the legacy standard SSTD 10. The standard provides a set of specifications that is consistent with the IBC and ASCE 7 wind loads, wind speed maps, and conventions.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

*Public Comment 1:***Med Kopczynski, City of Keene, NH, representing ICC IS-HRC Standards Committee, requests Approval as Submitted.**

Commenter's Reason: This proposal is to delete the current ICC legacy Standard SSTD 10 – 99 and replace with the new ICC– 600 Standard for Residential Construction in High Wind Regions. The SSTD 10 is based on the Standard Building Code wind loads and which used fastest-mile wind speeds. The new ICC– 600 standard provides a set of specifications that is consistent with the International Building Code and ASCE 7 wind loads, wind speed maps, and conventions.

The IBC-Structural Committee disapproved this code change because the standard proposed for inclusion in the code, ICC 600, was not finalized. Since that time, the ICC/IS-HRC Standards Committee has completed its work, submitted the standard to ANSI for approval, received approval, and published the standard. Other than the objections stated regarding the completion of the standard, the committee had no other technical concerns or issues regarding this proposed code change. Given that the standard proposed for reference is now complete and in compliance with the ICC criteria for referenced standards given in ICC Council Policy no. CP 28, the ICC/IS- HRC Standards Committee request approval of the proposed code change S79-07/08 Part I "As Submitted."

*Public Comment 2:***Joseph J. Messersmith, Jr., P.E., Portland Cement Association, requests Approval as Submitted.**

Commenter's Reason: As indicated in the committee reason, the change to reference ICC-600 in the IBC was disapproved because the standard was not complete. It should be noted that Part II of this change to reference this new standard in the IRC was approved in Palm Springs. Since the Palm Springs hearings, the standard has been completed and the membership is urged to overturn the motion for disapproval and subsequently vote to approve Part I of the change.

Original Proposal

Sections: 1609.1.1, 1609.1.1.1

Proponent: Bonnie Manley, American Iron and Steel Institute, representing American Iron and Steel Institute

Revise as follows:

1609.1.1 (Supp) Determination of wind loads. Wind loads on every building or structure shall be determined in accordance with Chapter 6 of ASCE 7. The type of opening protection required, the basic wind speed and the exposure category for a site is permitted to be determined in accordance with Section 1609 or ASCE 7. Wind shall be assumed to come from any horizontal direction and wind pressures shall be assumed to act normal to the surface considered.

Exceptions:

1. Subject to the limitations of Section 1609.1.1.1, the provisions of SBCCI SSTD 10 shall be permitted for applicable Group R-2 and R-3 buildings.
2. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of the AF&PA WFCM.
3. 3. 4. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of AISI S230.
4. 5. Designs using NAAMM FP 1001.
5. 6. Designs using TIA-222 for antenna-supporting structures and antennas.
5. 6. Wind Tunnel tests in accordance with Section 6.6 of ASCE 7, subject to the limitations in Section 609.1.1.2.

1609.1.1.1 Applicability. The provisions of SSTD 10 are applicable only to buildings located within Exposure B or C as defined in Section 1609.4. The provisions of SBCCI SSTD 10, ~~and the AF&PA WFCM~~ and AISI S230 shall not apply to buildings sited on the upper half of an isolated hill, ridge or escarpment meeting the following conditions:

1. The hill, ridge or escarpment is 60 feet (18 288 mm) or higher if located in Exposure B or 30 feet (9144 mm) or higher if located in Exposure C;
2. The maximum average slope of the hill exceeds 10 percent; and
3. The hill, ridge or escarpment is unobstructed upwind by other such topographic features for a distance from the high point of 50 times the height of the hill or 1 mile (1.61 km), whichever is greater.

Reason: The 2006 IBC recognizes the use of the *AISI Standard for Cold-formed Steel Framing- Prescriptive Method for One- and Two-family Dwellings* in Section 2210.6. In fact, these prescriptive requirements form the basis for the cold-formed steel light frame construction provisions in the IRC. Additionally, the document, which addresses wind speeds up to 150 MPH, has been included by reference in the new ICC-600. Therefore, it is appropriate to further integrate this document as an acceptable method to address wind load requirements by recognizing its applicability and limitations in Section 1609.1.1. This code change references the new 2007 edition of AISI S230 standard, which is based on ASCE 7-05 wind provisions.

Throughout the IBC and IRC, code changes are being introduced to update the recognition of the AISI Prescriptive Method to the 2007 edition, which is identified by the AISI S230-07 designation. Details of the substantive changes between the 2004 AISI Supplement and A230-07 are contained in the supporting statement for AISI's code change proposal to update this reference in Section 2210.6.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal adds an appropriate reference to the latest edition of the prescriptive cold-formed steel standard.

Assembly Action:

None

Final Hearing Results

Code Change No: S84-07/08

Original Proposal

Sections: 1609.1.1, 1609.6 (New)

Proponent: Edwin Huston, National Council of Structural Engineers Associations (NCSEA), representing NCSEA Code Advisory Committee – General Engineering Subcommittee

1. Revise as follows:

1609.1.1 (Supp) Determination of wind loads. Wind loads on every building or structure shall be determined in accordance with Chapter 6 of ASCE 7 or provisions of the Alternate All-heights Method in Section 1609.6. The type of opening protection required, the basic wind speed and the exposure category for a site is permitted to be determined in accordance with Section 1609 or ASCE 7. Wind shall be assumed to come from any horizontal direction and wind pressures shall be assumed to act normal to the surface considered.

Exceptions:

1. Subject to the limitations of Section 1609.1.1.1, the provisions of SBCCI SSTD 10 shall be permitted for applicable Group R-2 and R-3 buildings.
2. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of the AF&PA WFCM.

3. Designs using NAAMM FP 1001.
4. Designs using TIA-222 for antenna-supporting structures and antennas.
5. Wind Tunnel tests in accordance with Section 6.6 of ASCE 7, subject to the limitations in Section 1609.1.1.2.

2. Add new text as follows:

1609.6 Alternate All-Heights method. The alternate wind design provisions in this section are simplifications of the ASCE 7 Method 2-Analytical Procedure.

1609.6.1 Scope. As an alternate to ASCE 7 Section 6.5, the following provisions are permitted to be used to determine the wind effects on regularly shaped buildings, or other structures which meet all of the following conditions:

1. The building or other structure is less than 100 feet (30480 mm) in height, with a height to least width ratio of 4 or less.
2. The building or other structure is not sensitive to dynamic effects.
3. The building or other structure is not located on a site for which channeling effects or buffeting in the wake of upwind obstructions warrant special consideration.

1609.6.1.1 Modifications. The following modifications shall be made to certain subsections in ASCE 7: Section 1609.6.3 Symbols and Notations that are specific to this section are used in conjunction with the Symbols and Notations in ASCE 7 Section.6.3.

1609.6.2 Symbols and notations. Coefficients and variables used in the Alternate All-Heights Method equations are as follows:

- C_{net} \equiv net-pressure coefficient based on $K_d [(G) (C_p) - (GC_{pi})]$. Ref Table 1609.6.2(2)
- G \equiv Gust effect factor equal to 0.85 for rigid structures per ASCE 7 Section 6.5.8.1.
- K_d \equiv Wind directionality factor per ASCE 7 Table 6-4.
- P_{net} \equiv Design wind pressure to be used in determination of wind loads on buildings or other structures or their components and cladding, in lb/ft² (N/m²).
- q_s \equiv Wind velocity pressure in lb/ft² (N/m²). (Per Table 1609.6.2(1))

1609.6.3 Design equations. When using the Alternate All-Heights Method, the Main-Wind-Force-Resisting System, (MWFRS) and Components and Cladding of every structure shall be designed to resist the effects of wind pressures on the building envelope in accordance with Equation (16-36).

$$P_{net} = q_s K_z C_{net} [I K_{zt}] \quad \text{(Equation 16-36)}$$

Design wind forces for the MWFRS shall not be less than 10 lb/ft² (0.48 KN/m²) multiplied by the area of the structure projected on a plane normal to the assumed wind direction. See ASCE Section 6.1.4 for criteria. Design net wind pressure for components and cladding shall not be less than 10 lb/ft² (0.48 KN/m²) acting in either direction normal to the surface.

1609.6.4 Design procedure. The MWFRS and the components and cladding of every building or other structure shall be designed for the pressures calculated using Equation (16-36).

1609.6.4.1 Main Wind-Force-Resisting Systems. The MWFRS shall be investigated for the torsional effects identified in ASCE 7 Figure 6-9.

1609.6.4.2 Determination of K_z and K_{zt} . Velocity Pressure Exposure Coefficient, K_z shall be determined in accordance with ASCE 7 Section 6.5.6.6 and the Topographic Factor, K_{zt} shall be determined in accordance with ASCE 7 Section 6.5.7.

1. For the windward side of a structure, K_{zt} and K_z shall be based on height z .
2. For leeward and side walls, and for windward and leeward roofs, K_{zt} and K_z shall be based on mean roof height h .

1609.6.4.3 Determination of net pressure coefficients, C_{net} . For the design of the Main Wind-Force-Resisting-System and for Components and Cladding, the sum of the internal and external net pressure shall be based on the net pressure coefficient C_{net} .

1. The pressure coefficient, C_{net} , for walls and roofs shall be determined from Table 1609.6.2(2).
2. Where C_{net} may have more than one value, the more severe wind load combination shall be used for design.

1609.6.4.4 Application of wind pressures. When using the Alternate All-Heights Method, wind pressures shall be applied simultaneously on, and in a direction normal to, all building envelope wall and roof surfaces.

1609.6.4.4.1 Components and cladding. Wind pressure for each component or cladding element is applied as follows using C_{net} values based on the effective wind area, A contained within the zones in areas-of-discontinuity of width and/or length “a”, “2a” or “4a” at: corners of roofs and walls; edge strips for ridges, rakes and eaves; or field areas on walls or roofs as indicated in Figures in Table 1609.6.2(2) in accordance with the following:

1. Calculated pressures at local discontinuities acting over specific edge strips or corner boundary areas.
2. Include “field” (zone 1, 2 or 4, as applicable) pressures applied to areas beyond the boundaries of the areas-of-discontinuity.
3. Where applicable, the calculated pressures at discontinuities (zones 2 or 3) shall be combined with design pressures that apply specifically on rakes or eave overhangs.

TABLE 1609.6.2(1)
WIND VELOCITY PRESSURE (q_s) AT STANDARD HEIGHT OF 33 FEET ^{a, b, c}

BASIC WIND SPEED, V (mph)	<u>85</u>	<u>90</u>	<u>100</u>	<u>105</u>	<u>110</u>	<u>120</u>	<u>125</u>	<u>130</u>	<u>140</u>	<u>150</u>	<u>160</u>	<u>170</u>

	<u>Positive</u>		<u>3.64</u>	<u>3.95</u>
	<u>Negative</u>		<u>-2.45</u>	<u>-2.76</u>

- a. Linear interpolation between values in the table is acceptable.
- b. For open buildings, multispan gable roofs, stepped roofs, sawtooth roofs, domed roofs, solid free standing walls and solid signs apply ASCE 7.
- c. Some C_{net} values have been grouped together. Less conservative results may be obtained by applying ASCE 7.

Reason: The all heights wind provisions of ASCE 7 are time consuming and confusing. Many engineers make significant errors in their use of this method. There is a simplified method in ASCE 7, but it is limited in use. Member Organizations of NCSEA have brought forward an alternate method which is in full compliance with ASCE 7. This method is being considered by the ASCE 7 Wind Committee, but it won't be able to be placed in the standard until the 2012 IBC is adopted. To speed this transition, this method is proposed for the IBC first.

The derivation of this method from ASCE 7 Chapter 6 is as follows:

C_{net} values

$$q_z = 0.00256 K_z K_{zt} K_d V^2 I \quad \text{Eqn 6-15}$$

$$p = q G C_p - q_i (GC_{pi}) \quad \text{Eqn 6-17}$$

$$p = 0.00256 K_h K_{zt} K_d V^2 I G C_p - 0.00256 K_z K_{zt} K_d V^2 I (GC_{pi})$$

Rearranging terms:

$$p = (0.00256 V^2 K_h K_d G C_p - 0.00256 V^2 K_z K_d (GC_{pi})) K_{zt} I$$

Define: $q_z = 0.00256 V^2$

$$\text{so: } p = (q_s K_h K_d G C_p - q_s K_z K_d (GC_{pi})) K_{zt} I$$

$$\text{and: } p = q_s K_d (K_h G C_p - K_z (GC_{pi})) K_{zt} I$$

For leeward wall and roof elements

$$K_h = K_z$$

$$\text{so: } p = q_s K_z (K_d (G C_p - (GC_{pi}))) K_{zt} I$$

$$\text{Substitute } C_{net} = K_d (G C_p - (GC_{pi}))$$

$$\text{and we get: } p = q_s K_z C_{net} K_{zt} I$$

which is Eqn. 16-xx in the draft.

For windward roof elements

$K_h \approx K_z$ and the same relationship holds.

For buildings: $K_d = 0.85$

For rigid structures: $G = 0.85$

$$\text{so: } C_{net} = 0.85 (0.85 C_p - (GC_{pi}))$$

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1609.6.1 Scope. As an alternate to ASCE 7 Section 6.5, the following provisions are permitted to be used to determine the wind effects on regularly shaped buildings, or other structures which meet all of the following conditions:

1. The building or other structure is less than or equal to 75 400 feet (30480 22 860 mm) in height, with a height to least width ratio of 4 or less, or the building or other structure has a fundamental frequency greater than or equal to 1 hertz.
2. The building or other structure is not sensitive to dynamic effects.
3. The building or other structure is not located on a site for which channeling effects or buffeting in the wake of upwind obstructions warrant special consideration.
4. The building shall meet the requirements of a simple diaphragm building as defined in ASCE 7 Section 6.2.

(Portions of proposal not shown remain unchanged)

Committee Reason: This proposal provides a needed alternative that addresses concerns over the complexity of the ASCE 7 Method 2 wind analysis. Exam committees have considered this complexity to be the primary cause in the disparity in answers given to test questions on Method 2. Adding this now is similar to the approach taken when adding the simplified wind method to the SBC and the 2000 IBC, which prompted the ASCE 7 committee to get it into their document. With the floor modifications this proposal is superior to S85-07/08. The modification places additional limitations on buildings that can qualify for this method of analysis, by eliminating flexible buildings and requiring simple diaphragm building. These address some of the concerns that were raised in connection with S85-07/08.

There were still some concerns with assumptions regarding internal pressurization. The resulting values are not necessarily conservative for Components and Cladding as well as MWFRS for some nonsymmetrical configurations. The same comment concerning the use of ASCE 7 figures that is noted on S85-07/08 applies to this change as well. It would have been preferable to include necessary figures in this proposal. There is also a concern with diaphragms. The method should probably be limited to rigid diaphragms. It is possible that horizontal truss elements could be unconservatively designed on the windward side because of the preference given to maximum negative values in the selection of these coefficients. The same concern in hurricane prone regions discussed in S85-07/08 applies to this proposal as well. The scope of application is too broad. There are possible issues down the road if we've begun using these values and ASCE 7 introduces a version of this method which provides different values.

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Edwin Huston, National Council of Structural Engineers Association (NCSEA), representing NCSEA Code Advisory Committee, requests Approval as Modified by this Public Comment.

Further modify proposal as follows:

(Portions of table not shown remain unchanged)

- a) Linear interpolation between values in the table is acceptable.
b) For open buildings, multispan gable roofs, stepped roofs, sawtooth roofs, domed roofs, solid free standing walls and solid signs apply ASCE 7.
c) Some C_{net} values have been grouped together. Less conservative results may be obtained by applying ASCE 7.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: At the Code Change Hearings in Palm Springs, Mr. Chock, who served on the ICC Structural Committee, expressed some concerns which are printed in the second paragraph of the Committee Reason Statement in the Report on the Hearings. NCSEA asked for more detailed information on these concerns and we were invited to attend an ASCE/SEI 7 Wind Load Subcommittee meeting which was held in San Francisco, CA on March 12. Subsequent to that meeting Mr. Chock forwarded a list of technical concerns from ASCE/SEI 7 to NCSEA.

On June 6, 2008 NCSEA again attended an ASCE/SEI 7 Wind Load Subcommittee meeting which was held at ASCE Headquarters in Reston, VA to present a response to those technical concerns. Based on the discussions from that meeting, NCSEA has drafted this Public Comment to address a substantial technical concern from ASCE/SEI 7. This Public comment adds another set of pressure coefficients to include the case of negative internal pressurization of the building for the Main-Wind-Force-Resisting System.

In the NCSEA reason statement included with S84, the following statement appears:

The all heights wind provisions of ASCE 7 are time consuming and confusing. Many engineers make significant errors in their use of this method. There is a simplified method in ASCE 7, but it is limited in use. Member Organizations of NCSEA have brought forward an alternate method which is in full compliance with ASCE 7. This method is being considered by the ASCE 7 Wind Committee, but it won't be able to be placed in the standard until the 2012 IBC is adopted. To speed this transition, this method is proposed for the IBC first.

At the time this Code Change Proposal was submitted that statement was correct. Since that time, ASCE/SEI 7 has begun consideration of a different format for wind simplification. If this proposal is adopted by the Wind Load Subcommittee and the main committee it would appear in the ASCE/SEI 7-10 Standard and could be considered for adoption into the 2012 IBC. In the meantime, modification of S84 will permit an alternative wind load methodology, which is in full compliance with the Method 2 procedure for all-heights, to be included in the 2009 IBC.

Public Comment 2:

James Riemenschneider, Structural Engineers Association of Oregon (SEAO)/Kramer Gehlen & Associates, representing, Structural Engineers Association of Oregon (SEAO), Wind Committee requests Approval as Modified by this Public Comment.

Further modify proposal as follows:

1609.6.4.4.1 Components and Cladding. Wind pressure for each component or cladding element is applied as follows using C_{net} values based on the effective wind area, A contained within the zones in areas-of-discontinuity of width and/or length “a”, “2a” or “4a” at: corners of roofs and walls; edge strips for ridges, rakes and eaves; or field areas on walls or roofs as indicated in Figures in the Tables in ASCE 7 as referenced in Table 1609.6.2(2) in accordance with the following:

1. Calculated pressures at local discontinuities acting over specific edge strips or corner boundary areas.
2. Include “field” (zone 1, 2 or 4, as applicable) pressures applied to areas beyond the boundaries of the areas-of-discontinuity.
3. Where applicable, the calculated pressures at discontinuities (zones 2 or 3) shall be combined with design pressures that apply specifically on rakes or eave overhangs.

a. Linear interpolation between values in the table is acceptable.

b. For open buildings, multispans gable roofs, stepped roofs, sawtooth roofs, domed roofs, solid free standing walls and solid signs apply ASCE 7.

c. Some C_{net} values have been grouped together. Less conservative results may be obtained by applying ASCE 7.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: The S84-07/08 code change proposal stated incorrectly that the zones and thus the definitions of the "a", "2a", or "4"a distance over which they apply were in Table 1609.6.2(2). They are not. This Public comment corrects the text in Section 1609.6.4.4.1 and adds the appropriate references to the Figures in ASCE 7 in Table 1609.6.2(2).

Public Comment 3:

Don Scott, Structural Engineers of Washington (SEAW), representing SEAW Wind Engineering Committee, requests Approval as Modified by this Public Comment.

Further modify proposal as follows:

1609.6.1 Scope: As an alternate to ASCE 7 Section 6.5, the following provisions are permitted to be used to determine the wind effects on regularly shaped buildings, or regularly shaped other structures which meet all of the following conditions:

1. The building or other structure is less than or equal to 75 feet in height, with a height to least width ratio of 4 or less, or the building or other structure has a fundamental frequency greater than or equal to 1 hertz.
2. The building or other structure is not sensitive to dynamic effects.
3. The building or other structure is not located on a site for which channeling effects or buffeting in the wake of upwind obstructions warrant special consideration.
4. The building shall meet the requirements of a simple diaphragm building as defined in ASCE 7 Section 6.2, where wind loads are only transmitted to the Main-Wind-Force-Resisting System at the diaphragms.
5. For open buildings, multispans gable roofs, stepped roofs, sawtooth roofs, domed roofs, roofs with slopes greater than 45°, solid free standing walls and solid signs, and roof top equipment apply ASCE 7.

1609.6.2 Symbols and Notations. Coefficients and variables used in the Alternate All-Heights Method equations are as follows:

C_{net} = net-pressure coefficient based on $K_d [(G) (C_p) - (GC_{pi})]$, Ref Table 1609.6.2(2)

G = Gust effect factor equal to 0.85 for rigid structures per ASCE 7 Section 6.5.8.1.

K_d = Wind directionality factor per ASCE 7 Table 6-4.

P_{net} = Design wind pressure to be used in determination of wind loads on buildings or other structures or their components and cladding, in lb/ft² (N/m²).

q_s = Wind velocity stagnation pressure in lb/ft² (N/m²). (Per Table 1609.6.2(1))

1609.6.4.3 Determination of Net Pressure Coefficients, C_{net} . For the design of the Main Wind-Force-Resisting-System and for Components and Cladding, the sum of the internal and external net pressure shall be based on the net pressure coefficient C_{net} .

1. The pressure coefficient, C_{net} , for walls and roofs shall be determined from Table 1609.6.2(2).
2. Where C_{net} may have more than one value, the more severe wind load ~~combination~~ condition shall be used for design.

- a. Linear interpolation between values in the table is acceptable.
- b. For open buildings, multispans gable roofs, stepped roofs, sawtooth roofs, domed roofs, solid free standing walls and solid signs apply ASCE 7.
- c. Some C_{net} values have been grouped together. Less conservative results may be obtained by applying ASCE 7.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: At meetings in March and June with the ASCE/SEI 7 Wind Load Subcommittee, several improvements to Code Change Proposal S84 were discussed. These include:

- Adding the words regularly shaped to other structures in 1609.6.1 to avoid misapplication.
- Adding the words where wind loads are only transmitted to the Main-Wind-Force-Resisting System at the diaphragms. To Item 4 in 1609.6.1 to avoid misapplication. This change is under consideration by the ASCE/SEI 7 Wind Load Subcommittee and will appear in ASCE/SEI 7-10.
- Moving and expanding Footnote 2 to Table 1609.6.2(2) to Item 5 in 1609.6.1 to make it more visible.
- Changing the definition of q_s in 1609.6.2 from to Wind velocity pressure to Wind stagnation pressure to avoid confusion with ASCE/SEI 7.
- Changing the words wind load combination in Item 2 of 1609.6.4.3 to wind load condition to avoid confusion with the load combinations of Section 1605. In Table 1609.6.2(2) the Case 1 and Case 2 categories for wind perpendicular to a ridge were also changed from ~~case~~ to condition for the same reason.
- In Table 1609.6.2(2) Item 5. Components and Cladding in areas of discontinuity - Walls and parapets, the value for Wall Elements: $h \leq 60'$ (Zone 5), negative pressure for 500 SF or more for a Partially Enclosed condition was changed from 1.05 to 1.15 to correct a minor typographical mistake.

Final Hearing Results

AMPC1, 2, 3

Code Change No: S88-07/08

Original Proposal

Section: 1612.3.2 (New)

Proponent: Rebecca C. Quinn, R.C. Quinn Consulting, Inc., representing US Department of Homeland Security, Federal Emergency Management Agency

Revise as follows:

1612.3.1 (Supp) Design flood elevations. Where design flood elevations are not included in the flood hazard areas established in Section 1612.3, or where floodways are not designated, the building official is authorized to require the applicant to:

1. Obtain and reasonably utilize any design flood elevation and floodway data available from a federal, state or other source; or
2. Determine the design flood elevation and/or floodway in accordance with accepted hydrologic and hydraulic engineering practices used to define special flood hazard areas. Determinations shall be undertaken by a registered design professional who shall document that the technical methods used reflect currently accepted engineering practice.

1612.3.2 Determination of impacts. In riverine flood hazard areas where design flood elevations are specified but floodways have not been designated, the applicant shall demonstrate that the cumulative effect of the proposed buildings and structures, when combined with all other existing and anticipated flood hazard area encroachments, will not increase the design flood elevation more than 1 foot (305 mm) at any point within the jurisdiction of the applicable governing authority.

Reason: The purpose of this code change is to improve consistency with the requirements of the National Flood Insurance Program (NFIP) regarding development in flood hazard areas where base (or design) flood elevations are shown on the Flood Insurance Rate Map, but analyses to delineate the floodway were not performed. Development in riverine floodplains can increase flood levels and loads on other properties, especially if it occurs in areas known as floodways that must be reserved to convey flood flows. The floodway, as defined in 1612.2, is the area along riverine waterways that "must be reserved in order to discharge the base flood without cumulatively increasing the water surface elevation more than a designated height." For the situation addressed by this code change, the designed height is one foot.

Similar language appears in four locations in the I-Codes: (1) IBC 1803.4(4) to address proposed grading and filling; (2) IBC Appendix G103.4; (3) IBC Appendix J101.2; and IRC R324.1.3.2. The requirement to determine cumulative impacts has been part of the NFIP for more than 20 years and has been administered by more than 20,000 local jurisdictions that participate in the NFIP.

References:

Title 44 Code of Federal Regulations Parts 59 and 60, Regulations for Floodplain Management and Flood Hazard Identification." Online at <http://www.fema.gov/business/nfip/laws1.shtm>.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: While this may already be a part of the federal regulations, the committee felt it includes ill-defined terminology. Particularly the phrase "anticipated flood hazard areas" leaves too much to interpretation.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Rebecca C. Quinn, RCQuinn Consulting, Inc, representing Department of Homeland Security/Federal Emergency Management Agency, requests Approval as Modified by this Public Comment.

Replace proposal as follows:

1612.3.2 Determination of impacts. In riverine flood hazard areas where design flood elevations are specified but floodways have not been designated, the applicant shall provide a floodway analysis that demonstrates that the proposed work will not increase the design flood elevation more than 1 foot (305 mm) at any point within the jurisdiction of the applicable governing authority.

Commenter's Reason: This public comment modifies the code change by replacing the phrase considered to leave too much to interpretation with a statement that a floodway analysis is required to determine impacts. Development in riverine floodplains can increase flood levels and loads on other properties, especially if it occurs in areas known as floodways that must be reserved to convey flood flows. Floodways are the channels and those portions of riverine floodplains that convey most of the volume of floodwaters. Floodway analyses have been performed for decades. Commercial software packages for these analyses are readily available and FEMA provides software and technical guidance at www.fema.gov/plan/prevent/fhm/frm_soft.shtm#1.

The intent of the proposal is to improve consistency with the National Flood Insurance Program which requires applicants to demonstrate whether their proposed work will increase flood levels in floodplains where the NFIP's Flood Insurance Rate Map shows Base Flood Elevations, but floodways are not shown. A small percentage of floodplains where FEMA has specified Base Flood Elevations do not have designated floodways.

Final Hearing Results

S88-07/08

AMPC

Code Change No: S89-07/08

Original Proposal

Sections: 1612.4, 1801.1

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing himself

Revise as follows:

1612.4 Design and construction. The design and construction of buildings and structures located in flood hazard areas, including flood hazard areas subject to high velocity wave action, shall be in accordance with Chapter 5 of ASCE 7 and with ASCE 24.

1801.1 Scope. The provisions of this chapter shall apply to building and foundation systems ~~in those areas not subject to scour or water pressure by wind and wave action. Buildings and foundations subject to such scour or water pressure loads shall be designed in accordance with Chapter 16.~~

Reason: The purpose for this proposal is to align the provisions of the IBC, ASCE 7 and ASCE 24 with respect to the structural design of buildings and other structures in flood hazard areas. The current language implies that compliance with IBC Chapter 18 is required except for buildings and foundations subject to scour or water pressure by wind and wave action and the applicable requirements for them are specified in Chapter 16. The load combinations of IBC Section 1605 would not apply because there are none for flood loads. Sections 1605.2.2 and 1605.3.1.2 reference ASCE 7. Sections 2.3.3 and 2.4.2 of ASCE 7-05, in turn, specify load combinations that include flood loads. IBC Sections 1603.1.6 and 1612 specify requirements for determining flood hazard areas and documenting them on the construction documents. There are no other provisions in Chapter 16 specific to the structural design of buildings and other structures in flood hazard areas except for a reference to ASCE 24 in Section 1612.4. Chapter 5 of ASCE 7, however, contains comprehensive provisions for the determination of loads subjected to buildings and other structures located in "areas prone to flooding as defined on a flood hazard map."

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This code change adds a straightforward reference to the ASCE 7 flood load requirements, which has been missing from Section 1612.

Assembly Action:

None

Final Hearing Results

S89-07/08

AS

Code Change No: S92-07/08

Original Proposal

Section: 1613.6.6 (New)

Proponent: James S. Lai, SE, representing Structural Engineers Association of California

Add new text as follows:

1613.6.6 Minimum distance for building separation. All buildings and structures shall be separated from adjoining structures. Separations shall allow for the maximum inelastic response displacement (δ_M). δ_M shall be determined at critical locations with consideration for both translational and torsional displacements of the structure using Equation 16-45.

$$\delta_M = C_d \delta_{\max} \quad \text{(Equation 16-45)}$$

Where

C_d = Deflection amplification factor in Table 12.2-1 of ASCE 7.

δ_{\max} = Maximum displacement defined in Section 12.8.4.3 of ASCE 7.

Adjacent buildings on the same property shall be separated by a distance not less than δ_{MT} , determined by Equation 16-46.

$$\delta_{MT} = \sqrt{(\delta_{M1})^2 + (\delta_{M2})^2} \quad \text{(Equation 16-46)}$$

Where

δ_{M1}, δ_{M2} = The maximum inelastic response displacements of the adjacent buildings in accordance with Equation 16-45.

Where a structure adjoins a property line not common to a public way, the structure shall also be set back from the property line by not less than the maximum inelastic response displacement, δ_M , of that structure.

Exceptions:

1. Smaller separations or property line setbacks shall be permitted when justified by rational analyses.
2. Buildings and structures assigned to the Seismic Design Category A, B or C.

Reason: Purpose: To clarify requirements for separation distance between adjacent buildings.

Section 12.12.3 of ASCE 7-05 including Supplement No. 1 does not provide requirements for separation distances between adjacent buildings. Requirements for separation distances between adjacent buildings, not structurally connected, were included in IBC 2000 and 2003. However, when ASCE 7-05 was adopted by reference for IBC 2006, these requirements were omitted. In addition, ASCE 7-05 defines (δ_x) in Section 12.8.6 as the deflection of Level x at the center of mass. The actual displacement that needs to be used for building separation is the displacement at critical locations with consideration of both the translational and torsional displacements. These values can be significantly different.

This code change restores requirements for building separation in prior editions of IBC, and establishes minimum separation distance between adjoining buildings which are not structurally connected. The purpose of seismic separation is to permit adjoining buildings, or parts thereof, to respond to earthquake ground motion independently and thus preclude possible structural and non-structural damage caused by pounding between buildings or other structures.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1613.6.6 Minimum distance for building separation. All buildings and structures shall be separated from adjoining structures. Separations shall allow for the maximum inelastic response displacement (δ_M). δ_M shall be determined at critical locations with consideration for both translational and torsional displacements of the structure using Equation 16-45.

$$\delta_M = \frac{C_d \delta_{\max}}{I} \quad \text{(Equation 16-45)}$$

Where

C_d = Deflection amplification factor in Table 12.2-1 of ASCE 7.

δ_{\max} = Maximum displacement defined in Section 12.8.4.3 of ASCE 7

I = Importance factor in accordance with Section 11.5.1 of ASCE 7.

Adjacent buildings on the same property shall be separated by a distance not less than δ_{MT} , determined by Equation 16-46.

$$\delta_{MT} = \sqrt{(\delta_{M1})^2 + (\delta_{M2})^2} \quad \text{(Equation 16-46)}$$

Where

δ_{M1} , δ_{M2} = The maximum inelastic response displacements of the adjacent buildings in accordance with Equation 16-45.

Where a structure adjoins a property line not common to a public way, the structure shall also be set back from the property line by not less than the maximum inelastic response displacement, δ_{M1} , of that structure.

Exceptions:

1. Smaller separations or property line setbacks shall be permitted when justified by rational analyses.
2. Buildings and structures assigned to the Seismic Design Category A, B or C.

Committee Reason: Adding a requirement for building separation fills a void in the current earthquake provisions. The modification introduces the importance factor into the equation for determining maximum inelastic response to be consistent with ASCE 7.

Assembly Action:

None

Final Hearing Results

S92-07/08

AM

Code Change No: S93-07/08

Original Proposal

Section: 1613.6.6 (New)

Proponent: Jim W. Sealy, FAIA; Robert E. Bachman, SE; and John D. Gillengerten, Building Seismic Safety Council of the National Institute of Building Sciences, representing FEMA/BSSC Code Resource Support Committee

Add new text as follows:

1613.6.6 HVAC Ductwork with $I_p = 1.5$ Seismic supports are not required for HVAC ductwork with $I_p = 1.5$ if either of the following conditions are met for the full length of each duct run:

1. HVAC ducts are suspended from hangers 12 in. (305 mm) or less in length with hangers detailed to avoid significant bending of the hangers and their attachments or
2. HVAC ducts have a cross-sectional area of less than 6 ft² (0.557 m²).

Reason: This proposal extends the exemptions from seismic bracing requirements to include small ducts where $I_p=1.5$. All ducts are generally braced or guyed to prevent lateral motion or swing. Given the low inertial loads associated with small ducts, this prescriptive bracing is sufficient for seismic loads as well.

The proposed change should result in reduced cost in the installation of HVAC ducting for buildings assigned to Seismic Design Category D, E, and F where HVAC system is assigned a component importance factor of 4.5 (such as hospitals). There will be no change in cost in California amendments to the 2006 IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal eliminates unnecessary ductwork bracing for ducts that are small or where minimum prescriptive hangers are considered adequate.

Assembly Action:

None

Final Hearing Results

S93-07/08

AS

Code Change No: **S94-07/08**

Original Proposal

Section: 1613.6.6 (New)**Proponent:** Bonnie Manley, American Iron and Steel Institute, representing American Institute of Steel Construction**Add new text as follows:****1613.6.6 Steel plate shear wall height limits.** Modify Section 12.2.5.4 of ASCE 7 as follows:

12.2.5.4 Increased Building Height Limit for Steel Braced Frames, Special Steel Plate Shear Walls and Special Reinforced Concrete Shear Walls. The height limits in Table 12.2-1 are permitted to be increased from 160 ft (50 m) to 240 ft (75 m) for structures assigned to Seismic Design Categories D or E and from 100 ft (30 m) to 160 ft (50 m) for structures assigned to Seismic Design Category F that have steel braced frames, special steel plate shear walls or special reinforced concrete cast-in-place shear walls and that meet both of the following requirements:

1. The structure shall not have an extreme torsional irregularity as defined in Table 12.2-1 (horizontal structural irregularity Type 1b).
2. The braced frames or shear walls in any one plane shall resist no more than 60 percent of the total seismic forces in each direction, neglecting accidental torsional effects.

Reason: Special Steel Plate Shear Wall (SPSW) systems were first introduced in the 2005 editions of ASCE 7 and AISC 341. During the incorporation of the system's seismic design parameters and height limitations into ASCE 7, Table 12.2-1, the inclusion of this system in the permitted height increase of ASCE 7, Section 12.2.5.4 was inadvertently overlooked. This minor modification to ASCE 7, Section 12.2.5.4 corrects that oversight.

Please note, we will be pursuing a correction to Section 12.2.5.4 for the 2010 edition of ASCE 7, so it is anticipated that this amendment to ASCE 7-05 will be necessary only for the 2009 edition of the IBC.

Additional Background: FEMA 450 (2003), *NEHRP Recommended Provisions For Seismic Regulations For New Buildings And Other Structures*, which is the source document for ASCE 7-05, states the following in Section 4.3.1.4 and its associated commentary:

Provisions:

4.3.1.4 Seismic Design Category D. The structural framing system for structures assigned to Seismic Design Category D shall comply with Sec. 4.3.1.3 and the additional requirements of this section.

4.3.1.4.1 Building height limits. The height limits in Table 4.3-1 are permitted to be increased to 240 ft (70 m) in buildings that have steel braced frames or concrete cast-in-place shear walls if such buildings are configured such that the braced frames or shear walls arranged in any one plane conform to the following:

1. The braced frames or cast-in-place special reinforced concrete shear walls in any one plane shall resist no more than 60 percent of the total seismic forces in each direction, neglecting torsional effects, and
2. The seismic force in any braced frame or shear wall resulting from torsional effects shall not exceed 20 percent of the total seismic force in that braced frame or shear wall.

Commentary:

4.3.1.4 Seismic Design Category D. Sec. 4.3.1.4 covers Seismic Design Category D, which compares roughly to California design practice for normal buildings away from major faults. In keeping with the philosophy of present codes for zones of high seismic risk, these requirements continue limitations on the use of certain types of structures over 160 ft (49 m) in height but with some changes. Although it is agreed that the lack of reliable data on the behavior of high-rise buildings whose structural systems involve shear walls and/or braced frames makes it convenient at present to establish some limits, the values of 160 ft (49 m) and 240 ft (73 m) introduced in these requirements are arbitrary. Considerable disagreement exists regarding the adequacy of these values, and it is intended that these limitations be the subject of further study.

According to these requirements require that buildings in Category D over 160 ft (49 m) in height must have one of the following seismic-force-resisting systems:

1. A moment resisting frame system with special moment frames capable of resisting the total prescribed seismic force...
2. A dual system as defined in this chapter, wherein the prescribed forces are resisted by the entire system and the special moment frame is designed to resist at least 25 percent of the prescribed seismic force...

3. *The use of a shear wall (or braced frame) system of cast-in-place concrete or structural steel up to a height of 240 ft (73 m) is permitted only if braced frames or shear walls in any plane do not resist more than 60 percent of the seismic design force including torsional effects and the configuration of the lateral-force-resisting system is such that torsional effects result in less than a 20 percent contribution to the strength demand on the walls or frames. The intent is that each of these shear walls or braced frames be in a different plane and that the four or more planes required be spaced adequately throughout the plan or on the perimeter of the building in such a way that the premature failure of one of the single walls or frames will not lead to excessive inelastic torsion.*

Although a structural system with lateral force resistance concentrated in the interior core (Figure C4.3-1) is acceptable according to the Provisions, it is highly recommended that use of such a system be avoided, particularly for taller buildings. The intent is to replace it by the system with lateral force resistance distributed across the entire building (Figure C4.3-2). The latter system is believed to be more suitable in view of the lack of reliable data regarding the behavior of tall buildings having structural systems based on central cores formed by coupled shear walls or slender braced frames.

Based upon the provision language and accompanying commentary, there seems to be no reason to not include special SPSW in the increased height limitations of ASCE 7, Section 12.2.5.4.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This code change fills a void in the current ASCE 7 provision, by clarifying that it also applies to special steel plate shear wall systems.

Assembly Action:

None

Final Hearing Results

S94-07/08

AS

Code Change No: S96-07/08

Original Proposal

Sections: 1613.7 (New), 1613.7.1 (New)

Proponent: Jim Messersmith, Jr. PE, Portland Cement Association

Add new text as follows:

1613.7 General. The text of ASCE 7 shall be modified as indicated in Section 1613.7.1.

1613.7.1 ASCE 7, Section 11.7.5. Modify ASCE 7, Section 11.7.5 to read as follows:

11.7.5 Anchorage of walls. Walls shall be anchored to the roof and all floors and members that provide lateral support for the wall or that are supported by the wall. The anchorage shall provide a direct connection between the walls and the roof or floor construction. The connections shall be capable of resisting the forces specified in Section 11.7.3 applied horizontally, substituted for *E* in load combinations of Section 2.3 or 2.4.

Reason: Since ASCE 7-05 will be the loading standard referenced in the 2009 IBC, the only recourse to getting changes made to ASCE 7-05 is through modifications to the standard within the IBC.

The requirement that anchors attaching concrete and masonry walls to supporting construction be designed for a lower bound value of 280 pounds per linear foot is excessive and discriminatory considering that anchorage of walls of other materials, regardless of their mass, is required to be designed for a horizontal force of 5% of the weight of the wall tributary to the anchor.

To illustrate the punitive nature of the provision, consider two 10-foot high walls that are representative of walls used in single family dwellings and small commercial buildings; one a 5.5-inch thick concrete wall, the other a light-framed wall with 4-inch nominal masonry veneer anchored to the wall framing. The weight of the light-framed wall, including veneer, is estimated to be 45 psf; therefore, the weight tributary to an anchor at the top of the wall is 225 plf ($45 * (10/2) = 225$). The required design anchorage force for this wall is 11 plf ($225 * 0.05 = 11$). On the other hand, for the 5.5-inch concrete wall, which weighs 69 psf, the weight tributary to an anchor at the top of the wall is 345 plf ($69 * (10/2) = 345$). Based on the requirement that applies to walls of other than concrete or masonry, the required anchorage design force for the concrete wall should be 17 plf ($345 * 0.05 = 17$); however, 280 plf must be used to design the anchorage.

Let's examine how the 280 plf requirement compares to wind design. ASCE 7, Section 6.1.4.2 requires that components and cladding be designed for a minimum service level design wind pressure of 10 psf. For our example walls using this minimum design wind pressure, the strength level (factored) force at the top of the wall due to wind is 80 plf ($10 * (10/2) * 1.6 = 80$). Now let's determine what basic wind speed is required to produce a factored design force at the top of the wall of 280 plf (strength level). The service level (unfactored) force comparable to 280 plf is 175 plf ($280/1.6 = 175$). Since 175 plf is based on a tributary wall height of 5 feet, the design wind pressure is 35 psf ($175/5 = 35$). From ASCE 7, Figure 6-3, for a building in exposure B, height of 30 feet, K_{zt} of 1.0, and effective wind area of less than or equal to 10 square feet for wall area 4, the negative design pressure for a basic wind speed of 140 mph is 38.2 psf. Therefore, the requirement that the 5.5-inch, 10-foot high concrete wall be anchored against a force of 280 plf is the same as requiring that the connection be designed for a basic wind speed of approximately 135 mph.

It is obvious that in a world that is rapidly embracing performance-based design, the requirement that anchorages for concrete and masonry walls be designed for a force of 280 plf is not necessary and discriminates against these products. In addition, by singling out walls of concrete and masonry, walls of other materials that could have comparable mass per unit area are exempt from the requirement. Based on the foregoing, the requirement that anchorages for concrete and masonry walls be designed for 280 plf should be deleted.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The committee believes this is a reasonable change to the ASCE 7 requirement for anchorage of walls and it is consistent with the committee's action on S57-07/08.

Assembly Action:

None

Code Change No: **S101-07/08**

Original Proposal

Section: 1614 (New)

Proponent: Ronald O. Hamburger, SE, Simpson Gumpertz & Heger, Inc, representing National Council of Structural Engineers Associations/Ad Hoc Joint Industry Committee on Structural Integrity

Add new section as follows:

SECTION 1614
STRUCTURAL INTEGRITY

1614.1 General. Buildings and other structures assigned to Occupancy Category II, III, or IV, exceeding three stories above grade plane shall comply with the requirements of this section. Frame structures shall comply with the requirements of Section 1614.3. Bearing wall structures shall comply with the requirements of Section 1614.4.

Exception: Structures other than buildings with structural systems that are not like building structures including, but not limited to, billboards, signs, silos, tanks, stacks, mechanical and electrical equipment.

1614.2 Definitions. The following words and terms shall, for the purposes of Section 1614, have the meanings shown herein.

BEARING WALL STRUCTURE. A building or other structure in which vertical loads from floors and roofs are primarily supported by walls.

FRAME STRUCTURE. A building or other structure in which vertical loads from floors and roofs are primarily supported by columns.

1614.3 Frame structures. Frame structures shall comply with the requirements of this section.

1614.3.1 Concrete frame structures. Frame structures constructed primarily of reinforced or prestressed concrete, either cast-in-place or precast, or a combination of these, shall conform to the requirements of ACI 318 Sections 7.13, 13.3.8.5, 13.3.8.6, 16.5 and 18.12.6, b18.12.7 and 18.12.8 as applicable. Where ACI 318 requires that nonprestressed reinforcing or prestressing steel pass through the region bounded by the longitudinal column reinforcement, that reinforcing or prestressing steel shall have a minimum nominal tensile strength equal to 2/3 of the required one-way vertical strength of the connection of the floor or roof system to the column in each direction of beam or slab reinforcement passing through the column.

Exception: Where concrete slabs with continuous reinforcing having an area not less than 0.0015 times the concrete area in each of two orthogonal directions are present and are either monolithic with or equivalently bonded to beams, girders or columns, the longitudinal reinforcing or prestressing steel passing through the column reinforcement shall have a nominal tensile strength of 1/3 of the required one-way vertical strength of the connection of the floor or roof system to the column in each direction of beam or slab reinforcement passing through the column.

1614.3.2 Structural steel, open web steel joist or joist girder, or composite steel and concrete frame structures. Frame structures constructed with a structural steel frame or a frame composed of open web steel joists, joist girders with or without other structural steel elements or a frame composed of composite steel or composite steel joists and reinforced concrete elements shall conform to the requirements of this section.

1614.3.2.1 Columns. Each column splice shall have the minimum design strength in tension to transfer the design dead and live load tributary to the column between the splice and the splice or base immediately below.

1614.3.2.2 Beams. End connections of all beams and girders shall have a minimum nominal axial tensile strength equal to the required vertical shear strength for Allowable Strength Design (ASD) or 2/3 of the required shear strength for Load and Resistance Factor Design (LRFD) but not less than 10 kips (45 kN). For the purpose of this section, the shear force and the axial tensile force need not be considered to act simultaneously.

Exception: Where beams, girders, open web joist, and joist girders support a concrete slab or concrete slab on metal deck that is attached to the beam or girder with not less than 3/8 in. (9.5 mm) diameter headed shear studs, at a spacing of not more than 12 in. (305 mm) on center, averaged over the length of the member, or other attachment having equivalent shear strength, and the slab contains continuous distributed reinforcement in each of two orthogonal directions with an area not less than 0.0015 times the concrete area, the nominal axial tension strength of the end connection shall be permitted to be taken as half the required vertical shear strength for ASD or 1/3 of the required shear strength for LRFD, but not less than 10 kips (45 kN).

1614.4 Bearing wall structures. Bearing wall structures shall have vertical ties in all load bearing walls and longitudinal ties, transverse ties, and perimeter ties at each floor level in accordance with this section and as shown in Figure 1614.4.

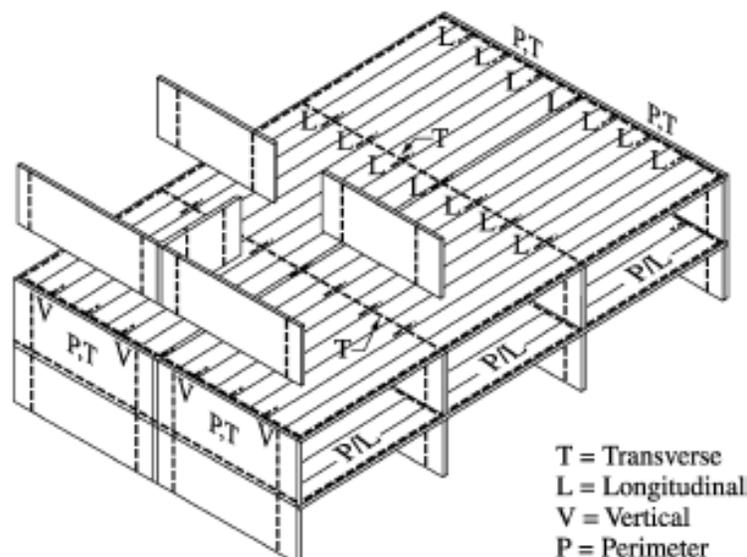

FIGURE 1614.4
LONGITUDINAL, PERIMETER, TRANSVERSE AND VERTICAL TIES

1614.4.1 Concrete wall structures. Precast bearing wall structures constructed solely of reinforced or prestressed concrete, or combinations of these shall conform to the requirements of Sections 7.13, 13.3.8.5 and 16.5 of ACI 318.

1614.4.2 Other bearing wall structures. Ties in bearing wall structures other than those covered in Section 1614.4.1 shall conform to this section.

1614.4.2.1 Longitudinal ties. Longitudinal ties shall consist of continuous reinforcement in slabs; continuous or spliced decks or sheathing; continuous or spliced members framing to, within, or across walls; or, connections of continuous framing members to walls. Longitudinal ties shall extend across interior load bearing walls and shall connect to exterior load bearing walls and shall be spaced at not greater than 10 feet (3038 mm) on center. Ties shall have a minimum nominal tensile strength, T_T , given by Equation 16-45. For ASD the minimum nominal tensile strength may be taken as 1.5 times the allowable tensile stress times the area of the tie.

$$T_T = wLs \leq \alpha_T s \quad \text{(Equation 16-45)}$$

where:

L = the span of the horizontal element in the direction of the tie, between bearing walls, ft, (m)

w = the weight per unit area of the floor or roof in the span being tied to or across the wall, psf, (N/m²)

S = the spacing between ties, ft (m)

α_T = a coefficient with a value of 1,500 lb/ft (2.25 kN/m) for masonry bearing wall structures and a value of 375 lb/ft (0.6 kN/m) for structures with bearing walls of light wood or cold formed steel frame construction.

1614.4.2.2 Transverse ties. Transverse ties shall consist of continuous reinforcement in slabs; continuous or spliced decks or sheathing; continuous or spliced members framing to, within, or across walls; or, connections of continuous framing members to walls. Transverse ties shall be placed no farther apart than the spacing of load bearing walls. Transverse ties shall have minimum nominal tensile strength T_T , given by Equation 16-45. For ASD the minimum nominal tensile strength may be taken as 1.5 times the allowable tensile stress times the area of the tie.

1614.4.2.3 Perimeter ties. Perimeter ties shall consist of continuous reinforcement in slabs; continuous or spliced decks or sheathing; continuous or spliced members framing to, within, or across walls; or, connections of continuous framing members to walls. Ties around the perimeter of each floor and roof shall be located within 4 feet (1219 mm) of the edge and shall provide a nominal strength in tension not less than T_p , given by Equation 16-46. For ASD the minimum nominal tensile strength may be taken as 1.5 times the allowable tensile stress times the area of the tie.

$$T_p = 200w \leq \beta_T \quad \text{(Equation 16-46)}$$

For SI:

$$T_p = 90.7w \leq \beta_T$$

where

w = as defined in Section 1614.4.2.1

β_T = a coefficient with a value of 16,000 lbs (7,200 KN) for structures with masonry bearing walls and a value of 4,000 lbs (1,300 KN) for structures with bearing walls of light wood or cold formed steel frame construction.

1614.4.3.4 Vertical ties. Vertical ties shall consist of continuous or spliced reinforcing, continuous or spliced members, wall sheathing or other engineered systems. Vertical tension ties shall be provided in bearing walls and shall be continuous over the height of the building. The minimum nominal tensile strength for vertical ties within a bearing wall shall be equal to the weight of the wall within that story plus the weight of diaphragm tributary to the wall in the story below. No fewer than two ties shall be provided for each wall. The strength of each tie need not exceed 3,000 lb/ft (450 kN/m) of wall tributary to the tie for walls of masonry construction or 750 lb/ft (140 kN/m) of wall tributary to the tie for walls of light wood or steel frame construction.

Reason: This proposal was developed by a broad industry coalition that includes participation by the National Council of Structural Engineers Associations, the Structural Engineering Institute of the American Society of Civil Engineers, the American Institute of Architects, the American Concrete Institute, the American Forest & Paper Association, the American Iron and Steel Institute, the American Institute of Steel Construction, the Masonry Alliance for Codes and Standards, The Masonry Society, the Portland Cement Association, the Steel Joist Institute, the

Precast/Prestressed Concrete Institute. Corresponding members included the International Code Council and the National Fire Protection Association. In addition, there was nonvoting participation by the National Institute of Building Sciences and the National Institute of Standards and Technology.

It is the general consensus of NCSEA and the other members of the Ad Hoc Joint Industry Committee on Structural Integrity that the requirements already embodied in the building codes and standards together with the common structural design and construction practices prevalent in the United States today provide the overwhelming majority of structures with adequate levels of reliability and safety. The proposed provisions contained in this proposal are predicated upon requirements contained within the ACI 318 for many years. by adapting those requirements to structures of other construction types based on the differing conditions of weight and detailing. It is the opinion of the Ad Hoc Joint Industry Committee that these provisions will generally enhance the general structural integrity and resistance of structures by establishing minimum requirements for tying together the primary structural elements.

No cost impact on structures that are three stories or less in height. For some structures exceeding three stories in height, this proposal may result in minor increases in structural cost due to the additional strength of connections that are required. However, as the provisions contained in this proposal embody common design practices employed by many structural engineers, for many structures, the cost impact will be negligible.

Cost Impact: No cost impact on structures that are three stories or less in height. For some structures exceeding three stories in height, this proposal may result in minor increases in structural cost due to the additional strength of connections that are required. However, as the provisions contained in this proposal embody common design practices employed by many structural engineers, for many structures, the cost impact will be negligible.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: There is a need for some structural integrity measures and some committee members feel this proposal would be a good step. However, it appears, as proposed, the current ACI 318 provisions for concrete have been extended to other materials without adequate explanation. The logic in doing so is lacking. These provisions would involve too many buildings that do not have integrity issues and there is no demonstrated need for enhancing these structures. There are also concerns about the consequences of requiring these provisions for buildings that are currently built all the time. There is some concern regarding how, or if, this analysis would relate to other required loading conditions – in particular, lateral loads.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Paul K. Heilstedt, PE, FAIA, Chair, representing ICC Code Technology Committee and Gerry Jones/Herman Brice, representing NIBS/MMC Committee for Translating the NIST World Trade Center Investigation Recommendations into Building Codes, request Approval as Modified by this Public Comment.

Modify proposal as follows:

1614.1 General. Buildings ~~classified as high rise buildings in accordance with Section 403 and other structures~~ assigned to Occupancy Category II, III, or IV, ~~exceeding three stories above grade plane~~ shall comply with the requirements of this section. Frame structures shall comply with the requirements of Section 1614.3. Bearing wall structures shall comply with the requirements of Section 1614.4.

~~**Exception:** Structures other than buildings with structural systems that are not like building structures including, but not limited to, billboards, signs, silos, tanks, stacks, mechanical and electrical equipment.~~

1614.4.2.1 Longitudinal ties. Longitudinal ties shall consist of continuous reinforcement in slabs; continuous or spliced decks or sheathing; continuous or spliced members framing to, within, or across walls; or, connections of continuous framing members to walls. Longitudinal ties shall extend across interior load bearing walls and shall connect to exterior load bearing walls and shall be spaced at not greater than 10 feet (3038 mm) on center. Ties shall have a minimum nominal tensile strength, T_T , given by Equation 16-45. For ASD the minimum nominal tensile strength ~~may shall be permitted to be~~ taken as 1.5 times the allowable tensile stress times the area of the tie.

$$T_T = wLs \leq \alpha_T s \qquad \text{(Equation 16-45)}$$

where:

- L = the span of the horizontal element in the direction of the tie, between bearing walls, ft, (m)
- w = the weight per unit area of the floor or roof in the span being tied to or across the wall, psf, (N/m²)
- S = the spacing between ties, ft (m)
- α_T = a coefficient with a value of 1,500 lb/ft (2.25 kN/m) for masonry bearing wall structures and a value of 375 lb/ft (0.6 kN/m) for structures with bearing walls of ~~light wood or cold formed steel frame construction.~~

1614.4.2.3 Perimeter ties. Perimeter ties shall consist of continuous reinforcement in slabs; continuous or spliced decks or sheathing; continuous or spliced members framing to, within, or across walls; or, connections of continuous framing members to walls. Ties around the perimeter of each floor and roof shall be located within 4 feet (1219 mm) of the edge and shall provide a nominal strength in tension not less than T_p , given by Equation 16-46. For ASD the minimum nominal tensile strength ~~may~~ shall be permitted to be taken as 1.5 times the allowable tensile stress times the area of the tie.

$$T_p = 200w \leq \beta_T \quad (\text{Equation 16-46})$$

For SI:

$$T_p = 90.7w \leq \beta_T$$

where

w = as defined in Section 1614.4.2.1

β_T = a coefficient with a value of 16,000 lbs (7,200 kN) for structures with masonry bearing walls and a value of 4,000 lbs (1,300 kN) for structures with bearing walls of ~~light wood~~ or cold formed steel frame construction.

1614.4.3.4 Vertical ties. Vertical ties shall consist of continuous or spliced reinforcing, continuous or spliced members, wall sheathing or other engineered systems. Vertical tension ties shall be provided in bearing walls and shall be continuous over the height of the building. The minimum nominal tensile strength for vertical ties within a bearing wall shall be equal to the weight of the wall within that story plus the weight of diaphragm tributary to the wall in the story below. No fewer than two ties shall be provided for each wall. The strength of each tie need not exceed 3,000 lb/ft (450 kN/m) of wall tributary to the tie for walls of masonry construction or 750 lb/ft (140 kN/m) of wall tributary to the tie for walls of ~~light wood~~ or steel frame construction.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: As noted in the reason for disapproval, there is a need for structural integrity provisions in the code and the reason further states that the provisions would involve too many building that do not have integrity issues. The CTC concurs with this philosophy - the need for such provisions should be a function of the relative risk. Low rise buildings which typically employ a less sophisticated structural system do not represent the same risk as taller buildings such as high rise buildings. Further, inclusion of Category II buildings also represents a large volume of buildings which would envelope a large population of buildings without detailing the risk. Category III buildings which are noted in Table 1604.5 of the code as "representing a substantial hazard to human life in the event of failure" such as high occupant load buildings, as well as Category IV buildings which are classified as "essential facilities" such as hospitals, warrant such provisions.

This public comment responds to these two fundamental issues by limiting the application to only Category III and IV buildings which are considered high rises.

Sections 164.4.2.1, 1614.4.2.3 and 1614.4.3.4 are correspondingly revised to remove the reference to wood construction as the application is now limited to high rises for which wood bearing walls would not be permitted based on type of construction.

Code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: <http://www.iccsafe.org/cs/cc/ctc/index.html>. Since its inception in April/2005, the CTC has held fifteen meetings - all open to the public. This public comment is a result of the CTC's investigation of the area of study entitled "NIST World Trade Center Recommendations". The CTC web page for this area of study is: <http://www.iccsafe.org/cs/cc/ctc/WTC.html>

Final Hearing Results

S101-07/08

AMPC1

Code Change No: S102-07/08

Original Proposal

Section: 1702

Proponent: Tony Crimi, A.C. Consulting Solutions Inc., representing North American Insulation Manufacturers' Association (NAIMA)

THIS CODE CHANGE PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY CODE DEVELOPMENT COMMITTEE. SEE THE HEARING ORDER FOR THE IBC FIRE SAFETY CODE DEVELOPMENT COMMITTEE.

Add new definitions as follows:

SECTION 1702 DEFINITIONS

INTUMESCENT FIRE RESISTANT COATINGS. Thin film liquid mixture applied to substrates by brush, roller, spray or trowel which expands into a protective foamed layer to provide fire-resistant protection of the substrates when exposed to flame or intense heat.

MASTIC FIRE RESISTANT COATINGS. Liquid mixture applied to a substrate by brush, roller, spray or trowel that provides fire resistant protection of a substrate when exposed to flame or intense heat.

Reason: Purpose: To introduce new definition for Mastic and Intumescent Fire Resistant Coatings which are described in Section 1704.11.

Section 1704.11 provides requirements for Special Inspections for mastic and intumescent fire-resistant coatings applied to structural elements and decks, but the IBC does not contain any definition describing these materials.

Section 1704.11 requires Special inspections for mastic and intumescent fire-resistant coatings applied to structural elements and decks be in accordance with AWCI 12-B which is entitled "Field Applied Thin-Film Intumescent Fire-Resistive Materials". Special inspections are also required to be based on the fire-resistance design as designated in the approved construction documents. However, neither the IBC nor the AWCI 12-B Standard provides any description or definition for these materials. In order to ensure that the Special Inspection procedures are appropriate, some definitions of these materials should be incorporated into the IBC. This would bring these in line with Sprayed Fire Resistive Materials (SFRM).

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

This code change was heard by the IBC Fire Safety Code Development Committee.

Committee Action:

Approved as Submitted

Committee Reason: The committee agreed that definitions for mastic and intumescent fire resistant coatings were appropriate additions to the code because requirements for application and special inspection of these coatings are currently specified in Section 1704.11.

Assembly Action:

None

Final Hearing Results

S102-07/08

AS

Code Change No: S103-07/08

Original Proposal

Section: 1703.1.1

Proponent: D. Kirk Harman, P.E., S.E., The Harman Group, Inc., representing The NCSEA Code Advisory Committee, Quality Assurance and Special Inspection Subcommittee

Revise as follows:

1703.1 Approved agency. An approved agency shall provide all information as necessary for the building official to determine that the agency meets the applicable requirements.

1703.1.1 Independence. An approved agency shall be objective, ~~and competent~~ and independent from the contractor who's work is being inspected. The agency shall also disclose possible conflicts of interest so that objectivity can be confirmed.

Reason: This change is to clarify the term "Independent". NCSEA believes that for the Special Inspections process to have adequate integrity, it is important that special inspections not be performed by employees or consultants of the contractor. However, the Code should not be interpreted to require independence from the various design professionals who have undertaken design on the project. The Special Inspections are for assurance of quality of construction and conformance to design standards. They are in no way a check of the design. The proposed edits to the existing language in the code clarify these issues.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1703.1.1 Independence. An approved agency shall be objective, competent and independent from the contractor responsible for the work ~~who's work is~~ being inspected. The agency shall also disclose possible conflicts of interest so that objectivity can be confirmed.

Committee Reason: This proposal elaborates on the requirement for an approved agency to be independent by adding that it is with respect to the contractor whose work is being inspected. The modification rewords this to make it clearer.

Assembly Action:

None

Final Hearing Results

S103-07/08

AM

Code Change No: S107-07/08

Original Proposal

Sections: 1704.1, 1704.1.2

Proponent: D. Kirk Harman, PE, SE, The Harman Group, Inc., representing The National Council of Structural Engineers (NCSEA) Code Advisory Committee Quality Assurance and Special Inspection Subcommittee

Revise as follows:

1704.1 (Supp) General. Where application is made for construction as described in this section, the owner or the registered design professional in responsible charge acting as the owner's agent shall employ one or more ~~special inspectors~~ approved agencies or provide special inspection services to ~~provide~~ perform inspections during construction on the types of work listed under Section 1704. These inspections are in addition to the inspections identified in Section 109.

The special inspector shall be a qualified person who shall demonstrate competence, to the satisfaction of the building official, for the inspection of the particular type of construction or operation requiring special inspection. The registered design professional in responsible charge and engineers of record involved in the design of the project are permitted to act as the approved agency and their personnel are permitted to inspect the work designed by them. The special inspector shall provide written documentation to the building official demonstrating their competence and relevant experience or training. Experience or training shall be considered relevant when the documented experience or training is related in complexity to the same type of special inspection activities for projects of similar complexity and material qualities. These qualifications are in addition to qualifications specified in other sections of this code.

Exceptions:

1. Special inspections are not required for work of a minor nature or as warranted by conditions in the jurisdiction as approved by the building official.
2. Special inspections are not required for building components unless the design involves the practice of professional engineering or architecture as defined by applicable state statutes and regulations governing the professional registration and certification of engineers or architects.
3. Unless otherwise required by the building official, special inspections are not required for occupancies in Group U that are accessory to a residential occupancy including, but not limited to, those listed in Section 312.1.

1704.1.2 Report requirement. Special inspectors shall keep records of inspections. The special inspector shall furnish inspection reports to the building official, and to the registered design professional in responsible charge. Reports shall indicate that work inspected was or was not completed ~~done~~ in conformance to approved construction documents. Discrepancies shall be brought to the immediate attention of the registered design professional in responsible charge and the contractor for correction. If the discrepancies are not corrected, the discrepancies shall

be brought to the attention of the building official and to the registered design professional in responsible charge prior to the completion of that phase of the work. A final report documenting required special inspections and correction of any discrepancies noted in the inspections shall be submitted at a point in time agreed upon prior to the start of work by the permit applicant and the building official ~~prior to the start of work~~.

Reason: NCSEA has received input from structural engineers in various locations throughout the United States stating that building officials sometimes take the position that the registered design professional in responsible charge and/or engineers of record responsible for design on a project are prohibited by the Code from performing Special Inspections. NCSEA believes that this is an incorrect interpretation of the Code. Special Inspections are a process to help assure conformance with design requirements and are not in any way intended to be a check of the design. This change is to clarify that the registered design professional and/or engineers of record involved in the design of the project may perform the special inspections.

NCSEA believes that Section 1704.1.2 does not clearly require reporting of incomplete work at all and does not require notification to the Registered Design Professional in Responsible Charge as to the outcome of Special Inspections. This change clarifies this in Section 1704.1.2.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1704.1 (Supp) General. Where application is made for construction as described in this section, the owner or the registered design professional in responsible charge acting as the owner's agent shall employ one or more approved agencies ~~or provide special inspection services~~ to perform inspections during construction on the types of work listed under Section 1704. These inspections are in addition to the inspections identified in Section 109.

The special inspector shall be a qualified person who shall demonstrate competence, to the satisfaction of the building official, for the inspection of the particular type of construction or operation requiring special inspection. The registered design professional in responsible charge and engineers of record involved in the design of the project are permitted to act as the approved agency and their personnel are permitted to ~~inspect~~ act as the special inspector for the work designed by them, provided those personnel meet the qualification requirements of this section to the satisfaction of the building official. The special inspector shall provide written documentation to the building official demonstrating their competence and relevant experience or training. Experience or training shall be considered relevant when the documented experience or training is related in complexity to the same type of special inspection activities for projects of similar complexity and material qualities. These qualifications are in addition to qualifications specified in other sections of this code.

Exceptions:

1. Special inspections are not required for work of a minor nature or as warranted by conditions in the jurisdiction as approved by the building official.
2. Special inspections are not required for building components unless the design involves the practice of professional engineering or architecture as defined by applicable state statutes and regulations governing the professional registration and certification of engineers or architects.
3. Unless otherwise required by the building official, special inspections are not required for occupancies in Group U that are accessory to a residential occupancy including, but not limited to, those listed in Section 312.1.

1704.1.2 Report requirement. Special inspectors shall keep records of inspections. The special inspector shall furnish inspection reports to the building official, and to the registered design professional in responsible charge. Reports shall indicate that work inspected was or was not completed in conformance to approved construction documents. Discrepancies shall be brought to the immediate attention of the ~~registered design professional in responsible charge and the~~ contractor for correction. If the discrepancies are not corrected, the discrepancies shall be brought to the attention of the building official and to the registered design professional in responsible charge prior to the completion of that phase of the work. A final report documenting required special inspections and correction of any discrepancies noted in the inspections shall be submitted at a point in time agreed upon prior to the start of work by the permit applicant and the building official.

Committee Reason: This code change clarifies the code by stating that the registered design professional is permitted to do special inspections where they can demonstrate their qualifications to the satisfaction of the building official. The modification addresses some objections that were raised by clarifying that the registered design profession must demonstrate qualifications to the building official like any other potential special inspector. Special inspections still must be coordinated with the other inspections required by Section 109. It was noted that experience with permitting this in Hawaii has been positive.

Assembly Action:

None

Final Hearing Results

S107-07/08

AM

Code Change No: S109-07/08

Original Proposal

Section: 1704.2.2

Proponent: Bonnie Manley, American Iron and Steel Institute, representing American Institute of Steel Construction

Revise as follows:

1704.2.2 Fabricator approval. Special inspections required by ~~this code~~ Section 1704 are not required where the work is done on the premises of a fabricator registered and approved to perform such work without special inspection. Approval shall be based upon review of the fabricator's written procedural and quality control manuals and periodic auditing of fabrication practices by an approved special inspection agency. At completion of fabrication, the approved fabricator shall submit a certificate of compliance to the building official stating that the work was performed in accordance with the approved construction documents.

Reason: This modification attempts to clarify exactly which inspections are permitted to be waived when work is done by a registered and approved fabricator. As written now, it could be interpreted to mean that the special inspections for seismic resistance required by Section 1707.2 could be waived. This is not appropriate and needs to be corrected.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Approved as Submitted**

Committee Reason: This is a clarification that makes the applicability of special inspections to approved fabricators clearer.

Assembly Action:**None**

Final Hearing Results

S109-07/08**AS**

Code Change No: S110-07/08

Original Proposal

Sections: 1704.3, 1704.3.1.1 (New)

Proponent: Bonnie Manley, American Iron and Steel Institute

1. Revise as follows:

1704.3 Steel construction. The special inspections for steel elements of buildings and structures shall be as required by Section 1704.3 and Table 1704.3.

Exceptions:

1. Special inspection of the steel fabrication process shall not be required where the fabricator does not perform any welding, thermal cutting or heating operation of any kind as part of the fabrication process. In such cases, the fabricator shall be required to submit a detailed procedure for material control that

demonstrates the fabricator's ability to maintain suitable records and procedures such that, at any time during the fabrication process, the material specification, grade and mill test reports for the main stress-carrying elements are capable of being determined.

2. The special inspector need not be continuously present during welding of the following items, provided the materials, welding procedures and qualifications of welders are verified prior to the start of the work; periodic inspections are made of the work in progress; and a visual inspection of all welds is made prior to completion or prior to shipment of shop welding.
 - 2.1. Single-pass fillet welds not exceeding 5/16 inch (7.9 mm) in size.
 - 2.2. Floor and roof deck welding.
 - 2.3. Welded studs when used for structural diaphragm.
 - 2.4. Welded sheet steel for cold-formed steel light frame construction framing members ~~such as studs and joists.~~
 - 2.5. Welding of stairs and railing systems.

2. Add new text as follows:

1704.3.1.1 Cold-formed steel. Welding inspection and welding inspector qualification for cold-formed steel, including metal floor and roof decks, shall be in accordance with AWS D1.3.

Reason: IBC Section 1704.3, Exception 2.4 was corrected to match the terminology used in IBC Section 2210. IBC Section 1704.3.1 on welding currently only references AWS D1.1. Since "Steel Construction" covers steel other than just structural steel, referencing AWS D1.1 alone is not sufficient. AWS D1.3 covers cold-formed steel and is added as a new subsection. Please see companion change which moves the reference to AWS D1.1 into a new subsection for "Structural Steel'."

Cost Impact: This code change will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1704.3 Steel construction. The special inspections for steel elements of buildings and structures shall be as required by Section 1704.3 and Table 1704.3.

Exceptions:

1. Special inspection of the steel fabrication process shall not be required where the fabricator does not perform any welding, thermal cutting or heating operation of any kind as part of the fabrication process. In such cases, the fabricator shall be required to submit a detailed procedure for material control that demonstrates the fabricator's ability to maintain suitable records and procedures such that, at any time during the fabrication process, the material specification, grade and mill test reports for the main stress-carrying elements are capable of being determined.
2. The special inspector need not be continuously present during welding of the following items, provided the materials, welding procedures and qualifications of welders are verified prior to the start of the work; periodic inspections are made of the work in progress; and a visual inspection of all welds is made prior to completion or prior to shipment of shop welding.
 - 2.1. Single-pass fillet welds not exceeding 5/16 inch (7.9 mm) in size.
 - 2.2. Floor and roof deck welding.
 - 2.3. Welded studs when used for structural diaphragm.
 - 2.4. Welded sheet steel for cold-formed steel ~~light frame construction~~ members.
 - 2.5. Welding of stairs and railing systems.

1704.3.1.1 Cold-formed steel. Welding inspection and welding inspector qualification for cold-formed steel, ~~including metal floor and roof decks,~~ shall be in accordance with AWS D1.3.

Committee Reason: This code change makes an important clarification for cold-formed steel. AWS D 1.3 is the appropriate reference standard for welding of cold formed steel. The modification is an editorial correction to make the scope of the reference clearer and consistent with the current extent of special inspections.

Assembly Action:

None

Final Hearing Results

S110-07/08

AM

Code Change No: **S111-07/08**

Original Proposal

Sections: 1704.3.1, 1704.3.1.1 (New), 1704.3.3

Proponent: Bonnie Manley, American Iron and Steel Institute, representing American Institute of Steel Construction

Revise as follows:

1704.3.1 Welding. Welding inspection ~~shall be in compliance with AWS D1.1. The basis for~~ and welding inspector qualification shall be in accordance with this section ~~AWS D1.1.~~

1704.3.1.1 Structural steel. Welding inspection and welding inspector qualification for structural steel shall be in accordance with AWS D1.1.

1704.3.3 High-strength bolts. Installation of high-strength bolts shall be ~~periodically~~ inspected in accordance with AISC specifications 360.

Reason: IBC Section 1704.3.1 on welding currently only references AWS D1.1, which specifically applies to structural steel members. This change clarifies the code.

The modification to Section 1704.3.3 is intended to correct and clarify the code. The term 'periodically' is recommended for deletion because 1704.3.3.3 requires continuous inspection for the two methods of installation. Also, the appropriate reference document for this section is AISC 360, Specification for Structural Steel Buildings.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal by adding new item as follows:

1704.3.1.3 Reinforcing steel. Welding inspection and welding inspector qualification for reinforcing steel shall be in accordance with AWS D1.4 and ACI 318.

(Portions of proposal not shown remain unchanged)

Committee Reason: This code change clarifies the applicable reference standard for welding and bolting of structural steel. The modification adds a new section to provide appropriate guidance on welding inspections for reinforcing steel.

Assembly Action:

None

Final Hearing Results

S111-07/08

AM

Code Change No: **S112-07/08**

Original Proposal

Table 1704.3

Proponent: Bonnie Manley, American Iron and Steel Institute, representing American Institute of Steel Construction

Revise table as follows:

TABLE 1704.3

REQUIRED VERIFICATION AND INSPECTION OF STEEL CONSTRUCTION

b. Reinforcing steel:				
1) Verification of weldability of	—	X	AWS D1.4 ACI 318; 3.5.2 AWS D1.4 or ACI 318:	—

VERIFICATION AND INSPECTION	CONTINUOUS	PERIODIC	REFERENCED STANDARD ^a	IBC REFERENCE
reinforcing steel other than ASTM A706			Section 3.5.2	
2) Reinforcing steel-resisting flexural and axial forces in intermediate and special moment frames, and boundary elements of special reinforced concrete shear walls and shear reinforcement.	X	—		
3) Shear reinforcement.	X	—		
4) Other reinforcing steel	—	X		
6. Inspection of steel frame joint details for compliance with approved construction documents:		X		1704.3.2
a. Details such as bracing and stiffening.	—	— X	—	1704.3.2
b. Member locations.	—	— X		
c. Application of joint details at each connection.	—	X		

For SI: 1 inch = 25.4 mm.

a. Where applicable, see also Section 1707.1, Special inspection for seismic resistance.

Reason: Modifications to Item #1: The modification in Item #1a clarifies the relationship between the referenced standards and rearranges them for better flow.

Modifications to Item #2a: This modification corrects the terminology from 'bearing-type connections' to 'snug-tight joints.'

Modifications to Item #2b and the addition of Item #2c: These modifications update the terminology used and distinguish between snug tight joints, and pretensioned and slip-critical joints using matchmarked turn-of-nut, twist-off bolt, or direct tension indicator methods of installation, which require periodic inspection in the text of 1704.3.3.2, and pretensioned and slip-critical joints using non-matchmarked turn-of-nut or calibrated wrench methods of installation, which require continuous inspection in 1704.3.3.3

Modifications to Item #3: The modification to Item #3 clarifies the application of this item and eliminates potential confusion with the use of the existing term "structural steel member," which includes only rolled steel structural shapes. Also, reference to the specific ASTM standards has been changed to the more generalized "applicable ASTM material standards" to match the verbiage in Table 1704, Item #1. Additionally, the modifications to Items #3a, 3b and 3c clarify that periodic inspection is required. AISC 360 and the applicable ASTM standards do not necessarily address the frequency of inspection of material identification using the terms "periodic" or "continuous". Instead, the proposal to do material identification on a periodic basis brings it into agreement with bolt material inspection (Items #1a and 1b) and rebar weldability (Item #5b1), also in Table 1704.4 Items #1 and 4, Table 1704.5.1 Item #1a, and Table 1704.5.3 Item #1a. Finally, the reference to Section 1708.4 is not appropriate and has been deleted.

Modifications to Item #4: The modifications to Items #4a and 4b clarify that periodic inspection is required. AISC 360 and the AWS A5 documents do not necessarily address the frequency of inspection of material identification using the terms "periodic" or "continuous". Instead, the proposal to do material identification on a periodic basis brings it into agreement with bolt material inspection (Items #1a and 1b) and rebar weldability (Item #5b1), also in Table 1704.4 Items #1 and 4, Table 1704.5.1 Item #1a, and Table 1704.5.3 Item #1a.

Modification to Item #5a and #5a(1): These modifications correct the terminology.

Addition of new Item #5a(4): The current table is missing an entry for plug and slot welds. The plug and slot weld provision is proposed to be included as continuous because it is not specifically listed as qualifying for periodic inspection in 1704.3.2.

Modification to Item #5b: This change is editorial. In keeping with the style of the table, the applicable referenced standards for Items #5b(1) and 5b (2) have been relocated to the cell below, which has been merged between #5b(1) and 5b (2). In addition, the relationship between the two referenced standards has been clarified.

Modification to Item #6: This change is editorial. In keeping with the style of the table, the IBC reference for Items #6 has been relocated to the cell below, which has been merged between #6a, 6b, and 6c.

Modifications to Item #6a, b, and c: The modifications to Items #6a, 6b and 6c clarify that periodic inspection is required by the IBC reference, Section 1704.3.2.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

Modify proposal as follows:

TABLE 1704.3 REQUIRED VERIFICATION AND INSPECTION OF STEEL CONSTRUCTION				
VERIFICATION AND INSPECTION	CONTINUOUS	PERIODIC	REFERENCED STANDARD ^a	IBC REFERENCE
1. Material verification of high-strength bolts, nuts and washers:				
a. Identification markings to conform to ASTM standards specified in the approved construction documents.	—	X	AISC 360, Section A3.3 and applicable ASTM material standards	—
b. Manufacturer's certificate of compliance required	—	X	—	—
2. Inspection of high-strength bolting:				
a. Snug-tight joints.	—	X		
b. Pretensioned and slip-critical joints using turn-of-nut with matchmarking, twist-off bolt, or direct tension indicator methods of installation.	—	X	AISC 360, Section M2.5	1704.3.3
c. Pretensioned and slip-critical joints using turn-of-nut without matchmarking or calibrated wrench methods of installation.	X	—		
3. Material verification of <u>structural steel and cold-formed steel deck</u> :				
a. For structural steel, identification markings to conform to AISC 360	—	X	AISC 360, Section M5.5	
b. For other steel, identification markings to conform to ASTM standards specified in the approved construction documents.	—	X	Applicable ASTM material standards	
c. Manufacturer's certified mill test reports.	—	X		
4. Material verification of weld filler materials:				
a. Identification markings to conform to AWS specification in the approved construction documents.	—	X	AISC 360, Section A3.5 and Applicable AWS A5 documents	—
b. Manufacturer's certificate of compliance required.	—	X	—	—
5. Inspection of welding:				
a. <u>Structural steel and cold-formed steel deck</u> :				
1) Complete and partial joint penetration groove welds.	X	—	AWS D1.1	1704.3.1
2) Multipass fillet welds	X	—		
3) Single-pass fillet welds > 5/16"	X	—		
4) Plug and slot welds	X	—		
5) Single-pass fillet welds ≤ 5/16"	—	X		
6) Floor and roof deck welds.	—	X	AWS D1.3	
b. Reinforcing steel:				
1) Verification of weldability of reinforcing steel other than ASTM A706	—	X	AWS D1.4 or ACI 318: Section 3.5.2	—
2) Reinforcing steel-resisting flexural and axial forces in intermediate and special moment frames, and boundary elements of special reinforced concrete shear walls and shear reinforcement.	X	—		
3) Shear reinforcement.	X	—		
4) Other reinforcing steel	—	X		
6. Inspection of steel frame joint details for compliance with approved construction documents:				
a. Details such as bracing and stiffening.	—	X	—	1704.3.2
b. Member locations.	—	X		
c. Application of joint details at each connection.	—	X		

Committee Reason: This proposal revises the table for inspection of steel construction to include appropriate nomenclature, making the table more user friendly. Requirements for slip-critical bolts are made clearer. The modification provides clarification that limits the inspection of cold-formed steel to floor and roof decks.

Assembly Action:

None

Final Hearing Results

S112-07/08

AM

Code Change No: S115-07/08

Original Proposal

Sections: 1704.3.4 (New), 1704.6.2 (New)

Proponent: Edwin Huston, National Council of Structural Engineers Association (NCSEA), representing NCSEA Code Advisory Committee – General Engineering Subcommittee

Add new text as follows:

1704.3.4 Cold-formed steel trusses spanning 60 feet or greater. Where a cold formed steel truss clear span is 60 feet (18288mm) or greater, the special inspector shall verify that the temporary installation restraint/bracing and the permanent individual truss member restraint/bracing are installed in accordance with the approved truss submittal package.

1704.6.2 Metal-plate connected wood trusses spanning 60 feet or greater. Where a truss clear span is 60 feet (18288 mm) or greater, the special inspector shall verify that the temporary installation restraint/bracing and the permanent individual truss member restraint/bracing are installed in accordance with the approved permit drawings.

Reason: This language is needed in order coordinate with Section 2210.3 (Cold Formed Steel Trusses) and Section 2303.4. (Wood Trusses) for criteria needed for long span truss conditions.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1704.3.4 Cold-formed steel trusses spanning 60 feet or greater. Where a cold formed steel truss clear span is 60 feet (18288mm) or greater, the special inspector shall verify that the temporary installation restraint/bracing and the permanent individual truss member restraint/bracing are installed in accordance with the approved truss submittal package.

1704.6.2 Metal-plate connected wood trusses spanning 60 feet or greater. Where a truss clear span is 60 feet (18288 mm) or greater, the special inspector shall verify that the temporary installation restraint/bracing and the permanent individual truss member restraint/bracing are installed in accordance with the approved ~~permit drawings~~ truss submittal package.

Committee Reason: This proposal adds special inspections for long span trusses that should be spelled out in the code. The modification makes an editorial change under the section for wood trusses to make the wording consistent with other code sections.

Assembly Action:

None

Final Hearing Results

S115-07/08

AM

Code Change No: **S117-07/08**

Original Proposal

Table 1704.4, Section 1912.2 (New)

Proponent: Randall Shackelford, P.E., Simpson Strong-Tie, Co., Inc. representing himself

1. Revise table as follows:

**TABLE 1704.4
REQUIRED VERIFICATION AND INSPECTION OF CONCRETE CONSTRUCTION**

VERIFICATION AND INSPECTION	CONTINUOUS	PERIODIC	REFERENCED STANDARD ^a	IBC REFERENCE
3. <u>Where allowable loads have been increased or design strengths have not been decreased, inspect headed bolts, headed studs, and hooked bolts to be installed in concrete prior to and during placement of concrete where allowable loads have been increased and inspect expansion and undercut anchors during installation in hardened concrete.</u>	X	—	<u>ACI 318: Appendix D</u>	1911.5, 1912.2

(Portions of table not shown remain unchanged)

2. Add new text as follows:

1912.2 Strength reduction for no special inspection. Where special inspection is not provided for the installation of anchors designed in accordance with this section, a 50-percent decrease in the tension design strength shall be taken. No decrease in shear design strength is required.

Reason: The purposes of the proposed code changes are to:

- 1) Utilize consistent language when referring to anchors, bolts, studs, etc between Table 1704.4 and IBC Sections 1911.1 and 1912.1.
- 2) Clarify that design strengths calculated under IBC Section 1912 presume that special inspection is provided.
- 3) Allow the design professional to eliminate the special inspection requirement provided that the design tension strengths calculated under IBC Section 1912 are decreased by 50 percent.

Justification (Reference the numbers above):

- 1) Use of inconsistent names for anchors between the code sections causes confusion and can lead users of the code to believe that some types of cast-in-place and post-installed anchors require special inspection while other types do not. The intent of the code is that the requirements for special inspection apply uniformly to all types of cast in place anchors and post-installed anchors, regardless of name.
- 2) The design strengths calculated under IBC Section 1912 (i.e. ACI 318 Appendix D) are based on the 5% fracture strengths of cast-in-place and post-installed anchors in concrete from research, theory, and testing. Unlike anchors in IBC Section 1911, no reductions have been pre-applied to the design strengths calculated in accordance with ACI 318 Appendix D to account for the removal of special inspection.
- 3) IBC Section 1911.5 allows design professionals the option of requiring or not requiring special inspection for anchors. If special inspection is not provided, the allowable tension load for anchors designed under Section 1911 is effectively reduced by 50 percent. The proposal permits design professionals to similarly eliminate the requirement for special inspection for anchors designed under Section 1912 by reducing design strength by 50 percent.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: With the testimony on this proposal as well as S116-07/08, it was obvious that there are unresolved issues and no consensus on just how to incorporate the needed inspections of concrete anchors at this time. The addition of special inspections for drilled-in anchors has merit, but the requirements are not yet clear enough.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

John Silva, Hilti North America, representing himself, requests Approval as Modified by this public comment.

Modify proposal as follows:

**TABLE 1704.4
REQUIRED VERIFICATION AND INSPECTION OF CONCRETE CONSTRUCTION**

VERIFICATION AND INSPECTION	CONTINUOUS	PERIODIC	REFERENCED STANDARDS	IBC REFERENCE
3. Where allowable loads have been increased or design strengths have not been decreased, inspection of headed bolts, headed studs, and hooked bolts to be installed in concrete prior to and during placement of concrete where allowable loads have been increased and inspect expansion and undercut anchors during installation in hardened concrete, or where strength design is used.	X	–	ACI 318 8.1.3, 21.2.8 Appendix D	1911.5, 1912.1 4912.2
4. Inspection of anchors installed in hardened concrete		X	ACI 318: 3.8.6, 8.1.3, 21.2.8	1912.1

(Portions of table not shown remain unchanged)

~~**1912.2 Strength reduction for no special inspection.** Where special inspection is not provided for the installation of anchors designed in accordance with this section, a 50-percent decrease in the tension design strength shall be taken. No decrease in shear design strength is required.~~

Commenter's Reason: Currently, Table 1704.4 does not require special inspection for the following cases:

- Bolts designed in accordance with the strength design procedures of ACI 318 Appendix D;
- Anchors installed in hardened concrete (e.g., expansion and undercut anchors); and
- All bolts and anchors designed to resist seismic loads.

While the ICC-ES Evaluation Service currently issues Evaluation Service Reports for expansion and undercut anchors with the requirement that continuous special inspection be provided in all cases, this is not explicitly supported by the code. The ICC-ES position is based on the global safety factor associated with anchor designs under Appendix D and on Section 1704.13; note however, that Section 1704.13 does not specify the type of special inspection, periodic or continuous, that is required. The imposition of continuous special inspection has created hardship for projects involving the installation of large numbers of anchors, whereby the simultaneous inspection of all installations is impractical and unwarranted. The omission of inspection requirements in Table 1704.4 for bolts designed in accordance with Appendix D (and, therefore, for all bolts and anchors designed to resist seismic loads) is simply in error.

S117-07/08 attempted to redress this situation by restoring the inspection requirements traditionally associated with the use of post-installed anchors under the allowable stress design rules (i.e., no special inspection for 50% tension resistance). This approach was rejected by the committee.

The proposal provided in this public comment adds "anchors installed in hardened concrete" as a new line item in Table 1704.4 and simultaneously clarifies the inspection requirements for CIP bolts ("bolts to be installed in concrete prior to and during placement of concrete") by adding "or where strength design is used" with the appropriate standard and section references. The inspection requirement for anchors installed in hardened concrete is given as "periodic". This reflects the usual manner in which anchor installations are treated in the inspection process and is also in conformance with Sections 1707.6, 1707.7 and 1707.8 for inspection of anchorage of architectural and mechanical components where seismic resistance is required.

This proposal is endorsed by the Concrete Anchor Manufacturers' Association and by the Rack Manufacturers Institute.

Final Hearing Results

S117-07/08

AMPC

Code Change No: S118-07/08

Original Proposal

Sections: 1704.5, Table 1704.5.1, Table 1704.5.3, 1708.1 through Table 1708.1.4

Proponent: Jason Thompson, Concrete Masonry Association, representing Masonry Alliance for Codes and Standards

1. Revise as follows:

1704.5 Masonry construction. Masonry construction shall be inspected and ~~evaluated~~ verified in accordance with the requirements of Sections 1704.5.1 through 1704.5.3, depending on the classification of the building or structure or nature of the occupancy, as defined by this code.

Exception: Special inspections shall not be required for:

1. Empirically designed masonry, glass unit masonry or masonry veneer designed by Section 2109, 2110 or Chapter 14, respectively, or by Chapter 5, 7 or 6 of ACI 530/ASCE 5/TMS 402, respectively, when they are part of structures classified as Occupancy Category I, II or III in accordance with Section 1604.5.
2. Masonry foundation walls constructed in accordance with Table 1805.5(1), 1805.5(2), 1805.5(3) or 1805.5(4).
3. Masonry fireplaces, masonry heaters or masonry chimneys installed or constructed in accordance with Section 2111, 2112 or 2113, respectively.

For SI: °C = (°F - 32)/1.8.

a. The specific standards referenced are those listed in Chapter 35.

2. Delete without substitution as follows:

1708.1 (Supp) Special inspections for wind requirements. Special inspections itemized in Sections 1708.2 through 1708.4, unless exempted by the exceptions to Section 1704.1, are required for buildings and structures constructed in the following areas:

1. In wind Exposure Category B, where the 3-second-gust basic wind speed is 120 miles per hour (52.8 m/se) or greater.
2. In wind Exposure Categories C or D, where the 3-second-gust basic wind speed is 110 mph (49 m/se) or greater.

1708.1.1 Empirically designed masonry and glass unit masonry in Occupancy Category I, II or III. For masonry designed by Section 2109 or 2110 or by Chapter 5 or 7 of ACI 530/ASCE 5/TMS 402 in structures classified as Occupancy Category I, II or III, in accordance with Section 1604.5, certificates of compliance used in masonry construction shall be verified prior to construction.

1708.1.2 Empirically designed masonry and glass unit masonry in Occupancy Category IV. The minimum testing and verification prior to construction for masonry designed by Section 2109 or 2110 or by Chapter 5 or 7 of ACI 530/ASCE 5/TMS 402 in structures classified as Occupancy Category IV, in accordance with Section 1604.5, shall comply with the requirements of Table 1708.1.2.

**TABLE 1708.1.2
LEVEL 1 QUALITY ASSURANCE
MINIMUM TESTS AND SUBMITTALS**

Certificates of compliance used in masonry construction.

Verification of f_m and f_{AAC} prior to construction, except where specifically exempted by this code.

1708.1.3 Engineered masonry in Occupancy Category I, II or III. The minimum testing and verification prior to construction for masonry designed by Section 2107 or 2108 or by chapters other than Chapter 5, 6 or 7 of ACI 530/ASCE 5/TMS 402 in structures classified as Occupancy Category I, II or III, in accordance with Section 1604.5, shall comply with Table 1708.1.2.

1708.1.4 Engineered masonry in Occupancy Category IV. The minimum testing and verification prior to construction for masonry designed by Section 2107 or 2108 or by chapters other than Chapter 5, 6 or 7 of ACI 530/ASCE 5/TMS 402 in structures classified as Occupancy Category IV, in accordance with Section 1604.5, shall comply with Table 1708.1.4.

**TABLE 1708.1.4
LEVEL 2 QUALITY ASSURANCE
MINIMUM TESTS AND SUBMITTALS**

Certificates of compliance used in masonry construction.

Verification of f_m and f_{AAC} prior to construction and every 5,000 square feet during construction.

Verification of proportions of materials in mortar and grout as delivered to the site.

(Renumber subsequent sections)

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

Reason: The revisions proposed in this code change reflect editorial and substantive revisions incorporated into the 2008 edition of the Building Code Requirements for Masonry Structures (TMS 402/ACI 530/ASCE 5), commonly referred to as the Masonry Standard Joint Committee (MSJC) Code. This code change proposal is one of several to harmonize the design and construction requirements for masonry within the IBC with those in the reference standard. A complete list of revisions incorporated into the reference standard is available for download at www.masonrystandards.org.

Specific revisions proposed above include:

IBC Section T1704.5.1 and 1704.5.3 have been revised to comply with the changes in the 2008 MSJC and to conform to the format of the tables for steel and concrete. In Section 1708 we are proposing to delete the Seismic Testing Provisions for masonry. 1708 doesn't indicate which SDC's require these tests. As such they are required in any SDC and are routinely performed in all SDC's. This has caused significant confusion to many practitioners who don't know when to require this testing. They think it is only required in zones of moderate or high seismicity. Moving these requirements to T1704.5.1 and 1704.5.3 allows them to be eliminated from 1708 and follows the model of concrete.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Errata: Revise first deleted section under item 2 to read as follows:

~~1708.1 Masonry. Testing and verification of masonry materials and assemblies prior to construction shall comply with the requirements of Sections 1708.1.1 through 1708.1.4, depending on the classification of the building or structure or nature of the occupancy, as defined by this code.~~

Committee Action:

Approved as Modified

Modify proposal as follows:

1704.5 Masonry construction. Masonry construction shall be inspected and verified in accordance with the requirements of Sections 1704.5.1 through 1704.5.3, depending on the classification of the building or structure or nature of the occupancy, as defined by this code.

Exception: Special inspections shall not be required for:

1. Empirically designed masonry, glass unit masonry or masonry veneer designed by Section 2109, 2110 or Chapter 14, respectively, or by Chapter 5, 7 or 6 of ACI 530/ASCE 5/TMS 402, respectively, when they are part of structures classified as Occupancy Category I, II or III in accordance with Section 1604.5.
2. Masonry foundation walls constructed in accordance with Table 1805.5(1), 1805.5(2), 1805.5(3) or 1805.5(4).
3. Masonry fireplaces, masonry heaters or masonry chimneys installed or constructed in accordance with Section 2111, 2112 or 2113, respectively.

**TABLE 1704.5.1
LEVEL 1 REQUIRED VERIFICATION AND INSPECTION OF MASONRY CONSTRUCTION
FREQUENCY OF INSPECTION REFERENCE FOR CRITERIA**

VERIFICATION AND INSPECTION	CONTINUOUS	PERIODIC	IBC SECTION	ACI 530/ASCE 5/TMS 402 ^a	ACI 530.1/ASCE 6/TMS 602 ^a
1. <u>Compliance with required inspection provisions of the construction documents and the approved submittals shall be verified. Verify compliance with the approved submittals</u>	—	X	—	—	Art. 1.5

**TABLE 1704.5.2
LEVEL 2 REQUIRED VERIFICATION AND INSPECTION OF MASONRY CONSTRUCTION**

VERIFICATION AND INSPECTION	CONTINUOUS	PERIODIC	REFERENCE FOR CRITERIA		
			IBC SECTION	TMS 402/ACI 530/ ASCE 5 ^a	TMS 602/ACI 530.1/ ASCE 6 ^a
1. <u>Compliance with required inspection provisions of the construction documents and the approved submittals. Verify compliance with the approved submittals</u>	—	X	—	—	Art. 1.5
5 The following shall be verified to ensure compliance:					
a. Proportions of site-prepared mortar, grout and prestressing grout for bonded tendons.	—	X	—	—	Art. 2.6A

VERIFICATION AND INSPECTION	CONTINUOUS	PERIODIC	REFERENCE FOR CRITERIA		
			IBC SECTION	TMS 402/ACI 530/ASCE 5 ^a	TMS 602/ACI 530.1/ ASCE 6 ^a
b. Placement of masonry units and construction of mortar joints.	—	X	—	—	Art. 3.3B
c. Placement of reinforcement, connectors and prestressing tendons and anchorages.	×	X	—	Sec. 1.13	Art. 3.4, 3.6A

(Portions of proposal not shown do not change)

Committee Reason: This code change brings the IBC requirements for masonry inspections into better alignment with the referenced standards for masonry construction. The modification retains the current requirement for periodic inspection of placement of reinforcement, connectors and prestressing tendons and anchorages. It also makes appropriate wording changes for the purpose of consistency.

Assembly Action:

None

Code Change No: **S121-07/08**

Original Proposal

Sections: 1704.7, 1704.8, 1704.9

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing himself

Revise as follows:

1704.7 (Supp) Soils. Special inspections for existing site soil conditions, fill placement and load-bearing requirements shall be as required by this section and Table 1704.7. The approved soils report, required by Section 1802.2, and the construction documents prepared by the registered design professionals shall be used to determine compliance. During fill placement, the special inspector shall determine that proper materials and procedures are used in accordance with the provisions of the approved soils report, as specified in Section 1803.5.

Exception: Special inspection is not required during placement of controlled fill having a total depth of 12 inches (305 mm) or less.

1704.8 (Supp) Pile foundations. Special inspections shall be performed during installation and testing of pile foundations as required by Table 1704.8. The approved soils report, required by Section 1802.2, and the construction documents prepared by the registered design professionals shall be used to determine compliance.

1704.9 (Supp) Pier foundations. Special inspections shall be performed during installation and testing of pier foundations as required by Table 1704.9. The approved soils report, required by Section 1802.2, and the construction documents prepared by the registered design professionals shall be used to determine compliance.

Reason: The changes are proposed for consistency with the provisions of Section 106.1 on submittal documents and Sections 106.2 and 1603 on construction documents. Please refer to the 2007 IBC Supplement for the current provisions in Sections 106.1 and 106.2, which were revised by Proposal G222-06/07-AM (Part I).

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This is a straightforward change which makes it clear that compliance is based on the construction documents.

Assembly Action:

None

Final Hearing Results

AS

Code Change No: S122-07/08

Original Proposal

Sections: 1704.7, Table 1704.7, 1704.8, Table 1704.8, 1704.9, Table 1704.9, 1704.10, 1707.5, 1803.5

Proponent: Edwin T. Huston, Smith & Huston, Inc., representing the National Council of Structural Engineering Associations

1. Revise as follows:

1704.7 (Supp) Soils. Special inspections for existing site soil conditions, fill placement and load-bearing requirements shall be as required by this section and Table 1704.7. The approved soils geotechnical report, ~~required by Section 1802.2~~, and the documents prepared by the registered design professional shall be used to determine compliance. During fill placement, the special inspector shall determine that proper materials and procedures are used in accordance with the provisions of the approved soils geotechnical report, ~~as specified in Section 1803.5~~.

Exception: ~~Special inspection is not required during placement of controlled fill having a total depth of 12 inches (305 mm) or less. Where Section 1803 does not require reporting of materials and procedures for fill placement, the special inspector shall verify that fill is compacted to a minimum of 90 percent Modified Proctor in accordance with ASTM D 1557.~~

**TABLE 1704.7
REQUIRED VERIFICATION AND INSPECTION OF SOILS**

VERIFICATION AND INSPECTION TASK	CONTINUOUS DURING TASK LISTED	PERIODICALLY DURING TASK LISTED
1. Verify materials below footings <u>shallow foundations</u> are adequate to achieve the design bearing capacity.	—	X
2. Verify excavations are extended to proper depth and have reached proper material.	—	X
3. Perform classification and testing of controlled <u>compacted fill</u> materials.	—	X
4. Verify use of proper materials, densities and lift thicknesses during placement and compaction of controlled <u>compacted fill</u> .	X	—
5. Prior to placement of controlled <u>compacted fill</u> , observe subgrade and verify that site has been prepared properly.	—	X

1704.8 (Supp) Pile Driven deep foundations. Special inspections shall be performed during installation and testing of pile driven deep foundations elements as required by Table 1704.8. The approved ~~soils~~ geotechnical report, ~~required by Section 1802.2,~~ and the documents prepared by the registered design professional shall be used to determine compliance.

**TABLE 1704.8
REQUIRED VERIFICATION AND INSPECTION OF PILE DRIVEN DEEP FOUNDATION ELEMENTS**

VERIFICATION AND INSPECTION TASK	CONTINUOUS DURING TASK LISTED	PERIODICALLY DURING TASK LISTED
1. Verify <u>pile element</u> materials, sizes and lengths comply with the requirements.	X	—
2. Determine capacities of test <u>piles elements</u> and conduct additional load tests, as required.	X	—
3. Observe driving operations and maintain complete and accurate records for each <u>pile element</u> .	X	—
4. Verify placement locations and plumbness, confirm type and size of hammer, record number of blows per foot of penetration, determine required penetrations to achieve design capacity, record tip and butt elevations and document any <u>pile damage to foundation elements</u> .	X	—
5. For steel <u>piles elements</u> , perform additional inspections in accordance with Section 1704.3.	—	—
6. For concrete <u>piles elements</u> and concrete-filled <u>piles elements</u> , perform additional inspections in accordance with Section 1704.4.	—	—
7. For specialty <u>piles elements</u> , perform additional inspections as determined by the registered design professional in responsible charge.	—	—
8. For augered uncased piles and caisson piles, perform inspections in accordance with Section 1704.9.	—	—

1704.9 (Supp) Pier Cast-in-place deep foundations. Special inspections shall be performed during installation and testing of pier cast-in-place deep foundations elements as required by Table 1704.9. The approved ~~soils~~ geotechnical report, ~~required by Section 1802.2,~~ and the documents prepared by the registered design professional shall be used to determine compliance.

**TABLE 1704.9
REQUIRED VERIFICATION AND INSPECTION OF PIER CAST-IN-PLACE DEEP FOUNDATION ELEMENTS**

VERIFICATION AND INSPECTION TASK	CONTINUOUS DURING TASK LISTED	PERIODICALLY DURING TASK LISTED
1. Observe drilling operations and maintain complete and accurate records for each <u>element pier</u> .	X	—
2. Verify placement locations and plumbness, confirm <u>element pier</u> diameters, bell diameters (if applicable), lengths, embedment into bedrock (if applicable) and adequate end bearing strata capacity.	X	—
3. For concrete <u>elements piers</u> , perform additional inspections in accordance with Section 1704.4.	—	—
4. For masonry piers, perform additional inspections in accordance with Section 1704.5.	—	—

1704.10 Vertical masonry foundation elements. ~~Special inspection shall be performed in accordance with Section 1704.5 for vertical masonry foundation elements.~~

(Renumber subsequent sections)

2. Delete without substitution:

~~**1707.5 Pier foundations.** Special inspection is required for pier foundations for buildings assigned to Seismic Design Category C, D, E or F in accordance with Section 1613. Periodic special inspection is required during placement of reinforcement and continuous special inspection is required during placement of the concrete.~~

3. Revise as follows:

1803.5 Compacted fill material. Where footings will bear on compacted fill material, the compacted fill shall comply with the provisions of an approved report, which shall contain the following:

1. Specifications for the preparation of the site prior to placement of compacted fill material.
2. Specifications for material to be used as compacted fill.
3. Test method to be used to determine the maximum dry density and optimum moisture content of the material to be used as compacted fill.
4. Maximum allowable thickness of each lift of compacted fill material.
5. Field test method for determining the in-place dry density of the compacted fill.
6. Minimum acceptable in-place dry density expressed as a percentage of the maximum dry density determined in accordance with Item 3.
7. Number and frequency of field tests required to determine compliance with Item 6.

Exception: ~~Compacted fill material less than 12 inches (305 mm) in depth or less~~ need not comply with an approved report, provided it has been compacted to a minimum of 90 percent Modified Proctor in accordance with ASTM D 1557. The compaction shall be verified by ~~a qualified inspector approved by the building official~~ special inspection in accordance with Section 1704.7.

Reason: Code clarification and update.

Removes conflict between Section 1704.7 (no special inspection) and Section 1803.5 (special inspection required). Corrects “controlled” as “compacted” in Table 1704.7.

Removes Section 1707.5, which is unnecessary. Section 1704.9 sets forth special inspection requirements for piers. Item 3 in Table 1704.9 requires compliance with Section 1704.4. For ALL seismic design categories Table 1704.4 requires periodic special inspection of reinforcement and continuous special inspection of concrete placement.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Errata: Revise Exception to Section 1803.5 as follows:

Exception: ~~Compacted fill material less than 12 inches (305 mm) in depth or less~~ need not comply with an approved report, provided it has been compacted to a minimum of 90 percent Modified Proctor in accordance with ASTM D 1557. The compaction shall be verified by ~~a qualified inspector approved by the building official~~ special inspection in accordance with Section 1704.7.

Committee Action:

Approved as Modified

Modify proposal as follows:

1704.7 (Supp) Soils. Special inspections for existing site soil conditions, fill placement and load-bearing requirements shall be as required by this section and Table 1704.7. The approved geotechnical report, and the documents prepared by the registered design professional shall be used to determine compliance. During fill placement, the special inspector shall determine that proper materials and procedures are used in accordance with the provisions of the approved geotechnical report.

Exception: Where Section 1803 does not require reporting of materials and procedures for fill placement, the special inspector shall verify that the in-place dry density of the compacted fill is compacted to a minimum of not less than 90 percent of the maximum dry density at optimum moisture content determined Modified Proctor in accordance with ASTM D 1557.

1803.5 Compacted fill material. Where footings will bear on compacted fill material, the compacted fill shall comply with the provisions of an approved report, which shall contain the following:

1. Specifications for the preparation of the site prior to placement of compacted fill material.
2. Specifications for material to be used as compacted fill.
3. Test method to be used to determine the maximum dry density and optimum moisture content of the material to be used as compacted fill.
4. Maximum allowable thickness of each lift of compacted fill material.

5. Field test method for determining the in-place dry density of the compacted fill.
6. Minimum acceptable in-place dry density expressed as a percentage of the maximum dry density determined in accordance with Item 3.
7. Number and frequency of field tests required to determine compliance with Item 6.

Exception: Compacted fill material 12 inches (305 mm) in depth or less need not comply with an approved report, provided the in-place dry density is not less than it has been compacted to a minimum of 90 percent of the maximum dry density at optimum moisture content Modified Proctor in accordance with ASTM D 1557. The compaction shall be verified special inspection in accordance with Section 1704.7.

(Portions of proposal not shown remain unchanged)

Committee Reason: This proposal clarifies the requirements for special inspections of soil and fill. The modification rewords the exceptions for consistency with ASTM D 1557.

Assembly Action:

None

Final Hearing Results

S122-07/08

AM

Code Change No: **S123-07/08**

Original Proposal

Table 1704.9

Proponent: Edwin T. Huston, Smith & Huston, Inc., representing National Council of Structural Engineering Associations

Revise table as follows:

**TABLE 1704.9
REQUIRED VERIFICATION AND INSPECTION OF PIER FOUNDATIONS**

VERIFICATION AND INSPECTION TASK	CONTINUOUS DURING TASK LISTED	PERIODICALLY DURING TASK LISTED
1. Observe drilling operations and maintain complete and accurate records for each pier.	X	—
2. Verify placement locations and plumbness, confirm pier diameters, bell diameters (if applicable), lengths, embedment into bedrock (if applicable) and adequate end bearing strata capacity. <u>Record concrete or grout volumes.</u>	X	—
3. For concrete piers, perform additional inspections in accordance with Section 1704.4.	—	—
4. For masonry piers, perform additional inspections in accordance with Section 1704.5.	—	—

Reason: Code update. Adds an item to the required special inspections for piers to reflect typical practice. Continuous special inspection is already required during placement of concrete (Table 1704.4, item 6). Recorded volumes of concrete or grout placed are often the first indicator of potentially significant problems with the construction.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: Recording concrete volume is a critical diagnostic tool. Adding it to the required special inspections for piers is consistent with current practice.

Assembly Action:

None

Final Hearing Results

S123-07/08

AS

Code Change No: **S125-07/08**

Original Proposal

Sections: 1705.3, 1707.1, 1708.2

Proponent: Bonnie Manley, American Iron and Steel Institute, representing American Institute of Steel Construction

1. Revise as follows:

1705.3 (Supp) Seismic resistance. The statement of special inspections shall include seismic requirements for the following cases:

1. The seismic-force-resisting systems in structures assigned to Seismic Design Category C, D, E or F, in accordance with Section 1613.
2. Designated seismic systems in structures assigned to Seismic Design Category D, E or F.
3. The following additional systems and components in structures assigned to Seismic Design Category C:
 - 3.1. Heating, ventilating and air-conditioning (HVAC) ductwork containing hazardous materials and anchorage of such ductwork.
 - 3.2. Piping systems and mechanical units containing flammable, combustible or highly toxic materials.
 - 3.3. Anchorage of electrical equipment used for emergency or standby power systems.
4. The following additional systems and components in structures assigned to Seismic Design Category D:
 - 4.1. Systems required for Seismic Design Category C.
 - 4.2. Exterior wall panels and their anchorage.
 - 4.3. Suspended ceiling systems and their anchorage.
 - 4.4. Access floors and their anchorage.
 - 4.5. Steel storage racks and their anchorage, where the importance factor is equal to 1.5 in accordance with Section 15.5.3 of ASCE 7.
5. The following additional systems and components in structures assigned to Seismic Design Category E or F:
 - 5.1. Systems required for Seismic Design Categories C and D.
 - 5.2. Electrical equipment.

Exception: Seismic requirements are permitted to be excluded from the statement of special inspections for structures designed and constructed in accordance with the following:

1. The structure consists of light-frame construction; the design spectral response acceleration at short periods, S_{DS} , is determined in Section 1613.5.4, does not exceed 0.5g; and the height of the structure does not exceed 35 feet (10 668 mm) above grade plane; or
2. The structure is constructed using a reinforced masonry structural system or reinforced concrete structural system; the design spectral response acceleration at short periods, S_{DS} , as determined in Section 1613.5.4, does not exceed 0.5g, and the height of the structure does not exceed 25 feet (7620 mm) above grade plane; or
3. Detached one- or two-family dwellings not exceeding two stories above grade plane, provided the structure does not have any of the following plan or vertical irregularities in accordance with Section 12.3.2 of ASCE 7:
 - 3.1. Torsional irregularity.
 - 3.2. Nonparallel systems.
 - 3.3. Stiffness irregularity extreme soft story and soft story.
 - 3.4. Discontinuity in capacity weak story.
4. Steel systems in structures that are assigned to Seismic Design Category C that are not specifically detailed for seismic resistance, with a response modification coefficient, R, of 3 or less, excluding cantilever column systems.

1707.1 Special inspections for seismic resistance. Special inspections itemized in Sections 1707.2 through 1707.10, unless exempted by the exceptions of Section 1704.1 or 1705.3, are required for the following:

1. The seismic-force-resisting systems in structures assigned to Seismic Design Category C, D, E or F, as determined in Section 1613.
2. Designated seismic systems in structures assigned to Seismic Design Category D, E or F.
3. Architectural, mechanical and electrical components in structures assigned to Seismic Design Category C, D, E or F that are required in Sections 1707.7 and 1707.8.

1708.2 (Supp) Testing and qualification for seismic resistance. The testing and qualification specified in Sections 1708.3 through 1708.6, unless exempted from special inspections by the exceptions of Section 1704.1 and 1705.3, are required as follows:

1. The seismic-force-resisting systems in structures assigned to Seismic Design Category C, D, E or F, as determined in Section 1613 shall meet the requirements of Sections 1708.3 and 1708.4, as applicable.
2. Designated seismic systems in structures assigned to Seismic Design Category D, E or F in Section 13.2.2 of ASCE 7 shall meet the requirements of Section 1708.5.
3. Architectural, mechanical and electrical components in structures assigned to Seismic Design Category C, D, E or F with an $I_p = 1.0$ shall be permitted to be seismically qualified by meeting the requirements of Section 1708.5.
4. The seismic isolation system in seismically isolated structures shall meet the testing requirements of Section 1708.6.

Reason: In Sections 1705.3, 1707.1 and 1708.2, a general reference to SDC C is included for seismic force resisting systems in order to recognize that many structural systems require special detailing because of their seismic response characteristics. However, this general requirement does not reflect the unique response characteristics of some steel buildings. ASCE 7-05, Table 12.2-1 assigns steel building structures a response modification coefficient of $R = 3$, if they are built in SDC A, B or C as a “steel system not specifically detailed for seismic resistance, excluding cantilever column systems.” For these building systems, the assigned seismic response coefficient reflects their inherent ductility. As a consequence, these structures are permitted to be constructed using only AISC 360 (that is, not detailed in accordance with the additional provisions of AISC 341). As these construction details and connections are the same as would be used in typical steel buildings following AISC 360, no additional inspection or testing should be required beyond that applied to typical steel buildings. The modifications to IBC Sections 1705.3, 1707.1 and 1708.2 reflect this concept.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1705.3 (Supp) Seismic resistance. The statement of special inspections shall include seismic requirements for the following cases:

1. The seismic-force-resisting systems in structures assigned to Seismic Design Category C, D, E or F, in accordance with Section 1613.

Exception: Requirements for the seismic-force resisting system are permitted to be excluded from the statement of special inspections for steel systems in structures assigned to Seismic Design Category C that are not specifically detailed for seismic resistance, with a response modification coefficient, R , of 3 or less, excluding cantilever column systems.

2. Designated seismic systems in structures assigned to Seismic Design Category D, E or F.
3. The following additional systems and components in structures assigned to Seismic Design Category C:
 - 3.1. Heating, ventilating and air-conditioning (HVAC) ductwork containing hazardous materials and anchorage of such ductwork.
 - 3.2. Piping systems and mechanical units containing flammable, combustible or highly toxic materials.
 - 3.3. Anchorage of electrical equipment used for emergency or standby power systems.
4. The following additional systems and components in structures assigned to Seismic Design Category D:
 - 4.1. Systems required for Seismic Design Category C.
 - 4.2. Exterior wall panels and their anchorage.
 - 4.3. Suspended ceiling systems and their anchorage.
 - 4.4. Access floors and their anchorage.
 - 4.5. Steel storage racks and their anchorage, where the importance factor is equal to 1.5 in accordance with Section 15.5.3 of ASCE 7.
5. The following additional systems and components in structures assigned to Seismic Design Category E or F:
 - 5.1. Systems required for Seismic Design Categories C and D.
 - 5.2. Electrical equipment.

Exception: Seismic requirements are permitted to be excluded from the statement of special inspections for structures designed and constructed in accordance with the following:

1. The structure consists of light-frame construction; the design spectral response acceleration at short periods, $S_p S$, is determined in Section 1613.5.4, does not exceed 0.5g; and the height of the structure does not exceed 35 feet (10 668 mm) above grade plane; or

2. The structure is constructed using a reinforced masonry structural system or reinforced concrete structural system; the design spectral response acceleration at short periods, S_{DS} , as determined in Section 1613.5.4, does not exceed 0.5g, and the height of the structure does not exceed 25 feet (7620 mm) above grade plane; or
3. Detached one- or two-family dwellings not exceeding two stories above grade plane, provided the structure does not have any of the following plan or vertical irregularities in accordance with Section 12.3.2 of ASCE 7:
 - 3.1. Torsional irregularity.
 - 3.2. Nonparallel systems.
 - 3.3. Stiffness irregularity extreme soft story and soft story.
 - 3.4. Discontinuity in capacity weak story.
4. ~~Steel systems in structures that are assigned to Seismic Design Category C that are not specifically detailed for seismic resistance, with a response modification coefficient, R , of 3 or less, excluding cantilever column systems.~~

(Portions of proposal not shown remain unchanged)

Committee Reason: The committee agrees that the new exception is consistent with the intent of the current code and differentiates between designs under AISC 360 versus AISC 341. The modification puts the exception in a more appropriate location.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

David P. Tyree, American Forest and Paper Association, requests Approval as Modified by this Public Comment.

Further modify proposal as follows:

1705.3 Seismic resistance. The statement of special inspections shall include seismic requirements for ~~the following cases:~~ cases covered in Sections 1705.3.1 through 1705.3.5.

Exception: Seismic requirements are permitted to be excluded from the statement of special inspections for structures designed and constructed in accordance with the following:

1. The structure consists of light-frame construction; the design spectral response acceleration at short periods, S_{DS} , as determined in Section 1613.5.4, does not exceed 0.5g; and the height of the structure does not exceed 35 feet (10 668 mm) above grade plane; or
2. The structure is constructed using a reinforced masonry structural system or reinforced concrete structural system; the design spectral response acceleration at short periods, S_{DS} , as determined in Section 1613.5.4, does not exceed 0.5g, and the height of the structure does not exceed 25 feet (7620 mm) above grade plane; or
3. Detached one- or two-family dwellings not exceeding two stories above grade plane, provided the structure does not have any of the following plan or vertical irregularities in accordance with Section 12.3.2 of ASCE 7:
 - 3.1. Torsional irregularity.
 - 3.2. Nonparallel systems.
 - 3.3. Stiffness irregularity-extreme soft story and soft story.
 - 3.4. Discontinuity in capacity-weak story.

~~1705.3.1~~ 4. The seismic-force-resisting systems in structures assigned to Seismic Design Category C, D, E or F, in accordance with Section 1613.

Exception: Requirements for the seismic-force resisting system are permitted to be excluded from the statement of special inspections for steel systems in structures assigned to Seismic Design Category C that are not specifically detailed for seismic resistance, with a response modification coefficient, R , of 3 or less, excluding cantilever column systems.

~~1705.3.2~~ 2. Designated seismic systems in structures assigned to Seismic Design Category D, E or F.

~~1705.3.3~~ 3. The following additional systems and components in structures assigned to Seismic Design Category C:

- 3.1. Heating, ventilating and air-conditioning (HVAC) ductwork containing hazardous materials and anchorage of such ductwork.
- 3.2. Piping systems and mechanical units containing flammable, combustible or highly toxic materials.
- 3.3. Anchorage of electrical equipment used for emergency or standby power systems.

~~1705.3.4~~ 4. The following additional systems and components in structures assigned to Seismic Design Category D:

- 4.1. Systems required for Seismic Design Category C.
- 4.2. Exterior wall panels and their anchorage.
- 4.3. Suspended ceiling systems and their anchorage.
- 4.4. Access floors and their anchorage.
- 4.5. Steel storage racks and their anchorage, where the importance factor is equal to 1.5 in accordance with Section 15.5.3 of ASCE 7.

1705.3.5 ~~5~~. The following additional systems and components in structures assigned to Seismic Design Category E or F:

- ~~5.1. Systems required for Seismic Design Categories C and D.~~
- ~~5.2. Electrical equipment.~~

Exception: ~~Seismic requirements are permitted to be excluded from the statement of special inspections for structures designed and constructed in accordance with the following:~~

- ~~1. The structure consists of light frame construction; the design spectral response acceleration at short periods, *SDS*, is determined in Section 1613.5.4, does not exceed 0.5g; and the height of the structure does not exceed 35 feet (10 668 mm) above grade plane; or~~
- ~~2. The structure is constructed using a reinforced masonry structural system or reinforced concrete structural system; the design spectral response acceleration at short periods, *SDS*, as determined in Section 1613.5.4, does not exceed 0.5g, and the height of the structure does not exceed 25 feet (7620 mm) above grade plane; or~~
- ~~3. Detached one- or two-family dwellings not exceeding two stories above grade plane, provided the structure does not have any of the following plan or vertical irregularities in accordance with Section 12.3.2 of ASCE 7:~~
 - ~~3.1. Torsional irregularity.~~
 - ~~3.2. Nonparallel systems.~~
 - ~~3.3. Stiffness irregularity extreme soft story and soft story.~~
 - ~~3.4. Discontinuity in capacity weak story.~~

(Portions of proposal not shown remain unchanged)

Commenter's Reason: This public comment is editorial in nature and rennumbers this section and the original proposal into a more user friendly format. Further, it relocates the existing exception which is placed under the current 5.1 (which obviously does not apply to electrical equipment and will cause confusion) to apply to the appropriate section, Section 1705.3.

Final Hearing Results

S125-07/08

AMPC

Code Change No: S127-07/08

Original Proposal

Section: 1706.1

Proponent: D. Kirk Harman, PE, SE, The Harman Group, Inc., representing The National Council of Structural Engineers Associations (NCSEA) Code Advisory Committee, Quality Assurance and Special Inspection Subcommittee

Delete without substitution:

SECTION 1706 CONTRACTOR RESPONSIBILITY

~~**1706.1 Contractor responsibility.** Each contractor responsible for the construction of a main wind- or seismic-force-resisting system, designated seismic system or a wind- or seismic-resisting component listed in the statement of special inspections shall submit a written statement of responsibility to the building official and the owner prior to the commencement of work on the system or component. The contractor's statement of responsibility shall contain the following: 1. Acknowledgment of awareness of the special requirements contained in the statement of special inspections; 2. Acknowledgment that control will be exercised to obtain conformance with the construction documents approved by the building official; 3. Procedures for exercising control within the contractor's organization, the method and frequency of reporting and the distribution of the reports; and 4. Identification and qualifications of the person(s) exercising such control and their position(s) in the organization.~~

(Renumber subsequent sections)

Reason: This requirement was originally to go along with the Quality Assurance Plan, which has now been deleted from the code. The requirement is unenforceable, is not followed typically by contractors and is often ignored by jurisdictions.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: There is no need for the section on contractor responsibility. Contractor responsibility is already implicit.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Stephan Kiefer, City of Livermore, representing Peninsula, East Bay and Monterey Bay Chapters (Tri-Chapters), requests Approval as Modified by this Public Comment.

Replace proposal as follows:

1706.1 Contractor responsibility. Each contractor responsible for the construction of a main wind- or seismic-force-resisting system, designated seismic system or a wind- or seismic-resisting component listed in the statement of special inspections shall submit a written statement of responsibility to the building official and the owner prior to the commencement of work on the system or component. The contractor's statement of responsibility shall contain ~~the following:~~ acknowledgement of awareness of the special requirements contained in the statement of special inspection.

- ~~1. Acknowledgement of awareness of the special requirements contained in the statement of special inspections;~~
- ~~2. Acknowledgement that control will be exercised to obtain conformance with the construction documents approved by the building official;~~
- ~~3. Procedures for exercising control within the contractor's organization, the method and frequency of reporting and the distribution of the reports; and~~
- ~~4. Identification and qualifications of the person(s) exercising such control and their position(s) in the organization.~~

Commenter's Reason: "Section 1704.1.1 requires that the registered design professional in responsible charge prepare and submits a "statement of special inspections" identifying the special inspections and tests required by Sections 1704, 1707, and 1708. Section 1706, as currently written, requires the Contractor to submit a written statement to the building official and to the owner acknowledging awareness of the items in the statement of special inspection, and describing how the contractor's quality control effort will be used to ensure that the work conforms with the construction documents. This section came into IBC at the beginning, directly from the Quality Assurance provisions of the NEHRP "Recommended Provisions for the Development of Seismic Regulations for New Buildings" (FEMA 95 from 1986, FEMA 222A from 1995.) These documents were the source for the "Quality Assurance Plan" of earlier editions of the IBC that is now called the statement of special inspection.

The contractor's statement of responsibility is a central part of this nationally-recognized long-standing effort to improve construction quality for seismic resistance by stressing the Contractor's Quality Control effort as an important element of the overall construction quality assurance effort, and thus should not be completely removed. This proposed modification simplifies the existing language by eliminating items 2, 3 and 4."

Final Hearing Results

S127-07/08

AMPC1

Code Change No: S128-07/08

Original Proposal

Section: 1707.2

Proponent: Bonnie Manley, American Iron and Steel Institute, representing American Institute of Steel Construction

Revise as follows:

1707.2 Structural steel. ~~Continuous special inspection is required for structural welding in accordance with AISC 341.~~ Special inspection for structural steel members shall be in accordance with the quality assurance plan requirements of AISC 341.

Exceptions:

1. ~~Single pass fillet welds not exceeding 5/16 inch (7.9 mm) in size.~~
2. ~~Floor and roof deck welding.~~

Reason: Between the 2003 and 2006 editions of the IBC, the terminology in Section 1705 was changed from “quality assurance plan” to “statement of special inspection”. Unfortunately, the change in terminology was not picked up in time for the 2005 edition of AISC 341, *Seismic Provisions for Structural Steel Buildings*. In order to ensure that there is no confusion, a direct reference to the quality assurance plan requirements in AISC 341 is recommended for structural steel members. Part 1, Appendix Q of the 2005 AISC Seismic Provisions provides a comprehensive Quality Assurance Plan including Tables of QC and QA inspection requirements. For structures designed according to AISC 341, it is required that QC and QA be provided as specified in that section.

Earlier versions of AISC 341 did not specifically address the frequency of welding inspection. However, the Quality Assurance Plan in Appendix Q of AISC 341-05 now addresses frequency of inspection. The first exception for single pass fillet welds is recommended for deletion. Fillet welds are now covered in Appendix Q of AISC 341-05, so the exception is no longer necessary. Also, the second exception for floor and roof deck welding is recommended for deletion. This section requires adequate special inspections for seismic resistance of structural steel only. Section 1704.3 Exception 2.2 already sufficiently addresses the welding of the floor and roof deck in a general manner.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Approved as Modified****Modify proposal as follows:**

1707.2 Structural steel. Special inspection for structural steel ~~members~~ shall be in accordance with the quality assurance plan requirements of AISC 341.

Exception: Special inspections of structural steel in structures assigned to Seismic Design Category C that are not specifically detailed for seismic resistance, with a response modification coefficient, R, of 3 or less, excluding cantilever column systems.

Committee Reason: This proposal helps clarify special inspections for seismic resistance. The modification adds as exception that is consistent with the intent of the current code as well as the action taken on S125-07/08.

Assembly Action:**None**

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

W. Lee Shoemaker, P.E., Ph.D., Thomas Associates Inc, representing Metal Building Manufacturers Association, requests Approval as Modified by this Public Comment.

Further modify proposal as follows:

1707.2 Structural steel. Special inspection for structural steel shall be in accordance with the quality assurance plan requirements of AISC 341.

Exceptions:

1. Special inspections of structural steel in structures assigned to Seismic Design Category C that are not specifically detailed for seismic resistance, with a response modification coefficient, R, of 3 or less, excluding cantilever column systems.
2. For ordinary moment frames, ultrasonic and magnetic particle testing of complete joint penetration groove welds is only required for demand critical welds.

Commenter-s Reason: This proposal is consistent with ongoing discussions at AISC to modify AISC 341 in recognition that ordinary moment frames have minimal inelastic straining. Therefore, only demand critical welds are of concern with regard to potential flaws in complete joint penetration groove welds. The first exception was accepted by the ICC Structural Committee as a modification by the proponent. The added exception is the modification requested by this public comment to make IBC 2009 consistent with what has been proposed to AISC 341 update process. But, because IBC-09 will reference the older edition of AISC 341 (2005), this exception needs to be added here as well. This is intended to be a temporary solution until AISC 341-10 is completed and adopted by the IBC.

Final Hearing Results

S128-07/08**AMPC**

Code Change No: S129-07/08

Original Proposal

Section: 1707.4

Proponent: Bonnie Manley, American Iron and Steel Institute, American Iron and Steel Institute

Revise as follows:

1707.4 Cold-formed steel framing and cold-formed steel light frame construction. Periodic special inspection is required during welding operations of elements of the seismic-force-resisting system. Periodic special inspection is required for screw attachment, bolting, anchoring and other fastening of components within the seismic-force-resisting system, including struts, braces, and hold-downs.

Exception: Special inspection is not required for cold-formed steel light frame shearwalls, shear panels and diaphragms, including screw attachment, bolting, anchoring and other fastening to other components of the seismic-force-resisting system, where either of the following apply:

1. The sheathing is gypsum board or fiberboard.
2. The sheathing is wood structural panel or steel sheets on only one side of the shear wall, shear panel or diaphragm assembly and the fastener spacing of the sheathing is more than 4 inches (102 mm) on center (o.c.).

Reason: The title of the section has been modified editorially to match the terminology used in IBC Section 2209 and Section 2210.

Wood and cold-formed steel light frame construction have similar requirements for their lateral force resisting systems. Therefore, the exception in IBC Section 1707.3 should also apply, with the appropriate adaptation, to cold-formed steel light frame construction. A quick historical review indicated that the 4" spacing for wood construction roughly translates to a minimum capacity of 380lb/ft. Cold-formed steel light frame shear walls, shear panels and diaphragms meeting the above requirements satisfy this minimum capacity, per AISI S213-07, *North American Standard for Cold-Formed Steel Framing – Lateral Design*.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1707.4 Cold-formed steel and cold-formed steel light frame construction. Periodic special inspection is required during welding operations of elements of the seismic-force-resisting system. Periodic special inspection is required for screw attachment, bolting, anchoring and other fastening of components within the seismic-force-resisting system, including shear walls, struts, braces, diaphragms, collectors (drag struts) and hold-downs.

Exception: Special inspection is not required for cold-formed steel light frame shear walls, ~~braces, shear panels and~~ diaphragms, ~~collectors (drag struts), and hold downs including screw attachment, bolting, anchoring and other fastening to other components of the seismic-force-resisting system,~~ where either of the following apply:

1. The sheathing is gypsum board or fiberboard.
2. The sheathing is wood structural panel or steel sheets on only one side of the shear wall, shear panel or diaphragm assembly and the fastener spacing of the sheathing is more than 4 inches (102 mm) on center (o.c.).

Committee Reason: This proposal makes appropriate editorial corrections to special inspection requirements for cold-formed steel. The modification corrects the title to more accurately reflect the subject matter and makes the charging language consistent with the exception.

Assembly Action:

None

Final Hearing Results

S129-07/08

AM

Code Change No: S130-07/08

Original Proposal

Section: 1707.7

Proponent: Andy Williams, Alcan Composites USA, Inc., representing himself

Revise as follows:

1707.7 (Supp) Architectural components. Periodic special inspection during the erection and fastening of exterior cladding, interior and exterior nonbearing walls and interior and exterior veneer in structures assigned to Seismic Design Category D, E, or F.

Exceptions:

1. Special inspection is not required for exterior cladding, interior and exterior nonbearing walls and interior and exterior veneer 30 feet (9144 mm) or less in height above grade or walking surface.
2. Special inspection is not required for exterior cladding and interior and exterior veneer weighing 5 psf (24.5 N/m²) or less.
3. Special inspection is not required for interior nonbearing walls weighing 15 psf (73.5 N/m²) or less.

Reason: This code change proposal is merely intended to editorially clarify the exceptions to this section which was revised during the last code development cycle. It is not intended to make any technical changes. It simply utilizes wording within the exceptions that is consistent with the wording in the charging paragraph to which the exceptions are made. Thus, the language in the exceptions will parallel the language in the main paragraph as the exceptions apply to the specific cases indicated. This should make these exceptions much more user friendly and easier to enforce.

Cost Impact: The code change proposal will not increase the cost of construction.

Committee Action:

Approved as Submitted

Committee Reason: This proposal is editorial and clearly defines the wall types in Exceptions 1 and 2.

Assembly Action:

None

S130-07/08

AS

Code Change No: S133-07/08

Original Proposal

Section: 1708.3

Proponent: Bonnie Manley, American Iron and Steel Institute, representing American Iron and Steel Institute

Revise as follows:

1708.3 (Supp) Cold-formed steel framing ~~light-frame construction~~. Periodic special inspection is required during welding operations of elements of the main wind-force-resisting system. Periodic special inspection is required for screw attachment, bolting, anchoring and other fastening of components within the main wind-force-resisting system, including struts, braces, and holdowns.

Exception: Special inspection is not required for cold-formed steel light-frame shearwalls, shear panels and diaphragms, including screw attachment, bolting, anchoring and other fastening to other components of the main wind-force-resisting system, where either of the following apply:

1. The sheathing is gypsum board or fiberboard.
2. The sheathing is wood structural panel or steel sheets on only one side of the shear wall, shear panel or diaphragm assembly and the fastener spacing of the sheathing is more than 4 inches (102 mm) on center (o.c.).

Reason: The title of the section has been modified editorially to match the terminology used in IBC Section 2210.

Wood and cold-formed steel light frame construction have similar requirements for their lateral force resisting systems. Therefore, the exception in IBC Section 1707.3 should also apply, with the appropriate adaptation, to cold-formed steel light frame construction. A quick historical review indicated that the 4" spacing for seismic detailing of wood construction, which is the presumed source of the wood construction exception, roughly translates to a minimum capacity of 380lb/ft. Cold-formed steel light frame shear walls, shear panels and diaphragms meeting the above requirements satisfy this minimum capacity, per AISI S213-07, *North American Standard for Cold-Formed Steel Framing – Lateral Design*.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1708.3 (Supp) Cold-formed steel light-frame construction. Periodic special inspection is required during welding operations of elements of the main wind-force-resisting system. Periodic special inspection is required for screw attachment, bolting, anchoring and other fastening of components within the main wind-force-resisting system, including shear walls, struts, braces, diaphragms, collectors (drag struts) and hold downs.

Exception: Special inspection is not required for cold-formed steel light-frame shear walls, braces, shear panels and diaphragms, collectors (drag struts) and hold downs including screw attachment, bolting, anchoring and other fastening to other components of the main wind-force-resisting system, where either of the following apply:

1. The sheathing is gypsum board or fiberboard.
2. The sheathing is wood structural panel or steel sheets on only one side of the shear wall, shear panel or diaphragm assembly and the fastener spacing of the sheathing is more than 4 inches (102 mm) on center (o.c.).

Committee Reason: This code change brings consistent and more concise language to the special inspection requirements for cold formed steel. The modification provides consistency between the exception and the charging language.

None

Final Hearing Results

S133-07/08

AM

Code Change No: S135-07/08

Original Proposal

Section: 1708.2

Proponent: Jim W. Sealy, FAIA; Robert E. Bachman, SE; and John D. Gillengerten, Building Seismic Safety Council of the National Institute of Building Sciences, representing FEMA/BSSC Code Resource Support Committee

Revise as follows:

1708.2 (Supp) Testing for seismic resistance. ~~The tests and qualification specified in Sections 1708.3 through 1708.6 are required as follows:~~

1. The seismic-force-resisting systems in structures assigned to Seismic Design Category C, D, E or F, as determined in Section 1613, shall meet the requirements of Sections 1708.3 and 1708.4, as applicable.
2. Designated seismic systems in structures assigned to Seismic Design Category C, D, E or F ~~is~~ subject to the special certification requirements of ASCE 7 Section 13.2.2 of ASCE shall meet the requirements of ~~are required to be tested in accordance with~~ Section 1708.5.
3. Architectural, mechanical and electrical components in structures assigned to Seismic Design Category C, D, E or F with an $I_p=1.0$ ~~shall be permitted to be seismically qualified by meeting the requirements of Section 1708.5~~ are required to be tested in accordance with Section 1708.5 where the general design requirements of ASCE 7 Section 13.2.1.2 for manufacturer's certification are satisfied by testing.
4. Seismic Isolation Systems are required to be tested in accordance with Section 1708.6.

Reason: This proposal clarifies the requirements for special certification of designated seismic systems. In ASCE 7, all nonstructural components must comply with general design provisions of Section 13.2.1. This section permits justification of components by project-specific design or certification by the manufacturer. The manufacturer can use analysis, testing, or experience data.

Special certification is only required for active mechanical and electrical components that must remain operable following an earthquake, and components with hazardous contents. Obtaining this certification requires shake table testing or use of experience data.

The changes to Items 1 and 4 provide pointers to the appropriate code sections. The changes to item 2 clarify when the special seismic qualification procedures (i.e., shake table testing) are required – only for those components identified in ASCE 7. Item 3 clarifies the process when the basic seismic design requirements (anchorage and bracing) are addressed by a manufacturer's certification.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal makes editorial changes to the requirements for testing for seismic resistance that help clarify the intent of this provision.

Assembly Action:

None

Final Hearing Results

S135-07/08

AS

Code Change No: **S136-07/08**

Original Proposal

Section: 1708.3

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing himself

Revise as follows:

1708.3 Reinforcing and prestressing steel. Certified mill test reports shall be provided for each shipment of ~~reinforcing steel reinforcement~~ used to resist flexural, shear and axial forces in reinforced concrete intermediate frames, and special moment frames and boundary elements of special reinforced concrete or reinforced and masonry shear walls. Where reinforcement complying with ASTM A 615 ~~reinforcing steel~~ is used to resist earthquake-induced flexural and axial forces in special moment frames and ~~in wall boundary elements of special reinforced concrete~~ shear walls in structures assigned to Seismic Design Category C, D, E or F, as determined in Section 1613, the testing requirements of Section 21.2.5 of ACI 318 shall be met. Where reinforcement complying with ASTM A 615 ~~reinforcing steel~~ is to be welded, chemical tests shall be performed to determine weldability in accordance with Section 3.5.2 of ACI 318.

Exception: Certified mill test reports are not required to be provided for reinforcement complying with ASTM A 706.

Reason: The purpose of this proposal is to align the provisions of IBC Section 1708.3 with related provisions in ASCE 7 and ACI 318. The reference to axial forces is deleted for consistency with Section 21.2.5 of ACI 318-05. The references to types of seismic-force resisting systems are revised for consistency with Table 12.1-1 of ASCE 7-05. The exception for reinforcement complying with ASTM A 706 is proposed in

recognition of the exemption from any special requirements for the use of such bars by Sections 3.5.2 and 21.2.5 of ACI 318-05. Note that Section 16 of ASTM A 706 specifies requirements for the marking of individual reinforcing bars complying with the standard for ready identification during construction.

The references in the proposal to sections of ACI 318, current and proposed, are to the 2005 edition. I assume the 2008 edition of ACI 318 will be the edition that is referenced in the 2009 IBC. The sections in the public draft of ACI 318-08 corresponding to the sections in the proposal are 21.1.5.2 for Section 21.2.5 and 3.5.2 for Section 3.5.2.

The reference to the testing requirements in Section 21.2.5 of ACI 318-05 ought to specify all frame members and structural wall boundary elements, which could conceivably include intermediate and special reinforced concrete moment frames and shear walls. Section 21.1.5.2 of the public draft of ACI 318-08, however, revises the requirement so that it applies to special moment frames, special structural walls and coupling beams. Section 21.1.1.4 of the public draft on structures assigned to Seismic Design Category C specifies compliance with the applicable provisions of Sections 21.1.3 through 21.1.7 for structures using special moment frames or special structural walls. The proposed revisions incorporate these upcoming changes in ACI 318.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

~~1708.3 Reinforcing and prestressing steel Concrete reinforcement. Certified mill test reports shall be provided for each shipment of reinforcement used to resist flexural and axial forces in reinforced concrete intermediate and special moment frames and boundary elements of special reinforced concrete and masonry shear walls. Where reinforcement complying with ASTM A 615 is used to resist earthquake-induced flexural and axial forces in special moment frames, and special reinforced concrete shear structural walls and coupling beams connecting special structural walls, in structures assigned to Seismic Design Category B, C, D, E or F, as determined in Section 1613, the testing requirements of reinforcement shall comply with Section 21.1.5.2 of ACI 318 shall be met. Certified mill test reports shall be provided for each shipment of such reinforcement. Where reinforcement complying with ASTM A 615 is to be welded, chemical tests shall be performed to determine weldability in accordance with Section 3.5.2 of ACI 318.~~

~~**Exception:** Certified mill test reports are not required to be provided for reinforcement complying with ASTM A 706.~~

Committee Reason: This code change to seismic testing of concrete reinforcement provides consistency with the ACI 318 standard. The modification makes further adjustments in the wording and eliminates the proposed exception to certified mill test reports.

Original Proposal

Section: 1708.4, Chapter 35

Proponent: Bonnie Manley, American Iron and Steel Institute, representing American Institute of Steel Construction

1. Revise as follows:

1708.4 (Supp) Structural steel. ~~Testing for structural steel shall be in accordance with the quality assurance plan requirements of AISC 341. The testing contained in the quality assurance plan shall be as required by AISC 341 and the additional requirements herein. The acceptance criteria for nondestructive testing shall be as required in AWS D1.1 as specified by the registered design professional. Base metal thicker than 1.5 inches (38 mm), where subject to through thickness weld shrinkage strains, shall be ultrasonically tested for discontinuities behind and adjacent to such welds after joint completion. Any material discontinuities shall be accepted or rejected on the basis of ASTM A 435 or ASTM A 898 (Level 1 criteria) and criteria as established by the registered design professional(s) in responsible charge and the construction documents~~

2. Revise Chapter 35 as follows:**AISC**

341-05 Seismic Provisions for Structural Steel Buildings, including Supplement No. 1 dated 2005~~6~~. . . . 1613.6.2, 1707.2, 1709~~8~~.4, 2205.2.1, 2205.2.2, 2205.3, 2205.3.1

ASTM INTERNATIONAL

~~A 435/A 435M—90 (2001) Specification for Straight-beam Ultrasonic Examination of Steel Plates~~

~~A 898/A 898M—91 (2001) Specification for Straight-Beam Ultrasonic Examination of Rolled Steel Shapes~~

AWS

D1.1—04 Structural Welding Code—Steel

Reason: Section 1709.4, 1st paragraph (Numbering based upon IBC-06 w/2007 Supplement): Between the 2003 and 2006 editions of the IBC, the terminology in Section 1705 was changed from “quality assurance plan” to “statement of special inspection”. Unfortunately, the change in terminology was not picked up in time for the 2005 edition of AISC 341, *Seismic Provisions for Structural Steel Buildings*. In order to ensure that there is no confusion, a direct reference to the quality assurance plan requirements in AISC 341 is recommended for structural steel. In fact, AISC 341-05 Appendix Q provides the user with the minimum acceptable requirements for a quality assurance plan that applies to the construction of welded joints, bolted joints, and other details in the seismic load resisting system. The requirements of AISC 341, Appendix Q are recommended for implementation without revision. Where appropriate, AISC 341-05 Appendix Q references AWS D1.1 for specific acceptance criteria. Thus, the second sentence of the first paragraph is unnecessary and redundant with language that currently exists in AISC 341-05.

Section 1709.4, 2nd paragraph: The requirements of this paragraph are recommended for deletion. This paragraph focuses on the ultrasonic testing of base metal that may be subject to lamellar tearing or have laminations present. However, AISC 341-05, Section 5.2(2)(c) currently addresses this specific topic by stating when non-destructive testing (NDT) is needed, where it is needed and the appropriate acceptance criteria as follows:

Q5.2(2)(c) Base Metal NDT for Lamellar Tearing and Laminations. After joint completion, base metal thicker than 1-1/2 in. (38 mm) loaded in tension in the through thickness direction in tee and corner joints, where the connected material is greater than 3/4 in. (19 mm) and contains CJP groove welds, shall be ultrasonically tested for discontinuities behind and adjacent to the fusion line of such welds. Any base metal discontinuities found within t/4 of the steel surface shall be accepted or rejected on the basis of criteria of AWS D1.1 Table 6.2, where t is the thickness of the part subjected to the through thickness strain.

Referenced in AISC-341, Section Q5.2(2)(c), AWS D1.1 Table 6.2 provides the acceptance criteria for ultrasonically tested joints when statically loaded. The criteria is similar to that used prior to adoption of the current language in IBC 2000, which had used the term of “larger reflector criteria” in the UBC, and left it to the engineer in the NBC. The “larger reflector criteria”, a termed used in the 1970s, is now identified as a “Class A” discontinuity in Table 6.2. By referencing only Table 6.2, and not referencing Class A, the additional considerations of flaw length and reflector height is made.

Finally, the direct references to ASTM A 435 and ASTM A898 are no longer needed because the AISC 341 criteria has been made more restrictive regarding permitted flaws, and more properly reflects the angle-beam ultrasonic methodology used for post-welding examinations. The prior reference to ASTM A 435 and A 898 were straight-beam ultrasonic tests to detect laminations in base metal prior to welding, and have been deemed inadequate for post-welding lamellar tearing checks.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1708.4 Structural steel. Testing for structural steel shall be in accordance with the quality assurance plan requirements of AISC 341.

Exception: Testing for structural steel in structures assigned to Seismic Design Category C that are not specifically detailed for seismic resistance, with a response modification coefficient, R, of 3 or less, excluding cantilever column systems.

(Portions of proposal not shown remain unchanged)

Committee Reason: This proposal helps clarify structural steel testing requirements for seismic resistance. The modification adds as exception that is consistent with the intent of the current code as well as S125-07/08.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

W. Lee Shoemaker, P.E., Ph.D, Thomas Associates, Inc, representing Metal Building Manufacturers Association requests Approval as Modified by this Public Comment.

Further modify proposal as follows:

1708.4 Structural steel. Testing for structural steel shall be in accordance with the quality assurance plan requirements of AISC 341.

Exceptions

1. Testing for structural steel in structures assigned to Seismic Design Category C that are not specifically detailed for seismic resistance, with a response modification coefficient, R, of 3 or less, excluding cantilever column systems.
2. For ordinary moment frames, ultrasonic and magnetic particle testing of complete joint penetration groove welds is only required for demand critical welds.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: This proposal is consistent with ongoing discussions at AISC to modify AISC 341 in recognition that ordinary moment frames have minimal inelastic straining. Therefore, only demand critical welds are of concern with regard to potential flaws in complete joint penetration groove welds. The first exception was accepted by the ICC Structural Committee as a modification by the proponent. The added exception is the modification requested by this public comment to make IBC 2009 consistent with what has been proposed to AISC 341 update process. But, because IBC-09 will reference the older edition of AISC 341 (2005), this exception needs to be added here as well. This is intended to be a temporary solution until AISC 341-10 is completed and adopted by the IBC.

Final Hearing Results

S137-07/08

AMPC

Code Change No: S138-07/08

Original Proposal

Section: 1708.5

Proponent: Jim W. Sealy, FAIA; Robert E. Bachman, SE; and John D. Gillengerten, Building Seismic Safety Council of the National Institute of Building Sciences, representing FEMA/BSSC Code Resource Support Committee

Revise as follows:

1708.5 (Supp) Seismic qualification certification of mechanical and electrical equipment nonstructural components. The registered design professional shall state the applicable seismic qualification certification requirements for nonstructural components and designated seismic systems on the construction documents. ~~Each~~

1. The manufacturer of each designated seismic system components subject to the provisions of ASCE 7 Section 13.2.2 shall test or analyze the component and its mounting system or anchorage and submit a certificate of compliance for review and acceptance by the registered design professional for the design of the designated seismic system and for approval by the building official. Qualification shall be by Certification shall be based on an actual test on a shake table, by three-dimensional shock tests, by an analytical method using dynamic characteristics and forces, by the use of experience data (i.e., historical data demonstrating acceptable seismic performance) or by a more rigorous analysis providing for equivalent safety.
2. Manufacturers certification of compliance for the general design requirements of ASCE 7 Section 13.2.1 shall be based on analysis, testing, or experience data.

Reason: This proposal clarifies the requirements for special certification of designated seismic systems, and clarifies the distinctions between seismic certification and special seismic certification. In ASCE 7, all nonstructural components must comply with general design provisions of Section 13.2.1, which permits justification of components by project-specific design or certification by the manufacturer (through analysis, testing, or experience data). Special certification is only required for active mechanical and electrical components that must remain operable following an earthquake, and components with hazardous contents. Obtaining this certification requires shake table testing or use of experience data. The term "seismic qualification" is replaced, since it does not apply.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This code change clarifies the code requirement for seismic certification of designated seismic systems.

Assembly Action:

Final Hearing Results

S138-07/08

AS

Code Change No: S139-07/08

Original Proposal

Section: 1708.5

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing himself

Revise as follows:

1708.5 (Supp) Seismic qualification of mechanical and electrical equipment. The registered design professional shall state the applicable seismic qualification requirements for designated seismic systems on the construction documents. Each manufacturer of designated seismic system components shall test or analyze the component and its mounting system or anchorage and submit a certificate of compliance for review and acceptance by the registered design professional responsible for the design of the designated seismic system and for approval by the building official. Qualification shall be by actual test on a shake table, by three-dimensional shock tests, by an analytical method using dynamic characteristics and forces, by the use of experience data (i.e., historical data demonstrating acceptable seismic performance) or by more rigorous analysis providing for equivalent safety.

Reason: The change is proposed for consistency with other instances in the IBC when a registered design professional's specific responsibilities are specified. This is also being proposed to correct an oversight on my part during development of Proposal S37-06/07-AM.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal provides consistency with other occurrences of the term registered design professional.

Assembly Action:

None

Final Hearing Results

S139-07/08

AS

Code Change No: **S140-07/08**

Original Proposal

Sections: 1709.2, [F] 903.3.5.2, 1802.2.6, 1802.2.7, 1805.5.1.3, 2306.4.2, 2306.4.3, 2306.4.4, 2306.4.5

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing himself

Revise as follows:

[F] 903.3.5.2 Secondary water supply. A secondary on-site water supply equal to the hydraulically calculated sprinkler demand, including the hose stream requirement, shall be provided for high-rise buildings ~~in assigned to~~ Seismic Design Category C, D, E or F as determined by this code. The secondary water supply shall have a duration of not less than 30 minutes as determined by the occupancy hazard classification in accordance with NFPA 13.

Exception: Existing buildings.

1709.2 (Supp) Structural observations for seismic resistance. Structural observations shall be provided for those structures ~~included in assigned to~~ Seismic Design Category D, E or F, as determined in Section 1613, where one or more of the following conditions exist:

1. The structure is classified as Occupancy Category III or IV in accordance with Table 1604.5.
2. The height of the structure is greater than 75 feet (22 860 mm) above the base.
3. The structure is assigned to Seismic Design Category E, is classified as Occupancy Category I or II in accordance with Table 1604.5, and is greater than two stories above grade plane.
4. When so designated by the registered design professional responsible for the structural design.
5. When such observation is specifically required by the building official.

1802.2.6 Seismic Design Category C. Where a structure is ~~determined to be in assigned to~~ Seismic Design Category C in accordance with Section 1613, an investigation shall be conducted and shall include an evaluation of the following potential hazards resulting from earthquake motions: slope instability, liquefaction and surface rupture due to faulting or lateral spreading.

1802.2.7 Seismic Design Category D, E or F. Where the structure is ~~determined to be in assigned to~~ Seismic Design Category D, E or F, in accordance with Section 1613, the soils investigation requirements for Seismic Design Category C, given in Section 1802.2.6, shall be met, in addition to the following. The investigation shall include:

1. A determination of lateral pressures on basement and retaining walls due to earthquake motions.
2. An assessment of potential consequences of any liquefaction and soil strength loss, including estimation of differential settlement, lateral movement or reduction in foundation soil-bearing capacity, and shall address mitigation measures. Such measures shall be given consideration in the design of the structure and can include but are not limited to ground stabilization, selection of appropriate foundation type and depths, selection of appropriate structural systems to accommodate anticipated displacements or any combination of these measures. The potential for liquefaction and soil strength loss shall be evaluated for site peak ground acceleration magnitudes and source characteristics consistent with the design earthquake ground motions. Peak ground acceleration shall be determined from a site-specific study taking into account soil amplification effects, as specified in Chapter 21 of ASCE 7.

Exception: A site-specific study need not be performed, provided that peak ground acceleration equal to $SDS/2.5$ is used, where SDS is determined in accordance with Section 21.2.1 of ASCE 7.

1805.5.1.3 Rubble stone. Foundation walls of rough or random rubble stone shall not be less than 16 inches (406 mm) thick. Rubble stone shall not be used for foundations ~~for~~ of structures ~~in assigned to~~ Seismic Design Category C, D, E or F.

2306.4.2 (Supp) Lumber sheathed shear walls. Single and double diagonally sheathed lumber shear walls shall be designed and constructed in accordance with AF&PA SDPWS. Single and double diagonally sheathed lumber walls shall not be used to resist seismic ~~loads~~ forces in structures ~~in assigned to~~ Seismic Design Category E or F.

2306.4.3 (Supp) Particleboard shear walls. Particleboard shear walls shall be designed and constructed in accordance with AF&PA SDPWS. Particleboard shear walls shall be permitted to resist horizontal forces using the allowable shear capacities set forth in Table 2306.4.3. Allowable capacities in Table 2306.4.3 are permitted to be increased 40 percent for wind design. Particleboard shall not be used to resist seismic forces in structures ~~in~~ assigned to Seismic Design Category D, E or F.

2306.4.4 (Supp) Fiberboard shear walls. Fiberboard shear walls shall be designed and constructed in accordance with AF&PA SDPWS. Fiberboard shear walls are permitted to resist horizontal forces using the allowable shear capacities set forth in Table 2306.4.4. Allowable capacities in Table 2306.4.4 are permitted to be increased 40 percent for wind design. Fiberboard shall not be used to resist seismic forces in structures ~~in~~ assigned to Seismic Design Category D, E or F.

2306.4.5 (Supp) Shear walls sheathed with other materials. Shear walls sheathed with portland cement plaster, gypsum lath, gypsum sheathing, or gypsum board shall be designed and constructed in accordance with AF&PA SDPWS. Shear walls sheathed with these materials are permitted to resist horizontal forces using the allowable shear capacities set forth in Table 2306.4.5. Shear walls sheathed with portland cement plaster, gypsum lath, gypsum sheathing, or gypsum board shall not be used to resist seismic ~~loads~~ forces in structures ~~in~~ assigned to Seismic Design Category E or F.

Reason: The changes are proposed for consistency with the use of "assigned to" in conjunction with structures and Seismic Design Category elsewhere in the 2006 IBC (more than 60 code sections) and with Proposal S39-04/05-AM. The sections in the proposal contain the only such instances in the 2007 Supplement and 2006 IBC with respect to structures and Seismic Design Category that merit consideration by the Correlating Committee. Other instances should be modified through the code development process. In Sections 2306.4.2 and 2306.4.5, "seismic loads" is changed to "seismic forces" for consistency with use of the latter term throughout the IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This change is an editorial improvement that uses more accurate wording that is consistent with the earthquake provisions.

Assembly Action:

None

Final Hearing Results

S140-07/08

AS

Code Change No: **S145-07/08**

Original Proposal

Section: 1801.2.1

Proponent: Edwin T. Huston, Smith & Huston, Inc., representing National Council of Structural Engineering Associations

Revise as follows:

1801.2.1 Foundation design for seismic overturning. Where the foundation is proportioned using the load combinations of Section 1605.2 or 1605.3.1, and the computation of the seismic overturning moment is by the equivalent lateral-force method or the modal analysis method, the proportioning shall be in accordance with Section 12.13.4 of ASCE 7.

Reason: Code consistency. ASCE 7 permits the reduction of seismic overturning for foundation design where either strength design or allowable stress design load combinations are used. The load combinations of Sections 1605.2 and 1605.3.1 correspond to the two sets of ASCE 7 load combinations. Because the load combinations in Section 1605.3.2 include 0.9D where overturning is assessed (rather than 0.6D as in Section 1605.3.1), reduction of seismic overturning in accordance with Section 12.13.4 of ASCE 7 would be unconservative where those load combinations are used.

In a related proposal Section 1801.2.1 is moved to new Section 1808.3.1. If both proposals are approved this change should be made in the new section.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal improves consistency with the ASCE 7 standard when using allowable stress design.

Assembly Action:

None

Final Hearing Results

Code Change No: S146-07/08

Original Proposal

Sections: 106.1, 1610.1, 1802, 1803, 1805.3.5, 1808.2.2, 1808.2.8.4, 1808.2.10, 3304.1.4, Appendix J101.1, J104.3, J106.1, J107.1, J107.6

Proponent: Edwin T. Huston, Smith & Huston, Inc., representing the National Council of Structural Engineering Associations

Revise as follows:

106.1 (Supp) General. Submittal documents consisting of construction documents, statement of special inspections, geotechnical report and other data shall be submitted in one or more sets with each application for a permit. The construction documents shall be prepared by a registered design professional where required by the statutes of the jurisdiction in which the project is to be constructed. Where special conditions exist, the building official is authorized to require additional construction documents to be prepared by a registered design professional.

Exception: The building official is authorized to waive the submission of construction documents and other data not required to be prepared by a registered design professional if it is found that the nature of the work applied for is such that review of construction documents is not necessary to obtain compliance with this code.

1610.1 General. Basement, foundation and retaining walls shall be designed to resist lateral soil loads. Soil loads specified in Table 1610.1 shall be used as the minimum design lateral soil loads unless specified determined otherwise ~~in by a soil geotechnical investigation report approved by the building official in accordance with Section 1803.~~ Basement walls and other walls in which horizontal movement is restricted at the top shall be designed for at-rest pressure. Retaining walls free to move and rotate at the top ~~are~~ shall be permitted to be designed for active pressure. Design lateral pressure from surcharge loads shall be added to the lateral earth pressure load. Design lateral pressure shall be increased if soils with expansion potential are present at the site.

Exception: Basement walls extending not more than 8 feet (2438 mm) below grade and supporting flexible floor systems shall be permitted to be designed for active pressure.

**SECTION ~~1802~~ 1803
FOUNDATION AND SOILS GEOTECHNICAL INVESTIGATIONS**

~~1802.4~~ 1803.1 General. ~~Foundation and soils~~ Geotechnical investigations shall be conducted in ~~conformance~~ accordance with ~~Sections 1802.2 through 1802.6~~ Section 1803.2 and reported in accordance with Section 1803.6. Where required by the building official ~~the classification and investigation of the soil or where geotechnical investigations involve in-situ testing, laboratory testing, or engineering calculations, such investigations shall be made conducted~~ by a registered design professional.

~~1802.2 1803.2~~ **Where Investigations required.** ~~The owner or applicant shall submit a foundation and soils investigation to the building official where required in~~ Geotechnical investigations shall be conducted in accordance with Sections 1802.2.1 through 1802.2.7 1803.3 through 1803.5.

Exception: ~~The building official need not require~~ shall be permitted to waive the requirement for a foundation or soils geotechnical investigation where satisfactory data from adjacent areas is available that demonstrates an investigation is not necessary for any of the conditions in Sections 1802.2.1 through 1802.2.6 1803.5.1 through 1803.5.6 and Sections 1803.5.10 and 1803.5.11.

~~1802.3~~ **Soil classification.** ~~Where required, soils shall be classified in accordance with Section 1802.3.1 or 1802.3.2.~~

~~1802.4~~ **1803.3 Basis of investigation.** Soil classification shall be based on observation and any necessary tests of the materials disclosed by borings, test pits or other subsurface exploration made in appropriate locations. Additional studies shall be made as necessary to evaluate slope stability, soil strength, position and adequacy of load-bearing soils, the effect of moisture variation on soil-bearing capacity, compressibility, liquefaction and expansiveness.

~~1802.4.1~~ **1803.3.1 Exploratory boring Scope of investigation.** The scope of the ~~soil~~ geotechnical investigation including the number and types of borings or soundings, the equipment used to drill and or sample, the in-situ testing equipment and the laboratory testing program shall be determined by a registered design professional.

~~1802.5~~ **1803.4 Soil boring and sampling Qualified representative.** ~~The soil boring and sampling investigation procedure and apparatus shall be in accordance with generally accepted engineering practice. The registered design professional shall have a fully qualified representative on the site during all boring and or sampling operations.~~

1803.5 Investigated conditions. Geotechnical investigations shall be conducted as indicated in Sections 1803.5.1 through 1803.5.12.

~~1802.3.1~~ **1803.5.1 General Classification.** ~~For the purposes of this chapter, the definition and classification of Soil materials for use in Table 1804.2 shall be~~ classified in accordance with ASTM D 2487.

~~1802.2.1~~ **1803.5.2 Questionable soil.** ~~Where the classification, strength or compressibility of the soil is in doubt or where a load-bearing value superior to that specified in this code is claimed, the building official shall be permitted to require that the necessary a geotechnical investigation be made conducted. Such investigation shall comply with the provisions of Sections 1802.4 through 1802.6.~~

~~1802.2.2~~ **1803.5.3 Expansive soils soil.** In areas likely to have expansive soil, the building official shall require soil tests to determine where such soils do exist.

~~1802.3.2~~ **Expansive soils.** Soils meeting all four of the following provisions shall be considered expansive, except that tests to show compliance with Items 1, 2 and 3 shall not be required if the test prescribed in Item 4 is conducted:

1. Plasticity index (PI) of 15 or greater, determined in accordance with ASTM D 4318.
2. More than 10 percent of the soil particles pass a No. 200 sieve (75 μ m), determined in accordance with ASTM D 422.
3. More than 10 percent of the soil particles are less than 5 micrometers in size, determined in accordance with ASTM D 422.
4. Expansion index greater than 20, determined in accordance with ASTM D 4829.

~~1802.2.3~~ **1803.5.4 Ground-water table.** A subsurface soil investigation shall be performed to determine whether the existing ground-water table is above or within 5 feet (1524 mm) below the elevation of the lowest floor level where such floor is located below the finished ground level adjacent to the foundation.

Exception: A subsurface soil investigation to determine the location of the ground-water table shall not be required where waterproofing is provided in accordance with Section 1807.

~~1802.2.4~~ **1803.5.5 Deep Pile and pier foundations.** ~~Pile and pier foundations shall be designed and installed on the basis of a foundation investigation and report as specified in Sections 1802.4 through 1802.6 and Section 1808.2.1. Where deep foundations will be used, a geotechnical investigation shall be conducted and shall include all of the following, unless sufficient data upon which to base the design and installation is otherwise available:~~

1. Recommended deep foundation types and installed capacities.
2. Recommended center-to-center spacing of deep foundation elements.
3. Driving criteria.
4. Installation procedures.
5. Field inspection and reporting procedures (to include procedures for verification of the installed bearing capacity where required).
6. Load test requirements.
7. Suitability of deep foundation materials for the intended environment.
8. Designation of bearing stratum or strata.
9. Reductions for group action, where necessary.

1802.2.5 1803.5.6 Rock strata. Where subsurface explorations at the project site indicate variations or doubtful characteristics in the structure of the rock upon which foundations are to be constructed, a sufficient number of borings shall be made to a depth of not less than 10 feet (3048 mm) below the level of the foundations to provide assurance of the soundness of the foundation bed and its load-bearing capacity.

1803.5.7 Excavation near foundations. Where excavation will remove lateral support from any foundation, an investigation shall be conducted to assess the potential consequences and address mitigation measures.

1803.5.8 Compacted fill material. Where shallow foundations will bear on compacted fill material more than 12 inches (305 mm) in depth, a geotechnical investigation shall be conducted and shall include all of the following:

1. Specifications for the preparation of the site prior to placement of compacted fill material.
2. Specifications for material to be used as compacted fill.
3. Test methods to be used to determine the maximum dry density and optimum moisture content of the material to be used as compacted fill.
4. Maximum allowable thickness of each lift of compacted fill material.
5. Field test method for determining the in-place dry density of the compacted fill.
6. Minimum acceptable in-place dry density expressed as a percentage of the maximum dry density determined in accordance with Item 3.
7. Number and frequency of field tests required to determine compliance with Item 6.

1803.5.9 Controlled low-strength material (CLSM). Where shallow foundations will bear on controlled low-strength material (CLSM), a geotechnical investigation shall be conducted and shall include all of the following:

1. Specifications for the preparation of the site prior to placement of the CLSM.
2. Specifications for the CLSM.
3. Laboratory or field test method(s) to be used to determine the compressive strength or bearing capacity of the CLSM.
4. Test methods for determining the acceptance of the CLSM in the field.
5. Number and frequency of field tests required to determine compliance with Item 4.

1803.5.10 Alternate setback and clearance. Where setbacks or clearances other than those required in Section 1805.3 are desired, the building official shall be permitted to require a geotechnical investigation by a registered design professional to demonstrate that the intent of Section 1805.3 would be satisfied. Such an investigation shall include consideration of material, height of slope, slope gradient, load intensity and erosion characteristics of slope material.

1802.2.6 1803.5.11 Seismic Design Category Categories C through F. Where a For structures is determined assigned to be in Seismic Design Category C, D, E, or F in accordance with Section 1613, an a geotechnical investigation shall be conducted, and shall include an evaluation of all the following potential geologic and seismic hazards resulting from earthquake motions:

1. Slope instability.
2. Liquefaction.
3. Differential settlement. and
4. Surface rupture displacement due to faulting or lateral spreading.

1802.2.7 1803.5.12 Seismic Design Category Categories D, E or through F. Where the For structures is determined assigned to be in Seismic Design Category D, E or F, in accordance with Section 1613, the soils geotechnical investigation requirements for Seismic Design Category C, given in required by Section 1802.2.6 1803.5.11, shall be met, in addition to the following. The investigation shall also include:

1. ~~A~~The determination of lateral pressures on basement and retaining walls due to earthquake motions.
2. The potential for liquefaction and soil strength loss evaluated for site peak ground accelerations, magnitudes, and source characteristics consistent with the design earthquake ground motions. Peak ground acceleration shall be permitted to be determined based on a site-specific study taking into account soil amplification effects, as specified in Chapter 21 of ASCE 7, or, in the absence of such a study, peak ground accelerations shall be assumed equal to $S_{DS} / 2.5$, where S_{DS} is determined in accordance with Section 11.4 of ASCE 7.
3. An assessment of potential consequences of ~~any~~ liquefaction and soil strength loss, including estimation of differential settlement, lateral movement ~~or~~, lateral loads on foundations, reduction in foundation soil-bearing capacity, increases in lateral pressures on retaining walls and flotation of buried structures.
4. ~~and shall address Discussion of mitigation measures. Such measures shall be given consideration in the design of the structure and can include, but are such as, but not limited to, ground stabilization, selection of appropriate foundation type and depths, selection of appropriate structural systems to accommodate anticipated displacements and forces, or any combination of these measures and how they shall be considered in the design of the structure. The potential for liquefaction and soil strength loss shall be evaluated for site peak ground acceleration magnitudes and source characteristics consistent with the design earthquake ground motions. Peak ground acceleration shall be determined from a site-specific study taking into account soil amplification effects, as specified in Chapter 21 of ASCE 7.~~

~~**Exception:** A site-specific study need not be performed provided that peak ground acceleration equal to $S_{DS} / 2.5$ is used, where S_{DS} is determined in accordance with Section 21.2.1 of ASCE 7.~~

~~**4802-6 1803.6 Reports Reporting.** The soil classification and design load-bearing capacity shall be shown on the construction document. Where geotechnical investigations are required by the building official, a written report of the investigations shall be submitted that includes to the building official by the owner or authorized agent at the time of permit application. This geotechnical report shall include, but need not be limited to, the following information:~~

1. A plot showing the location of ~~test borings and/or excavations~~ the soil investigations.
2. A complete record of the soil boring and penetration test logs and soil samples.
3. A record of the soil profile.
4. Elevation of the water table, if encountered.
5. Recommendations for foundation type and design criteria, including but not limited to: bearing capacity of natural or compacted soil; provisions to mitigate the effects of expansive soils; mitigation of the effects of liquefaction, differential settlement and varying soil strength; and the effects of adjacent loads.
6. Expected total and differential settlement.
7. ~~Pile and pier~~ Deep foundation information in accordance with Section ~~4808.2-2~~ 1803.5.5.
8. Special design and construction provisions for ~~footings or~~ foundations of structures founded on expansive soils, as necessary.
9. Compacted fill material properties and testing in accordance with Section ~~4803.5~~ 1803.5.8.
10. Controlled low-strength material properties and testing in accordance with Section 1803.5.9.

SECTION 4803 1804 EXCAVATION, GRADING AND FILL

~~**4803-1 1804.1 Excavations Excavation near footings or foundations.** Excavations Excavation for any purpose shall not remove lateral support from any footing or foundation without first underpinning or protecting the footing or foundation against settlement or lateral translation.~~

~~**4803-2 1804.2 Placement of backfill.** The excavation outside the foundation shall be backfilled with soil that is free of organic material, construction debris, cobbles and boulders or with a controlled low-strength material (CLSM). The backfill shall be placed in lifts and compacted, in a manner that does not damage the foundation or the waterproofing or dampproofing material.~~

~~**Exception:** Controlled low-strength material need not be compacted.~~

~~**4803-3 1804.3 Site grading.** The ground immediately adjacent to the foundation shall be sloped away from the building at a slope of not less than one unit vertical in 20 units horizontal (5-percent slope) for a minimum distance of 10 feet (3048 mm) measured perpendicular to the face of the wall. If physical obstructions or lot lines prohibit 10 feet (3048 mm) of horizontal distance, a 5-percent slope shall be provided to an approved alternate method of diverting water away from the foundation. Swales used for this purpose shall be sloped a minimum of 2 percent where located within 10 feet (3048 mm) of the building foundation. Impervious surfaces within 10 feet (3048 mm) of the building foundation shall be sloped a minimum of 2 percent away from the building.~~

Exception: Where climatic or soil conditions warrant, the slope of the ground away from the building foundation ~~is~~ shall be permitted to be reduced to not less than one unit vertical in 48 units horizontal (2-percent slope).

The procedure used to establish the final ground level adjacent to the foundation shall account for additional settlement of the backfill.

1803.4 1804.4 Grading and fill in flood hazard areas. In flood hazard areas established in Section 1612.3, grading and/or fill shall not be approved:

1. Unless such fill is placed, compacted and sloped to minimize shifting, slumping and erosion during the rise and fall of floor water and, as applicable, wave action.
2. In floodways, unless it has been demonstrated through hydrologic and hydraulic analyses performed by a registered design professional in accordance with standard engineering practice that the proposed grading or fill, or both, will not result in any increase in flood levels during the occurrence of the design flood.
3. In flood hazard areas subject to high-velocity wave action, unless such fill is conducted and/or placed to avoid diversion of water and waves toward any building or structure.
4. Where design flood elevations are specified but floodways have not been designated, unless it has been demonstrated that the cumulative effect of the proposed floor hazard area encroachment, when combined with all other existing and anticipated floor hazard area encroachment, will not increase the design flood elevation more than one foot (305 mm) at any point.

1803.5 1804.5 Compacted fill material. Where ~~footings~~ shallow foundations will bear on compacted fill material, the compacted fill shall comply with the provisions of an approved geotechnical report, ~~which shall contain the following:~~ as set forth in Section 1803.

- ~~1. Specifications for the preparation of the site prior to placement of compacted fill material.~~
- ~~2. Specifications for material to be used as compacted fill.~~
- ~~3. Test method to be used to determine the maximum dry density and optimum moisture content of the material to be used as compacted fill.~~
- ~~4. Maximum allowable thickness of each lift of compacted fill material.~~
- ~~5. Field test method for determining the in-place dry density of the compacted fill.~~
- ~~6. Minimum acceptable in-place dry density expressed as a percentage of the maximum dry density determined in accordance with Item 3.~~
- ~~7. Number and frequency of field tests required to determine compliance with Item 6.~~

Exception: Compacted fill material less than 12 inches (305 mm) in depth need not comply with an approved report, provided it has been compacted to a minimum of 90 percent Modified Proctor in accordance with ASTM D 1557. The compaction shall be verified by a qualified inspector approved by the building official.

1803.6 1804.6 Controlled low-strength material (CLSM). Where ~~footings~~ shallow foundations will bear on controlled low-strength material (CLSM), the CLSM shall comply with the provisions of an approved geotechnical report, ~~which shall contain the following:~~ as set forth in Section 1803.

- ~~1. Specifications for the preparation of the site prior to placement of the CLSM.~~
- ~~2. Specifications for the CLSM.~~
- ~~3. Laboratory or field test method(s) to be used to determine the compressive strength or bearing capacity of the CLSM.~~
- ~~4. Test methods for determining the acceptance of the CLSM in the field.~~
- ~~5. Number and frequency of field tests required to determine compliance with Item 4.~~

1805.3.5 Alternate setback and clearance. Alternate setbacks and clearances are permitted, subject to the approval of the building official. The building official ~~is~~ shall be permitted to require an a geotechnical investigation and recommendation of a registered design professional to demonstrate that the intent of this section has been satisfied. Such an investigation shall include consideration of material, height of slope, slope gradient, load intensity and erosion characteristics of slope material as set forth in Section 1803.5.10.

1808.2.2 General. Pier and pile foundations shall be designed and installed on the basis of a foundation geotechnical investigation as defined set forth in Section ~~1802~~ 1803 ~~unless sufficient data upon which to base the design and installation is available.~~

~~The investigation and report provisions of Section 1802 shall be expanded to include, but not be limited to, the following:~~

1. ~~Recommended pier or pile types and installed capacities.~~
2. ~~Recommended center-to-center spacing of piers or piles.~~
3. ~~Driving criteria.~~
4. ~~Installation procedures.~~
5. ~~Field inspection and reporting procedures (to include procedures for verification of the installed bearing capacity where required).~~
6. ~~Pier or pile load test requirements.~~
7. ~~Durability of pier or pile materials.~~
8. ~~Designation of bearing stratum or strata.~~
9. ~~Reductions for group action, where necessary.~~

1808.2.8.4 Allowable frictional resistance. The assumed frictional resistance developed by any pier or uncased cast-in-place pile shall not exceed one-sixth of the bearing value of the soil material at minimum depth as set forth in Table 1804.2, up to a maximum of 500 psf (24 kPa), unless a greater value is allowed by the building official after a ~~soil~~ geotechnical investigation as specified in Section ~~4802~~ 1803 is submitted or a greater value is substantiated by a load test in accordance with Section 1808.2.8.3. Frictional resistance and bearing resistance shall not be assumed to act simultaneously unless ~~recommended~~ determined by a ~~soil~~ geotechnical investigation ~~as specified in accordance with~~ Section ~~4802~~ 1803.

1808.2.10 Use of higher allowable pier or pile stresses. Allowable stresses greater than those specified for piers or for each pile type in Sections 1809 and 1810 are permitted where supporting data justifying such higher stresses is filed with the building official. Such substantiating data shall include:

1. A ~~soils~~ geotechnical investigation in accordance with Section ~~4802~~ 1803.
2. Pier or pile load tests in accordance with Section 1808.2.8.3, regardless of the load supported by the pier or pile.

The design and installation of the pier or pile foundation shall be under the direct supervision of a registered design professional knowledgeable in the field of soil mechanics and pier or pile foundations who shall certify to the building official that the piers or piles as installed satisfy the design criteria.

3304.1.4 Fill supporting foundations. Fill to be used to support the foundations of any building or structure shall comply with Section ~~4803.5~~ 1804.5. Special inspections of compacted fill shall be in accordance with Section 1704.7.

J101.1 Scope. The provisions of this chapter apply to grading, excavation and earthwork construction, including fills and embankments. Where conflicts occur between the technical requirements of this chapter and the ~~soils~~ geotechnical report, the ~~soils~~ geotechnical report shall govern.

J104.3 Soils report. A ~~soils~~ geotechnical report prepared by a registered design ~~professionals~~ professional shall be provided ~~which~~. The report shall identify contain at least the following:

1. The nature and distribution of existing soils;
2. Conclusions and recommendations for grading procedures;
3. Soil design criteria for any structures or embankments required to accomplish the proposed grading; and
4. Where necessary, slope stability studies, and recommendations and conclusions regarding site geology.

Exception: A ~~soils~~ geotechnical report is not required where the building official determines that the nature of the work applied for is such that a report is not necessary.

J106.1 Maximum slope. The slope of cut surfaces shall be no steeper than is safe for the intended use, and shall be no steeper than 2 horizontal to 1 vertical (50 percent) unless the ~~applicant~~ owner or authorized agent furnishes a ~~soils~~ geotechnical report justifying a steeper slope.

Exceptions:

1. A cut surface may be at a slope of 1.5 horizontal to 1 vertical (67 percent) provided that all the following are met:
 - 1.1. It is not intended to support structures or surcharges.
 - 1.2. It is adequately protected against erosion.
 - 1.3. It is no more than 8 feet (2438 mm) in height.
 - 1.4. It is approved by the building official.
 - 1.5. Ground-water is not encountered.
2. A cut surface in bedrock shall be permitted to be at a slope of 1 horizontal to 1 vertical (100 percent).

J107.1 General. Unless otherwise recommended in the ~~soils~~ geotechnical report, fills shall comply with the ~~conform~~ to provisions of this section.

J107.6 Maximum slope. The slope of fill surfaces shall be no steeper than is safe for the intended use. Fill slopes steeper than 2 horizontal to 1 vertical (50 percent) shall be justified by ~~soils~~ a geotechnical report ~~reports~~ or engineering data.

Reason: Code update and clarification.

Reorganizes and clarifies the sections related to geotechnical investigations and excavation, grading and fill. Provides consistent use of “geotechnical” as related to investigations and reports.

Section 1802.1 allows the building official to require that investigations be conducted by a registered design professional (RDP), but does NOT allow the building official to remove such a requirement that appears elsewhere. Several sections of the code do require investigations by a RDP. The text of 1802.1 is revised to clarify those requirements. Section 1802.4.1 requires that a RDP establish the scope of investigations that involve borings and soundings, drilling and sampling, in-situ testing, and laboratory testing. Since the purpose of borings, soundings, drilling, and sampling is related to “in-situ testing, laboratory testing, or engineering calculations”, the scope is slightly revised by use of those terms in new Section 1803.1. Several sections outside 1802 set forth requirements for geotechnical investigations; those items are all collected and coordinated in this proposal.

Where excavation will remove lateral support for a foundation, current Section 1803.1 requires underpinning or protection against settlement or lateral translation. In practice, compliance requires a geotechnical investigation. Section 1803.5.7 is added to reflect that reality.

The addition of a tenth item in the section on reporting relates to an item that already requires investigation.

The requirements related to seismic design categories are recast (and slightly revised) for better agreement with Section 11.8.2 and 11.8.3 of ASCE 7-05.

The change is made to Section J106.1 because cuts below the ground-water table are less stable than those above.

Bibliography:

Composite of Chapter 18 reorganization assuming all of proponent’s proposals are approved.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Errata: Replace the entire proposal with the following:

Revise as follows:

106.1 [Supp] General. Submittal documents consisting of construction documents, statement of special inspections, geotechnical report and other data shall be submitted in one or more sets with each application for a permit. The construction documents shall be prepared by a registered design professional where required by the statutes of the jurisdiction in which the project is to be constructed. Where special conditions exist, the building official is authorized to require additional construction documents to be prepared by a registered design professional.

Exception: The building official is authorized to waive the submission of construction documents and other data not required to be prepared by a registered design professional if it is found that the nature of the work applied for is such that review of construction documents is not necessary to obtain compliance with this code.

1610.1 General. Basement, foundation and retaining walls shall be designed to resist lateral soil loads. Soil loads specified in Table 1610.1 shall be used as the minimum design lateral soil loads unless ~~specified determined~~ otherwise in by a soil geotechnical investigation report approved by the building official in accordance with Section 1803. Basement walls and other walls in which horizontal movement is restricted at the top shall be designed for at-rest pressure. Retaining walls free to move and rotate at the top ~~are~~ shall be permitted to be designed for active pressure. Design lateral pressure from surcharge loads shall be added to the lateral earth pressure load. Design lateral pressure shall be increased if soils with expansion potential are present at the site.

Exception: Basement walls extending not more than 8 feet (2438 mm) below grade and supporting flexible floor systems shall be permitted to be designed for active pressure.

**SECTION ~~1802~~ 1803
FOUNDATION AND SOILS GEOTECHNICAL INVESTIGATIONS**

~~1802.1~~ **1803.1 General.** ~~Foundation and soils~~ Geotechnical investigations shall be conducted in ~~conformance~~ accordance with ~~Sections 1802.2 through 1802.6~~ Section 1803.2 and reported in accordance with Section 1803.6. Where required by the building official ~~the classification and investigation of the soil or where geotechnical investigations involve in-situ testing, laboratory testing, or engineering calculations, such investigations shall be made~~ conducted by a registered design professional.

~~1802.2~~ **1803.2 Where investigations required.** ~~The owner or applicant shall submit a foundation and soils investigation to the building official where required in~~ Geotechnical investigations shall be conducted in accordance with ~~Sections 1802.2.1 through 1802.2.7~~ 1803.3 through 1803.5.

Exception: The building official ~~need not require~~ shall be permitted to waive the requirement for a foundation or soils geotechnical-investigation where satisfactory data from adjacent areas is available that demonstrates an investigation is not necessary for any of the conditions in ~~Sections 1802.2.1 through 1802.2.6~~ 1803.5.1 through 1803.5.6 and Sections 1803.5.10 and 1803.5.11.

~~1802.3~~ **Soil classification.** Where required, soils shall be classified in accordance with ~~Section 1802.3.1 or 1802.3.2~~.

~~1802.4~~ **1803.3 Basis of investigation.** Soil classification shall be based on observation and any necessary tests of the materials disclosed by borings, test pits or other subsurface exploration made in appropriate locations. Additional studies shall be made as necessary to evaluate slope stability, soil strength, position and adequacy of load-bearing soils, the effect of moisture variation on soil-bearing capacity, compressibility, liquefaction and expansiveness.

1802.4.1 1803.3.1 Exploratory boring Scope of investigation. The scope of the soil geotechnical investigation including the number and types of borings or soundings, the equipment used to drill and/or sample, the in-situ testing equipment and the laboratory testing program shall be determined by a registered design professional.

1802.5 1803.4 Soil boring and sampling Qualified representative. The soil boring and sampling investigation procedure and apparatus shall be in accordance with generally accepted engineering practice. The registered design professional shall have a fully qualified representative on the site during all boring and/or sampling operations.

1803.5 Investigated conditions. Geotechnical investigations shall be conducted as indicated in Sections 1803.5.1 through 1803.5.12.

1802.3.1 1803.5.1 General Classification. For the purposes of this chapter, the definition and classification of Soil materials for use in Table 4804.2 shall be classified in accordance with ASTM D 2487.

1802.2.1 1803.5.2 Questionable soil. Where the classification, strength or compressibility of the soil is in doubt or where a load-bearing value superior to that specified in this code is claimed, the building official shall be permitted to require that the necessary a geotechnical investigation be made conducted. Such investigation shall comply with the provisions of Sections 1802.4 through 1802.6.

1802.2.2 1803.5.3 Expansive soils soil. In areas likely to have expansive soil, the building official shall require soil tests to determine where such soils do exist.

1802.3.2 Expansive soils. Soils meeting all four of the following provisions shall be considered expansive, except that tests to show compliance with Items 1, 2 and 3 shall not be required if the test prescribed in Item 4 is conducted:

1. Plasticity index (PI) of 15 or greater, determined in accordance with ASTM D 4318.
2. More than 10 percent of the soil particles pass a No. 200 sieve (75 µm), determined in accordance with ASTM D 422.
3. More than 10 percent of the soil particles are less than 5 micrometers in size, determined in accordance with ASTM D 422.
4. Expansion index greater than 20, determined in accordance with ASTM D 4829.

1802.2.3 1803.5.4 Ground-water table. A subsurface soil investigation shall be performed to determine whether the existing ground-water table is above or within 5 feet (1524 mm) below the elevation of the lowest floor level where such floor is located below the finished ground level adjacent to the foundation.

Exception: A subsurface soil investigation to determine the location of the ground-water table shall not be required where waterproofing is provided in accordance with Section 1807.

1802.2.4 1803.5.5 Deep Pile and pier foundations. Pile and pier foundations shall be designed and installed on the basis of a foundation investigation and report as specified in Sections 1802.4 through 1802.6 and Section 1808.2.1. Where deep foundations will be used, a geotechnical investigation shall be conducted and shall include all of the following, unless sufficient data upon which to base the design and installation is otherwise available:

1. Recommended deep foundation types and installed capacities.
2. Recommended center-to-center spacing of deep foundation elements.
3. Driving criteria.
4. Installation procedures.
5. Field inspection and reporting procedures (to include procedures for verification of the installed bearing capacity where required).
6. Load test requirements.
7. Suitability of deep foundation materials for the intended environment.
8. Designation of bearing stratum or strata.
9. Reductions for group action, where necessary.

1802.2.5 1803.5.6 Rock strata. Where subsurface explorations at the project site indicate variations or doubtful characteristics in the structure of the rock upon which foundations are to be constructed, a sufficient number of borings shall be made to a depth of not less than 10 feet (3048 mm) below the level of the foundations to provide assurance of the soundness of the foundation bed and its load-bearing capacity.

1803.5.7 Excavation near foundations. Where excavation will remove lateral support from any foundation, an investigation shall be conducted to assess the potential consequences and address mitigation measures.

1803.5.8 Compacted fill material. Where shallow foundations will bear on compacted fill material more than 12 inches (305 mm) in depth, a geotechnical investigation shall be conducted and shall include all of the following:

1. Specifications for the preparation of the site prior to placement of compacted fill material.
2. Specifications for material to be used as compacted fill.
3. Test methods to be used to determine the maximum dry density and optimum moisture content of the material to be used as compacted fill.
4. Maximum allowable thickness of each lift of compacted fill material.
5. Field test method for determining the in-place dry density of the compacted fill.
6. Minimum acceptable in-place dry density expressed as a percentage of the maximum dry density determined in accordance with Item 3.
7. Number and frequency of field tests required to determine compliance with Item 6.

1803.5.9 Controlled low-strength material (CLSM). Where shallow foundations will bear on controlled low-strength material (CLSM), a geotechnical investigation shall be conducted and shall include all of the following:

1. Specifications for the preparation of the site prior to placement of the CLSM.
2. Specifications for the CLSM.
3. Laboratory or field test method(s) to be used to determine the compressive strength or bearing capacity of the CLSM.
4. Test methods for determining the acceptance of the CLSM in the field.
5. Number and frequency of field tests required to determine compliance with Item 4.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

1803.5.10 Alternate setback and clearance. Where setbacks or clearances other than those required in Section 1805.3 are desired, the building official shall be permitted to require a geotechnical investigation by a registered design professional to demonstrate that the intent of Section 1805.3 would be satisfied. Such an investigation shall include consideration of material, height of slope, slope gradient, load intensity and erosion characteristics of slope material.

1802.2.6 1803.5.11 Seismic Design Category Categories C through F. Where a For structures is determined assigned to be in Seismic Design Category C, D, E, or F in accordance with Section 1613, an a geotechnical investigation shall be conducted, and shall include an evaluation of all the following potential geologic and seismic hazards resulting from earthquake motions:

1. Slope instability.
2. Liquefaction.
3. Differential settlement. and
4. Surface rupture displacement due to faulting or lateral spreading.

1802.2.7 1803.5.12 Seismic Design Category Categories D, E or through F. Where the For structures is determined assigned to be in Seismic Design Category D, E or F; in accordance with Section 1613, the soils geotechnical investigation requirements for Seismic Design Category C, given in required by Section 1802.2.6 1803.5.11, shall be met, in addition to the following. The investigation shall also include:

1. A-The determination of lateral pressures on basement and retaining walls due to earthquake motions.
2. The potential for liquefaction and soil strength loss evaluated for site peak ground accelerations, magnitudes, and source characteristics consistent with the design earthquake ground motions. Peak ground acceleration shall be permitted to be determined based on a site-specific study taking into account soil amplification effects, as specified in Chapter 21 of ASCE 7, or, in the absence of such a study, peak ground accelerations shall be assumed equal to $S_{DS}/2.5$, where S_{DS} is determined in accordance with Section 11.4 of ASCE 7.
3. An assessment of potential consequences of any liquefaction and soil strength loss, including estimation of differential settlement, lateral movement or lateral loads on foundations, reduction in foundation soil-bearing capacity, increases in lateral pressures on retaining walls and flotation of buried structures.
4. and shall address Discussion of mitigation measures. Such measures shall be given consideration in the design of the structure and can include, but are such as, but not limited to, ground stabilization, selection of appropriate foundation type and depths, selection of appropriate structural systems to accommodate anticipated displacements and forces, or any combination of these measures and how they shall be considered in the design of the structure. The potential for liquefaction and soil strength loss shall be evaluated for site peak ground acceleration magnitudes and source characteristics consistent with the design earthquake ground motions. Peak ground acceleration shall be determined from a site-specific study taking into account soil amplification effects, as specified in Chapter 21 of ASCE 7.

Exception: A site-specific study need not be performed provided that peak ground acceleration equal to $S_{DS}/2.5$ is used, where S_{DS} is determined in accordance with Section 21.2.1 of ASCE 7.

1802.6 1803.6 Reports Reporting. The soil classification and design load-bearing capacity shall be shown on the construction document. Where geotechnical investigations are required by the building official, a written report of the investigations shall be submitted that includes to the building official by the owner or authorized agent at the time of permit application. This geotechnical report shall include, but need not be limited to, the following information:

1. A plot showing the location of test borings and/or excavations the soil investigations.
2. A complete record of the soil boring and penetration test logs and soil samples.
3. A record of the soil profile.
4. Elevation of the water table, if encountered.
5. Recommendations for foundation type and design criteria, including but not limited to: bearing capacity of natural or compacted soil; provisions to mitigate the effects of expansive soils; mitigation of the effects of liquefaction, differential settlement and varying soil strength; and the effects of adjacent loads.
6. Expected total and differential settlement.
7. Pile and pier Deep foundation information in accordance with Section 4808.2.2 1803.5.5.
8. Special design and construction provisions for footings or foundations of structures founded on expansive soils, as necessary.
9. Compacted fill material properties and testing in accordance with Section 4803.5 1803.5.8.
10. Controlled low-strength material properties and testing in accordance with Section 1803.5.9.

SECTION 4803 1804 EXCAVATION, GRADING AND FILL

1803.4 1804.1 Excavations Excavation near footings or foundations. Excavations Excavation for any purpose shall not remove lateral support from any footing or foundation without first underpinning or protecting the footing or foundation against settlement or lateral translation.

1803.2 1804.2 Placement of backfill. The excavation outside the foundation shall be backfilled with soil that is free of organic material, construction debris, cobbles and boulders or with a controlled low-strength material (CLSM). The backfill shall be placed in lifts and compacted, in a manner that does not damage the foundation or the waterproofing or dampproofing material.

Exception: Controlled low-strength material need not be compacted.

1803.3 1804.3 Site grading. The ground immediately adjacent to the foundation shall be sloped away from the building at a slope of not less than one unit vertical in 20 units horizontal (5-percent slope) for a minimum distance of 10 feet (3048 mm) measured perpendicular to the face of the wall. If physical obstructions or lot lines prohibit 10 feet (3048 mm) of horizontal distance, a 5-percent slope shall be provided to an approved alternate method of diverting water away from the foundation. Swales used for this purpose shall be sloped a minimum of 2 percent where located within 10 feet (3048 mm) of the building foundation. Impervious surfaces within 10 feet (3048 mm) of the building foundation shall be sloped a minimum of 2 percent away from the building.

Exception: Where climatic or soil conditions warrant, the slope of the ground away from the building foundation is shall be permitted to be reduced to not less than one unit vertical in 48 units horizontal (2-percent slope).

The procedure used to establish the final ground level adjacent to the foundation shall account for additional settlement of the backfill.

1803.4 1804.4 Grading and fill in flood hazard areas. In flood hazard areas established in Section 1612.3, grading and/or fill shall not be approved:

1. Unless such fill is placed, compacted and sloped to minimize shifting, slumping and erosion during the rise and fall of floor water and, as applicable, wave action.
2. In floodways, unless it has been demonstrated through hydrologic and hydraulic analyses performed by a registered design professional in accordance with standard engineering practice that the proposed grading or fill, or both, will not result in any increase in flood levels during the occurrence of the design flood.
3. In flood hazard areas subject to high-velocity wave action, unless such fill is conducted and/or placed to avoid diversion of water and waves toward any building or structure.
4. Where design flood elevations are specified but floodways have not been designated, unless it has been demonstrated that the cumulative effect of the proposed flood hazard area encroachment, when combined with all other existing and anticipated flood hazard area encroachment, will not increase the design flood elevation more than one foot (305 mm) at any point.

1803.5 1804.5 Compacted fill material. Where ~~footings shallow foundations~~ will bear on compacted fill material, the compacted fill shall comply with the provisions of an approved geotechnical report, which shall contain the following: as set forth in Section 1803.

1. ~~Specifications for the preparation of the site prior to placement of compacted fill material.~~
2. ~~Specifications for material to be used as compacted fill.~~
3. ~~Test method to be used to determine the maximum dry density and optimum moisture content of the material to be used as compacted fill.~~
4. ~~Maximum allowable thickness of each lift of compacted fill material.~~
5. ~~Field test method for determining the in-place dry density of the compacted fill.~~
6. ~~Minimum acceptable in-place dry density expressed as a percentage of the maximum dry density determined in accordance with Item 3.~~
7. ~~Number and frequency of field tests required to determine compliance with Item 6.~~

Exception: Compacted fill material less than 12 inches (305 mm) in depth need not comply with an approved report, provided it has been compacted to a minimum of 90 percent Modified Proctor in accordance with ASTM D 1557. The compaction shall be verified by a qualified inspector approved by the building official.

1803.6 1804.6 Controlled low-strength material (CLSM). Where ~~footings shallow foundations~~ will bear on controlled low-strength material (CLSM), the CLSM shall comply with the provisions of an approved geotechnical report, which shall contain the following: as set forth in Section 1803.

1. ~~Specifications for the preparation of the site prior to placement of the CLSM.~~
2. ~~Specifications for the CLSM.~~
3. ~~Laboratory or field test method(s) to be used to determine the compressive strength or bearing capacity of the CLSM.~~
4. ~~Test methods for determining the acceptance of the CLSM in the field.~~
5. ~~Number and frequency of field tests required to determine compliance with Item 4.~~

1805.3.5 Alternate setback and clearance. Alternate setbacks and clearances are permitted, subject to the approval of the building official. The building official is shall be permitted to require an geotechnical investigation and recommendation of a registered design professional to demonstrate that the intent of this section has been satisfied. Such an investigation shall include consideration of material, height of slope, slope gradient, load intensity and erosion characteristics of slope material as set forth in Section 1803.5.10.

1808.2.2 General. Pier and pile foundations shall be designed and installed on the basis of a foundation geotechnical investigation as defined set forth in Section 1802 1803 unless sufficient data upon which to base the design and installation is available.

The investigation and report provisions of Section 1802 shall be expanded to include, but not be limited to, the following:

1. ~~Recommended pier or pile types and installed capacities.~~
2. ~~Recommended center-to-center spacing of piers or piles.~~
3. ~~Driving criteria.~~
4. ~~Installation procedures.~~
5. ~~Field inspection and reporting procedures (to include procedures for verification of the installed bearing capacity where required).~~
6. ~~Pier or pile load test requirements.~~
7. ~~Durability of pier or pile materials.~~
8. ~~Designation of bearing stratum or strata.~~
9. ~~Reductions for group action, where necessary.~~

1808.2.8.4 Allowable frictional resistance. The assumed frictional resistance developed by any pier or uncased cast-in-place pile shall not exceed one-sixth of the bearing value of the soil material at minimum depth as set forth in Table 1804.2, up to a maximum of 500 psf (24 kPa), unless a greater value is allowed by the building official after a ~~soil geotechnical~~ investigation as specified in Section ~~1802 1803~~ is submitted or a greater value is substantiated by a load test in accordance with Section 1808.2.8.3. Frictional resistance and bearing resistance shall not be assumed to act simultaneously unless ~~recommended determined~~ by a soil geotechnical investigation as specified in accordance with Section 1802 1803.

1808.2.10 Use of higher allowable pier or pile stresses. Allowable stresses greater than those specified for piers or for each pile type in Sections 1809 and 1810 are permitted where supporting data justifying such higher stresses is filed with the building official. Such substantiating data shall include:

1. A ~~soils geotechnical~~ investigation in accordance with Section ~~1802 1803~~.
2. Pier or pile load tests in accordance with Section 1808.2.8.3, regardless of the load supported by the pier or pile.

The design and installation of the pier or pile foundation shall be under the direct supervision of a registered design professional knowledgeable in the field of soil mechanics and pier or pile foundations who shall certify to the building official that the piers or piles as installed satisfy the design criteria.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

3304.1.4 Fill supporting foundations. Fill to be used to support the foundations of any building or structure shall comply with Section ~~4803.5~~ 1804.5. Special inspections of compacted fill shall be in accordance with Section 1704.7.

J101.1 Scope. The provisions of this chapter apply to grading, excavation and earthwork construction, including fills and embankments. Where conflicts occur between the technical requirements of this chapter and the ~~soils~~ geotechnical report, the ~~soils~~ geotechnical report shall govern.

J104.3 Soils report. A ~~soils~~ geotechnical report prepared by a registered design ~~professionals~~ professional shall be provided ~~which~~. The report shall identify contain at least the following:

1. The nature and distribution of existing soils;
2. Conclusions and recommendations for grading procedures;
3. Soil design criteria for any structures or embankments required to accomplish the proposed grading; and
4. Where necessary, slope stability studies, and recommendations and conclusions regarding site geology.

Exception: A ~~soils~~ geotechnical report is not required where the building official determines that the nature of the work applied for is such that a report is not necessary.

J106.1 Maximum slope. The slope of cut surfaces shall be no steeper than is safe for the intended use, and shall be no steeper than 2 horizontal to 1 vertical (50 percent) unless the ~~applicant~~ owner or authorized agent furnishes a ~~soils~~ geotechnical report justifying a steeper slope.

Exceptions:

1. A cut surface may be at a slope of 1.5 horizontal to 1 vertical (67 percent) provided that all the following are met:
 - 1.1. It is not intended to support structures or surcharges.
 - 1.2. It is adequately protected against erosion.
 - 1.3. It is no more than 8 feet (2438 mm) in height.
 - 1.4. It is approved by the building official.
 - 1.5. Ground-water is not encountered.
2. A cut surface in bedrock shall be permitted to be at a slope of 1 horizontal to 1 vertical (100 percent).

J107.1 General. Unless otherwise recommended in the ~~soils~~ geotechnical report, fills shall ~~conform to~~ comply with the provisions of this section.

J107.6 Maximum slope. The slope of fill surfaces shall be no steeper than is safe for the intended use. Fill slopes steeper than 2 horizontal to 1 vertical (50 percent) shall be justified by ~~soils reports~~ a geotechnical report or engineering data.

Committee Action:

Approved as Modified

Modify proposal as follows:

1803.5.4 Ground-water table. A subsurface soil investigation shall be performed to determine whether the existing ground-water table is above or within 5 feet (1524 mm) below the elevation of the lowest floor level where such floor is located below the finished ground level adjacent to the foundation.

Exception: A subsurface soil investigation to determine the location of the ground-water table shall not be required where waterproofing is provided in accordance with Section ~~4807~~ 1805.

1803.5.10 Alternate setback and clearance. Where setbacks or clearances other than those required in Section ~~4805.3~~ 1808.7 are desired, the building official shall be permitted to require a geotechnical investigation by a registered design professional to demonstrate that the intent of Section ~~4805.3~~ 1808.7 would be satisfied. Such an investigation shall include consideration of material, height of slope, slope gradient, load intensity and erosion characteristics of slope material.

1803.5.12 Seismic Design Categories D through F. For structures assigned to Seismic Design Category D, E or F in accordance with Section 1613, the geotechnical investigation required by Section 1803.5.11 shall also include:

1. The determination of lateral pressures on ~~basement~~ foundation walls and retaining walls due to earthquake motions.
2. The potential for liquefaction and soil strength loss evaluated for site peak ground accelerations, magnitudes, and source characteristics consistent with the design earthquake ground motions. Peak ground acceleration shall be permitted to be determined based on a site-specific study taking into account soil amplification effects, as specified in Chapter 21 of ASCE 7, or, in the absence of such a study, peak ground accelerations shall be assumed equal to $S_{DS} / 2.5$, where S_{DS} is determined in accordance with Section 11.4 of ASCE 7.
3. An assessment of potential consequences of liquefaction and soil strength loss, including estimation of differential settlement, lateral movement, lateral loads on foundations, reduction in foundation soil-bearing capacity, increases in lateral pressures on retaining walls and flotation of buried structures.
4. Discussion of mitigation measures such as, but not limited to, ground stabilization, selection of appropriate foundation type and depths, selection of appropriate structural systems to accommodate anticipated displacements and forces, or any combination of these measures and how they shall be considered in the design of the structure.

(Portions of proposal not shown remain unchanged)

Committee Reason: This proposal improves the code by removing redundancy and reorganizing the Chapter 18 provisions. The modification corrects section references to correlate with other approved changes and provides an editorial change to foundation walls for consistency in terminology.

Assembly Action:

None

Final Hearing Results

S146-07/08

AM

Code Change No: **S147-07/08**

Original Proposal

Sections: 1804, 1804.1, 1804.2, Table 1804.2, 1804.3, 1804.3.1, 1806.3.2, 1806.3.3, 1806.3.4

Proponent: Edwin T. Huston, Smith & Huston, Inc., representing the National Council of Structural Engineering Associations

Revise as follows:

SECTION ~~1804~~ 1806 **ALLOWABLE PRESUMPTIVE LOAD-BEARING VALUES OF SOILS**

~~1804.1 Design.~~ **1806.1 Load combinations.** The presumptive load-bearing values provided in Table ~~1804.2~~ 1806.2 shall be used with the allowable stress design load combinations specified in Section 1605.3. The values of vertical foundation pressure and lateral bearing pressure given in Table 1806.2 shall be permitted to be increased by one-third where used with the alternative basic load combinations of Section 1605.3.2 that include wind or earthquake loads.

~~1804.2~~ **1806.2 Presumptive load-bearing values.** ~~The maximum allowable foundation pressure, lateral pressure or lateral sliding resistance load-bearing values used in design for supporting soils near the surface shall not exceed the values specified in Table 1804.2 1806.2 unless data to substantiate the use of a higher value values are submitted and approved. Where the building official has reason to doubt the classification, strength, or compressibility of the soil, the requirements of Section 1802.2.1 shall be satisfied.~~

Presumptive load-bearing values shall apply to materials with similar physical characteristics and dispositions. Mud, organic silt, organic clays, peat or unprepared fill shall not be assumed to have a presumptive load-bearing capacity unless data to substantiate the use of such a value are submitted.

Exception: A presumptive load-bearing capacity ~~is~~ shall be permitted to be used where the building official deems the load-bearing capacity of mud, organic silt or unprepared fill is adequate for the support of lightweight ~~and~~ or temporary structures.

TABLE ~~1804.2~~ 1806.2
ALLOWABLE FOUNDATION AND LATERAL PRESSURE
PRESUMPTIVE LOAD-BEARING VALUES

CLASS OF MATERIALS	ALLOWABLE VERTICAL FOUNDATION PRESSURE (psf) ^d	LATERAL BEARING PRESSURE (psf/f below natural grade) ^d	LATERAL SLIDING RESISTANCE	
			Coefficient of friction ^a	Cohesion Resistance (psf) ^b
1. Crystalline bedrock	12,000	1,200	0.70	—
2. Sedimentary and foliated rock	4,000	400	0.35	—
3. Sandy gravel and/or gravel (GW and GP)	3,000	200	0.35	—
4. Sand, silty sand, clayey sand, silty gravel and clayey gravel (SW, SP, SM, SC, GM and GC)	2,000	150	0.25	—
5. Clay, sandy clay, silty clay, clayey silt, silt and sandy silt (CL, ML, MH and CH)	1,500 ^e	100	—	130

For SI: 1 pound per square foot = 0.0479 kPa, 1 pound per square foot per foot = 0.157 kPa/m.

a. Coefficient to be multiplied by the dead load.

b. ~~Lateral sliding resistance~~ Cohesion value to be multiplied by the contact area, as limited by Section ~~1806.3.2~~ 1804.3.

- ~~e. Where the building official determines that in-place soils with an allowable bearing capacity of less than 1,500 psf are likely to be present at the site, the allowable bearing capacity shall be determined by a soils investigation.~~
~~d. An increase of one-third is permitted when using the alternate load combinations in Section 1605.3.2 that include wind or earthquake loads.~~

1804.3 1806.3 Lateral sliding load resistance. Where the presumptive values of Table 1806.2 are used to determine resistance to lateral loads, the calculations shall be in accordance with Sections 1806.3.1 through 1806.3.4.

1806.3.1 Combined resistance. The total resistance of structural walls to lateral loads sliding shall be permitted to be determined calculated by combining the values derived from the lateral bearing pressure and the lateral sliding resistance specified shown in Table 1804.2 1806.2 unless data to substantiate the use of higher values are submitted for approval.

1806.3.2 Lateral sliding resistance limit. For clay, sandy clay, silty clay, and clayey silt, silt and sandy silt, in no case shall the lateral sliding resistance exceed one-half the dead load.

~~**1804.3.1 Increases in allowable lateral sliding resistance.** The resistance values derived from the table are~~
1806.3.3 Increase for depth. The lateral bearing pressures specified in Table 1806.2 shall be permitted to be increased by the tabular value for each additional foot (305 mm) of depth to a maximum of 15 times the tabular value.

1806.3.4 Increase for poles. Isolated poles for uses such as flagpoles or signs and poles used to support buildings that are not adversely affected by a 0.5 inch (12.7 mm) motion at the ground surface due to short-term lateral wind or earthquake loads are shall be permitted to be designed using lateral bearing values lateral bearing pressures equal to two times the tabular values.

Reason: Code clarification. Changes are editorial. Moves the footnote (d) concerning load combinations to the introductory section with the same scope. Recasts the content of footnote c by referring to the broader requirement in Section 1802.2.1. Makes the terminology more consistent throughout the section. Removes the unnecessary text concerning substantiation of higher values, which is already covered in Section 1802.2.1 and new Section 1806.2. Fixes the apparent oversight of two soil types that appear in item 5 of the table for the list in the section limiting lateral sliding resistance. Clarifies that “short-term lateral loads” are “wind or earthquake loads”.

Bibliography:

Composite of Chapter 18 reorganization assuming all of proponent’s proposals are approved.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Errata: Revise Exception to Section 1804.2 as follows:

Exception: A presumptive load-bearing capacity ~~is~~ shall be permitted to be used where the building official deems the load-bearing capacity of mud, organic silt or unprepared fill is adequate for the support of lightweight ~~and~~ or temporary structures.

Committee Action:

Approved as Modified

Modify proposal as follows:

1806.2 Presumptive load-bearing values. The load-bearing values used in design for supporting soils near the surface shall not exceed the values specified in Table 1806.2 unless data to substantiate the use of higher values are submitted and approved. Where the building official has reason to doubt the classification, strength, or compressibility of the soil, the requirements of Section ~~1802.2.4~~ 1803.5.2 shall be satisfied.

Presumptive load-bearing values shall apply to materials with similar physical characteristics and dispositions. Mud, organic silt, organic clays, peat or unprepared fill shall not be assumed to have a presumptive load-bearing capacity unless data to substantiate the use of such a value are submitted.

Exception: A presumptive load-bearing capacity shall be permitted to be used where the building official deems the load-bearing capacity of mud, organic silt or unprepared fill is adequate for the support of lightweight or temporary structures.

1806.3.4 Increase for poles. Isolated poles for uses such as flagpoles or signs and poles used to support buildings that are not adversely affected by a 0.5 inch (12.7 mm) motion at the ground surface due to ~~wind or earthquake~~ short-term lateral loads shall be permitted to be designed using lateral bearing pressures equal to two times the tabular values.

(Portions of proposal not shown remain unchanged)

Committee Reason: This code change makes editorial changes that provide clarification of the current requirements. The modification correlates section references with other approved code changes and reinstates the original wording “short term lateral” loads which was more general than had been proposed.

Assembly Action:

None

Code Change No: **S149-07/08**

Original Proposal

Sections: 1610, 1807 (New), 1805.5.2, 1805.5.4, 1805.5.5, 1805.6

Proponent: Edwin T. Huston, Smith & Huston, Inc., representing National Council of Structural Engineering Associations

1. Revise as follows:

1610.1 General. ~~Basement~~ Foundation walls and retaining walls shall be designed to resist lateral soil loads. Soil loads specified in Table 1610.1 shall be used as the minimum design lateral soil loads unless specified otherwise in a soil investigation report approved by the building official. ~~Basement~~ Foundation walls and other walls in which horizontal movement is restricted at the top shall be designed for at-rest pressure. Retaining walls free to move and rotate at the top ~~are shall be~~ permitted to be designed for active pressure. Design lateral pressure from surcharge loads shall be added to the lateral earth pressure load. Design lateral pressure shall be increased if soils ~~with expansion potential are present at the site~~ at the site are expansive. Foundation walls shall be designed to support the weight of the full hydrostatic pressure of undrained backfill unless a drainage system is installed in accordance with Sections 1807.4.2 and 1807.4.3.

Exception: ~~Basement~~ Foundation walls extending not more than 8 feet (2438 mm) below grade and ~~supporting laterally supported at the top by flexible floor systems~~ diaphragms shall be permitted to be designed for active pressure.

TABLE 1610.1
SOIL LATERAL SOIL LOAD

DESCRIPTION OF BACKFILL MATERIAL ^c	UNIFIED SOIL CLASSIFICATION	DESIGN LATERAL SOIL LOAD ^a (pounds per square foot per foot of depth)	
		Active pressure	At-rest pressure
Well-graded, clean gravels; gravel-sand mixes	GW	30	60
Poorly graded clean gravels; gravel-sand mixes	GP	30	60

Poorly graded clean sands; sand-gravel mixes	SP	30	60
Silty sands, poorly graded sand-silt mixes	SM	45	60
Sand-silt clay mix with plastic fines	SM-SC	45	100
Clayey sands, poorly graded sand-clay mixes	SC	60	100
Inorganic silts and clayey silts	ML	45	100
Mixture of inorganic silt and clay	ML-CL	60	100
Inorganic clays of low to medium plasticity	CL	60	100
Organic silts and silt clays, low plasticity	OL	Note b	Note b
Inorganic clayey silts, elastic silts	MH	Note b	Note b
Inorganic clays of high plasticity	CH	Note b	Note b
Organic clays and silty clays	OH	Note b	Note b

For SI: 1 pound per square foot per foot of depth = 0.157 kPa/m, 1 foot = 304.8 mm.

- a. Design lateral soil loads are given for moist conditions for the specified soils at their optimum densities. Actual field conditions shall govern. Submerged or saturated soil pressures shall include the weight of the buoyant soil plus the hydrostatic loads.
- b. Unsuitable as backfill material.
- c. The definition and classification of soil materials shall be in accordance with ASTM D 2487.

SECTION 1807
FOUNDATION WALLS, RETAINING WALLS, AND EMBEDDED POSTS AND POLES

1807.1 Foundation walls. Foundation walls shall be designed and constructed in accordance with Sections 1807.1.1 through 1807.1.6. Foundation walls shall be supported by foundations designed in accordance with Section 1808.

1807.1.1 Design lateral soil loads. Foundation walls shall be designed for the lateral soil loads set forth in Section 1610.

1807.1.2 Unbalanced backfill height. Unbalanced backfill height is the difference in height between the exterior finish ground level and the lower of the top of the concrete footing that supports the foundation wall or the interior finish ground level. Where an interior concrete slab on grade is provided and is in contact with the interior surface of the foundation wall, the unbalanced backfill height shall be permitted to be measured from the exterior finish ground level to the top of the interior concrete slab.

1805.5.1.3 1807.1.3 Rubble stone foundation walls. Foundation walls of rough or random rubble stone shall not be less than 16 inches (406 mm) thick. Rubble stone shall not be used for foundations walls for structures ~~in~~ assigned to Seismic Design Category C, D, E or F.

1805.4.6 1807.1.4 Permanent wood foundations systems. Permanent wood foundation systems shall be designed and installed in accordance with AF&PA Technical Report No. 7. Lumber and plywood shall be treated in accordance with AWPA U1 (Commodity Specification A, Use Category 4B and Section 5.2) and shall be identified in accordance with Section 2303.1.8.1.

1805.5 1807.1.5 Concrete and masonry foundation walls. Concrete and masonry foundation walls shall be designed in accordance with Chapter 19 or 21, respectively as applicable.

Exception: Concrete and masonry foundation walls that are laterally supported at the top and bottom within the parameters of Tables 1805.5(1) through 1805.5(5) ~~are~~ shall be permitted to be designed and constructed in accordance with Sections 1805.5.1 through 1805.5.5 Section 1807.1.6.

1807.1.6 Prescriptive design of concrete and masonry foundation walls. Concrete and masonry foundation walls that are laterally supported at the top and bottom shall be permitted to be designed and constructed in accordance with this section.

1805.5.4 1807.1.6.1 Foundation wall thickness. The minimum thickness of concrete and masonry foundation walls shall comply with Sections 1805.5.1.1 through 1805.5.1.3.

1805.5.1.1 Thickness at top of foundation wall. The thickness of prescriptively designed foundation walls shall not be less than the thickness of the wall supported, except that foundation walls of at least 8 inch (203 mm) nominal width ~~are~~ shall be permitted to support brick-veneered frame walls and 10-inch-wide (254 mm) cavity walls provided the requirements of Section 1805.5.1.2 1807.1.6.2 or 1807.1.6.3 are met. ~~Corbeling of masonry shall be in accordance with Section 2104.2. Where an 8-inch (203 mm) wall is corbelled, the top corbel shall not extend higher than the bottom of the floor framing and shall be a full course of headers at least 6 inches (152 mm) in length or the top course bed joint shall be tied to the vertical wall projection. The tie shall be W2.8 (4.8 mm) and spaced at a maximum horizontal distance of 36 inches (914 mm). The hollow space behind the corbelled masonry shall be filled with mortar or grout.~~

1805.5.1.2 Thickness based on soil loads, unbalanced backfill height and wall height. The thickness of foundation walls shall comply with the requirements of Table 1805.5(5) for concrete walls, Table 1805.5(1) for plain masonry walls or Table 1805.5(2), 1805.5(3) or 1805.5(4) for masonry walls with reinforcement. When using the tables, masonry shall be laid in running bond and the mortar shall be Type M or S.

~~Unbalanced backfill height is the difference in height between the exterior finish ground level and the lower of the top of the concrete footing that supports the foundation wall or the interior finish ground level. Where an interior concrete slab on grade is provided and is in contact with the interior surface of the foundation wall, the unbalanced backfill height is permitted to be measured from the exterior finish ground level to the top of the interior concrete slab.~~

1805.5.2 Foundation wall materials. Concrete foundation walls constructed in accordance with Table 1805.5(5) shall comply with Section 1805.5.2.1. Masonry foundation walls constructed in accordance with Table 1805.5(1), 1805.5(2), 1805.5(3) or 1805.5(4) shall comply with Section 1805.5.2.2.

1805.5.2.4 1807.1.6.2 Concrete foundation walls. Concrete foundation walls shall comply with the following:

1. The thickness shall comply with the requirements of Table 1807.1.6.2.
2. The size and spacing of vertical reinforcement shown in Table ~~1805.5(5)~~ 1807.1.6.2 is based on the use of reinforcement with a minimum yield strength of 60,000 psi (414 Mpa). Vertical reinforcement with a minimum yield strength of 40,000 psi (276 Mpa) or 50,000 psi (345 Mpa) is shall be permitted, provided the same size bar is used and the spacing shown in the table is reduced by multiplying the spacing by 0.67 or 0.83, respectively.
3. Vertical reinforcement, when required, shall be placed nearest the inside face of the wall a distance, d , from the outside face (soil face) of the wall. The distance, d , is equal to the wall thickness, t , minus 1.25 inches (32 mm) plus one-half the bar diameter, d_b , [$d = t - (1.25 + d_b / 2)$]. The reinforcement shall be placed within a tolerance of $\pm 3/8$ inch (9.5 mm) where d is less than or equal to 8 inches (203 mm) or $\pm 1/2$ inch (12.7 mm) where d is greater than 8 inches (203 mm).
4. In lieu of the reinforcement shown in Table ~~1805.5(5)~~ 1807.1.6.2, smaller reinforcing bar sizes with closer spacings that provide an equivalent cross-sectional area of reinforcement per unit length are shall be permitted.
5. Concrete cover for reinforcement measured from the inside face of the wall shall not be less than 3/4 inch (19.1 mm). Concrete cover for reinforcement measured from the outside face of the wall shall not be less than 1.5 inches (38 mm) for No. 5 bars and smaller, and not less than 2 inches (51 mm) for larger bars.
6. Concrete shall have a specified compressive strength, f'_c , of not less than 2,500 psi (17.2 MPa) at 28 days.
7. The unfactored axial load per linear foot of wall shall not exceed $1.2 t f'_c$ where t is the specified wall thickness in inches.

1805.5.5.4 1807.1.6.2.1 Seismic requirements for concrete foundation walls. Based on the seismic design category assigned to the structure in accordance with Section 1613, concrete foundation walls designed using Table ~~1805.5(5)~~ 1807.1.6.2 shall be subject to the following limitations:

1. Seismic Design Categories A and B. No additional seismic requirements, except provide not less than two No. 5 bars around window and door openings. Such bars shall extend at least 24 inches (610 mm) beyond the corners of the openings.
2. Seismic Design Categories C, D, E and F. Tables shall not be used except as allowed for plain concrete members in Section 1908.1.15.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot per foot = 0.157 kPa/m.

- For design lateral soil loads for different classes of soil, see Section 1610.
- Provisions for this table are based on design and construction requirements specified in Section 1805.5.2.1 1807.1.6.2.
- "PC" means plain concrete.
- Where unbalanced backfill height exceeds 8 feet and design lateral soil loads from Table 1610.1 are used, the requirements for 30 and 45 psf per foot of depth are not applicable. See Section 1610.
- For height of unbalanced backfill, see Section 1805.5.1.2 1807.1.2.

1805.5.2.2 1807.1.6.3 Masonry foundation walls. Masonry foundation walls shall comply with the following:

- The thickness shall comply with the requirements of Table 1807.1.6.3(1) for plain masonry walls or Table 1807.1.6.3(2), 1807.1.6.3(3) or 1807.1.6.3(4) for masonry walls with reinforcement.
- Vertical reinforcement shall have a minimum yield strength of 60,000 psi (414 Mpa).
- The specified location of the reinforcement shall equal or exceed the effective depth distance, *d*, noted in Tables 1805.5(2), 1805.5(3) and 1805.5(4) 1807.1.6.3(2), 1807.1.6.3(3) and 1807.1.6.3(4) and shall be measured from the face of the exterior (soil) side of the wall to the center of the vertical reinforcement. The reinforcement shall be placed within the tolerances specified in ACI 530.1/ASCE 6/TMS 402, Article 3.4 B7 of the specified location.
- Grout shall comply with Section 2103.12.
- Concrete masonry units shall comply with ASTM C 90.
- Clay masonry units shall comply with ASTM C 652 for hollow brick, except compliance with ASTM C 62 or C 216 is shall be permitted when where solid masonry units are installed in accordance with Table 1805.5(1) 1807.1.6.3(1) for plain masonry.
- Masonry units shall be laid in running bond and installed with Type M or S mortar in accordance with Section 2103.8.
- The unfactored axial load per linear foot of wall shall not exceed $1.2 t f'_m$ where *t* is the specified wall thickness in inches and *f'_m* is the specified compressive strength of masonry in pounds per square inch.
- At least 4 inches (102 mm) of solid masonry shall be provided at girder supports at the top of hollow masonry unit foundation walls.
- Corbeling of masonry shall be in accordance with Section 2104.2. Where an 8-inch (203 mm) wall is corbelled, the top corbel shall not extend higher than the bottom of the floor framing and shall be a full course of headers at least 6 inches (152 mm) in length or the top course bed joint shall be tied to the vertical wall projection. The tie shall be W2.8 (4.8 mm) and spaced at a maximum horizontal distance of 36 inches (914 mm). The hollow space behind the corbelled masonry shall be filled with mortar or grout.

1805.5.3 1807.1.6.3.1 Alternative foundation wall reinforcement. In lieu of the reinforcement provisions for masonry foundation walls in Table 1805.5(2), 1805.5(3) or 1805.5(4) 1807.1.6.3(2), 1807.1.6.3(3) or 1807.1.6.3(4), alternative reinforcing bar sizes and spacings having an equivalent cross-sectional area of reinforcement per linear foot (mm) of wall are shall be permitted to be used, provided the spacing of reinforcement does not exceed 72 inches (1829 mm) and reinforcing bar sizes do not exceed No. 11.

1805.5.4 Hollow masonry walls. At least 4 inches (102 mm) of solid masonry shall be provided at girder supports at the top of hollow masonry unit foundation walls.

1805.5.5 Seismic requirements. Tables 1805.5(1) through 1805.5(5) shall be subject to the following limitations in Sections 1805.5.5.1 and 1805.5.5.2 based on the seismic design category assigned to the structure as defined in Section 1613.

~~1805.5.5.2 1807.1.6.3.2~~ **Seismic requirements for masonry foundation walls.** Based on the seismic design category assigned to the structure in accordance with Section 1613, masonry foundation walls designed using Tables ~~1805.5(1) through 1805.5(4)~~ 1807.1.6.3(1) through 1807.1.6.3(4) shall be subject to the following limitations:

1. Seismic Design Categories A and B. No additional seismic requirements.
2. Seismic Design Category C. A design using Tables ~~1805.5(1) through 1805.5(4)~~ 1807.1.6.3(1) through 1807.1.6.3(4) is subject to the seismic requirements of Section 2106.4.
3. Seismic Design Category D. A design using Tables ~~1805.2(2) through 1805.5(4)~~ 1807.1.6.3(2) through 1807.1.6.3(4) is subject to the seismic requirements of Section 2106.5.
4. Seismic Design Categories E and F. A design using Tables ~~1805.2(2) through 1805.5(4)~~ 1807.1.6.3(2) through 1807.1.6.3(4) is subject to the seismic requirements of Section 2106.6.

(Renumber subsequent sections)

TABLE 1805.5(1) 1807.1.6.3(1)
PLAIN MASONRY FOUNDATION WALLS ^{a, b, c}

MAXIMUM WALL HEIGHT (feet)	MAXIMUM UNBALANCED BACKFILL HEIGHT ^e (feet)	MINIMUM NOMINAL WALL THICKNESS (inches)

	10-0 ^e	#7 at 72" o.c.	#8 at 72" o.c.	#9 at 72" o.c.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot per foot = 0.157 kPa/m.

- a. For design lateral soil loads, see Section 1610. ~~Soil classes are in accordance with the Unified Soil Classification System and design lateral soil loads are for moist soil conditions without hydrostatic pressure.~~
- b. Provisions for this table are based on design and construction requirements specified in Section 1805.5.2.2 1807.1.6.3.
- c. For alternative reinforcement, see Section ~~1805.5.3~~ 1807.1.6.3.1.
- d. For height of unbalanced backfill, see Section ~~1805.5.1.2~~ 1807.1.2.
- e. Where unbalanced backfill height exceeds 8 feet and design lateral soil loads from Table 1610.1 are used, the requirements for 30 and 45 psf per foot of depth are not applicable. See Section 1610.

SECTION 1806
RETAINING WALLS

1807.2 Retaining walls. Retaining walls shall be designed in accordance with Sections 1807.2.1 through 1807.2.3.

1806.4 1807.2.1 General. Retaining walls shall be designed to ensure stability against overturning, sliding, excessive foundation pressure and water uplift.

1807.2.2 Design lateral soil loads. Retaining walls shall be designed for the lateral soil loads set forth in Section 1610.

1807.2.3 Safety factor. Retaining walls shall be designed ~~for~~ to resist the lateral action of soil to produce sliding and overturning with a safety factor of 1.5 against lateral sliding and overturning. The load combinations of Section 1605.3 shall not apply to these requirements.

1805.7 1807.3 Designs employing lateral bearing Embedded posts and poles. Designs to resist both axial and lateral loads employing posts or poles as columns embedded in earth or embedded in concrete footings in the earth shall ~~conform to the requirements of~~ be in accordance with Sections 1805.7.1 through 1805.7.3 1807.3.1 through 1807.3.3.

1805.7.1 1807.3.1 Limitations. The design procedures outlined in this section are subject to the following limitations:

1. The frictional resistance for structural walls and slabs on silts and clays shall be limited to one-half of the normal force imposed on the soil by the weight of the footing or slab.
2. Posts embedded in earth shall not be used to provide lateral support for structural or nonstructural materials such as plaster, masonry or concrete unless bracing is provided that develops the limited deflection required.

Wood poles shall be treated in accordance with AWPA U1 for sawn timber posts (Commodity Specification A, Use Category 4B), and for round timber posts (Commodity Specification B, Use Category 4B).

1805.7.2 1807.3.2 Design criteria. The depth to resist lateral loads shall be determined by using the design criteria established in Sections 1805.7.2.1 through 1805.7.2.3 1807.3.2.1 through 1807.3.2.3, or by other methods approved by the building official.

1805.7.2.4 1807.3.2.1 Nonconstrained. The following formula shall be used in determining the depth of embedment required to resist lateral loads where no lateral constraint is provided at the ground surface, such as by a rigid floor or rigid ground surface pavement, and where no lateral constraint is provided above the ground surface, such as by a structural diaphragm.

$$d = 0.5 A \{1 + [1 + (4.36 h / A)]^{1/2}\} \quad \text{(Equation 18-1)}$$

where:

- A = 2.34 $P / S_1 b$.
- b = Diameter of round post or footing or diagonal dimension of square post or footing, feet (m).
- d = Depth of embedment in earth in feet (m) but not over 12 feet (3658 mm) for purpose of computing lateral pressure.
- h = Distance in feet (m) from ground surface to point of application of "P."
- P = Applied lateral force in pounds (kN).
- S_1 = Allowable lateral soil-bearing pressure as set forth in Section 1804.3 based on a depth of one-third the depth of embedment in pounds per square foot (psf) (kPa).

1805.7.2.2 1807.3.2.2 Constrained. The following formula shall be used to determine the depth of embedment required to resist lateral loads where lateral constraint is provided at the ground surface, such as by a rigid floor or pavement.

$$d^2 = 4.25 (P h / S_3 b) \quad \text{(Equation 18-2)}$$

or alternatively

$$d^2 = 4.25 (M_g / S_3 b) \quad \text{(Equation 18-3)}$$

where:

- M_g = Moment in the post at grade, in foot-pounds (kN-m).
- S_3 = Allowable lateral soil-bearing pressure as set forth in Section 1804.3 based on a depth equal to the depth of embedment in pounds per square foot (kPa).

1805.7.2.3 1807.3.2.3 Vertical load. The resistance to vertical loads shall be determined by using the allowable soil-bearing vertical foundation pressure set forth in Table 1804.2.

1805.7.3 1807.3.3 Backfill. The backfill in the annular space around columns not embedded in poured footings shall be by one of the following methods:

1. Backfill shall be of concrete with an ultimate strength of 2,000 psi (13.8 MPa) at 28 days. The hole shall not be less than 4 inches (102 mm) larger than the diameter of the column at its bottom or 4 inches (102 mm) larger than the diagonal dimension of a square or rectangular column.
2. Backfill shall be of clean sand. The sand shall be thoroughly compacted by tamping in layers not more than 8 inches (203 mm) in depth.
3. Backfill shall be of controlled low-strength material (CLSM).

2. Delete without substitution:

~~**1805.5.6 Foundation wall drainage.** Foundation walls shall be designed to support the weight of the full hydrostatic pressure of undrained backfill unless a drainage system is installed in accordance with Sections 1807.4.2 and 1807.4.3.~~

~~**1805.6 Foundation plate or sill bolting.** Wood foundation plates or sills shall be bolted or strapped to the foundation or foundation wall as provided in Chapter 23.~~

Reason: Code clarification.

Makes terminology in 1610.1 consistent with Chapter 18; the IBC does not recognize “basement walls,” instead calling them “foundation walls.” Moves the loading requirement of Section 1805.5.6 to 1610.1, where the related loading requirements occur. Makes the scoping language of the Section 1610.1 exception consistent with the sections concerning foundation walls (current Section 1805.5); the key condition is that walls are “laterally supported at the top”, not that the walls are “supporting” a floor. Also, “flexible floor systems” are undefined, but “flexible diaphragms” are defined.

Editorial reorganization to group requirements related to laterally loaded elements (foundation walls, retaining walls, and embedded posts and poles). Recognizes the distinction between foundation walls and foundations. Moves reference to design lateral soil loads from footnotes to text. Moves the definition of unbalanced backfill height from the prescriptive design requirements to a general section. Moves the general requirements related to rubble stone out of the prescriptive design requirements where it does not apply (as rubble stone is not laid in running bond).

Moves requirements related to permanent wood foundation systems to this section on foundation walls. According to AF&PA PWF-06, such systems are “engineered to support lateral soil pressures as well as dead, live, snow, wind, and seismic loads,” where the foundation wall behavior is primary and vertical load behavior is secondary. That document also repeated refers to “foundation walls” (for instance, see Figures 3 and 4).

Makes footnotes for prescriptively designed concrete and masonry foundation walls more consistent. Separates prescriptive design requirements for concrete and masonry foundation walls.

In each of the tables, clarifies the important footnote related to applicability of 30 and 45 psf design loads. Where the unbalanced backfill height exceeds 8 feet, Section 1610.1 requires that foundation walls be designed for at-rest pressures. Where lateral soil loads from Table 1610.1 are used, values of 30 and 45 psf occur only for active pressure. Therefore, where both of these conditions are satisfied, the prescriptive design table entries for 30 and 45 psf cannot be used.

For prescriptively designed masonry foundation walls, the revision to item 7 (running bond) was in 1805.5.1.2, item 9 was in Section 1805.5.4, and item 10 was in Section 1805.5.1.1.

Section 1805.6 is not needed. As that section indicates, the requirements for sill plate anchorage appear in Chapter 23 (Sections 2305.3.11 and 2308.6).

The safety factor for stability of retaining walls predates modern load combinations. The revised text makes clear that load combinations do not apply to consideration of retaining wall sliding and overturning.

Correlation note: In Section 1704.5 exception 2 change “Table 1805.5(1), 1805.5(2), 1805.5(3) or 1805.5(4)” to “Table 1807.1.6.3(1), 1807.1.6.3(2), 1807.1.6.3(3) or 1807.1.6.3(4)”.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Errata: Replace the entire proposal with the following:

Revise as follows:

1610.1 General. ~~Basement~~ Foundation walls and retaining walls shall be designed to resist lateral soil loads. Soil loads specified in Table 1610.1 shall be used as the minimum design lateral soil loads unless specified otherwise in a soil investigation report approved by the building official. ~~Basement Foundation~~ walls and other walls in which horizontal movement is restricted at the top shall be designed for at-rest pressure. Retaining walls free to move and rotate at the top ~~are~~ shall be permitted to be designed for active pressure. Design lateral pressure from surcharge loads shall be added to the lateral earth pressure load. Design lateral pressure shall be increased if soils ~~with expansion potential are present at the site~~ at the site are expansive. Foundation walls shall be designed to support the weight of the full hydrostatic pressure of undrained backfill unless a drainage system is installed in accordance with Sections 1807.4.2 and 1807.4.3.

Exception: ~~Basement Foundation~~ walls extending not more than 8 feet (2438 mm) below grade and ~~supporting~~ laterally supported at the top by flexible floor systems diaphragms shall be permitted to be designed for active pressure.

**TABLE 1610.1
SOIL LATERAL SOIL LOAD**

DESCRIPTION OF BACKFILL MATERIAL ^c	UNIFIED SOIL CLASSIFICATION	DESIGN LATERAL SOIL LOAD ^a (pounds per square foot per foot of depth)	
		Active pressure	At-rest pressure
Well-graded, clean gravels; gravel-sand mixes	GW	30	60
Poorly graded clean gravels; gravel-sand mixes	GP	30	60
Silty gravels, poorly graded gravel-sand mixes	GM	40	60
Clayey gravels, poorly graded gravel-and-clay mixes	GC	45	60
Well-graded, clean sands; gravelly sand mixes	SW	30	60
Poorly graded clean sands; sand-gravel mixes	SP	30	60
Silty sands, poorly graded sand-silt mixes	SM	45	60
Sand-silt clay mix with plastic fines	SM-SC	45	100
Clayey sands, poorly graded sand-clay mixes	SC	60	100
Inorganic silts and clayey silts	ML	45	100
Mixture of inorganic silt and clay	ML-CL	60	100
Inorganic clays of low to medium plasticity	CL	60	100
Organic silts and silt clays, low plasticity	OL	Note b	Note b
Inorganic clayey silts, elastic silts	MH	Note b	Note b
Inorganic clays of high plasticity	CH	Note b	Note b
Organic clays and silty clays	OH	Note b	Note b

For SI: 1 pound per square foot per foot of depth = 0.157 kPa/m, 1 foot = 304.8 mm.

- Design lateral soil loads are given for moist conditions for the specified soils at their optimum densities. Actual field conditions shall govern. Submerged or saturated soil pressures shall include the weight of the buoyant soil plus the hydrostatic loads.
- Unsuitable as backfill material.
- The definition and classification of soil materials shall be in accordance with ASTM D 2487.

SECTION 1807 FOUNDATION WALLS, RETAINING WALLS, AND EMBEDDED POSTS AND POLES

1807.1 Foundation walls. Foundation walls shall be designed and constructed in accordance with Sections 1807.1.1 through 1807.1.6. Foundation walls shall be supported by foundations designed in accordance with Section 1808.

1807.1.1 Design lateral soil loads. Foundation walls shall be designed for the lateral soil loads set forth in Section 1610.

1807.1.2 Unbalanced backfill height. Unbalanced backfill height is the difference in height between the exterior finish ground level and the lower of the top of the concrete footing that supports the foundation wall or the interior finish ground level. Where an interior concrete slab on grade is provided and is in contact with the interior surface of the foundation wall, the unbalanced backfill height shall be permitted to be measured from the exterior finish ground level to the top of the interior concrete slab.

1805.5.1.3 1807.1.3 Rubble stone foundation walls. Foundation walls of rough or random rubble stone shall not be less than 16 inches (406 mm) thick. Rubble stone shall not be used for foundation walls for structures assigned to Seismic Design Category C, D, E or F.

1805.4.6 1807.1.4 Permanent wood foundation systems. Permanent wood foundation systems shall be designed and installed in accordance with AF&PA Technical Report No. 7. Lumber and plywood shall be treated in accordance with AWPA U1 (Commodity Specification A, Use Category 4B and Section 5.2) and shall be identified in accordance with Section 2303.1.8.1.

1805.5 1807.1.5 Concrete and masonry foundation walls. Concrete and masonry foundation walls shall be designed in accordance with Chapter 19 or 21, respectively as applicable.

Exception: Concrete and masonry foundation walls that are laterally supported at the top and bottom within the parameters of Tables 1805.5(4) through 1805.5(5) are shall be permitted to be designed and constructed in accordance with Sections 1805.5.1 through 1805.5.5 Section 1807.1.6.

1807.1.6 Prescriptive design of concrete and masonry foundation walls. Concrete and masonry foundation walls that are laterally supported at the top and bottom shall be permitted to be designed and constructed in accordance with this section.

1805.5.1 1807.1.6.1 Foundation wall thickness. The minimum thickness of concrete and masonry foundation walls shall comply with Sections 1805.5.1.1 through 1805.5.1.3.

1805.5.1.1 Thickness at top of foundation wall. The thickness of prescriptively designed foundation walls shall not be less than the thickness of the wall supported, except that foundation walls of at least 8 inch (203 mm) nominal width are shall be permitted to support brick-veneered frame walls and 10-inch-wide (254 mm) cavity walls provided the requirements of Section 1805.5.1.2 1807.1.6.2 or 1807.1.6.3 are met. Corbeling of masonry shall be in accordance with Section 2104.2. Where an 8-inch (203 mm) wall is corbelled, the top corbel shall not extend higher than the bottom of the floor framing and shall be a full course of headers at least 6 inches (152 mm) in length or the top course bed joint shall be tied to the vertical wall projection. The tie shall be W2.8 (4.8 mm) and spaced at a maximum horizontal distance of 36 inches (914 mm). The hollow space behind the corbelled masonry shall be filled with mortar or grout.

1805.5.1.2 Thickness based on soil loads, unbalanced backfill height and wall height. The thickness of foundation walls shall comply with the requirements of Table 1805.5(5) for concrete walls, Table 1805.5(4) for plain masonry walls or Table 1805.5(2), 1805.5(3) or 1805.5(4) for masonry walls with reinforcement. When using the tables, masonry shall be laid in running bond and the mortar shall be Type M or S.

Unbalanced backfill height is the difference in height between the exterior finish ground level and the lower of the top of the concrete footing that supports the foundation wall or the interior finish ground level. Where an interior concrete slab on grade is provided and is in contact with the interior surface of the foundation wall, the unbalanced backfill height is permitted to be measured from the exterior finish ground level to the top of the interior concrete slab.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

1805.5.2 Foundation wall materials. Concrete foundation walls constructed in accordance with Table 1805.5(5) shall comply with Section 1805.5.2.1. Masonry foundation walls constructed in accordance with Table 1805.5(1), 1805.5(2), 1805.5(3) or 1805.5(4) shall comply with Section 1805.5.2.2.

1805.5.2.4 1807.1.6.2 Concrete foundation walls. Concrete foundation walls shall comply with the following:

1. The thickness shall comply with the requirements of Table 1807.1.6.2.
2. The size and spacing of vertical reinforcement shown in Table ~~1805.5(5)~~ 1807.1.6.2 is based on the use of reinforcement with a minimum yield strength of 60,000 psi (414 Mpa). Vertical reinforcement with a minimum yield strength of 40,000 psi (276 Mpa) or 50,000 psi (345 Mpa) is shall be permitted, provided the same size bar is used and the spacing shown in the table is reduced by multiplying the spacing by 0.67 or 0.83, respectively.
3. Vertical reinforcement, when required, shall be placed nearest the inside face of the wall a distance, d , from the outside face (soil face) of the wall. The distance, d , is equal to the wall thickness, t , minus 1.25 inches (32 mm) plus one-half the bar diameter, d_b , [$d = t - (1.25 + d_b / 2)$]. The reinforcement shall be placed within a tolerance of $\pm 3/8$ inch (9.5 mm) where d is less than or equal to 8 inches (203 mm) or $\pm 1/2$ inch (12.7 mm) where d is greater than 8 inches (203 mm).
4. In lieu of the reinforcement shown in Table ~~1805.5(5)~~ 1807.1.6.2, smaller reinforcing bar sizes with closer spacings that provide an equivalent cross-sectional area of reinforcement per unit length are shall be permitted.
5. Concrete cover for reinforcement measured from the inside face of the wall shall not be less than 3/4 inch (19.1 mm). Concrete cover for reinforcement measured from the outside face of the wall shall not be less than 1.5 inches (38 mm) for No. 5 bars and smaller, and not less than 2 inches (51 mm) for larger bars.
6. Concrete shall have a specified compressive strength, f'_c , of not less than 2,500 psi (17.2 MPa) at 28 days.
7. The unfactored axial load per linear foot of wall shall not exceed $1.2 t f'_c$ where t is the specified wall thickness in inches.

1805.5.4 1807.1.6.2.1 Seismic requirements for concrete foundation walls. Based on the seismic design category assigned to the structure in accordance with Section 1613, concrete foundation walls designed using Table ~~1805.5(5)~~ 1807.1.6.2 shall be subject to the following limitations:

1. Seismic Design Categories A and B. No additional seismic requirements, except provide not less than two No. 5 bars around window and door openings. Such bars shall extend at least 24 inches (610 mm) beyond the corners of the openings.
2. Seismic Design Categories C, D, E and F. Tables shall not be used except as allowed for plain concrete members in Section 1908.1.15.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot per foot = 0.157 kPa/m.

- a. For design lateral soil loads for different classes of soil, see Section 1610.
- b. Provisions for this table are based on design and construction requirements specified in Section ~~1805.5.2.4~~ 1807.1.6.2.
- c. "PC" means plain concrete.
- d. Where unbalanced backfill height exceeds 8 feet and design lateral soil loads from Table 1610.1 are used, the requirements for 30 and 45 psf per foot of depth are not applicable. See Section 1610.
- e. For height of unbalanced backfill, see Section ~~1805.5.4.2~~ 1807.1.2.

1805.5.2.2 1807.1.6.3 Masonry foundation walls. Masonry foundation walls shall comply with the following:

1. The thickness shall comply with the requirements of Table 1807.1.6.3(1) for plain masonry walls or Table 1807.1.6.3(2), 1807.1.6.3(3) or 1807.1.6.3(4) for masonry walls with reinforcement.
2. Vertical reinforcement shall have a minimum yield strength of 60,000 psi (414 Mpa).
3. The specified location of the reinforcement shall equal or exceed the effective depth distance, d , noted in Tables 4805.5(2), 4805.5(3) and 4805.5(4) 1807.1.6.3(2), 1807.1.6.3(3) and 1807.1.6.3(4) and shall be measured from the face of the exterior (soil) side of the wall to the center of the vertical reinforcement. The reinforcement shall be placed within the tolerances specified in ACI 530.1/ASCE 6/TMS 402, Article 3.4 B7 of the specified location.
4. Grout shall comply with Section 2103.12.
5. Concrete masonry units shall comply with ASTM C 90.
6. Clay masonry units shall comply with ASTM C 652 for hollow brick, except compliance with ASTM C 62 or C 216 is shall be permitted ~~when~~ where solid masonry units are installed in accordance with Table 4805.5(4) 1807.1.6.3(1) for plain masonry.
7. Masonry units shall be laid in running bond and installed with Type M or S mortar in accordance with Section 2103.8.
8. The unfactored axial load per linear foot of wall shall not exceed $1.2 t f'_m$ where t is the specified wall thickness in inches and f'_m is the specified compressive strength of masonry in pounds per square inch.
9. At least 4 inches (102 mm) of solid masonry shall be provided at girder supports at the top of hollow masonry unit foundation walls.
10. Corbeling of masonry shall be in accordance with Section 2104.2. Where an 8-inch (203 mm) wall is corbeled, the top corbel shall not extend higher than the bottom of the floor framing and shall be a full course of headers at least 6 inches (152 mm) in length or the top course bed joint shall be tied to the vertical wall projection. The tie shall be W2.8 (4.8 mm) and spaced at a maximum horizontal distance of 36 inches (914 mm). The hollow space behind the corbelled masonry shall be filled with mortar or grout.

4805.5.3 1807.1.6.3.1 Alternative foundation wall reinforcement. In lieu of the reinforcement provisions for masonry foundation walls in Table 4805.5(2), 4805.5(3) or 4805.5(4) 1807.1.6.3(2), 1807.1.6.3(3) or 1807.1.6.3(4), alternative reinforcing bar sizes and spacings having an equivalent cross-sectional area of reinforcement per linear foot (mm) of wall ~~are~~ shall be permitted to be used, provided the spacing of reinforcement does not exceed 72 inches (1829 mm) and reinforcing bar sizes do not exceed No. 11.

4805.5.4 Hollow masonry walls. At least 4 inches (102 mm) of solid masonry shall be provided at girder supports at the top of hollow masonry unit foundation walls.

4805.5.5 Seismic requirements. Tables 1805.5(1) through 1805.5(5) shall be subject to the following limitations in Sections 1805.5.5.1 and 1805.5.5.2 based on the seismic design category assigned to the structure as defined in Section 1613.

4805.5.5.2 1807.1.6.3.2 Seismic requirements for masonry foundation walls. Based on the seismic design category assigned to the structure in accordance with Section 1613, masonry foundation walls designed using Tables 4805.5(1) through 4805.5(4) 1807.1.6.3(1) through 1807.1.6.3(4) shall be subject to the following limitations:

1. Seismic Design Categories A and B. No additional seismic requirements.
2. Seismic Design Category C. A design using Tables 4805.5(1) through 4805.5(4) 1807.1.6.3(1) through 1807.1.6.3(4) is subject to the seismic requirements of Section 2106.4.
3. Seismic Design Category D. A design using Tables 4805.2(2) through 4805.5(4) 1807.1.6.3(2) through 1807.1.6.3(4) is subject to the seismic requirements of Section 2106.5.
4. Seismic Design Categories E and F. A design using Tables 4805.2(2) through 4805.5(4) 1807.1.6.3(2) through 1807.1.6.3(4) is subject to the seismic requirements of Section 2106.6.

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot per foot = 0.157 kPa/m.

- a. For design lateral soil loads, see Section 1610. Soil classes are in accordance with the Unified Soil Classification System and design lateral soil loads are for moist soil conditions without hydrostatic pressure.
- b. Provisions for this table are based on design and construction requirements specified in Section 1805.5.2.2 1807.1.6.3.
- c. For alternative reinforcement, see Section 1805.5.3 1807.1.6.3.1.
- d. For height of unbalanced backfill, see Section 1805.5.4.2 1807.1.2.
- e. Where unbalanced backfill height exceeds 8 feet and design lateral soil loads from Table 1610.1 are used, the requirements for 30 and 45 psf per foot of depth are not applicable. See Section 1610.

TABLE 1805.5(3) 1807.1.6.3(3)
10-INCH MASONRY FOUNDATION WALLS WITH REINFORCEMENT WHERE $d \geq 6.75$ INCHES^{a, b, c}

MAXIMUM WALL HEIGHT (feet-inches)	MAXIMUM UNBALANCED BACKFILL HEIGHT ^d (feet-inches)	VERTICAL REINFORCEMENT

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound per square foot per foot = 0.157 kPa/m.

- a. For design lateral soil loads, see Section 1610. Soil classes are in accordance with the Unified Soil Classification System and design lateral soil loads are for moist soil conditions without hydrostatic pressure.
- b. Provisions for this table are based on design and construction requirements specified in Section 4805.5.2.2 1807.1.6.3.
- c. For alternative reinforcement, see Section 4805.5.3 1807.1.6.3.1.
- d. For height of unbalanced backfill, see Section 4805.5.1.2 1807.1.2.
- e. Where unbalanced backfill height exceeds 8 feet and design lateral soil loads from Table 1610.1 are used, the requirements for 30 and 45 psf per foot of depth are not applicable. See Section 1610.

**SECTION 1806
RETAINING WALLS**

1807.2 Retaining walls. Retaining walls shall be designed in accordance with Sections 1807.2.1 through 1807.2.3.

4806.4 1807.2.1 General. Retaining walls shall be designed to ensure stability against overturning, sliding, excessive foundation pressure and water uplift.

1807.2.2 Design lateral soil loads. Retaining walls shall be designed for the lateral soil loads set forth in Section 1610.

~~1807.2.3 Safety factor.~~ Retaining walls shall be designed for to resist the lateral action of soil to produce sliding and overturning with a safety factor of 1.5 against lateral sliding and overturning. The load combinations of Section 1605.3 shall not apply to these requirements.

~~1805.7 1807.3 Designs employing lateral bearing~~ **Embedded posts and poles.** Designs to resist both axial and lateral loads employing posts or poles as columns embedded in earth or embedded in concrete footings in the earth shall conform to the requirements of be in accordance with Sections 1805.7.1 through 1805.7.3 1807.3.1 through 1807.3.3.

~~1805.7.4~~ **1807.3.1 Limitations.** The design procedures outlined in this section are subject to the following limitations:

1. The frictional resistance for structural walls and slabs on silts and clays shall be limited to one-half of the normal force imposed on the soil by the weight of the footing or slab.
2. Posts embedded in earth shall not be used to provide lateral support for structural or nonstructural materials such as plaster, masonry or concrete unless bracing is provided that develops the limited deflection required.

Wood poles shall be treated in accordance with AWP A U1 for sawn timber posts (Commodity Specification A, Use Category 4B), and for round timber posts (Commodity Specification B, Use Category 4B).

~~1805.7.2~~ **1807.3.2 Design criteria.** The depth to resist lateral loads shall be determined by using the design criteria established in Sections ~~1805.7.2.1 through 1805.7.2.3~~ 1807.3.2.1 through 1807.3.2.3, or by other methods approved by the building official.

~~1805.7.2.4~~ **1807.3.2.1 Nonconstrained.** The following formula shall be used in determining the depth of embedment required to resist lateral loads where no lateral constraint is provided at the ground surface, such as by a rigid floor or rigid ground surface pavement, and where no lateral constraint is provided above the ground surface, such as by a structural diaphragm.

$$d = 0.5 A \{1 + [1 + (4.36 h / A)]^{1/2}\} \quad \text{(Equation 18-1)}$$

where:

- A = 2.34 P / S₁ b.
- b = Diameter of round post or footing or diagonal dimension of square post or footing, feet (m).
- d = Depth of embedment in earth in feet (m) but not over 12 feet (3658 mm) for purpose of computing lateral pressure.
- h = Distance in feet (m) from ground surface to point of application of "P."
- P = Applied lateral force in pounds (kN).
- S₁ = Allowable lateral soil-bearing pressure as set forth in Section 1804.3 based on a depth of one-third the depth of embedment in pounds per square foot (psf) (kPa).

~~1805.7.2.2~~ **1807.3.2.2 Constrained.** The following formula shall be used to determine the depth of embedment required to resist lateral loads where lateral constraint is provided at the ground surface, such as by a rigid floor or pavement.

$$d^2 = 4.25 (P h / S_3 b) \quad \text{(Equation 18-2)}$$

or alternatively

$$d^2 = 4.25 (M_g / S_3 b) \quad \text{(Equation 18-3)}$$

where:

- M_g = Moment in the post at grade, in foot-pounds (kN-m).
- S₃ = Allowable lateral soil-bearing pressure as set forth in Section 1804.3 based on a depth equal to the depth of embedment in pounds per square foot (kPa).

~~1805.7.2.3~~ **1807.3.2.3 Vertical load.** The resistance to vertical loads shall be determined by using the allowable soil-bearing vertical foundation pressure set forth in Table 1804.2.

~~1805.7.3~~ **1807.3.3 Backfill.** The backfill in the annular space around columns not embedded in poured footings shall be by one of the following methods:

1. Backfill shall be of concrete with an ultimate strength of 2,000 psi (13.8 MPa) at 28 days. The hole shall not be less than 4 inches (102 mm) larger than the diameter of the column at its bottom or 4 inches (102 mm) larger than the diagonal dimension of a square or rectangular column.
2. Backfill shall be of clean sand. The sand shall be thoroughly compacted by tamping in layers not more than 8 inches (203 mm) in depth.
3. Backfill shall be of controlled low-strength material (CLSM).

Delete without substitution:

~~1805.5.6 Foundation wall drainage.~~ Foundation walls shall be designed to support the weight of the full hydrostatic pressure of undrained backfill unless a drainage system is installed in accordance with Sections 1807.4.2 and 1807.4.3.

~~1805.6 Foundation plate or sill bolting.~~ Wood foundation plates or sills shall be bolted or strapped to the foundation or foundation wall as provided in Chapter 23.

Committee Action:

Approved as Modified

Modify proposal as follows:

1610.1 General. Foundation walls and retaining walls shall be designed to resist lateral soil loads. Soil loads specified in Table 1610.1 shall be used as the minimum design lateral soil loads unless specified otherwise in a soil investigation report approved by the building official. Foundation walls and other walls in which horizontal movement is restricted at the top shall be designed for at-rest pressure. Retaining walls free to move and

rotate at the top shall be permitted to be designed for active pressure. Design lateral pressure from surcharge loads shall be added to the lateral earth pressure load. Design lateral pressure shall be increased if soils at the site are expansive. Foundation walls shall be designed to support the weight of the full hydrostatic pressure of undrained backfill unless a drainage system is installed in accordance with Sections ~~1807.4.2 and 1807.4.3~~ 1805.4.2 and 1805.4.3.

Exception: Foundation walls extending not more than 8 feet (2438 mm) below grade and laterally supported at the top by flexible diaphragms shall be permitted to be designed for active pressure.

1807.1.6.2.1 Seismic requirements. Based on the seismic design category assigned to the structure in accordance with Section 1613, concrete foundation walls designed using Table 1807.1.6.2 shall be subject to the following limitations:

1. Seismic Design Categories A and B. No additional seismic requirements, except provide reinforcement around openings in accordance with Section 1909.6.3, not less than two No. 5 bars around window and door openings. Such bars shall extend at least 24 inches (610 mm) beyond the corners of the openings.
2. Seismic Design Categories C, D, E and F. Tables shall not be used except as allowed for plain concrete members in Section 1908.1.15.

1807.2.3 Safety factor. Retaining walls shall be designed to resist the lateral action of soil to produce sliding and overturning with a minimum safety factor of 1.5 in each case. The load combinations of Section 1605-3 shall not apply to ~~these requirements~~ this requirement. Instead, design shall be based on 0.7 times nominal earthquake loads, 1.0 times other nominal loads, and investigation with one or more of the variable loads set to zero.

1807.3.2.1 Nonconstrained. The following formula shall be used in determining the depth of embedment required to resist lateral loads where no lateral constraint is provided at the ground surface, such as by a rigid floor or rigid ground surface pavement, and where no lateral constraint is provided above the ground surface, such as by a structural diaphragm.

$$d = 0.5 A \{1 + [1 + (4.36 h / A)]^{1/2}\} \quad \text{(Equation 18-1)}$$

where:

$A = 2.34 P / S_1 b$.

$b =$ Diameter of round post or footing or diagonal dimension of square post or footing, feet (m).

$d =$ Depth of embedment in earth in feet (m) but not over 12 feet (3658 mm) for purpose of computing lateral pressure.

$h =$ Distance in feet (m) from ground surface to point of application of "P."

$P =$ Applied lateral force in pounds (kN).

$S_1 =$ Allowable lateral soil-bearing pressure as set forth in Section ~~1804.3~~ 1806.2 based on a depth of one-third the depth of embedment in pounds per square foot (psf) (kPa).

1807.3.2.2 Constrained. The following formula shall be used to determine the depth of embedment required to resist lateral loads where lateral constraint is provided at the ground surface, such as by a rigid floor or pavement.

$$d^2 = 4.25 (P h / S_3 b) \quad \text{(Equation 18-2)}$$

or alternatively

$$d^2 = 4.25 (M_g / S_3 b) \quad \text{(Equation 18-3)}$$

where:

$M_g =$ Moment in the post at grade, in foot-pounds (kN-m).

$S_3 =$ Allowable lateral soil-bearing pressure as set forth in Section ~~1804.3~~ 1806.2 based on a depth equal to the depth of embedment in pounds per square foot (kPa).

1807.3.2.3 Vertical load. The resistance to vertical loads shall be determined using the vertical foundation pressure set forth in Table ~~1804.2~~ 1806.2.

(Portions of proposal not shown remain unchanged)

Committee Reason: The approval is consistent with other committee actions on proposals that reformat Chapter 18. The modification provides correlation of section references with other approved code changes. The modification to Section 1807.1.6.2.1 provides coordination with Chapter 19 requirements. The modification to Section 1807.2.3 makes editorial changes, clarifies that 0.7 times the earthquake load should be used and coordinates this section with Section 1605.

Original Proposal

Sections: 1801.2, 1801.2.1, 1805, 1808, 1809, 1809.2.1, 1908.2.2.5, 1809.2.3.5, 1810.1.1, 1810.1.3, 1810.2.5, 1810.3.4, 1810.4.4, 1810.6.5, 1812.3, 1812.5, 1812.10, 1812.7, 1808.2.23.2, 1809.2.3.1, 1810.3.4, 1810.5.4, 1810.6.4, 1810.7.2, 1810.7.4, 1810.7.6, 1810.8.2

Proponent: Edwin T. Huston, Smith & Huston, Inc., representing the National Council of Structural Engineering Associations

1. Revise as follows:

1801.2 Design basis. Allowable bearing pressures, allowable stresses and design formulas provided in this chapter shall be used with the allowable stress design load combinations specified in Section 1605.3. The quality and design of materials used structurally in excavations, ~~footings~~ and foundations shall ~~conform to~~ comply with the requirements specified in Chapters 16, 19, 21, 22 and 23 of this code. Excavations and fills shall also comply with Chapter 33.

**SECTION ~~1805~~ 1808
FOOTINGS AND FOUNDATIONS**

1808.1 General. Foundations shall be designed and constructed in accordance with Sections 1808.2 through 1808.9. Shallow foundations shall also satisfy the requirements of Section 1809. Deep foundations shall also satisfy the requirements of Section 1810.

~~1805.4 Footings.~~ Footings shall be designed and constructed in accordance with Sections 1805.4.1 through 1805.4.6.

~~1805.4.1~~ **1808.2 Design for capacity and settlement.** ~~Footings~~ Foundations shall be so designed that the allowable bearing capacity of the soil is not exceeded, and that differential settlement is minimized. ~~The minimum width of footings shall be 12 inches (305 mm).~~ ~~Footings~~ Foundations in areas with expansive soils shall be designed in accordance with the provisions of Section ~~1805.8~~ 1808.6.

~~1805.4.1.1~~ **1808.3 Design loads.** ~~Footings~~ Foundations shall be designed for the most unfavorable effects due to the combinations of loads specified in Section 1605.2 or 1605.3. The dead load is permitted to include the weight of foundations, ~~footings~~ and overlying fill. Reduced live loads, as specified in Sections 1607.9 and 1607.11, ~~are~~ shall be permitted to be used in the design of ~~footings~~ foundations.

~~1801.2.1~~ **1808.3.1 Foundation design for Seismic overturning.** Where ~~the foundation is~~ foundations are proportioned using the load combinations of Section 1605.2, and the computation of seismic overturning ~~moment effects~~ is by ~~the~~ Equivalent Lateral Force method Analysis or the Modal Analysis method, the proportioning shall be in accordance with Section 12.13.4 of ASCE 7.

~~1805.4.1.2~~ **1808.4 Vibratory loads.** Where machinery operations or other vibrations are transmitted through the foundation, consideration shall be given in the ~~footing~~ foundation design to prevent detrimental disturbances of the soil.

~~1805.2.3~~ **1808.5 Shifting or moving soils.** Where it is known that the shallow subsoils are of a shifting or moving character, ~~footings~~ foundations shall be carried to a sufficient depth to ensure stability.

~~1805.8~~ **1808.6 Design for expansive soils.** ~~Footings or~~ Foundations for buildings and structures founded on expansive soils shall be designed in accordance with Section ~~1805.8.1 or 1805.8.2~~ 1808.6.1 or 1808.6.2.

Exception: ~~Footings or~~ Foundation design need not comply with Section ~~1805.8.1 or 1805.8.2~~ 1808.6.1 or 1808.6.2 where one of the following conditions is satisfied:

1. The soil is removed in accordance with Section ~~1805.8.3, nor where~~ 1808.6.3; or
2. The building official approves stabilization of the soil in accordance with Section ~~1805.8.4~~ 1808.6.4.

~~1805.8.1~~ 1808.6.1 Foundations. ~~Footings or~~ Foundations placed on or within the active zone of expansive soils shall be designed to resist differential volume changes and to prevent structural damage to the supported structure. Deflection and racking of the supported structure shall be limited to that which will not interfere with the usability and serviceability of the structure.

Foundations placed below where volume change occurs or below expansive soil shall comply with the following provisions:

1. Foundations extending into or penetrating expansive soils shall be designed to prevent uplift of the supported structure.
2. Foundations penetrating expansive soils shall be designed to resist forces exerted on the foundation due to soil volume changes or shall be isolated from the expansive soil.

~~1805.8.2~~ 1808.6.2 Slab-on-ground foundations. Moments, shears and deflections for use in designing slab-on-ground, mat or raft foundations on expansive soils shall be determined in accordance with *WRI/CRSI Design of Slab-on-ground Foundations* or *PTI Standard Requirements for Analysis of Shallow Concrete Foundations on Expansive Soils*. Using the moments, shears and deflections determined above, nonprestressed slabs-on-ground, mat or raft foundations on expansive soils shall be designed in accordance with *WRI/CRSI Design of Slab-on-ground Foundations* and post-tensioned slab-on-ground, mat or raft foundations on expansive soils shall be designed in accordance with *PTI Standard Requirements for Design of Shallow Post-tensioned Concrete Foundations on Expansive Soils*. It shall be permitted to analyze and design such slabs by other methods that account for soil-structure interaction, the deformed shape of the soil support, the plate or stiffened plate action of the slab, as well as both center lift and edge lift conditions. Such alternative methods shall be rational and the basis for all aspects and parameters of the method shall be available for peer review.

~~1805.8.3~~ 1808.6.3 Removal of expansive soil. Where expansive soil is removed in lieu of designing ~~footings or~~ foundations in accordance with Section ~~1805.8.1 or 1805.8.2~~ 1808.6.1 or 1808.6.2, the soil shall be removed to a depth sufficient to ensure a constant moisture content in the remaining soil. Fill material shall not contain expansive soils and shall comply with Section 1803.5 or 1803.6.

Exception: Expansive soil need not be removed to the depth of constant moisture, provided the confining pressure in the expansive soil created by the fill and supported structure exceeds the swell pressure.

~~1805.8.4~~ 1808.6.4 Stabilization. Where the active zone of expansive soils is stabilized in lieu of designing ~~footings or~~ foundations in accordance with Section ~~1805.8.1 or 1805.8.2~~ 1808.6.1 or 1808.6.2, the soil shall be stabilized by chemical, dewatering, presaturation or equivalent techniques.

~~1805.3~~ 1808.7 Footings Foundations on or adjacent to slopes. The placement of buildings and structures on or adjacent to slopes steeper than one unit vertical in three units horizontal (33.3-percent slope) shall ~~conform to~~ comply with Sections ~~1805.3.1 through 1805.3.5~~ 1808.7.1 through 1808.7.5.

~~1805.3.4~~ 1808.7.1 Building clearance from ascending slopes. In general, buildings below slopes shall be set a sufficient distance from the slope to provide protection from slope drainage, erosion and shallow failures. Except as provided for in Section ~~1805.3.5~~ 1808.7.5 and Figure ~~1805.3.4~~ 1808.7.1, the following criteria will be assumed to provide this protection. Where the existing slope is steeper than one unit vertical in one unit horizontal (100-percent slope), the toe of the slope shall be assumed to be at the intersection of a horizontal plane drawn from the top of the foundation and a plane drawn tangent to the slope at an angle of 45 degrees (0.79 rad) to the horizontal. Where a retaining wall is constructed at the toe of the slope, the height of the slope shall be measured from the top of the wall to the top of the slope.

**FIGURE ~~1805.3.4~~ 1808.7.1
FOUNDATION CLEARANCES FROM SLOPES**

(No changes to Figure)

~~1805.3.2~~ 1808.7.2 Footing Foundation setback from descending slope surface. ~~Footings~~ Foundations on or adjacent to slope surfaces shall be founded in firm material with an embedment and set back from the slope surface sufficient to provide vertical and lateral support for the ~~footing foundation~~ without detrimental settlement. Except as provided for in Section ~~1805.3.5~~ 1808.7.5 and Figure ~~1805.3.4~~ 1808.7.1, the following setback is deemed adequate to meet the criteria. Where the slope is steeper than 1 unit vertical in 1 unit horizontal (100-percent slope), the required setback shall be measured from an imaginary plane 45 degrees (0.79 rad) to the horizontal, projected upward from the toe of the slope.

~~1805.3.3~~ **1808.7.3 Pools.** The setback between pools regulated by this code and slopes shall be equal to one-half the building footing setback distance required by this section. That portion of the pool wall within a horizontal distance of 7 feet (2134 mm) from the top of the slope shall be capable of supporting the water in the pool without soil support.

~~1805.3.4~~ **1808.7.4 Foundation elevation.** On graded sites, the top of any exterior foundation shall extend above the elevation of the street gutter at point of discharge or the inlet of an approved drainage device a minimum of 12 inches (305 mm) plus 2 percent. Alternate elevations are permitted subject to the approval of the building official, provided it can be demonstrated that required drainage to the point of discharge and away from the structure is provided at all locations on the site.

~~1805.3.5~~ **1808.7.5 Alternate setback and clearance.** Alternate setbacks and clearances are permitted, subject to the approval of the building official. The building official is permitted to require an investigation and recommendation of a registered design professional to demonstrate that the intent of this section has been satisfied. Such an investigation shall include consideration of material, height of slope, slope gradient, load intensity and erosion characteristics of slope material.

~~1805.4.2~~ **1808.8 Concrete footings foundations.** The design, materials and construction of concrete ~~footings~~ foundations shall comply with Sections ~~1805.4.2.1 through 1805.4.2.6~~ 1808.8.1 through 1808.8.6 and the provisions of Chapter 19.

Exception: Where a ~~specific design is not provided~~, concrete footings supporting walls of light-frame construction are ~~permitted to be designed in accordance with Table 1805.4.2 1809.7~~, a specific design in accordance with Chapter 19 is not required.

~~1805.4.2.1~~ **1808.8.1 Concrete or grout strength and mix proportioning.** Concrete ~~or grout in footings foundations~~ shall have a specified compressive strength (f'_c) ~~of not less than 2,500 pounds per square inch (psi) (17 237 kPa) at 28 days~~ the largest applicable value indicated in Table 1808.8.1.

~~1810.1.1~~ **Materials.** Concrete shall have a 28-day specified compressive strength (f'_c) ~~of not less than 2,500 psi (17.24 MPa).~~ Where concrete is placed through a funnel hopper at the top of a deep foundation element ~~the pile~~, the concrete mix shall be designed and proportioned so as to produce a cohesive workable mix having a slump of not less than 4 inches (102 mm) and not more than 6 inches (152 mm). Where concrete ~~or grout~~ is to be pumped, the mix design including slump shall be adjusted to produce a pumpable mixture ~~concrete~~.

**TABLE 1808.8.1
MINIMUM SPECIFIED COMPRESSIVE STRENGTH, f'_c , OF CONCRETE OR GROUT**

CONDITION	SPECIFIED COMPRESSIVE STRENGTH, f'_c
1. <u>Foundations for structures assigned to Seismic Design Category A, B, or C</u>	2,500 psi (17.24 MPa)
2a. <u>Foundations for Group R or U occupancies of light-framed construction, two stories or less in height, assigned to Seismic Design Category D, E, or F</u>	2,500 psi (17.24 MPa)
2b. <u>Foundations for other structures assigned to Seismic Design Category D, E, or F</u>	3,000 psi (20.68 MPa)
3. <u>Precast nonprestressed driven piles</u>	3,000 psi (20.68 MPa)
4. <u>Socketed drilled shafts</u>	4,000 psi (27.58 MPa)
5. <u>Micropiles</u>	4,000 psi (27.58 MPa)
6. <u>Precast prestressed driven piles</u>	5,000 psi (34.48 MPa)

1808.8.2 Concrete cover. The concrete cover provided for prestressed and nonprestressed reinforcement in foundations shall be no less than that specified in Table 1808.8.2. Concrete cover shall be measured from the concrete surface to the outermost surface of the steel to which the cover requirement applies. Where concrete is placed in a temporary or permanent casing or a mandrel, the inside face of the casing or mandrel shall be considered the concrete surface.

**TABLE 1808.8.2
MINIMUM CONCRETE COVER**

FOUNDATION ELEMENT OR CONDITION	MINIMUM COVER
1. <u>Shallow foundations</u>	<u>In accordance with Section 7.7 of ACI 318</u>
2. <u>Precast nonprestressed deep foundation elements</u> ^a <u>Exposed to seawater</u> <u>Not manufactured under plant conditions</u> <u>Manufactured under plant control conditions</u>	<u>3 inches (76 mm)</u> <u>2 inches (51 mm)</u> <u>In accordance with Section 7.7.3 of ACI 318</u>
3. <u>Precast prestressed deep foundation elements</u> <u>Exposed to seawater</u> <u>Other</u>	<u>2.5 inches (64 mm)</u> <u>In accordance with Section 7.7.3 of ACI 318</u>
4. <u>Cast-in-place deep foundation elements not enclosed by a steel pipe, tube, or permanent casing</u>	<u>2.5 inches (64 mm)</u>
5. <u>Cast-in-place deep foundation elements enclosed by a steel pipe, tube, or permanent casing</u>	<u>1 inch (25 mm)</u>
6. <u>Structural steel core within a steel pipe, tube, or permanent casing</u>	<u>2 inches (51 mm)</u>

a. Longitudinal bars spaced less than 1.5 inches (38 mm) clear distance apart shall be considered bundled bars for which the minimum concrete cover shall be equal to that for the equivalent diameter of the bundled bars.

1805.4.2.4 1808.8.3 Placement of concrete. Concrete shall be placed in such a manner as to ensure the exclusion of any foreign matter and to secure a full-sized foundation. Concrete footings shall not be placed through water unless a tremie or other method approved by the building official is used. Where placed under or in the presence of water, the concrete shall be deposited by approved means to ensure minimum segregation of the mix and negligible turbulence of the water. Where depositing concrete from the top of a deep foundation element, the concrete shall be chuted directly into smooth-sided pipes or tubes or poured in a rapid and continuous operation through a funnel hopper centered at the top of the element.

1805.4.2.5 1808.8.4 Protection of concrete. Concrete footings foundations shall be protected from freezing during depositing and for a period of not less than five days thereafter. Water shall not be allowed to flow through the deposited concrete.

1805.4.2.6 1808.8.5 Forming of concrete. Concrete footings foundations are permitted to be cast against the earth where, in the opinion of the building official, soil conditions do not require forming form work. Where forming form work is required, it shall be in accordance with Chapter 6 of ACI 318.

1805.9 1808.8.6 Seismic requirements. See Section 1908 for additional requirements for ~~footings and~~ foundations of structures assigned to Seismic Design Category C, D, E or F.

~~For structures assigned to Seismic Design Category D, E or F, provisions of ACI 318, Sections 21.10.1 to 21.10.3 through 21.10.4, shall apply when where not in conflict with the provisions of Section 1805 Sections 1808 through 1810. Concrete shall have a specified compressive strength of not less than 3,000 psi (20.68 MPa) at 28 days.~~

Exceptions:

- ~~1. Group R or U occupancies of light-framed construction and two stories or less above grade plane are permitted to use concrete with a specified compressive strength of not less than 2,500 psi (17.2 MPa) at 28 days.~~
1. Detached one- and two-family dwellings of light-frame construction and two stories or less above grade plane are not required to comply with the provisions of ACI 318, Sections 21.10.1 through ~~to~~ 21.10.3 21.10.4.
2. Section 21.10.4.4(a) of ACI 318 shall not apply.

~~1812.7~~ **1808.9 Vertical masonry foundation elements.** ~~Where the unsupported height of foundation piers exceeds six times the least dimension, the allowable working stress on piers of unit masonry shall be reduced~~ Vertical masonry foundation elements that are not foundation piers as defined in Section 2102.1 shall be designed as piers, walls, or columns, as applicable, in accordance with ACI 530/ASCE 5/TMS 402.

1809
SHALLOW FOUNDATIONS

~~1805.1~~ **1809.1 (Supp) General.** ~~Footings and Shallow foundations shall be designed and constructed in accordance with Sections 1805.1 through 1805.9~~ 1809.2 through 1809.13.

1809.2 Supporting soils. ~~Footings and Shallow foundations shall be built on undisturbed soil, compacted fill material or controlled low-strength material (CLSM). Compacted fill material shall be placed in accordance with Section 1803.5. CLSM shall be placed in accordance with Section 1803.6.~~

1809.3 Stepped footings. ~~The top surface of footings shall be level. The bottom surface of footings is shall be permitted to have a slope not exceeding one unit vertical in 10 units horizontal (10-percent slope). Footings shall be stepped where it is necessary to change the elevation of the top surface of the footing or where the surface of the ground slopes more than one unit vertical in 10 units horizontal (10-percent slope).~~

~~1805.2~~ **1809.4 Depth and width of footings.** ~~The minimum depth of footings below the undisturbed ground surface shall be 12 inches (305 mm). Where applicable, the depth of footings requirements of Section 1809.5 shall also conform to Sections 1805.2.1 through 1805.2.3~~ be satisfied. The minimum width of footings shall be 12 inches (305 mm).

~~1805.2.4~~ **1809.5 Frost protection.** ~~Except where otherwise protected from frost, foundation walls, piers and other permanent supports of buildings and structures shall be protected from frost by one or more of the following methods:~~

1. Extending below the frost line of the locality;
2. Constructing in accordance with ASCE-32; or
3. Erecting on solid rock.

Exception: Free-standing buildings meeting all of the following conditions shall not be required to be protected:

1. ~~Classified in~~ Assigned to Occupancy Category I, in accordance with Section 1604.5;
2. Area of 600 square feet (56 m²) or less for light-frame construction or 400 square feet (37 m²) or less for other than light-frame construction; and
3. Eave height of 10 feet (3048 mm) or less.

~~Footings~~ Shallow foundations shall not bear on frozen soil unless such frozen condition is of a permanent character.

~~1805.2.2~~ **1809.6 Isolated Location of footings.** ~~Footings on granular soil shall be so located that the line drawn between the lower edges of adjoining footings shall not have a slope steeper than 30 degrees (0.52 rad) with the horizontal, unless the material supporting the higher footing is braced or retained or otherwise laterally supported in an approved manner or a greater slope has been properly established by engineering analysis.~~

1809.7 Prescriptive footings for light-frame construction. Where a specific design is not provided, concrete or masonry-unit footings supporting walls of light-frame construction shall be permitted to be designed in accordance with Table 1809.7.

TABLE 1805.4.2 1809.7
PRESCRIPTIVE FOOTINGS SUPPORTING WALLS OF LIGHT-FRAME CONSTRUCTION ^{a, b, c, d, e}

NUMBER OF FLOORS SUPPORTED BY THE FOOTING ^f	WIDTH OF FOOTING (inches)	THICKNESS OF FOOTING (inches)
1	12	6
2	15	6
3	18	8 ^g

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

- a. Depth of footings shall be in accordance with Section ~~1805.2~~ 1809.4.
- b. The ground under the floor ~~is~~ shall be permitted to be excavated to the elevation of the top of the footing.
- c. Interior-stud-bearing walls ~~are~~ shall be permitted to be supported by isolated footings. The footing width and length shall be twice the width shown in this table, and footings shall be spaced not more than 6 feet on center.
- d. See Section 1908 for additional requirements for concrete footings of structures assigned to Seismic Design Category C, D, E or F.
- e. For thickness of foundation walls, see Section 1805.5.
- f. Footings ~~are~~ shall be permitted to support a roof in addition to the stipulated number of floors. Footings supporting roof only shall be as required for supporting one floor.
- g. Plain concrete footings for Group R-3 occupancies ~~are~~ shall be permitted to be 6 inches thick.

~~1805.4.2.3~~ 1809.8 Plain concrete footings. The edge thickness of plain concrete footings supporting walls of other than light-frame construction shall not be less than 8 inches (203 mm) where placed on soil.

Exception: For plain concrete footings supporting Group R-3 occupancies, the edge thickness is permitted to be 6 inches (152 mm), provided that the footing does not extend beyond a distance greater than the thickness of the footing on either side of the supported wall.

~~1805.4.3~~ 1809.9 Masonry-unit footings. The design, materials and construction of masonry-unit footings shall comply with Sections ~~1805.4.3.1 and 1805.4.3.2~~ 1809.9.1 and 1809.9.2, and the provisions of Chapter 21.

Exception: Where a specific design is not provided, masonry-unit footings supporting walls of light-frame construction ~~are~~ shall be permitted to be designed in accordance with Table ~~1805.4.2~~ 1809.7.

~~1805.4.3.1~~ 1809.9.1 Dimensions. Masonry-unit footings shall be laid in Type M or S mortar complying with Section 2103.8 and the depth shall not be less than twice the projection beyond the wall, pier or column. The width shall not be less than 8 inches (203 mm) wider than the wall supported thereon.

~~1805.4.3.2~~ 1809.9.2 Offsets. The maximum offset of each course in brick foundation walls stepped up from the footings shall be 1.5 inches (38 mm) where laid in single courses, and 3 inches (76 mm) where laid in double courses.

~~1805.5.7~~ 1809.10 Pier and curtain wall foundations. Except in Seismic Design Categories D, E and F, pier and curtain wall foundations ~~are~~ shall be permitted to be used to support light-frame construction not more than two stories above grade plane, provided the following requirements are met:

1. All load-bearing walls shall be placed on continuous concrete footings bonded integrally with the exterior wall footings.
2. The minimum actual thickness of a load-bearing masonry wall shall not be less than 4 inches (102 mm) nominal or 3.625 inches (92 mm) actual thickness, and shall be bonded integrally with piers spaced 6 feet (1829 mm) on center (o.c.).
3. Piers shall be constructed in accordance with Chapter 21 and the following:
 - 3.1. The unsupported height of the masonry piers shall not exceed 10 times their least dimension.
 - 3.2. Where structural clay tile or hollow concrete masonry units are used for piers supporting beams and girders, the cellular spaces shall be filled solidly with concrete or Type M or S mortar.

Exception: Unfilled hollow piers ~~are~~ shall be permitted where the unsupported height of the pier is not more than four times its least dimension.
 - 3.3. Hollow piers shall be capped with 4 inches (102 mm) of solid masonry or concrete or the cavities of the top course shall be filled with concrete or grout.
4. The maximum height of a 4-inch (102mm) load-bearing masonry foundation wall supporting wood frame walls and floors shall not be more than 4 feet (1219 mm) in height.
5. The unbalanced fill for 4-inch (102 mm) foundation walls shall not exceed 24 inches (610 mm) for solid masonry, nor 12 inches (305mm) for hollow masonry.

~~1805.4.4~~ 1809.11 Steel grillage footings. Grillage footings of structural steel shapes shall be separated with approved steel spacers and be entirely encased in concrete with at least 6 inches (152 mm) on the bottom and at least 4 inches (102 mm) at all other points. The spaces between the shapes shall be completely filled with concrete or cement grout.

~~1805.4.5~~ 1809.12 Timber footings. Timber footings ~~are~~ shall be permitted for buildings of Type V construction and as otherwise approved by the building official. Such footings shall be treated in accordance with AWPA U1 (Commodity Specification A, Use Category 4B). Treated timbers are not required where placed entirely below

permanent water level, or where used as capping for wood piles that project above the water level over submerged or marsh lands. The compressive stresses perpendicular to grain in untreated timber footings supported upon treated piles shall not exceed 70 percent of the allowable stresses for the species and grade of timber as specified in the AF&PA NDS.

(Re-number Section 1805.4.6)

1805.4.2.2 1809.13 Footing seismic ties. Where a structure is assigned to Seismic Design Category D, E or F in accordance with Section 1613, individual spread footings founded on soil defined in Section 1613.5.2 as Site Class E or F shall be interconnected by ties. Ties shall be capable of carrying, in tension or compression, a force equal to the product of the larger footing load times the seismic coefficient S_{DS} divided by 10 unless it is demonstrated that equivalent restraint is provided by reinforced concrete beams within slabs on grade or reinforced concrete slabs on grade.

1808.2.23.2 Seismic Design Category D, E or F. Where a structure is assigned to Seismic Design Category D, E or F in accordance with Section 1613, the requirements for Seismic Design Category C given in Section 1808.2.23.1 shall be met, in addition to the following. ~~Provisions of ACI 318, Section 21.10.4, shall apply when not in conflict with the provisions of Sections 1808 through 1812. Concrete shall have a specified compressive strength of not less than 3,000 psi (20.68 MPa) at 28 days.~~

Exceptions:

- ~~1. Group R or U occupancies of light framed construction and two stories or less above grade plane are permitted to use concrete with a specified compressive strength of not less than 2,500 psi (17.2 MPa) at 28 days.~~
- ~~2. Detached one and two family dwellings of light frame construction and two stories or less in height are not required to comply with the provisions of ACI 318, Section 21.10.4.~~
- ~~3. Section 21.10.4.4(a) of ACI 318 need not apply to concrete piles.~~

1809.2.3.1 Materials. Prestressing steel shall conform to ASTM A 416. ~~Concrete shall have a 28-day specified compressive strength (f'_c) of not less than 5,000 psi (34.48 MPa).~~

1810.3.4 Reinforcement. For piles installed with a hollow-stem auger, where full-length longitudinal steel reinforcement is placed without lateral ties, the reinforcement shall be placed through the hollow stem of the auger prior to filling the pile with concrete. ~~All pile reinforcement shall have a concrete cover of not less than 2.5 inches (64 mm).~~

Exception: Where physical constraints do not allow the placement of the longitudinal reinforcement prior to filling the pile with concrete or where partial-length longitudinal reinforcement is placed without lateral ties, the reinforcement is allowed to be placed after the piles are completely concreted but while concrete is still in a semifluid state.

1810.5.4 Reinforcement. ~~Reinforcement shall not be placed within 1 inch (25 mm) of the steel shell.~~ Reinforcing shall be required for unsupported pile lengths or where the pile is designed to resist uplift or unbalanced lateral loads.

1810.6.4 Reinforcement. Reinforcement steel shall conform to Section 1810.1.2. ~~Reinforcement shall not be placed within 1 inch (25 mm) of the steel casing.~~

1810.7.2 Materials. Pipe and steel cores shall conform to the material requirements in Section 1809.3. Pipes shall have a minimum wall thickness of 3/8 inch (9.5 mm) and shall be fitted with a suitable steel-driving shoe welded to the bottom of the pipe. ~~Concrete shall have a 28-day specified compressive strength (f'_c) of not less than 4,000 psi (27.58 MPa). The concrete mix shall be designed and proportioned so as to produce a cohesive workable mix with a slump of 4 inches to 6 inches (102 mm to 152 mm).~~

1810.7.4 Structural core. The gross cross-sectional area of the structural steel core shall not exceed 25 percent of the gross area of the caisson. ~~The minimum clearance between the structural core and the pipe shall be 2 inches (51 mm).~~ Where cores are to be spliced, the ends shall be milled or ground to provide full contact and shall be full-depth welded.

1810.7.6 Installation. The rock socket and pile shall be thoroughly cleaned of foreign materials before filling with concrete. Steel cores shall be bedded in cement grout at the base of the rock socket. ~~Concrete shall not be placed through water except where a tremie or other approved method is used.~~

1810.8.2 (Supp) Materials. Grout shall have a specified compressive strength (f'_c) of not less than 4,000 psi (27.58 MPa). The grout mix shall be designed and proportioned so as to produce a pumpable mixture. Reinforcement shall consist of deformed reinforcing bars in accordance with ASTM A 615 Grade 60 or 75 or ASTM A 722 Grade 150.

The steel pipe shall have a minimum wall thickness of 3/16 inch (4.8 mm). Splices shall comply with Section 1808.2.7. The steel pipe shall have a minimum yield strength exceeding 45,000 psi (310 MPa) and a minimum elongation of 15 percent as shown by mill certifications or two coupon test samples per 40,000 pounds (18 160 kg) of pipe.

2. Delete without substitution:

1809.2.2.1 Materials. Concrete shall have a 28-day specified compressive strength (f'_c) of not less than 3,000 psi (20.68 MPa).

1809.2.2.5 Concrete cover. Reinforcement for piles that are not manufactured under plant conditions shall have a concrete cover of not less than 2 inches (51 mm).

Reinforcement for piles manufactured under plant control conditions shall have a concrete cover of not less than 1.25 inches (32 mm) for No. 5 bars and smaller, and not less than 1.5 inches (38 mm) for No. 6 through No. 11 bars except that longitudinal bars spaced less than 1.5 inches (38 mm) clear distance apart shall be considered bundled bars for which the minimum concrete cover shall be equal to that for the equivalent diameter of the bundled bars. Reinforcement for piles exposed to seawater shall have a concrete cover of not less than 3 inches (76 mm).

1809.2.3.5 Concrete cover. Prestressing steel and pile reinforcement shall have a concrete cover of not less than 1-1/4 inches (32 mm) for square piles of 12 inches (305 mm) or smaller size and 1-1/2 inches (38 mm) for larger piles, except that for piles exposed to seawater, the minimum protective concrete cover shall not be less than 2-1/2 inches (64 mm).

1810.1.3 Concrete placement. Concrete shall be placed in such a manner as to ensure the exclusion of any foreign matter and to secure a full-sized shaft. Concrete shall not be placed through water except where a tremie or other approved method is used. When depositing concrete from the top of the pile, the concrete shall not be chuted directly into the pile but shall be poured in a rapid and continuous operation through a funnel hopper centered at the top of the pile.

1810.2.5 Concrete cover. The minimum concrete cover shall be 2-1/2 inches (64 mm) for uncased shafts and 1 inch (25 mm) for cased shafts.

1810.4.4 Concrete cover. Pile reinforcement shall have a concrete cover of not less than 2.5 inches (64 mm), measured from the inside face of the drive casing or mandrel.

1810.6.5 Placing concrete. The placement of concrete shall conform to Section 1810.1.3, but is permitted to be chuted directly into smooth sided pipes and tubes without a centering funnel hopper.

1812.3 Materials. Concrete shall have a 28-day specified compressive strength (f'_c) of not less than 2,500 psi (17.24 MPa). Where concrete is placed through a funnel hopper at the top of the pier, the concrete mix shall be designed and proportioned so as to produce a cohesive workable mix having a slump of not less than 4 inches (102 mm) and not more than 6 inches (152 mm). Where concrete is to be pumped, the mix design including slump shall be adjusted to produce a pumpable concrete.

1812.5 Concrete placement. Concrete shall be placed in such a manner as to ensure the exclusion of any foreign matter and to secure a full-sized shaft. Concrete shall not be placed through water except where a tremie or other approved method is used. When depositing concrete from the top of the pier, the concrete shall not be chuted directly into the pier but shall be poured in a rapid and continuous operation through a funnel hopper centered at the top of the pier.

1812.10 Dewatering. Where piers are carried to depths below water level, the piers shall be constructed by a method that will provide accurate preparation and inspection of the bottom, and the depositing or construction of sound concrete or other masonry in the dry.

Reason: Clarifies the scope of requirements related to design of all foundations and design of shallow foundations. Collects and unifies general requirements (for instance, related to concrete strength, concrete cover, and concrete placement) to reduce unnecessary repetition.

The revisions in new Section 1808.9 fix a conflict in the existing code. The present text refers to masonry foundation piers with an unsupported height that exceeds six times the least dimension. However, Section 2102.1 and ACI 530 define a masonry foundation pier as having a height less than or equal to 4 times its thickness. The revised text directs the reader to the pertinent definition and design requirements. Depending on the dimensions of a vertical masonry element, it is designed as a foundation pier, a pier, a wall, or a column.

Section 1812.10 is deleted because it conflicts with other requirements and unnecessarily restates other requirements. Section 1812.5 permits placement of concrete in water where proper methods are employed, so placement “in the dry” is not required. Requirements for inspection are already set forth in Chapter 17.

Correlation notes: In Section 1704.4 exception item 2.2, change “Table 1805.4.2” to “Table 1809.7”. In Section 1704.4 exception item 4, change “Table 1805.5(5)” to “Table 1807.1.6.2”.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Errata: Replace the entire proposal with the following:

Revise as follows:

1801.2 Design basis. Allowable bearing pressures, allowable stresses and design formulas provided in this chapter shall be used with the allowable stress design load combinations specified in Section 1605.3. The quality and design of materials used structurally in excavations, footings and foundations shall conform to comply with the requirements specified in Chapters 16, 19, 21, 22 and 23 of this code. Excavations and fills shall also comply with Chapter 33.

SECTION ~~1805~~ 1808 FOOTINGS AND FOUNDATIONS

1808.1 General. Foundations shall be designed and constructed in accordance with Sections 1808.2 through 1808.9. Shallow foundations shall also satisfy the requirements of Section 1809. Deep foundations shall also satisfy the requirements of Section 1810.

~~1805.4 Footings.~~ Footings shall be designed and constructed in accordance with Sections 1805.4.1 through 1805.4.6.

~~1805.4.1-1808.2 Design for capacity and settlement.~~ Footings Foundations shall be so designed that the allowable bearing capacity of the soil is not exceeded, and that differential settlement is minimized. ~~The minimum width of footings shall be 12 inches (305 mm).~~ Footings Foundations in areas with expansive soils shall be designed in accordance with the provisions of Section ~~1805.8~~ 1808.6.

~~1805.4.1.4 1808.3 Design loads.~~ Footings Foundations shall be designed for the most unfavorable effects due to the combinations of loads specified in Section 1605.2 or 1605.3. The dead load is permitted to include the weight of foundations, footings and overlying fill. Reduced live loads, as specified in Sections 1607.9 and 1607.11, ~~are shall be~~ permitted to be used in the design of ~~footings foundations~~.

~~1804.2.4 1808.3.1 Foundation design for seismic overturning.~~ Where ~~the foundation is~~ foundations are proportioned using the load combinations of Section 1605.2, and the computation of seismic overturning ~~moment effects~~ is by the Equivalent Lateral Force ~~method~~ Analysis or the Modal Analysis ~~method~~, the proportioning shall be in accordance with Section 12.13.4 of ASCE 7.

~~1805.4.1.2 1808.4 Vibratory loads.~~ Where machinery operations or other vibrations are transmitted through the foundation, consideration shall be given in the ~~footing foundation~~ design to prevent detrimental disturbances of the soil.

~~1805.2.3 1808.5 Shifting or moving soils.~~ Where it is known that the shallow subsoils are of a shifting or moving character, ~~footings foundations~~ shall be carried to a sufficient depth to ensure stability.

~~1805.8 1808.6 Design for expansive soils.~~ Footings or Foundations for buildings and structures founded on expansive soils shall be designed in accordance with Section ~~1805.8.1 or 1805.8.2~~ 1808.6.1 or 1808.6.2.

Exception: Footing or Foundation design need not comply with Section ~~1805.8.1 or 1805.8.2~~ 1808.6.1 or 1808.6.2 where one of the following conditions is satisfied:

1. The soil is removed in accordance with Section ~~1805.8.3, nor where~~ 1808.6.3; or
2. The building official approves stabilization of the soil in accordance with Section ~~1805.8.4~~ 1808.6.4.

~~1805.8.4 1808.6.1 Foundations.~~ Footings or Foundations placed on or within the active zone of expansive soils shall be designed to resist differential volume changes and to prevent structural damage to the supported structure. Deflection and racking of the supported structure shall be limited to that which will not interfere with the usability and serviceability of the structure.

Foundations placed below where volume change occurs or below expansive soil shall comply with the following provisions:

1. Foundations extending into or penetrating expansive soils shall be designed to prevent uplift of the supported structure.
2. Foundations penetrating expansive soils shall be designed to resist forces exerted on the foundation due to soil volume changes or shall be isolated from the expansive soil.

~~1805.8.2 1808.6.2 Slab-on-ground foundations.~~ Moments, shears and deflections for use in designing slab-on-ground, mat or raft foundations on expansive soils shall be determined in accordance with *WRI/CRSI Design of Slab-on-ground Foundations* or *PTI Standard Requirements for Analysis of Shallow Concrete Foundations on Expansive Soils*. Using the moments, shears and deflections determined above, nonprestressed slabs-on-ground, mat or raft foundations on expansive soils shall be designed in accordance with *WRI/CRSI Design of Slab-on-ground Foundations* and post-tensioned slab-on-ground, mat or raft foundations on expansive soils shall be designed in accordance with *PTI Standard*

Requirements for Design of Shallow Post-tensioned Concrete Foundations on Expansive Soils. It shall be permitted to analyze and design such slabs by other methods that account for soil-structure interaction, the deformed shape of the soil support, the plate or stiffened plate action of the slab, as well as both center lift and edge lift conditions. Such alternative methods shall be rational and the basis for all aspects and parameters of the method shall be available for peer review.

1805.8.3 1808.6.3 Removal of expansive soil. Where expansive soil is removed in lieu of designing ~~footings~~ or foundations in accordance with Section ~~1805.8.4 or 1805.8.2~~ 1808.6.1 or 1808.6.2, the soil shall be removed to a depth sufficient to ensure a constant moisture content in the remaining soil. Fill material shall not contain expansive soils and shall comply with Section 1803.5 or 1803.6.

Exception: Expansive soil need not be removed to the depth of constant moisture, provided the confining pressure in the expansive soil created by the fill and supported structure exceeds the swell pressure.

1805.8.4 1808.6.4 Stabilization. Where the active zone of expansive soils is stabilized in lieu of designing ~~footings~~ or foundations in accordance with Section ~~1805.8.4 or 1805.8.2~~ 1808.6.1 or 1808.6.2, the soil shall be stabilized by chemical, dewatering, presaturation or equivalent techniques.

1805.3 1808.7 Footings Foundations on or adjacent to slopes. The placement of buildings and structures on or adjacent to slopes steeper than one unit vertical in three units horizontal (33.3-percent slope) shall ~~conform to~~ comply with Sections ~~1805.3.1 through 1805.3.5~~ 1808.7.1 through 1808.7.5.

1805.3.4 1808.7.1 Building clearance from ascending slopes. In general, buildings below slopes shall be set a sufficient distance from the slope to provide protection from slope drainage, erosion and shallow failures. Except as provided ~~for~~ in Section ~~1805.3.5~~ 1808.7.5 and Figure ~~1805.3.4~~ 1808.7.1, the following criteria will be assumed to provide this protection. Where the existing slope is steeper than one unit vertical in one unit horizontal (100-percent slope), the toe of the slope shall be assumed to be at the intersection of a horizontal plane drawn from the top of the foundation and a plane drawn tangent to the slope at an angle of 45 degrees (0.79 rad) to the horizontal. Where a retaining wall is constructed at the toe of the slope, the height of the slope shall be measured from the top of the wall to the top of the slope.

**FIGURE ~~1805.3.4~~ 1808.7.1
FOUNDATION CLEARANCES FROM SLOPES**

(No changes to Figure)

1805.3.2 1808.7.2 Footing Foundation setback from descending slope surface. ~~Footings Foundations~~ on or adjacent to slope surfaces shall be founded in firm material with an embedment and set back from the slope surface sufficient to provide vertical and lateral support for the ~~footing foundation~~ without detrimental settlement. Except as provided for in Section ~~1805.3.5~~ 1808.7.5 and Figure ~~1805.3.4~~ 1808.7.1, the following setback is deemed adequate to meet the criteria. Where the slope is steeper than 1 unit vertical in 1 unit horizontal (100-percent slope), the required setback shall be measured from an imaginary plane 45 degrees (0.79 rad) to the horizontal, projected upward from the toe of the slope.

1805.3.3 1808.7.3 Pools. The setback between pools regulated by this code and slopes shall be equal to one-half the building footing setback distance required by this section. That portion of the pool wall within a horizontal distance of 7 feet (2134 mm) from the top of the slope shall be capable of supporting the water in the pool without soil support.

1805.3.4 1808.7.4 Foundation elevation. On graded sites, the top of any exterior foundation shall extend above the elevation of the street gutter at point of discharge or the inlet of an approved drainage device a minimum of 12 inches (305 mm) plus 2 percent. Alternate elevations are permitted subject to the approval of the building official, provided it can be demonstrated that required drainage to the point of discharge and away from the structure is provided at all locations on the site.

1805.3.5 1808.7.5 Alternate setback and clearance. Alternate setbacks and clearances are permitted, subject to the approval of the building official. The building official is permitted to require an investigation and recommendation of a registered design professional to demonstrate that the intent of this section has been satisfied. Such an investigation shall include consideration of material, height of slope, slope gradient, load intensity and erosion characteristics of slope material.

1805.4.2 1808.8 Concrete footings foundations. The design, materials and construction of concrete ~~footings~~ foundations shall comply with Sections ~~1805.4.2.1 through 1805.4.2.6~~ 1808.8.1 through 1808.8.6 and the provisions of Chapter 19.

Exception: Where ~~a specific design is not provided~~, concrete footings supporting walls of light-frame construction are ~~permitted to be~~ designed in accordance with Table ~~1805.4.2~~ 1809.7, a specific design in accordance with Chapter 19 is not required.

1805.4.2.4 1808.8.1 Concrete or grout strength and mix proportioning. Concrete or grout in ~~footings~~ foundations shall have a specified compressive strength ($f'c$) of not less than ~~2,500 pounds per square inch (psi) (17-237 kPa)~~ at 28 days the largest applicable value indicated in Table 1808.8.1.

1810.1.1 Materials. Concrete shall have a 28-day specified compressive strength ($f'c$) of not less than 2,500 psi (17.24 MPa). Where concrete is placed through a funnel hopper at the top of ~~a deep foundation element~~ the pile, the concrete mix shall be designed and proportioned so as to produce a cohesive workable mix having a slump of not less than 4 inches (102 mm) and not more than 6 inches (152 mm). Where concrete or grout is to be pumped, the mix design including slump shall be adjusted to produce a pumpable mixture ~~concrete~~.

TABLE 1808.8.1
MINIMUM SPECIFIED COMPRESSIVE STRENGTH, f'_c , OF CONCRETE OR GROUT

CONDITION	SPECIFIED COMPRESSIVE STRENGTH, f'_c
1. Foundations for structures assigned to Seismic Design Category A, B, or C	2,500 psi (17.24 MPa)
2a. Foundations for Group R or U occupancies of light-framed construction, two stories or less in height, assigned to Seismic Design Category D, E, or F	2,500 psi (17.24 MPa)
2b. Foundations for other structures assigned to Seismic Design Category D, E, or F	3,000 psi (20.68 MPa)
3. Precast nonprestressed driven piles	3,000 psi (20.68 MPa)
5. Socketed drilled shafts	4,000 psi (27.58 MPa)
6. Micropiles	4,000 psi (27.58 MPa)
7. Precast prestressed driven piles	5,000 psi (34.48 MPa)

1808.8.2 Concrete cover. The concrete cover provided for prestressed and nonprestressed reinforcement in foundations shall be no less than that specified in Table 1808.8.2. Concrete cover shall be measured from the concrete surface to the outermost surface of the steel to which the cover requirement applies. Where concrete is placed in a temporary or permanent casing or a mandrel, the inside face of the casing or mandrel shall be considered the concrete surface.

TABLE 1808.8.2
MINIMUM CONCRETE COVER

FOUNDATION ELEMENT OR CONDITION	MINIMUM COVER
1. Shallow foundations	In accordance with Section 7.7 of ACI 318
2. Precast nonprestressed deep foundation elements ^a Exposed to seawater Not manufactured under plant conditions Manufactured under plant control conditions	3 inches (76 mm) 2 inches (51 mm) In accordance with Section 7.7.3 of ACI 318
3. Precast prestressed deep foundation elements Exposed to seawater Other	2.5 inches (64 mm) In accordance with Section 7.7.3 of ACI 318
4. Cast-in-place deep foundation elements not enclosed by a steel pipe, tube, or permanent casing	2.5 inches (64 mm)
5. Cast-in-place deep foundation elements enclosed by a steel pipe, tube, or permanent casing	1 inch (25 mm)
6. Structural steel core within a steel pipe, tube, or permanent casing	2 inches (51 mm)

a. Longitudinal bars spaced less than 1.5 inches (38 mm) clear distance apart shall be considered bundled bars for which the minimum concrete cover shall be equal to that for the equivalent diameter of the bundled bars.

1805.4.2.4 1808.8.3 Placement of concrete. Concrete shall be placed in such a manner as to ensure the exclusion of any foreign matter and to secure a full-sized foundation. Concrete ~~footings~~ shall not be placed through water unless a tremie or other method approved by the building official is used. Where placed under or in the presence of water, the concrete shall be deposited by approved means to ensure minimum segregation of the mix and negligible turbulence of the water. ~~Where depositing concrete from the top of a deep foundation element, the concrete shall be chuted directly into smooth-sided pipes or tubes or poured in a rapid and continuous operation through a funnel hopper centered at the top of the element.~~

1805.4.2.5 1808.8.4 Protection of concrete. Concrete ~~footings~~ foundations shall be protected from freezing during depositing and for a period of not less than five days thereafter. Water shall not be allowed to flow through the deposited concrete.

1805.4.2.6 1808.8.5 Forming of concrete. Concrete ~~footings~~ foundations are permitted to be cast against the earth where, in the opinion of the building official, soil conditions do not require ~~forming form work~~. Where ~~forming form work~~ is required, it shall be in accordance with Chapter 6 of ACI 318.

1805.9 1808.8.6 Seismic requirements. See Section 1908 for additional requirements for ~~footings and~~ foundations of structures assigned to Seismic Design Category C, D, E or F.

For structures assigned to Seismic Design Category D, E or F, provisions of ACI 318, Sections 21.10.1 ~~to 21.10.3~~ through 21.10.4, shall apply ~~when where~~ not in conflict with the provisions of ~~Section 1805~~ Sections 1808 through 1810. ~~Concrete shall have a specified compressive strength of not less than 3,000 psi (20.68 MPa) at 28 days.~~

Exceptions:

- Group R or U occupancies of light-framed construction and two stories or less above grade plane are permitted to use concrete with a specified compressive strength of not less than 2,500 psi (17.2 MPa) at 28 days.

1. Detached one- and two-family dwellings of light-frame construction and two stories or less above grade plane are not required to comply with the provisions of ACI 318, Sections 21.10.1 ~~through to 21.10.3~~ 21.10.4.
2. ~~Section 21.10.4.4(a) of ACI 318 shall not apply.~~

~~4812.7~~ **1808.9 Vertical masonry foundation elements.** ~~Where the unsupported height of foundation piers exceeds six times the least dimension, the allowable working stress on piers of unit masonry shall be reduced.~~ Vertical masonry foundation elements that are not foundation piers as defined in Section 2102.1 shall be designed as piers, walls, or columns, as applicable, in accordance with ACI 530/ASCE 5/TMS 402.

1809 SHALLOW FOUNDATIONS

~~4805.4~~ **1809.1 [Supp] General.** ~~Footings and Shallow foundations shall be designed and constructed in accordance with Sections 4805.4 through 4805.9~~ 1809.2 through 1809.13.

1809.2 Supporting soils. ~~Footings and Shallow foundations shall be built on undisturbed soil, compacted fill material or controlled low-strength material (CLSM). Compacted fill material shall be placed in accordance with Section 1803.5. CLSM shall be placed in accordance with Section 1803.6.~~

1809.3 Stepped footings. ~~The top surface of footings shall be level. The bottom surface of footings is shall be permitted to have a slope not exceeding one unit vertical in 10 units horizontal (10-percent slope). Footings shall be stepped where it is necessary to change the elevation of the top surface of the footing or where the surface of the ground slopes more than one unit vertical in 10 units horizontal (10-percent slope).~~

~~4805.2~~ **1809.4 Depth and width of footings.** ~~The minimum depth of footings below the undisturbed ground surface shall be 12 inches (305 mm). Where applicable, the depth of footings requirements of Section 1809.5 shall also conform to Sections 1805.2.1 through 1805.2.3 be satisfied. The minimum width of footings shall be 12 inches (305 mm).~~

~~4805.2.4~~ **1809.5 Frost protection.** ~~Except where otherwise protected from frost, foundation walls, piers and other permanent supports of buildings and structures shall be protected from frost by one or more of the following methods:~~

1. Extending below the frost line of the locality;
2. Constructing in accordance with ASCE-32; or
3. Erecting on solid rock.

Exception: Free-standing buildings meeting all of the following conditions shall not be required to be protected:

1. ~~Classified in~~ Assigned to Occupancy Category I, in accordance with Section 1604.5;
2. Area of 600 square feet (56 m²) or less for light-frame construction or 400 square feet (37 m²) or less for other than light-frame construction; and
3. Eave height of 10 feet (3048 mm) or less.

~~Footings~~ Shallow foundations shall not bear on frozen soil unless such frozen condition is of a permanent character.

~~4805.2.2~~ **1809.6 Isolated Location of footings.** ~~Footings on granular soil shall be so located that the line drawn between the lower edges of adjoining footings shall not have a slope steeper than 30 degrees (0.52 rad) with the horizontal, unless the material supporting the higher footing is braced or retained or otherwise laterally supported in an approved manner or a greater slope has been properly established by engineering analysis.~~

1809.7 Prescriptive footings for light-frame construction. ~~Where a specific design is not provided, concrete or masonry-unit footings supporting walls of light-frame construction shall be permitted to be designed in accordance with Table 1809.7.~~

TABLE 4805.4.2 1809.7
PRESCRIPTIVE FOOTINGS SUPPORTING WALLS OF LIGHT-FRAME CONSTRUCTION ^{a, b, c, d, e}

NUMBER OF FLOORS SUPPORTED BY THE FOOTING ^f	WIDTH OF FOOTING (inches)	THICKNESS OF FOOTING (inches)
1	12	6
2	15	6
3	18	8 ^g

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

- a. ~~Depth of footings shall be in accordance with Section 4805.2~~ 1809.4.
- b. ~~The ground under the floor is shall be~~ permitted to be excavated to the elevation of the top of the footing.
- c. ~~Interior-stud-bearing walls are shall be~~ permitted to be supported by isolated footings. The footing width and length shall be twice the width shown in this table, and footings shall be spaced not more than 6 feet on center.
- d. See Section 1908 for additional requirements for concrete footings of structures assigned to Seismic Design Category C, D, E or F.
- e. For thickness of foundation walls, see Section 1805.5.
- f. ~~Footings are shall be~~ permitted to support a roof in addition to the stipulated number of floors. Footings supporting roof only shall be as required for supporting one floor.
- g. ~~Plain concrete footings for Group R-3 occupancies are shall be~~ permitted to be 6 inches thick.

~~4805.4.2.3~~ **1809.8 Plain concrete footings.** ~~The edge thickness of plain concrete footings supporting walls of other than light-frame construction shall not be less than 8 inches (203 mm) where placed on soil.~~

Exception: For plain concrete footings supporting Group R-3 occupancies, the edge thickness is permitted to be 6 inches (152 mm), provided that the footing does not extend beyond a distance greater than the thickness of the footing on either side of the supported wall.

~~4805.4.3~~ **1809.9 Masonry-unit footings.** ~~The design, materials and construction of masonry-unit footings shall comply with Sections 4805.4.3.1 and 4805.4.3.2~~ 1809.9.1 and 1809.9.2, and the provisions of Chapter 21.

Exception: Where a specific design is not provided, masonry-unit footings supporting walls of light-frame construction ~~are shall be~~ permitted to be designed in accordance with Table ~~4805.4.2~~ 1809.7.

1805.4.3.4 1809.9.1 Dimensions. Masonry-unit footings shall be laid in Type M or S mortar complying with Section 2103.8 and the depth shall not be less than twice the projection beyond the wall, pier or column. The width shall not be less than 8 inches (203 mm) wider than the wall supported thereon.

1805.4.3.2 1809.9.2 Offsets. The maximum offset of each course in brick foundation walls stepped up from the footings shall be 1.5 inches (38 mm) where laid in single courses, and 3 inches (76 mm) where laid in double courses.

1805.5.7 1809.10 Pier and curtain wall foundations. Except in Seismic Design Categories D, E and F, pier and curtain wall foundations ~~are~~ shall be permitted to be used to support light-frame construction not more than two stories above grade plane, provided the following requirements are met:

1. All load-bearing walls shall be placed on continuous concrete footings bonded integrally with the exterior wall footings.
2. The minimum actual thickness of a load-bearing masonry wall shall not be less than 4 inches (102 mm) nominal or 3.625 inches (92 mm) actual thickness, and shall be bonded integrally with piers spaced 6 feet (1829 mm) on center (o.c.).
3. Piers shall be constructed in accordance with Chapter 21 and the following:
 - 3.1. The unsupported height of the masonry piers shall not exceed 10 times their least dimension.
 - 3.2. Where structural clay tile or hollow concrete masonry units are used for piers supporting beams and girders, the cellular spaces shall be filled solidly with concrete or Type M or S mortar.

Exception: Unfilled hollow piers ~~are~~ shall be permitted where the unsupported height of the pier is not more than four times its least dimension.

- 3.3. Hollow piers shall be capped with 4 inches (102 mm) of solid masonry or concrete or the cavities of the top course shall be filled with concrete or grout.
4. The maximum height of a 4-inch (102mm) load-bearing masonry foundation wall supporting wood frame walls and floors shall not be more than 4 feet (1219 mm) in height.
5. The unbalanced fill for 4-inch (102 mm) foundation walls shall not exceed 24 inches (610 mm) for solid masonry, nor 12 inches (305mm) for hollow masonry.

1805.4.4 1809.11 Steel grillage footings. Grillage footings of structural steel shapes shall be separated with approved steel spacers and be entirely encased in concrete with at least 6 inches (152 mm) on the bottom and at least 4 inches (102 mm) at all other points. The spaces between the shapes shall be completely filled with concrete or cement grout.

1805.4.5 1809.12 Timber footings. Timber footings ~~are~~ shall be permitted for buildings of Type V construction and as otherwise approved by the building official. Such footings shall be treated in accordance with AWPA U1 (Commodity Specification A, Use Category 4B). Treated timbers are not required where placed entirely below permanent water level, or where used as capping for wood piles that project above the water level over submerged or marsh lands. The compressive stresses perpendicular to grain in untreated timber footings supported upon treated piles shall not exceed 70 percent of the allowable stresses for the species and grade of timber as specified in the AF&PA NDS.

(Renumber Section 1805.4.6)

1805.4.2.2 1809.13 Footing seismic ties. Where a structure is assigned to Seismic Design Category D, E or F in accordance with Section 1613, individual spread footings founded on soil defined in Section 1613.5.2 as Site Class E or F shall be interconnected by ties. Ties shall be capable of carrying, in tension or compression, a force equal to the product of the larger footing load times the seismic coefficient S_{DS} divided by 10 unless it is demonstrated that equivalent restraint is provided by reinforced concrete beams within slabs on grade or reinforced concrete slabs on grade.

1808.2.23.2 Seismic Design Category D, E or F. Where a structure is assigned to Seismic Design Category D, E or F in accordance with Section 1613, the requirements for Seismic Design Category C given in Section 1808.2.23.1 shall be met, in addition to the following. ~~Provisions of ACI 318, Section 21.10.4, shall apply when not in conflict with the provisions of Sections 1808 through 1812. Concrete shall have a specified compressive strength of not less than 3,000 psi (20.68 MPa) at 28 days.~~

Exceptions:

- ~~1. Group R or U occupancies of light-framed construction and two stories or less above grade plane are permitted to use concrete with a specified compressive strength of not less than 2,500 psi (17.2 MPa) at 28 days.~~
- ~~2. Detached one- and two-family dwellings of light-frame construction and two stories or less in height are not required to comply with the provisions of ACI 318, Section 21.10.4.~~
- ~~3. Section 21.10.4.4(a) of ACI 318 need not apply to concrete piles.~~

1809.2.3.1 Materials. Prestressing steel shall conform to ASTM A 416. ~~Concrete shall have a 28-day specified compressive strength (f'_c) of not less than 5,000 psi (34.48 MPa).~~

1810.3.4 Reinforcement. For piles installed with a hollow-stem auger, where full-length longitudinal steel reinforcement is placed without lateral ties, the reinforcement shall be placed through the hollow stem of the auger prior to filling the pile with concrete. ~~All pile reinforcement shall have a concrete cover of not less than 2.5 inches (64 mm).~~

Exception: Where physical constraints do not allow the placement of the longitudinal reinforcement prior to filling the pile with concrete or where partial-length longitudinal reinforcement is placed without lateral ties, the reinforcement is allowed to be placed after the piles are completely concreted but while concrete is still in a semifluid state.

1810.5.4 Reinforcement. ~~Reinforcement shall not be placed within 1 inch (25 mm) of the steel shell.~~ Reinforcing shall be required for unsupported pile lengths or where the pile is designed to resist uplift or unbalanced lateral loads.

1810.6.4 Reinforcement. Reinforcement steel shall conform to Section 1810.1.2. ~~Reinforcement shall not be placed within 1 inch (25 mm) of the steel casing.~~

1810.7.2 Materials. Pipe and steel cores shall conform to the material requirements in Section 1809.3. Pipes shall have a minimum wall thickness of 3/8 inch (9.5 mm) and shall be fitted with a suitable steel-driving shoe welded to the bottom of the pipe. ~~Concrete shall have a 28-day specified compressive strength (f'_c) of not less than 4,000 psi (27.58 MPa). The concrete mix shall be designed and proportioned so as to produce a cohesive workable mix with a slump of 4 inches to 6 inches (102 mm to 152 mm).~~

1810.7.4 Structural core. The gross cross-sectional area of the structural steel core shall not exceed 25 percent of the gross area of the caisson. ~~The minimum clearance between the structural core and the pipe shall be 2 inches (51 mm).~~ Where cores are to be spliced, the ends shall be milled or ground to provide full contact and shall be full-depth welded.

1810.7.6 Installation. The rock socket and pile shall be thoroughly cleaned of foreign materials before filling with concrete. Steel cores shall be bedded in cement grout at the base of the rock socket. ~~Concrete shall not be placed through water except where a tremie or other approved method is used.~~

1810.8.2 [Supp] Materials. ~~Grout shall have a specified compressive strength (f'_c) of not less than 4,000 psi (27.58 MPa). The grout mix shall be designed and proportioned so as to produce a pumpable mixture.~~ Reinforcement shall consist of deformed reinforcing bars in accordance with ASTM A 615 Grade 60 or 75 or ASTM A 722 Grade 150.

The steel pipe shall have a minimum wall thickness of 3/16 inch (4.8 mm). Splices shall comply with Section 1808.2.7. The steel pipe shall have a minimum yield strength exceeding 45,000 psi (310 MPa) and a minimum elongation of 15 percent as shown by mill certifications or two coupon test samples per 40,000 pounds (18 160 kg) of pipe.

Delete without substitution:

~~**1809.2.2.1 Materials.** Concrete shall have a 28-day specified compressive strength (f'_c) of not less than 3,000 psi (20.68 MPa).~~

~~**1809.2.2.5 Concrete cover.** Reinforcement for piles that are not manufactured under plant conditions shall have a concrete cover of not less than 2 inches (51 mm).~~

~~Reinforcement for piles manufactured under plant control conditions shall have a concrete cover of not less than 1.25 inches (32 mm) for No. 5 bars and smaller, and not less than 1.5 inches (38 mm) for No. 6 through No. 11 bars except that longitudinal bars spaced less than 1.5 inches (38 mm) clear distance apart shall be considered bundled bars for which the minimum concrete cover shall be equal to that for the equivalent diameter of the bundled bars. Reinforcement for piles exposed to seawater shall have a concrete cover of not less than 3 inches (76 mm).~~

~~**1809.2.3.5 Concrete cover.** Prestressing steel and pile reinforcement shall have a concrete cover of not less than 1-1/4 inches (32 mm) for square piles of 12 inches (305 mm) or smaller size and 1-1/2 inches (38 mm) for larger piles, except that for piles exposed to seawater, the minimum protective concrete cover shall not be less than 2-1/2 inches (64 mm).~~

~~**1810.1.3 Concrete placement.** Concrete shall be placed in such a manner as to ensure the exclusion of any foreign matter and to secure a full-sized shaft. Concrete shall not be placed through water except where a tremie or other approved method is used. When depositing concrete from the top of the pile, the concrete shall not be chuted directly into the pile but shall be poured in a rapid and continuous operation through a funnel hopper centered at the top of the pile.~~

~~**1810.2.5 Concrete cover.** The minimum concrete cover shall be 2-1/2 inches (64 mm) for uncased shafts and 1 inch (25 mm) for cased shafts.~~

~~**1810.4.4 Concrete cover.** Pile reinforcement shall have a concrete cover of not less than 2.5 inches (64 mm), measured from the inside face of the drive casing or mandrel.~~

~~**1810.6.5 Placing concrete.** The placement of concrete shall conform to Section 1810.1.3, but is permitted to be chuted directly into smooth-sided pipes and tubes without a centering funnel hopper.~~

~~**1812.3 Materials.** Concrete shall have a 28-day specified compressive strength (f'_c) of not less than 2,500 psi (17.24 MPa). Where concrete is placed through a funnel hopper at the top of the pier, the concrete mix shall be designed and proportioned so as to produce a cohesive workable mix having a slump of not less than 4 inches (102 mm) and not more than 6 inches (152 mm). Where concrete is to be pumped, the mix design including slump shall be adjusted to produce a pumpable concrete.~~

~~**1812.5 Concrete placement.** Concrete shall be placed in such a manner as to ensure the exclusion of any foreign matter and to secure a full-sized shaft. Concrete shall not be placed through water except where a tremie or other approved method is used. When depositing concrete from the top of the pier, the concrete shall not be chuted directly into the pier but shall be poured in a rapid and continuous operation through a funnel hopper centered at the top of the pier.~~

~~**1812.10 Dewatering.** Where piers are carried to depths below water level, the piers shall be constructed by a method that will provide accurate preparation and inspection of the bottom, and the depositing or construction of sound concrete or other masonry in the dry.~~

Committee Action:

Approved as Modified

Modify proposal as follows:

1808.6.3 Removal of expansive soil. Where expansive soil is removed in lieu of designing foundations in accordance with Section 1808.6.1 or 1808.6.2, the soil shall be removed to a depth sufficient to ensure a constant moisture content in the remaining soil. Fill material shall not contain expansive soils and shall comply with Section ~~1803.5 or 1803.6~~ 1804.5 or 1804.6.

Exception: Expansive soil need not be removed to the depth of constant moisture, provided the confining pressure in the expansive soil created by the fill and supported structure exceeds the swell pressure.

**TABLE 1808.8.1
MINIMUM SPECIFIED COMPRESSIVE STRENGTH, f'_c , OF CONCRETE OR GROUT**

FOUNDATION ELEMENT OR CONDITION	SPECIFIED COMPRESSIVE STRENGTH, f'_c
1. Foundations for structures assigned to Seismic Design Category A, B, or C	2,500 psi
2a. Foundations for Group R or U occupancies of light-framed construction, two stories or less in height, assigned to Seismic Design Category D, E, or F	2,500 psi
2b. Foundations for other structures assigned to Seismic Design Category D, E, or F	3,000 psi
3. Precast nonprestressed driven piles	3,000 4,000 psi
5. Socketed drilled shafts	4,000 psi
6. Micropiles	4,000 psi
7. Precast prestressed driven piles	5,000 psi

1808.8.2 Concrete cover. The concrete cover provided for prestressed and nonprestressed reinforcement in foundations shall be no less than ~~that the largest applicable value specified in Table 1808.8.2. Longitudinal bars spaced less than 1.5 inches (38 mm) clear distance apart shall be considered bundled bars for which the concrete cover provided shall also be no less than that required by Section 7.7.4 of ACI 318.~~ Concrete cover shall be measured from the concrete surface to the outermost surface of the steel to which the cover requirement applies. Where concrete is placed in a temporary or permanent casing or a mandrel, the inside face of the casing or mandrel shall be considered the concrete surface.

**TABLE 1808.8.2
MINIMUM CONCRETE COVER**

FOUNDATION ELEMENT OR CONDITION	MINIMUM COVER
1. Shallow foundations	In accordance with Section 7.7 of ACI 318
2. Precast nonprestressed deep foundation elements ^a Exposed to seawater Not manufactured under plant conditions Manufactured under plant control conditions	3 inches 2 inches In accordance with Section 7.7.3 of ACI 318
3. Precast prestressed deep foundation elements Exposed to seawater Other	2.5 inches In accordance with Section 7.7.3 of ACI 318
4. Cast-in-place deep foundation elements not enclosed by a steel pipe, tube, or permanent casing	2.5 inches
5. Cast-in-place deep foundation elements enclosed by a steel pipe, tube, or permanent casing	1 inch
6. Structural steel core within a steel pipe, tube, or permanent casing	2 inches
7. <u>Cast-in-place drilled shafts enclosed by a stable rock socket</u>	<u>1.5 inches</u>

a. ~~Longitudinal bars spaced less than 1.5 inches (38 mm) clear distance apart shall be considered bundled bars for which the minimum concrete cover shall be equal to that for the equivalent diameter of the bundled bars.~~

1808.8.3 Placement of concrete. Concrete shall be placed in such a manner as to ensure the exclusion of any foreign matter and to secure a full-sized foundation. Concrete shall not be placed through water unless a tremie or other method approved by the building official is used. Where placed under or in the presence of water, the concrete shall be deposited by approved means to ensure minimum segregation of the mix and negligible turbulence of the water. Where depositing concrete from the top of a deep foundation element, the concrete shall be chuted directly into smooth-sided pipes or tubes or ~~poured placed~~ in a rapid and continuous operation through a funnel hopper centered at the top of the element.

1809.2 Supporting soils. Shallow foundations shall be built on undisturbed soil, compacted fill material or controlled low-strength material (CLSM). Compacted fill material shall be placed in accordance with Section ~~1803.5~~ 1804.5. CLSM shall be placed in accordance with Section ~~1803.6~~ 1804.6.

1809.5 Frost protection. Except where otherwise protected from frost, foundations ~~walls~~ and other permanent supports of buildings and structures shall be protected from frost by one or more of the following methods:

1. Extending below the frost line of the locality;
2. Constructing in accordance with ASCE-32; or
3. Erecting on solid rock.

Exception: Free-standing buildings meeting all of the following conditions shall not be required to be protected:

1. Assigned to Occupancy Category I, in accordance with Section 1604.5;
2. Area of 600 square feet (56 m²) or less for light-frame construction or 400 square feet (37 m²) or less for other than light-frame construction; and
3. Eave height of 10 feet (3048 mm) or less.

Shallow foundations shall not bear on frozen soil unless such frozen condition is of a permanent character.

TABLE 1809.7
PRESCRIPTIVE FOOTINGS SUPPORTING WALLS OF LIGHT-FRAME CONSTRUCTION ^{a, b, c, d, e}

NUMBER OF FLOORS SUPPORTED BY THE FOOTING ^f	WIDTH OF FOOTING (inches)	THICKNESS OF FOOTING (inches)
1	12	6
2	15	6
3	18	8 ^g

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

- Depth of footings shall be in accordance with Section 1809.4.
- The ground under the floor shall be permitted to be excavated to the elevation of the top of the footing.
- Interior-stud-bearing walls shall be permitted to be supported by isolated footings. The footing width and length shall be twice the width shown in this table, and footings shall be spaced not more than 6 feet on center.
- See Section 1908 for additional requirements for concrete footings of structures assigned to Seismic Design Category C, D, E or F.
- For thickness of foundation walls, see Section ~~4805.5~~ 1807.1.6.
- Footings shall be permitted to support a roof in addition to the stipulated number of floors. Footings supporting roof only shall be as required for supporting one floor.
- Plain concrete footings for Group R-3 occupancies shall be permitted to be 6 inches thick.

1809.8 Plain concrete footings. The edge thickness of plain concrete footings supporting walls of other than light-frame construction shall not be less than 8 inches (203 mm) where placed on soil or rock.

Exception: For plain concrete footings supporting Group R-3 occupancies, the edge thickness is permitted to be 6 inches (152 mm), provided that the footing does not extend beyond a distance greater than the thickness of the footing on either side of the supported wall.

(Portions of proposal not shown remain unchanged)

Committee Reason: This reformatting of the foundation provisions makes the section easier to understand and apply. The modification makes editorial clarifications as well as section number correlations based on prior approved code changes. In addition, the minimum strength required for precast nonprecast driven piles (see Table 1808.8.1) is increased to avoid damage during installation. Also footnote a is removed from Table 1808.8.2 and the spacing requirement is added to Section 1808.8.2. Item 7 is added to Table 1808.8.2 to address piers in a rock socket cored in competent rock.

AS

Code Change No: S152-07/08

Original Proposal

Sections: 1805.4.2.1, 1805.5.2.1, 1805.7.3, 1805.9, 1808.2.23.2, 1809.2.2.1, 1809.2.2.3, 1809.2.2.4, 1809.2.3.1, 1809.2.3.3, 1809.2.3.4, 1810.1.1, 1810.2.2, 1810.3.1, 1810.4.1, 1810.5.2, 1810.5.2.3, 1810.6.2, 1810.7.2, 1812.3

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing himself

Revise as follows:

1805.4.2.1 Concrete strength. Concrete in footings shall have a specified compressive strength (f'_c) of not less than 2,500 pounds per square inch (psi) (17 237 kPa) ~~at 28 days.~~

1805.5.2.1 Concrete foundation walls. Concrete foundation walls shall comply with the following:

1. The size and spacing of vertical reinforcement shown in Table 1805.5(5) is based on the use of reinforcement with a minimum yield strength of 60,000 psi (414 MPa). Vertical reinforcement with a minimum yield strength of 40,000 psi (276 MPa) or 50,000 psi (345 MPa) is permitted, provided the same size bar is used and the spacing shown in the table is reduced by multiplying the spacing by 0.67 or 0.83, respectively.
2. Vertical reinforcement, when required, shall be placed nearest the inside face of the wall a distance, d , from the outside face (soil side) of the wall. The distance, d , is equal to the wall thickness, t , minus 1.25 inches (32 mm) plus one-half the bar diameter, d_b [$d = t - (1.25 + d_b/2)$]. The reinforcement shall be placed within a tolerance of $\pm 3/8$ inch (9.5 mm) where d is less than or equal to 8 inches (203 mm) or $\pm 1/2$ inch (12.7 mm) where d is greater than 8 inches (203 mm).

3. In lieu of the reinforcement shown in Table 1805.5(5), smaller reinforcing bar sizes with closer spacings that provide an equivalent cross-sectional area of reinforcement per unit length of wall are permitted.
4. Concrete cover for reinforcement measured from the inside face of the wall shall not be less than 3/4 inch (19.1 mm). Concrete cover for reinforcement measured from the outside face of the wall shall not be less than 1.5 inches (38 mm) for No. 5 bars and smaller and not less than 2 inches (51 mm) for larger bars.
5. Concrete shall have a specified compressive strength, f'_c , of not less than 2,500 psi (17.2 MPa) ~~at 28 days~~.
6. The unfactored axial load per linear foot of wall shall not exceed $1.2 t f'_c$, where t is the specified wall thickness in inches.

1805.7.3 Backfill. The backfill in the annular space around columns not embedded in poured footings shall be by one of the following methods:

1. Backfill shall be of concrete with ~~an ultimate-a specified compressive~~ strength of 2,000 psi (13.8 MPa) ~~at 28 days~~. The hole shall not be less than 4 inches (102 mm) larger than the diameter of the column at its bottom or 4 inches (102 mm) larger than the diagonal dimension of a square or rectangular column.
2. Backfill shall be of clean sand. The sand shall be thoroughly compacted by tamping in layers not more than 8 inches (203 mm) in depth.
3. Backfill shall be of controlled low-strength material (CLSM).

1805.9 (Supp) Seismic requirements. See Section 1908 for additional requirements for footings and foundations of structures assigned to Seismic Design Category C, D, E or F.

For structures assigned to Seismic Design Category D, E or F, provisions of ACI 318, Sections 21.10.1 to 21.10.3, shall apply when not in conflict with the provisions of Section 1805. Concrete shall have a specified compressive strength of not less than 3,000 psi (20.68 MPa) ~~at 28 days~~.

Exceptions:

1. Group R or U occupancies of light-framed construction and two stories or less above grade plane are permitted to use concrete with a specified compressive strength of not less than 2,500 psi (17.2 MPa) ~~at 28 days~~.
2. Detached one- and two-family dwellings of light-frame construction and two stories or less above grade plane are not required to comply with the provisions of ACI 318, Sections 21.10.1 to 21.10.3.

1808.2.23.2 (Supp) Seismic Design Category D, E or F. Where a structure is assigned to Seismic Design Category D, E or F in accordance with Section 1613, the requirements for Seismic Design Category C given in Section 1808.2.23.1 shall be met, in addition to the following. Provisions of ACI 318, Section 21.10.4, shall apply when not in conflict with the provisions of Sections 1808 through 1812. Concrete shall have a specified compressive strength of not less than 3,000 psi (20.68 MPa) ~~at 28 days~~.

Exceptions:

1. Group R or U occupancies of light-frame construction and two stories or less above grade plane are permitted to use concrete with a specified compressive strength of not less than 2,500 psi (17.2 MPa) ~~at 28 days~~.
2. Detached one- and two-family dwellings of light-frame construction and two stories or less in height are not required to comply with the provisions of ACI 318, Section 21.10.4.
3. Section 21.10.4.4(a) of ACI 318 need not apply to concrete piles.

1809.2.2.1 Materials. Concrete shall have a ~~28-day~~ specified compressive strength (f'_c) of not less than 3,000 psi (20.68 MPa).

1809.2.2.3 Allowable stresses. The allowable compressive stress in the concrete shall not exceed 33 percent of the ~~28-day~~ specified compressive strength (f'_c) applied to the gross cross-sectional area of the pile. The allowable compressive stress in the reinforcing steel shall not exceed 40 percent of the yield strength of the steel (f_y) or a maximum of 30,000 psi (207 MPa). The allowable tensile stress in the reinforcing steel shall not exceed 50 percent of the yield strength of the steel (f_y) or a maximum of 24,000 psi (165 MPa).

1809.2.2.4 Installation. A precast concrete pile shall not be driven before the concrete has attained a compressive strength of at least 75 percent of the ~~28-day~~ specified compressive strength (f'_c), but not less than the strength sufficient to withstand handling and driving forces.

1809.2.3.1 Materials. Prestressing steel shall conform to ASTM A 416. Concrete shall have a ~~28-day~~ specified compressive strength (f'_c) of not less than 5,000 psi (34.48 MPa).

1809.2.3.3 (Supp) Allowable stresses. The allowable compressive stress, f_c , in concrete shall be determined as follows:

$$f_c = 0.33 f'_c - 0.27 f_{pc} \quad \text{(Equation 18-10)}$$

where:

f'_c = The ~~28-day~~ specified compressive strength of the concrete.

f_{pc} = The effective prestress stress on the gross section.

1809.2.3.4 Installation. A prestressed pile shall not be driven before the concrete has attained a compressive strength of at least 75 percent of the ~~28-day~~ specified compressive strength (f'_c), but not less than the strength sufficient to withstand handling and driving forces.

1810.1.1 Materials. Concrete shall have a ~~28-day~~ specified compressive strength (f'_c) of not less than 2,500 psi (17.24 MPa). Where concrete is placed through a funnel hopper at the top of the pile, the concrete mix shall be designed and proportioned so as to produce a cohesive workable mix having a slump of not less than 4 inches (102 mm) and not more than 6 inches (152 mm). Where concrete is to be pumped, the mix design including slump shall be adjusted to produce a pumpable concrete.

1810.2.2 Allowable stresses. The maximum allowable design compressive stress for concrete not placed in a permanent steel casing shall be 25 percent of the ~~28-day~~ specified compressive strength (f'_c). Where the concrete is placed in a permanent steel casing, the maximum allowable concrete stress shall be 33 percent of the ~~28-day~~ specified compressive strength (f'_c).

1810.3.1 Allowable stresses. The allowable design stress in the concrete of drilled or augered uncased piles shall not exceed 33 percent of the ~~28-day~~ specified compressive strength (f'_c). The allowable compressive stress of reinforcement shall not exceed 40 percent of the yield strength of the steel or 25,500 psi (175.8 MPa).

1810.4.1 Allowable stresses. The allowable design stress in the concrete shall not exceed 25 percent of the ~~28-day~~ specified compressive strength (f'_c) applied to a cross-sectional area not greater than the inside area of the drive casing or mandrel.

1810.5.2 Allowable stresses. The allowable design compressive stress in the concrete shall not exceed 33 percent of the ~~28-day~~ specified compressive strength (f'_c). The allowable concrete compressive stress shall be 0.40 (f'_c) for that portion of the pile meeting the conditions specified in Sections 1810.5.2.1 through 1810.5.2.4.

1810.5.2.3 Strength. The ratio of steel yield strength (f_y) to ~~28-day~~ specified compressive strength (f'_c) shall not be less than six.

1810.6.2 Allowable stresses. The allowable design compressive stress in the concrete shall not exceed 33 percent of the ~~28-day~~ specified compressive strength (f'_c). The allowable design compressive stress in the steel shall not exceed 35 percent of the minimum specified yield strength of the steel (F_y), provided F_y shall not be assumed greater than 36,000 psi (248 MPa) for computational purposes.

Exception: Where justified in accordance with Section 1808.2.10, the allowable stresses are permitted to be increased to 0.50 F_y .

1810.7.2 Materials. Pipe and steel cores shall conform to the material requirements in Section 1809.3. Pipes shall have a minimum wall thickness of 3/8 inch (9.5 mm) and shall be fitted with a suitable steel-driving shoe welded to the bottom of the pipe. Concrete shall have a ~~28-day~~ specified compressive strength (f'_c) of not less than 4,000 psi (27.58 MPa). The concrete mix shall be designed and proportioned so as to produce a cohesive workable mix with a slump of 4 inches to 6 inches (102 mm to 152 mm).

1812.3 Materials. Concrete shall have a ~~28-day~~ specified compressive strength (f'_c) of not less than 2,500 psi (17.24 MPa). Where concrete is placed through a funnel hopper at the top of the pier, the concrete mix shall be designed and proportioned so as to produce a cohesive workable mix having a slump of not less than 4 inches (102 mm) and not more than 6 inches (152 mm). Where concrete is to be pumped, the mix design including slump shall be adjusted to produce a pumpable concrete.

Reason: The change is proposed for consistency with the provisions of ACI 318-05, which establishes the technical provisions for the determination of specified compressive strength, including the time periods for strength tests of concrete samples. For example, Section 5.1.3 requires the specified compressive strength to be based on 28-day tests unless otherwise specified. Other test ages shall be specified in the design drawings or specifications. Section 5.6.2.4 requires a strength test to be the average of the strengths of two cylinder tests made from the same sample of concrete and tested at 28 days or at a test age designated for determination of the specified compressive strength. Requirements for setting the test age are already contained in ACI 318-05. Also specifying the test age in Chapter 18 of the IBC is redundant with respect to the commonly used test age of 28 days and in conflict with ACI 318 when a test age other than 28 days is preferred.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1805.7.3 Backfill. The backfill in the annular space around columns not embedded in poured footings shall be by one of the following methods:

1. Backfill shall be of concrete with a specified compressive strength of not less than 2,000 psi (13.8 MPa). The hole shall not be less than 4 inches (102 mm) larger than the diameter of the column at its bottom or 4 inches (102 mm) larger than the diagonal dimension of a square or rectangular column.
2. Backfill shall be of clean sand. The sand shall be thoroughly compacted by tamping in layers not more than 8 inches (203 mm) in depth.
3. Backfill shall be of controlled low-strength material (CLSM).

(Portions of proposal not shown remain unchanged)

Committee Reason: This code change makes the IBC references to concrete compressive strength consistent with ACI 318 terminology. The modification makes an editorial change that helps to clarify the intent of Section 1805.7.3.

Assembly Action:

None

Final Hearing Results

S152-07/08

AM

Code Change No: S153-07/08

Original Proposal

Sections: 1805.4.2.2, 1808.2.23.1

Proponent: Edwin T. Huston, Smith & Huston, Inc., National Council of Structural Engineering Associations

Revise as follows:

1805.4.2.2 Footing seismic ties. Where a structure is assigned to Seismic Design Category D, E or F in accordance with Section 1613, individual spread footings founded on soil defined in Section 1613.5.2 as Site Class E or F shall be interconnected by ties. Unless it is demonstrated that equivalent restraint is provided by reinforced concrete beams within slabs on grade or reinforced concrete slabs on grade, Ties shall be capable of carrying, in tension or compression, a force equal to the lesser of the product of the larger footing design gravity load times the seismic coefficient, S_{DS} , divided by 10, and 25 percent of the smaller footing design gravity load, ~~unless it is demonstrated that equivalent restraint is provided by reinforced concrete beams within slabs on grade or reinforced concrete slabs on grade.~~

1808.2.23.1 (Supp) Seismic Design Category C. Where a structure is assigned to Seismic Design Category C in accordance with Section 1613, the following shall apply. Individual pile caps, piers or piles shall be interconnected by ties. Unless it can be demonstrated that equivalent restraint is provided by reinforced concrete beams within slabs on grade or reinforced concrete slabs on grade or confinement by competent rock, hard cohesive soils or very dense granular soils, Ties shall be capable of carrying, in tension ~~and~~ or compression, a force equal to the lesser of the

product of the larger pile cap or column design gravity load times the seismic coefficient, S_{DS} , divided by 10, and 25 percent of the smaller pile cap or column design gravity load unless it can be demonstrated that equivalent restraint is provided by reinforced concrete beams within slabs on grade or reinforced concrete slabs on grade or confinement by competent rock, hard cohesive soils or very dense granular soils.

Exception: In Groups R-3 and U occupancies of light-frame construction, pier foundations supporting foundation walls, isolated interior posts detailed so the pier is not subject to lateral loads, or exterior decks and patios, are not subject to interconnection if it can be shown the soils are of adequate stiffness, subject to the approval of the building official.

Reason: Code coordination, clarification, and relaxation of an overly restrictive code requirement. Changes “and” to “or” in Section 1808.2.23.1 for consistency with Section 1805.4.2.2 and with ASCE 7-05 Sections 12.13.5.2 and 12.13.6.2.

Clarifies the footing loads that are used to determine the tie force.

Where very large, heavily load foundations are adjacent to very small, lightly loads foundations basing the tie force on the larger foundation load can result in tie forces that are larger than the vertical loads being resisted by the smaller foundation. The added limit is to address this case.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This code change makes editorial improvements and fixes an overly restrictive requirement for foundation ties.

Assembly Action:

None

Code Change No: S154-07/08

Original Proposal

Sections: 1805.4.6, 1807.2, 2304.9.5.2, Chapter 35; IRC R401.1, Chapter 43

Proponent: David P. Tyree, PE, CBO and Dennis Pitts, American Forest & Paper Association

THESE PROPOSALS ARE ON THE AGENDA OF THE IBC STRUCTURAL AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I—IBC STRUCTURAL

1. Revise as follows:

1805.4.6 Wood foundations. Wood foundation systems shall be designed and installed in accordance with AF&PA ~~Technical Report No. 7~~ PWF. Lumber and plywood shall be treated in accordance with AWPA U1 (Commodity Specification A, Use Category 4B and Section 5.2) and shall be identified in accordance with Section 2303.1.8.1.

1807.2 Dampproofing required. Where hydrostatic pressure will not occur as determined by Section 1802.2.3, floors and walls for other than wood foundation systems shall be dampproofed in accordance with this section. Wood foundation systems shall be constructed in accordance with AF&PA ~~Technical Report No. 7~~ PWF.

2304.9.5.2 (Supp) Fastenings for wood foundations. Fastenings for wood foundations shall be as required in AF&PA ~~Technical Report No. 7~~ PWF.

2. Revise Chapter 35 standards as follows:

American Forest & Paper Association

~~T.R. No. 7—87 Technical Report—Basic Requirements for Permanent Wood Foundation System~~
ANSI/AF&PA PWF-2007 Permanent Wood Foundation Design Specification.

PART II—IRC BUILDING/ENERGY

1. Revise as follows:

R401.1 Application. The provisions of this chapter shall control the design and construction of the foundation and foundation spaces for all buildings. In addition to the provisions of this chapter, the design and construction of foundations in areas prone to flooding as established by Table R301.2(1) shall meet the provisions of Section R324. Wood foundations shall be designed and installed in accordance with AF&PA ~~Report No. 7 PWF.~~

Exception: The provisions of this chapter shall be permitted to be used for wood foundations only in the following situations:

1. In buildings that have no more than two floors and a roof.
2. When interior basement and foundation walls are constructed at intervals not exceeding 50 feet (15 240 mm).

Wood foundations in Seismic Design Category D₀, D₁ or D₂ shall be designed in accordance with accepted engineering practice.

2. Revise standards in Chapter 43 as follows:

American Forest & Paper Association

~~T.R. No. 7—87 Basic Requirements for Permanent Wood Foundation System~~
ANSI/AF&PA PWF-2007 Permanent Wood Foundation Design Specification.

Reason: (IBC) This is an update to an existing AF&PA technical report which has been revised now to be a standard. The new standard is approved as an AF&PA standard and will further be approved as an ANSI consensus standard by August 2007. AF&PA's new standard for the design of Permanent Wood Foundations (PWF) entitled *PWF Design Specification (AF&PA PWF-2007)* was developed and balloted through AF&PA's Wood Design Standards Committee (WDSC), an ANSI-approved standards development group. The new PWF Design Specification was written as part of an effort to update design recommendations and procedures in the wood industry's documents design aides, such as *Technical Report 7: The Permanent Wood Foundation System* (1987) and the *The Permanent Wood Foundation System: Design, Fabrication and Installation Manual* (1987). Development of the new standard provides updated information and references to the latest wood design standards (NDS & SDPWS), the latest load standard (ASCE 7), and provides a consensus-based standard that can be referenced in the building code, replacing reference to *Technical Report 7*.

(IRC) The Permanent Wood Foundation Design Specification was developed as a consensus standard to replace reference to an AF&PA technical report that has been referenced in the codes for at least 20 years. The new specification refers the designer to current versions of the ASCE 7 standard for loading and to AF&PA's *National Design Specification for Wood Construction* and *Special Design Provisions for Wind and Seismic* for resistance. It also includes special requirements for below-ground design of treated wood structures. Copies of the Specification will be submitted separately.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Note: The following analysis was not in the Code Change Proposal book but was posted on the ICC website.

Analysis: Review of proposed new standard AF & PA PWF-07 indicated that, in the opinion of ICC Staff, the standard did comply with ICC standards criteria.

PART I – IBC STRUCTURAL

Committee Action:

Approved as Submitted

Committee Reason: This code change improves the code by adopting the latest version of the wood foundation standard by reference.

Assembly Action:

None

PART II – IRC B/E
Committee Action:

Approved as Submitted

Committee Reason: This change updates the referenced technical Report to a consensus standard and is needed in the code.

Assembly Action:

None

Final Hearing Results

S154-07/08, Part I	AS
S154-07/08, Part II	AS

Code Change No: S155-07/08

Original Proposal

Sections: 202, 714.3, 1805.9, 1808.2.23.2, 2209.1, 2210, 2302.1; IRC R202, R403.1.4.1, R702.3.3, R702.3.6

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing himself

THESE PROPOSALS ARE ON THE AGENDA OF THE IBC STRUCTURAL AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Revise as follows:

SECTION 202
DEFINITIONS

LIGHT-FRAME CONSTRUCTION. A type of construction whose vertical and horizontal structural elements are primarily formed by a system of repetitive wood or ~~light-gage~~ cold-formed steel framing members.

714.3 (Supp) Membrane protection. King studs and boundary elements that are integral elements in load-bearing walls of ~~light-framed~~ light-frame construction shall be permitted to have required fire-resistance ratings provided by the membrane protection provided for the load-bearing wall.

1805.9 (Supp) Seismic requirements. See Section 1908 for additional requirements for footings and foundations of structures assigned to Seismic Design Category C, D, E or F.

For structures assigned to Seismic Design Category D, E or F, provisions of ACI 318, Sections 21.10.1 to 21.10.3, shall apply when not in conflict with the provisions of Section 1805. Concrete shall have a specified compressive strength of not less than 3,000 psi (20.68 MPa) at 28 days.

Exceptions:

1. Group R or U occupancies of ~~light-framed~~ light-frame construction and two stories or less above grade plane are permitted to use concrete with a specified compressive strength of not less than 2,500 psi (17.2 MPa) at 28 days.
2. Detached one- and two-family dwellings of light-frame construction and two stories or less above grade plane are not required to comply with the provisions of ACI 318, Sections 21.10.1 to 21.10.3.

1808.2.23.2 (Supp) Seismic Design Category D, E or F. Where a structure is assigned to Seismic Design Category D, E or F in accordance with Section 1613, the requirements for Seismic Design Category C given in Section 1808.2.23.1 shall be met, in addition to the following. Provisions of ACI 318, Section 21.10.4, shall apply when not in conflict with the provisions of Sections 1808 through 1812. Concrete shall have a specified compressive strength of not less than 3,000 psi (20.68 MPa) at 28 days.

Exceptions:

1. Group R or U occupancies of ~~light-frame~~ light-frame construction and two stories or less above grade plane are permitted to use concrete with a specified compressive strength of not less than 2,500 psi (17.2 MPa) at 28 days.
2. Detached one- and two-family dwellings of light-frame construction and two stories or less in height are not required to comply with the provisions of ACI 318, Section 21.10.4.
3. Section 21.10.4.4(a) of ACI 318 need not apply to concrete piles.

2209.1 General. The design of cold-formed carbon and low-alloy steel structural members shall be in accordance with AISI-NAS. The design of cold-formed stainless-steel structural members shall be in accordance with ASCE 8. Cold-formed steel ~~light-framed~~ light-frame construction shall comply with Section 2210.

SECTION 2210 COLD-FORMED STEEL ~~LIGHT-FRAMED~~ LIGHT-FRAME CONSTRUCTION

2302.1 Definitions. The following words and terms shall, for the purposes of this chapter, have the meanings shown herein.

CONVENTIONAL LIGHT-FRAME ~~WOOD~~ CONSTRUCTION. A type of construction whose primary structural elements are formed by a system of repetitive wood-framing members. See Section 2308 for conventional light-frame ~~wood~~ construction provisions.

PART II – IRC BUILDING/ENERGY

Revise as follows:

SECTION R202 DEFINITIONS

~~LIGHT-FRAMED~~ LIGHT-FRAME CONSTRUCTION. A type of construction whose vertical and horizontal structural elements are primarily formed by a system of repetitive wood or ~~light-gage~~ cold-formed steel framing members.

R403.1.4.1 Frost protection. Except where otherwise protected from frost, foundation walls, piers and other permanent supports of buildings and structures shall be protected from frost by one or more of the following methods:

1. Extended below the frost line specified in Table R301.2.(1);
2. Constructing in accordance with Section R403.3;
3. Constructing in accordance with ASCE 32; or
4. Erected on solid rock.

Exceptions:

1. Protection of freestanding accessory structures with an area of 600 square feet (56 m²) or less, of ~~light-framed~~ light-frame construction, with an eave height of 10 feet (3048 mm) or less shall not be required.
2. Protection of freestanding accessory structures with an area of 400 square feet (37m²) or less, of other than ~~light-framed~~ light-frame construction, with an eave height of 10 feet (3048 mm) or less shall not be required.
3. Decks not supported by a dwelling need not be provided with footings that extend below the frost line. Footings shall not bear on frozen soil unless the frozen condition is permanent.

R702.3.3 Steel framing. Steel framing supporting gypsum board shall not be less than 1.25 inches (32 mm) wide in the least dimension. ~~Light-gage~~ nonload-bearing cold-formed steel framing shall comply with ASTM C 645. Load-bearing steel framing and steel framing from 0.033 inch to 0.112 inch (1 mm to 3 mm) thick shall comply with ASTM C 955.

R702.3.6 Fastening. Screws for attaching gypsum board to wood framing shall be Type W or Type S in accordance with ASTM C 1002 and shall penetrate the wood not less than ⁵/₈ inch (16 mm). Screws for attaching gypsum board to ~~light-gage~~ cold-formed steel framing shall be Type S in accordance with ASTM C 1002 and shall penetrate the steel not less than ³/₈ inch (10 mm). Screws for attaching gypsum board to steel framing 0.033 inch to 0.112 inch (1mm to 3 mm) thick shall comply with ASTM C 954.

Reason: The purpose for the proposal is to harmonize the IBC, the IRC and the reference standards of both codes with respect to light-frame construction, cold-formed steel framing members and conventional light-frame construction. In IBC Section 2302.1, “conventional light-frame wood construction” is changed to “conventional light-frame construction” for consistency with IBC Section 2308 on conventional light-frame construction where the latter term is used consistently throughout the section. A thorough search of the IBC and IRC was performed during preparation of this proposal and the proposed revisions represent the only revisions necessary to complete the process of harmonization. Note that Section 11.2 of ASCE 7-05 defines “light-frame construction.”

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I – IBC STRUCTURAL

Committee Action:

Approved as Submitted

Committee Reason: This proposal creates consistency in terminology referring to light-frame construction throughout the code. It also harmonizes the IBC with the IRC.

Assembly Action:

None

PART II – IRC B/E

Committee Action:

Approved as Submitted

Committee Reason: This change updates the terminology of light-gage to cold-formed to agree with current standards. Also, harmonizes the IRC with the IBC with respect to light-frame construction.

Assembly Action:

None

Final Hearing Results

S155-07/08, Part I	AS
S155-07/08, Part II	AS

Code Change No: S156-07/08

Original Proposal

Section: 1806.1

Proponent: William Sherman, CH2M HILL, representing himself.

Revise as follows:

1806.1 General. Retaining walls shall be designed to ensure stability against overturning, sliding, excessive foundation pressure and water uplift. Retaining walls shall be designed for a safety factor of 1.5 against lateral sliding and overturning excluding load combinations that include seismic forces. The dead load factor used in load combinations under Section 1605.3 shall be taken as 1.0 when used with the safety factors defined in this section. The safety factor against lateral sliding shall be taken as the available soil resistance at the base of the structure's foundation divided by the net lateral force applied to the structure.

Reason: This proposal provides clarification and modification of existing code provisions.

An existing code clarification related to IBC 2000 states that the safety factor of 1.5 does not apply to load combinations that include seismic, but the published code remains unclear in this respect. Wording is added to clarify.

It is not practical to apply a reduction factor to dead loads, e.g. 0.6D, when an overall safety factor of 1.5 is also applied to stability requirements. Impractical and costly structures may result without the proposed revision.

The code does not define how the sliding safety factor is to be determined. Different safety factors can be obtained where passive pressures are included for retaining wall stability (depending upon whether the passive pressure force is included in the numerator or denominator). The proposed wording is based on recommended safety factor requirements in EM 1110-2-2502.

References:

EM 1110-2-2502, Retaining and Flood Walls, by the US Army Corps of Engineers (USACE).

Cost Impact: This code change proposal will reduce the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1806.1 General. Retaining walls shall be designed to ensure stability against overturning, sliding, excessive foundation pressure and water uplift. Retaining walls shall be designed for a safety factor of 1.5 against lateral sliding and overturning ~~excluding load combinations that include seismic forces. The dead load factor used in load combinations under Section 1605.3 shall be taken as 1.0 when used with the safety factors defined in this section.~~ The safety factor against lateral sliding shall be taken as the available soil resistance at the base of the ~~structure's~~ retaining wall foundation divided by the net lateral force applied to the ~~structure~~ retaining wall.

Exception: Where earthquake loads are included, the minimum safety factor for retaining wall sliding and overturning shall be 1.1.

Committee Reason: This code change clarifies the required factor of safety against overturning and sliding under earthquake loading. The modification makes the factor of safety under earthquake loading 1.1 and moves the requirement to an exception.

Assembly Action:

None

Final Hearing Results

S156-07/08

AM

Code Change No: **S157-07/08**

Original Proposal

Section: 1806.1

Proponent: William Sherman, CH2M HILL, representing himself.

Revise as follows:

1806.1 General. Retaining walls shall be designed to ensure stability against overturning, sliding, excessive foundation pressure and water uplift. Retaining walls shall be designed for a safety factor of 1.5 against lateral sliding and overturning. Where a keyway is extended below the wall base with the intent to engage passive pressure and enhance sliding stability, lateral soil pressures on both sides of the keyway shall be considered in the sliding analysis.

Reason: Add a new requirement to existing provisions for retaining wall analyses, to ensure that a complete free-body diagram is used in design. Many software programs and design procedures for retaining walls with keyways ignore any driving pressures acting on the keyway, which is unconservative and ignores basic free-body diagram concepts. This provision clarifies that such forces must be considered but allows the engineer to determine the appropriate procedure.

References:

EM 1110-2-2502, Retaining and Flood Walls, by the US Army Corps of Engineers (USACE).

Cost Impact: This code change proposal will increase the cost of construction due to more conservative retaining wall design requirements than are commonly used.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal provides information on keyways used in retaining walls that should help designers in their analysis.

Assembly Action:

None

Code Change No: **S158-07/08**

Original Proposal

Sections: 1807, 1805

Proponent: Edwin T. Huston, Smith & Huston, Inc., representing the National Council of Structural Engineering Associations

Revise as follows:

**SECTION ~~1807~~ 1805
DAMPPOOFING AND WATERPROOFING**

~~1807.1~~ Where required. **1805.1 General.** Walls or portions thereof that retain earth and enclose interior spaces and floors below grade shall be waterproofed and dampproofed in accordance with this section, with the exception of those spaces containing groups other than residential and institutional where such omission is not detrimental to the building or occupancy.

Ventilation for crawl spaces shall comply with Section 1203.4.

~~1807.1.1~~ 1805.1.1 **Story above grade plane.** Where a basement is considered a story above grade plane and the finished ground level adjacent to the basement wall is below the basement floor elevation for 25 percent or more of the perimeter, the floor and walls shall be dampproofed in accordance with Section ~~4807.2~~ 1805.2 and a foundation drain shall be installed in accordance with Section ~~4807.4.2~~ 1805.4.2. The foundation drain shall be installed around the portion of the perimeter where the basement floor is below ground level. The provisions of Sections 1802.2.3, ~~1805.3~~ 1807.3 and ~~1805.4.1~~ 1807.4.1 shall not apply in this case.

~~1807.1.2~~ 1805.1.2 **Under-floor space.** The finished ground level of an under-floor space such as a crawl space shall not be located below the bottom of the footings. Where there is evidence that the ground-water table rises to within 6 inches (152 mm) of the ground level at the outside building perimeter, or that the surface water does not readily drain from the building site, the ground level of the under-floor space shall be as high as the outside finished ground level, unless an approved drainage system is provided. The provisions of Sections 1802.2.3, ~~4807.2~~, ~~1807.3~~ and ~~1807.4~~ 1805.2, 1805.3 and 1805.4 shall not apply in this case.

~~1807.1.2.1~~ 1805.1.2.1 **Flood hazard areas.** For buildings and structures in flood hazard areas as established in Section 1612.3, the finished ground level of an under-floor space such as a crawl space shall be equal to or higher than the outside finished ground level.

Exception: Under-floor spaces of Group R-3 buildings that meet the requirements of FEMA/FIA-TB-11.

~~1807.1.3~~ 1805.1.3 **Ground-water control.** Where the ground-water table is lowered and maintained at an elevation not less than 6 inches (152 mm) below the bottom of the lowest floor, the floor and walls shall be dampproofed in accordance with Section ~~4807.2~~ 1805.2. The design of the system to lower the ground-water table shall be based on accepted principles of engineering that shall consider, but not necessarily be limited to, permeability of the soil, rate at which water enters the drainage system, rated capacity of pumps, head against which pumps are to operate and the rated capacity of the disposal area of the system.

~~1807.2~~ 1805.2 **Dampproofing required.** Where hydrostatic pressure will not occur as determined by Section 1802.2.3, floors and walls for other than wood foundation systems shall be dampproofed in accordance with this section. Wood foundation systems shall be constructed in accordance with AF&PA Technical Report No. 7.

~~1807.2.1~~ 1805.2.1 **Floors.** Dampproofing materials for floors shall be installed between the floor and the base course required by Section ~~4807.4.1~~ 1805.4.1, except where a separate floor is provided above a concrete slab. Where installed beneath the slab, dampproofing shall consist of not less than 6-mil (0.006 inch; 0.152 mm) polyethylene with joints lapped not less than 6 inches (152 mm), or other approved methods or materials. Where permitted to be installed on top of the slab, dampproofing shall consist of mopped-on bitumen, not less than 4-mil (0.004 inch; 0.102 mm) polyethylene, or other approved methods or materials. Joints in the membrane shall be lapped and sealed in accordance with the manufacturer's installation instructions.

4807.2.2 1805.2.2 Walls. Dampproofing materials for walls shall be installed on the exterior surface of the wall, and shall extend from the top of the footing to above ground level.

Dampproofing shall consist of a bituminous material, 3 pounds per square yard (16 N/m²) of acrylic modified cement, 0.125 inch (3.2 mm) coat of surface-bonding mortar complying with ASTM C 887, any of the materials permitted for waterproofing by Section ~~4807.3.2~~ 1805.3.2 or other approved methods or materials.

4807.2.2.1 1805.2.2.1 Surface preparation of walls. Prior to application of dampproofing materials on concrete walls, holes and recesses resulting from the removal of form ties shall be sealed with a bituminous material or other approved methods or materials. Unit masonry walls shall be parged on the exterior surface belowground level with not less than 0.375 inch (9.5 mm) of portland cement mortar. The parging shall be covered at the footing.

Exception: Parging of unit masonry walls is not required where a material is approved for direct application to the masonry.

4807.3 1805.3 Waterproofing required. Where the ground-water investigation required by Section 1802.2.3 indicates that a hydrostatic pressure condition exists, and the design does not include a ground-water control system as described in Section ~~4807.4.3~~ 1805.1.3, walls and floors shall be waterproofed in accordance with this section.

4807.3.1 1805.3.1 Floors. Floors required to be waterproofed shall be of concrete and designed and constructed to withstand the hydrostatic pressures to which the floors will be subjected.

Waterproofing shall be accomplished by placing a membrane of rubberized asphalt, butyl rubber, fully adhered/fully bonded HDPE or polyolefin composite membrane or not less than 6-mil [0.006 inch (0.152 mm)] polyvinyl chloride with joints lapped not less than 6 inches (152 mm) or other approved materials under the slab. Joints in the membrane shall be lapped and sealed in accordance with the manufacturer's installation instructions.

4807.3.2 1805.3.2 Walls. Walls required to be waterproofed shall be of concrete or masonry and shall be designed and constructed to withstand the hydrostatic pressures and other lateral loads to which the walls will be subjected.

Waterproofing shall be applied from the bottom of the wall to not less than 12 inches (305 mm) above the maximum elevation of the ground-water table. The remainder of the wall shall be dampproofed in accordance with Section ~~4807.2.2~~ 1805.2.2. Waterproofing shall consist of two-ply hot-mopped felts, not less than 6-mil (0.006 inch; 0.152 mm) polyvinyl chloride, 40-mil (0.040 inch; 1.02 mm) polymer-modified asphalt, 6-mil (0.006 inch; 0.152 mm) polyethylene or other approved methods or materials capable of bridging nonstructural cracks. Joints in the membrane shall be lapped and sealed in accordance with the manufacturer's installation instructions.

4807.3.2.1 1805.3.2.1 Surface preparation of walls. Prior to the application of waterproofing materials on concrete or masonry walls, the walls shall be prepared in accordance with Section ~~4807.2.2.1~~ 1805.2.2.1.

4807.3.3 1805.3.3 Joints and penetrations. Joints in walls and floors, joints between the wall and floor and penetrations of the wall and floor shall be made water-tight utilizing approved methods and materials.

4807.4 1805.4 Subsoil drainage system. Where a hydrostatic pressure condition does not exist, dampproofing shall be provided and a base shall be installed under the floor and a drain installed around the foundation perimeter. A subsoil drainage system designed and constructed in accordance with Section ~~4807.4.3~~ 1805.1.3 shall be deemed adequate for lowering the ground-water table.

4807.4.1 1805.4.1 Floor base course. Floors of basements, except as provided for in Section ~~4807.4.4~~ 1805.1.1, shall be placed over a floor base course not less than 4 inches (102 mm) in thickness that consists of gravel or crushed stone containing not more than 10 percent of material that passes through a No. 4 (4.75 mm) sieve.

Exception: Where a site is located in well-drained gravel or sand/gravel mixture soils, a floor base course is not required.

4807.4.2 1805.4.2 Foundation drain. A drain shall be placed around the perimeter of a foundation that consists of gravel or crushed stone containing not more than 10-percent material that passes through a No. 4 (4.75 mm) sieve. The drain shall extend a minimum of 12 inches (305 mm) beyond the outside edge of the footing. The thickness shall be such that the bottom of the drain is not higher than the bottom of the base under the floor, and that the top of the drain is not less than 6 inches (152 mm) above the top of the footing. The top of the drain shall be covered with an approved filter membrane material. Where a drain tile or perforated pipe is used, the invert of the pipe or tile shall not be higher than the floor elevation. The top of joints or the top of perforations shall be protected with an approved filter membrane material. The pipe or tile shall be placed on not less than 2 inches (51 mm) of gravel or crushed stone complying with Section ~~4807.4.4~~ 1805.4.1, and shall be covered with not less than 6 inches (152 mm) of the same material.

~~1807.4.3~~ **1805.4.3 Drainage discharge.** The floor base and foundation perimeter drain shall discharge by gravity or mechanical means into an approved drainage system that complies with the *International Plumbing Code*.

Exception: Where a site is located in well-drained gravel or sand/gravel mixture soils, a dedicated drainage system is not required.

Reason: Relocates the section as part of an overall reorganization to consolidate structural design requirements that may later appear in reference standards. Makes minor editorial revisions of section titles (new Sections 1805.1, 1805.2, and 1805.3).

Bibliography:

Composite of Chapter 18 reorganization assuming all of proponent's proposals are approved.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1805.1.1 Story above grade plane. Where a basement is considered a story above grade plane and the finished ground level adjacent to the basement wall is below the basement floor elevation for 25 percent or more of the perimeter, the floor and walls shall be dampproofed in accordance with Section 1805.2 and a foundation drain shall be installed in accordance with Section 1805.4.2. The foundation drain shall be installed around the portion of the perimeter where the basement floor is below ground level. The provisions of Sections ~~1802.2.3~~ 1803.5.4, 1805.3 and 1805.4.1 shall not apply in this case.

1805.1.2 Under-floor space. The finished ground level of an under-floor space such as a crawl space shall not be located below the bottom of the footings. Where there is evidence that the ground-water table rises to within 6 inches (152 mm) of the ground level at the outside building perimeter, or that the surface water does not readily drain from the building site, the ground level of the under-floor space shall be as high as the outside finished ground level, unless an approved drainage system is provided. The provisions of Sections ~~1802.2.3~~, 1803.5.4, 1805.2, 1805.3 and 1805.4 shall not apply in this case.

1805.2 Dampproofing. Where hydrostatic pressure will not occur as determined by Section ~~1802.2.3~~ 1803.5.4, floors and walls for other than wood foundation systems shall be dampproofed in accordance with this section. Wood foundation systems shall be constructed in accordance with AF&PA Technical Report No. 7.

1805.3 Waterproofing. Where the ground-water investigation required by Section ~~1802.2.3~~ 1803.5.4 indicates that a hydrostatic pressure condition exists, and the design does not include a ground-water control system as described in Section 1805.1.3, walls and floors shall be waterproofed in accordance with this section.

(Portions of proposal not shown remain unchanged)

Committee Reason: This proposal makes some editorial corrections in the section on dampproofing and waterproofing and is coordinated with the other proposals to reformat Chapter 18. The modification provides further section number correlations based on approval of code change S146-07/08.

Assembly Action:

None

Final Hearing Results

S158-07/08

AM

Code Change No: **S159-07/08**

Original Proposal

Sections: 1807.1.2.1; IRC R408.7

Proponent: Rebecca C. Quinn, RC Quinn Consulting, Inc., representing US Department of Homeland Security, Federal Emergency Management Agency

THESE PROPOSALS ARE ON THE AGENDA OF THE IBC STRUCTURAL AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Revise as follows:

1807.1.2.1 Flood hazard areas. For buildings and structures in flood hazard areas as established in Section 1612.3, the finished ground level of an under-floor space such as a crawl space shall be equal to or higher than the outside finished ground level on at least one side.

Exception: Under-floor spaces of Group R-3 buildings that meet the requirements of FEMA/ FIA-TB-11.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R408.7 Flood resistance. For buildings located in areas prone to flooding as established in Table R301.2(1):

1. Walls enclosing the under-floor space shall be provided with flood openings in accordance with Section R324.2.2.
2. The finished ground level of the under-floor space shall be equal to or higher than the outside finished ground level on at least one side.

Exception: Under-floor spaces that meet the requirements of FEMA/FIA TB 11-1.

Reason: (IBC) The purpose of this code change is to clarify the existing requirement which is overly restrictive in that it requires the entire finished ground level of under-flood spaces to be equal to or higher than the outside finished ground level. In flood hazard areas, if the floor of an enclosed area, including a crawlspace, is below the exterior grade on all sides, then the building is considered to have a basement (as defined in 1612.2). Note that an under-floor space may be partially below grade; as long as the interior finished ground level is at or above the exterior finished grade on at least one side, then a basement as defined in 1612.2 is not created. Section 1807.1.2 specifies that the interior ground level of under-floor spaces may be below-grade if an approved drainage system is provided. This code change clarifies that that arrangement is not allowed in flood hazard areas because a basement (as defined in 1612.2) would be created.

(IRC) The purpose of this code change is to clarify the existing requirement which is overly restrictive in that it requires the entire finished ground level of under-flood spaces to be equal to or higher than the outside finished ground level. In flood hazard areas, if the floor of an enclosed area, including a crawlspace, is below the exterior grade on all sides, then the building is considered to have a basement (see R324.2.1(3)). Note that an under-floor space may be partially below grade; as long as the interior finished ground level is at or above the exterior finished grade on at least one side, then a basement is not created. Section R408.6 requires the grade in under-floor spaces to be as high as the outside finished grade unless an approved drainage system is provided. This code change clarifies that that arrangement is not allowed in flood hazard areas because a basement (below-grade on all sides) would be created.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I – IBC STRUCTURAL

Committee Action:

Approved as Submitted

Committee Reason: This change aligns an IBC requirement in flood hazard areas with the NFIP.

Assembly Action:

None

PART II – IRC B/E
Committee Action:

Approved as Submitted

Committee Reason: This change provides a much needed clarification and removes an overly restrictive requirement.

Assembly Action:

None

Code Change No: **S160-07/08**

Original Proposal

Sections: 1808, 1809, 1810, 1811, 1812

Proponent: Edwin T. Huston, Smith & Huston, Inc., representing the National Council of Structural Engineering Associations

1. Revise as follows:

SECTION 1808 1802
PIER AND PILE DEFINITIONS

1808.1 1802.1 Definitions. The following words and terms shall, for the purposes of this section chapter, have the meanings shown herein.

DEEP FOUNDATION. A deep foundation is a foundation element that does not satisfy the definition of a shallow foundation.

DRILLED SHAFT. A drilled shaft is a cast-in-place deep foundation element constructed by drilling a hole (with or without permanent casing) into soil or rock and filling it with fluid concrete.

Socketed drilled shaft A socketed drilled shaft is a drilled shaft with a permanent pipe or tube casing that extends down to bedrock and an uncased socket drilled into the bedrock.

MICROPILES. ~~Micro piles are 12-inch (305 mm) diameter or less, A micropile is a bored, grouted-in-place piles incorporating steel pipe (casing) and/or steel reinforcement deep foundation element that develops its load-carrying capacity by means of a bond zone in soil, bedrock, or a combination of soil and bedrock.~~

SHALLOW FOUNDATION. A shallow foundation is an individual or strip footing, a mat foundation, a slab on grade foundation, or a similar foundation element.

FLEXURAL LENGTH. ~~Flexural length is the length of the pile from the first point of zero lateral deflection to the underside of the pile cap or grade beam.~~

PIER FOUNDATIONS. ~~Pier foundations consist of isolated masonry or cast-in-place concrete structural elements extending into firm materials. Piers are relatively short in comparison to their width, with lengths less than or equal to 12 times the least horizontal dimension of the pier. Piers derive their load-carrying capacity through skin friction, through end bearing, or a combination of both.~~

Belled piers. ~~Belled piers are cast-in-place concrete piers constructed with a base that is larger than the diameter of the remainder of the pier. The belled base is designed to increase the load-bearing area of the pier in end bearing.~~

PILE FOUNDATIONS. Pile foundations consist of concrete, wood or steel structural elements either driven into the ground or cast in place. Piles are relatively slender in comparison to their length, with lengths exceeding 12 times the least horizontal dimension. Piles derive their load-carrying capacity through skin friction, through end bearing, or a combination of both.

Augered uncased piles. Augered uncased piles are constructed by depositing concrete into an uncased augered hole, either during or after the withdrawal of the auger.

Caisson piles. Caisson piles are cast in place concrete piles extending into bedrock. The upper portion of a caisson pile consists of a cased pile that extends to the bedrock. The lower portion of the caisson pile consists of an uncased socket drilled into the bedrock.

Concrete-filled steel pipe and tube piles. Concrete-filled steel pipe and tube piles are constructed by driving a steel pipe or tube section into the soil and filling the pipe or tube section with concrete. The steel pipe or tube section is left in place during and after the deposition of the concrete.

Driven uncased piles. Driven uncased piles are constructed by driving a steel shell into the soil to shore an unexcavated hole that is later filled with concrete. The steel casing is lifted out of the hole during the deposition of the concrete.

Enlarged base piles. Enlarged base piles are cast in place concrete piles constructed with a base that is larger than the diameter of the remainder of the pile. The enlarged base is designed to increase the load-bearing area of the pile in end bearing.

Steel-cased piles. Steel cased piles are constructed by driving a steel shell into the soil to shore an unexcavated hole. The steel casing is left permanently in place and filled with concrete.

Timber piles. Timber piles are round, tapered timbers with small (tip) end embedded into the soil.

SECTION 1810 DEEP FOUNDATIONS

1808.2 Piers and piles—general requirements.

1808.2.1 Design. Piles are permitted to be designed in accordance with provisions for piers in Section 1808 and Sections 1812.3 through 1812.10 where either of the following conditions exists, subject to the approval of the building official:

1. Group R-3 and U occupancies not exceeding two stories of light-frame construction, or
2. Where the surrounding foundation materials furnish adequate lateral support for the pile.

1810.1 General. Deep foundations shall be analyzed, designed, detailed, and installed in accordance with Sections 1810.1 through 1810.4.

1808.2.2 1810.1.1 General Geotechnical Investigation. Pier and pile Deep foundations shall be designed and installed on the basis of a foundation investigation as defined in Section 1802, unless sufficient data upon which to base the design and installation is available. The investigation and report provisions of Section 1802 shall be expanded to include, but not be limited to, the following:

1. Recommended pier or pile types and installed capacities.
2. Recommended center-to-center spacing of piers or piles.
3. Driving criteria.
4. Installation procedures.
5. Field inspection and reporting procedures (to include procedures for verification of the installed bearing capacity where required).
6. Pier or pile load test requirements.
7. Durability of pier or pile materials.
8. Designation of bearing stratum or strata.
9. Reductions for group action, where necessary.

1808.2.18 1810.1.2 Use of existing piers or piles deep foundation elements. ~~Piers or piles~~ Deep foundation elements left in place where a structure has been demolished shall not be used for the support of new construction unless satisfactory evidence is submitted to the building official, which indicates that the ~~piers or piles elements~~ elements are sound and meet the requirements of this code. Such ~~piers or piles elements~~ elements shall be load tested or redriven to verify their capacities. The design load applied to such ~~piers or piles elements~~ elements shall be the lowest allowable load as determined by tests or redriving data.

1810.1.3 Deep foundation elements classified as columns. Deep foundation elements standing unbraced in air, water, or fluid soils shall be classified as columns and designed as such in accordance with the provisions of this code from their top down to the point where adequate lateral support is provided in accordance with Section 1810.2.1.

Exception: Where the unsupported height to least horizontal dimension of a cast-in-place deep foundation element does not exceed three, it shall be permitted to design and construct such an element as a pedestal in accordance with ACI 318.

1808.2.3 1810.1.4 Special types of piles deep foundations. The use of types of ~~piles~~ deep foundation elements not specifically mentioned herein is permitted, subject to the approval of the building official, upon the submission of acceptable test data, calculations and other information relating to the structural properties and load capacity of such ~~piles elements~~ elements. The allowable stresses for materials shall not in any case exceed the limitations specified herein.

1808.2.9 Lateral support.

1810.2 Analysis. The analysis of deep foundations for design shall be in accordance with Sections 1810.2.1 through 1810.2.5.

1808.2.9.1 1810.2.1 General Lateral support. Any soil other than fluid soil shall be deemed to afford sufficient lateral support ~~to the pier or pile to prevent buckling of deep foundation elements~~ and to permit the design of the ~~pier or pile elements~~ elements in accordance with accepted engineering practice and the applicable provisions of this code.

1808.2.9.2 Unbraced piles. ~~Piles standing~~ Where deep foundation elements stand unbraced in air, water, or in fluid soils, it shall be designed as columns in accordance with the provisions of this code. ~~Such piles driven into firm ground can be considered~~ permitted to consider them fixed and laterally supported at a point 5 feet (1524 mm) below the ground surface and in soft material at into stiff soil or 10 feet (3048 mm) below the ground surface into soft soil unless otherwise prescribed by the building official after a foundation investigation by an approved agency.

1808.2.5 1810.2.2 Stability. ~~Piers or piles~~ Deep foundation elements shall be braced to provide lateral stability in all directions. Three or more ~~piles elements~~ elements connected by a rigid cap shall be considered braced, provided that the ~~piles elements~~ elements are located in radial directions from the centroid of the group not less than 60 degrees (1 rad) apart. A ~~two-pile two-element~~ group in a rigid cap shall be considered to be braced along the axis connecting the two piles elements. Methods used to brace ~~piers or piles deep foundation elements~~ elements shall be subject to the approval of the building official.

~~Piles~~ Deep foundation elements supporting walls shall be ~~driven placed~~ alternately in lines spaced at least 1 foot (305 mm) apart and located symmetrically under the center of gravity of the wall load carried, unless effective measures are taken to provide for eccentricity and lateral forces, or the ~~wall-piles foundation elements~~ elements are adequately braced to provide for lateral stability. ~~A single row of piles without lateral bracing is permitted for one- and two-family dwellings and lightweight construction not exceeding two stories above grade plane or 35 feet (10 668 mm) in building height, provided the centers of the piles are located within the width of the foundation wall.~~

Exceptions:

1. Isolated cast-in-place deep foundation elements without lateral bracing shall be permitted where the least horizontal dimension is no less than 2 feet (610 mm), adequate lateral support in accordance with Section 1810.2.1 is provided for the entire height and the height does not exceed 12 times the least horizontal dimension.
2. A single row of deep foundation elements without lateral bracing is permitted for one- and two-family dwellings and lightweight construction not exceeding two stories above grade plane or 35 feet (10 668 mm) in building height, provided the centers of the elements are located within the width of the supported wall.

1808.2.12 1810.2.3 Settlement analysis. The settlement of ~~piers, individual piles or groups of piles~~ a single deep foundation element or group thereof shall be estimated based on approved methods of analysis. The predicted settlement shall cause neither harmful distortion of, nor instability in, the structure, nor cause any stresses to exceed allowable values.

~~1808.2.23.1.2~~ **1810.2.4 Design details Lateral loads.** Pier or pile ~~The~~ moments, shears and lateral deflections used for design of deep foundation elements shall be established considering the nonlinear interaction of the shaft and soil, as recommended determined by a registered design professional. Where the ratio of the depth of embedment of the pile to pile diameter or width element to its least horizontal dimension is less than or equal to six, ~~the pile may be assumed to be~~ it shall be permitted to assume the element is rigid.

~~Pile group effects from soil on lateral pile nominal strength shall be included where pile center-to-center spacing in the direction of lateral force is less than eight pile diameters. Pile group effects on vertical nominal strength shall be included where pile center-to-center spacing is less than three pile diameters. The pile uplift soil nominal strength shall be taken as the pile uplift strength as limited by the frictional force developed between the soil and the pile.~~

~~Where a minimum length for reinforcement or the extent of closely spaced confinement reinforcement is specified at the top of the pier or pile, provisions shall be made so that those specified lengths or extents are maintained after pier or pile cutoff.~~

1808.2.23.2.1 1810.2.4.1 Design details for piers, piles and grade beams Seismic Design Categories D through F. ~~Piers or piles~~ For structures assigned to Seismic Design Category D, E, or F, deep foundation elements on Site Class E or F sites, as determined in Section 1613.5.2, shall be designed and constructed to withstand maximum imposed curvatures from earthquake ground motions and structure response. Curvatures shall include free-field soil strains modified for soil-pile foundation-structure interaction coupled with pier or pile foundation element deformations induced by lateral pier or pile resistance to structure seismic forces associated with earthquake loads imparted to the foundation by the structure.

Exception: ~~Piers or piles~~ Deep foundation elements that satisfy the following additional detailing requirements shall be deemed to comply with the curvature capacity requirements of this section.

1. Precast prestressed concrete piles detailed in accordance with Section ~~1809.2.3.2.2~~ 1810.3.8.3.3.
2. Cast-in-place ~~concrete piles~~ deep foundation elements with a minimum longitudinal reinforcement ratio of 0.005 extending the full length of the pile element and detailed in accordance with Sections 21.4.4.1, 21.4.4.2 and 21.4.4.3 of ACI 318 as required by this Section ~~1810.3.9.4.2.2~~.

~~Where constructed of nonprestressed concrete such piers or piles shall be designed and detailed in accordance with Sections 21.4.4.1, 21.4.4.2 and 21.4.4.3 of ACI 318 within seven pile diameters of the pile cap and within seven pile diameters of the interfaces of strata that are hard or stiff and strata that are liquefiable or are composed of soft to medium stiff clay.~~

~~Grade beams shall comply with the provisions in Section 21.10.3 of ACI 318 for grade beams, except where they have the capacity to resist the forces from the load combinations in Section 1605.4.~~

1810.2.5 Group effects. The analysis shall include group effects on lateral behavior where the center-to-center spacing of deep foundation elements in the direction of lateral force is less than eight times the least horizontal dimension of an element. The analysis shall include group effects on axial behavior where the center-to-center spacing of deep foundation elements is less than three times the least horizontal dimension of an element.

1810.3 Design and Detailing. Deep foundations shall be designed and detailed in accordance with Sections 1810.3.1 through 1810.3.12.

1810.3.1 Design conditions. Design of deep foundations shall include the design conditions specified in Sections 1810.3.1.1 through 1810.3.1.5, as applicable.

1810.3.1.1 Design methods for concrete elements. Where concrete deep foundations are laterally supported in accordance with Section 1810.2.1 for the entire height and applied forces cause bending moments no greater than those resulting from accidental eccentricities, structural design of the element using the load combinations of Section 1605.3 and the allowable stresses specified in this chapter shall be permitted. Otherwise, the structural design of concrete deep foundation elements shall use the load combinations of Section 1605.2 and approved strength design methods.

1810.3.1.2 Composite elements. Where a single deep foundation element comprises two or more sections of different materials or different types spliced together, each section of the composite assembly shall satisfy the applicable requirements of this code, and the maximum allowable load shall be limited by the capacity of the weakest section.

~~1808.2.8.8~~ **1810.3.1.3 Overloads on piers or piles Mislocation.** The maximum compressive load on any pier or pile due to mislocation shall not exceed To resist the effects of mislocation, compressive overload of deep foundation elements to 110 percent of the allowable design load shall be permitted.

~~1809.2.1.4~~ **1810.3.1.4 Design and manufacture Driven piles.** Driven piles shall be designed and manufactured in accordance with accepted engineering practice to resist all stresses induced by handling, driving and service loads.

~~1810.5.4~~ **1810.3.1.5 Materials Casings.** Pile shells or Temporary and permanent casings shall be of steel and shall be sufficiently strong to resist collapse and sufficiently water tight to exclude any foreign materials during the placing of concrete. Steel shells shall have a sealed tip with a diameter of not less than 8 inches (203 mm). Where a permanent casing is considered reinforcing steel, the steel shall be protected under the conditions specified in Section 1810.3.2.5. Horizontal joints in the casing shall be spliced in accordance with Section 1810.3.6.

1810.3.2 Materials. The materials used in deep foundations elements shall satisfy the requirements of Sections 1810.3.2.1 through 1810.3.2.8, as applicable.

~~1810.2.4~~ **1810.3.2.1 Materials Concrete.** Where concrete is cast in a steel pipe or where an enlarged base is formed by compacting concrete, the maximum size for coarse aggregate for concrete shall be 3/4 inch (19.1 mm). Concrete to be compacted shall have a zero slump.

1810.3.2.1.1 Seismic hooks. For structures assigned to Seismic Design Category C, D, E, or F in accordance with Section 1613, the ends of hoops, spirals and ties used in concrete deep foundation elements shall be terminated with seismic hooks, as defined in Section 21.1 of ACI 318, and shall be turned into the confined concrete core.

1810.3.2.2 Prestressing steel. Prestressing steel shall conform to ASTM A 416.

~~1809.3.4~~ **1810.3.2.3 Materials Structural steel.** Structural steel piles, steel pipe and fully welded steel piles fabricated from plates shall conform to ASTM A 36, ASTM A 252, ASTM A 283, ASTM A 572, ASTM A 588, ASTM A 690, ASTM A 913 or ASTM A 992.

~~1809.4~~ **1810.3.2.4 Timber piles.** Timber piles deep foundation elements shall be designed as piles or poles in accordance with the AF&PA NDS.

~~1809.1.1~~ **Materials.** Round timber piles elements shall conform to ASTM D 25. Sawn timber piles elements shall conform to DOC PS-20.

~~1809.1.2~~ **1810.3.2.4.1 Preservative treatment.** Timber piles deep foundation elements used to support permanent structures shall be treated in accordance with this section unless it is established that the tops of the untreated timber piles elements will be below the lowest ground-water level assumed to exist during the life of the structure. Preservative and minimum final retention shall be in accordance with AWPA U1 (Commodity Specification E, Use Category 4C) for round timber piles elements and AWPA U1 (Commodity Specification A, Use Category 4B) for sawn timber piles elements. Preservative-treated timber piles elements shall be subject to a quality control program administered by an approved agency. Pile Element cutoffs shall be treated in accordance with AWPA M4.

~~1808.2.47~~ **1810.3.2.5 Protection of pile materials.** Where boring records or site conditions indicate possible deleterious action on pier or pile the materials used in deep foundation elements because of soil constituents, changing water levels or other factors, the pier or pile materials elements shall be adequately protected by materials, methods or processes approved by the building official. Protective materials shall be applied to the piles elements so as not to be rendered ineffective by driving installation. The effectiveness of such protective measures for the particular purpose shall have been thoroughly established by satisfactory service records or other evidence.

1810.3.2.6 Allowable stresses. The allowable stresses for materials used in deep foundation elements shall not exceed those specified in Table 1810.3.2.6.

TABLE 1810.3.2.6
ALLOWABLE STRESSES FOR MATERIALS USED IN DEEP FOUNDATION ELEMENTS

MATERIAL TYPE AND CONDITION	MAXIMUM ALLOWABLE STRESS^a
1. <u>Concrete or grout in compression^b</u> <u>Cast-in-place with a permanent casing in accordance with Section 1810.3.2.7</u> <u>Cast-in-place in a pipe, tube, or other permanent casing</u> <u>Cast-in-place without a permanent casing</u> <u>Precast nonprestressed</u> <u>Precast prestressed</u>	$0.4 f'_c$ $0.33 f'_c$ $0.3 f'_c$ $0.33 f'_c$ $0.33 f'_c - 0.27 f_{pc}$
2. <u>Nonprestressed reinforcement in compression</u>	$0.4 f_y \leq 30,000$ psi
3. <u>Structural steel in compression</u> <u>Cores within concrete-filled pipes or tubes</u> <u>Pipes, tubes, or H-piles, where justified in accordance with Section 1810.3.2.8</u> <u>Pipes or tubes for micropiles</u> <u>Other pipes, tubes, or H-piles</u>	$0.5 F_y \leq 32,000$ psi $0.5 F_y \leq 32,000$ psi $0.4 F_y \leq 32,000$ psi $0.35 F_y \leq 16,000$ psi
4. <u>Nonprestressed reinforcement in tension</u> <u>Within micropiles</u> <u>Other conditions</u>	$0.6 f_y$ $0.5 f_y \leq 24,000$ psi
5. <u>Structural steel in tension</u> <u>Pipes, tubes, or H-piles, where justified in accordance with Section 1810.3.2.8</u> <u>Other pipes, tubes, or H-piles</u>	$0.5 F_y \leq 32,000$ psi $0.35 F_y \leq 16,000$ psi
6. <u>Timber</u>	In accordance with the AF&PA NDS

- a. f'_c is the specified compressive strength of the concrete or grout; f_{pc} is the compressive stress on the gross concrete section due to effective prestress forces only; f_y is the specified yield strength of reinforcement; F_y is the specified minimum yield stress of structural steel.
- b. The stresses specified apply to the gross cross-sectional area within the concrete surface. Where a temporary or permanent casing is used, the inside face of the casing shall be considered the concrete surface.

1810.5.2 1810.3.2.7 Allowable stresses Increased allowable compressive stress for cased cast-in-place elements. The allowable design compressive stress in the concrete shall not exceed 33 percent of the 28-day specified compressive strength (f'_c). The allowable concrete compressive stress shall be $0.40 (f'_c)$ for that portion of the pile meeting the conditions specified in Sections 1810.5.2.1 through 1810.5.2.4. shall be permitted to be increased as specified in Table 1810.3.2.6 for those portions of permanently cased cast-in-place elements that satisfy the following conditions:

1. The design shall not use the casing to resist any portion of the axial load imposed.
2. The casing shall have a sealed tip and be mandrel driven.
3. **1810.5.2.1 Shell thickness.** The thickness of the steel shell casing shall not be less than manufacturer's standard gage No. 14 gage (0.068 inch) (1.75 mm) minimum.
4. **1810.5.2.2 Shell type.** The shell casing shall be seamless or provided with seams of strength equal to the basic material and be of a configuration that will provide confinement to the cast-in-place concrete.
5. **1810.5.2.3 Strength.** The ratio of steel yield strength (F_y) to 28-day specified compressive strength (f'_c) shall not be less than six.
6. **1810.5.2.4 Diameter.** The nominal pile diameter of the element shall not be greater than 16 inches (406 mm).

1808.2.10 1810.3.2.8 Use Justification of higher allowable pier or pile stresses. Use of allowable stresses greater than those specified for piers or for each pile type in Sections 1809 and 1810 are in Section 1810.3.2.6 shall be permitted where supporting data justifying such higher stresses is filed with the building official. Such substantiating data shall include:

1. A soils investigation in accordance with Section 1802.2; and
2. Pier or pile Load tests in accordance with Section 1808.2.8.3 1810.3.3.1.2, regardless of the load supported by the pier or pile element.

The design and installation of the ~~pier or pile~~ deep foundation elements shall be under the direct supervision of a registered design professional knowledgeable in the field of soil mechanics and ~~pier or pile~~ deep foundations who shall certify to the building official that the ~~piers or piles~~ elements as installed satisfy the design criteria.

~~1808.2.8.4~~ 1810.3.3 Determination of allowable loads. The allowable axial and lateral loads on ~~piers or piles~~ deep foundation elements shall be determined by an approved formula, load tests or method of analysis.

1810.3.3.1 Allowable axial load. The allowable axial load on a deep foundation element shall be determined in accordance with Section 1810.3.3.1.

~~1808.2.8.2~~ 1810.3.3.1.1 Driving criteria. The allowable compressive load on any ~~pile~~ driven deep foundation element where determined by the application of an approved driving formula shall not exceed 40 tons (356 kN). For allowable loads above 40 tons (356 kN), the wave equation method of analysis shall be used to estimate ~~pile~~ driveability ~~of~~ for both driving stresses and net displacement per blow at the ultimate load. Allowable loads shall be verified by load tests in accordance with Section ~~1808.2.8.3~~ 1810.3.3.1.2. The formula or wave equation load shall be determined for gravity-drop or power-actuated hammers and the hammer energy used shall be the maximum consistent with the size, strength and weight of the driven ~~piles~~ elements. The use of a follower is permitted only with the approval of the building official. The introduction of fresh hammer cushion or pile cushion material just prior to final penetration is not permitted.

~~1808.2.8.3~~ 1810.3.3.1.2 Load tests. Where design compressive loads ~~per pier or pile~~ are greater than those permitted by Section ~~1808.2.10~~ or determined using the allowable stresses specified in Section 1810.3.2.6 where the design load for any ~~pier or pile~~ deep foundation element is in doubt, or where ~~cast-in-place deep foundation elements have an enlarged base formed either by compacting concrete or by driving a precast base,~~ control test ~~piers or piles~~ elements shall be tested in accordance with ASTM D 1143 or ASTM D 4945. At least one ~~pier or pile~~ element shall be ~~test loaded~~ load tested in each area of uniform subsoil conditions. Where required by the building official, additional ~~piers or piles~~ elements shall be load tested where necessary to establish the safe design capacity. The resulting allowable loads shall not be more than one-half of the ultimate axial load capacity of the test ~~pier or pile~~ element as assessed by one of the published methods listed in Section ~~1808.2.8.3.4~~ 1810.3.3.1.3 with consideration for the test type, duration and subsoil. The ultimate axial load capacity shall be determined by a registered design professional with consideration given to tolerable total and differential settlements at design load in accordance with Section ~~1808.2.42~~ 1810.2.3. In subsequent installation of the balance of deep foundation piles elements, all ~~piles~~ elements shall be deemed to have a supporting capacity equal to that of the control ~~pile~~ element where such ~~piles~~ elements are of the same type, size and relative length as the test ~~pile~~ element; are installed using the same or comparable methods and equipment as the test ~~pile~~ element; are installed in similar subsoil conditions as the test ~~pile~~ element; and, for driven ~~piles~~ elements, where the rate of penetration (e.g., net displacement per blow) of such ~~piles~~ elements is equal to or less than that of the test ~~pile~~ element driven with the same hammer through a comparable driving distance.

~~1808.2.8.3.4~~ 1810.3.3.1.3 Load test evaluation methods. It shall be permitted to evaluate ~~pile~~ load tests ~~with~~ of deep foundation elements using any of the following methods:

1. Davisson Offset Limit.
2. Brinch-Hansen 90% Criterion.
3. Butler-Hoy Criterion.
4. Other methods approved by the building official.

~~1808.2.8.4~~ 1810.3.3.1.4 Allowable frictional resistance. The assumed frictional resistance developed by any ~~pier or uncased cast-in-place pile~~ deep foundation element shall not exceed one-sixth of the bearing value of the soil material at minimum depth as set forth in Table 1804.2, up to a maximum of 500 psf (24 kPa), unless a greater value is allowed by the building official ~~after~~ on the basis of a soil investigation as specified in Section 1802 is submitted or a greater value is substantiated by a load test in accordance with Section ~~1808.2.8.3~~ 1810.3.3.1.2. Frictional resistance and bearing resistance shall not be assumed to act simultaneously unless recommended by a soil investigation as specified in Section 1802.

~~1808.2.8.5~~ 1810.3.3.1.5 Uplift capacity of a single deep foundation element. Where required by the design, the uplift capacity of a single ~~pier or pile~~ deep foundation element shall be determined by an approved method of analysis based on a minimum factor of safety of three or by load tests conducted in accordance with ASTM D 3689. The maximum allowable uplift load shall not exceed the ultimate load capacity as determined in Section ~~1808.2.8.3~~ 1810.3.3.1.2 divided by a factor of safety of two.

1810.3.3.1.6 Uplift capacity of grouped deep foundation elements. For ~~pile groups~~ grouped deep foundation elements subjected to uplift, the allowable working uplift load for the group shall be the lesser of:

1. The proposed individual ~~pile~~ pile uplift working load times the number of ~~piles~~ elements in the group.
2. Two-thirds of the effective weight of the ~~pile~~ pile group and the soil contained within a block defined by the perimeter of the group and the length of the ~~pile~~ pile element.

~~4808.2.8.6~~ **1810.3.3.1.7 Load-bearing capacity.** ~~Piers, individual piles and groups of piles~~ Deep foundation elements shall develop ultimate load capacities of at least twice the design working loads in the designated load-bearing layers. Analysis shall show that no soil layer underlying the designated load-bearing layers causes the load-bearing capacity safety factor to be less than two.

~~4808.2.8.7~~ **1810.3.3.1.8 Bent piers or piles deep foundation elements.** The load-bearing capacity of ~~piers or piles~~ deep foundation elements discovered to have a sharp or sweeping bend shall be determined by an approved method of analysis or by load testing a representative ~~pier or pile~~ element.

~~4808.2.9.3~~ **1810.3.3.2 Allowable lateral load.** Where required by the design, the lateral load capacity of a ~~pier, a single pile~~ deep foundation element or a ~~pile~~ group thereof shall be determined by an approved method of analysis or by lateral load tests to at least twice the proposed design working load. The resulting allowable load shall not be more than one-half of that test load that produces a gross lateral movement of 1 inch (25 mm) at the ground surface.

~~4808.2.11~~ **1810.3.4 Piles in Subsiding areas soils.** Where ~~piles~~ deep foundation elements are installed through subsiding fills or other subsiding strata and derive support from underlying firmer materials, consideration shall be given to the downward frictional forces that may be imposed on the ~~piles~~ elements by the subsiding upper strata.

Where the influence of subsiding fills is considered as imposing loads on the ~~pile~~ element, the allowable stresses specified in this chapter ~~are~~ shall be permitted to be increased where satisfactory substantiating data are submitted.

1810.3.5 Dimensions of deep foundation elements. The dimensions of deep foundation elements shall be in accordance with Sections 1810.3.5.1 through 1810.3.5.3, as applicable.

~~4809.2.1.2~~ **1810.3.5.1 Minimum dimension Precast.** The minimum lateral dimension of precast concrete deep foundation elements shall be 8 inches (203 mm). Corners of square ~~piles~~ elements shall be chamfered.

1810.3.5.2 Cast-in-place or grouted-in-place. Cast-in-place and grouted-in-place deep foundation elements shall satisfy the requirements of this section.

1810.3.5.2.1 Cased. Cast-in-place deep foundation elements with a permanent casing shall have a nominal outside diameter of not less than 8 inches (203 mm).

~~4840.3.2~~ **1810.3.5.2.2 Dimensions Uncased.** Cast-in-place deep foundation elements without a permanent casing shall have a diameter of not less than 12 inches (305 mm). The ~~pile~~ element length shall not exceed 30 times the average diameter. ~~The minimum diameter shall be 12 inches (305 mm).~~

Exception: The length of the ~~pile~~ element is permitted to exceed 30 times the diameter, provided that the design and installation of the ~~pile foundation~~ deep foundations are under the direct supervision of a registered design professional knowledgeable in the field of soil mechanics and ~~pile~~ deep foundations. The registered design professional shall certify to the building official that the ~~piles~~ elements were installed in compliance with the approved construction documents.

1810.3.5.2.3 Micropiles. Micropiles shall have an outside diameter of 12 inches (305 mm) or less. There is no minimum diameter for micropiles.

1810.3.5.3 Steel. Steel deep foundation elements shall satisfy the requirements of this section.

~~4809.3.3~~ **1810.3.5.3.1 Dimensions of H-piles.** Sections of H-piles shall comply with the following:

1. The flange projections shall not exceed 14 times the minimum thickness of metal in either the flange or the web and the flange widths shall not be less than 80 percent of the depth of the section.
2. The nominal depth in the direction of the web shall not be less than 8 inches (203 mm).
3. Flanges and web shall have a minimum nominal thickness of 3/8 inch (9.5 mm).

~~1809.3.4~~ **1810.3.5.3.2 Dimensions of Steel pipes piles and tubes.** Steel pipe piles driven open-ended pipes and tubes used as deep foundation elements shall have a nominal outside diameter of not less than 8 inches (203 mm). ~~The pipe~~ Where steel pipes or tubes are driven open-ended, they shall have a minimum of 0.34 square inch (219 mm²) of steel in cross section to resist each 1,000 foot-pounds (1356 Nm) of pile hammer energy, or shall have the equivalent strength for steels having a yield strength greater than 35,000 psi (241 MPa) or the wave equation analysis shall be permitted to be used to assess compression stresses induced by driving to evaluate if the pile section is appropriate for the selected hammer. Where a pipe or tube with wall thickness less than 0.179 inch (4.6 mm) is driven open ended, a suitable cutting shoe shall be provided. Concrete filled steel pipes or tubes in structures assigned to Seismic Design Category C, D, E, or F shall have a wall thickness of not less than 3/16 inch (5 mm). The pipe or tube casing for socketed drilled shafts shall have a nominal outside diameter of not less than 18 inches (457 mm), a wall thickness of not less than 3/8 inch (9.5 mm), and a suitable steel driving shoe welded to the bottom; the diameter of the rock socket shall be approximately equal to the inside diameter of the casing.

Exceptions:

1. There is no minimum diameter for steel pipes or tubes used in micropiles.
2. ~~1810.6.3 Minimum dimensions.~~ Piles shall have a nominal outside diameter of not less than 8 inches (203 mm) and a minimum wall thickness in accordance with Section 1809.3.4. For mandrel-driven pipes or tubes piles, the minimum wall thickness shall be 1/10 inch (2.5 mm).

~~1808.2.7~~ **1810.3.6 Splices.** Splices shall be constructed so as to provide and maintain true alignment and position of the component parts of the pier or pile deep foundation element during installation and subsequent thereto and shall be of adequate strength to transmit the vertical and lateral loads and moments occurring at the location of the splice during driving and under service loading. ~~Where deep foundation elements of the same type are being spliced,~~ splices shall develop not less than 50 percent of the ~~least capacity of the pier or pile in bending~~ strength of the weaker section. Where deep foundation elements of different materials or different types are being spliced, splices shall develop the full compressive strength and not less than 50 percent of the tension and bending strength of the weaker section. Where structural steel cores are to be spliced, the ends shall be milled or ground to provide full contact and shall be full-depth welded.

In addition, Splices occurring in the upper 10 feet (3048 mm) of the embedded portion of the pier or pile an element shall be capable of resisting at allowable working stresses the moment and shear that would result from an assumed eccentricity of the pier or pile axial load of 3 inches (76 mm), or the pier or pile element shall be braced in accordance with Section ~~1808.2.5~~ 1810.2.2 to other piers or piles deep foundation elements that do not have splices in the upper 10 feet (3048 mm) of embedment.

1810.3.6.1 Seismic Design Categories C through F. For structures assigned to Seismic Design Category C, D, E, or F, splices of deep foundation elements shall develop the lesser of the following:

1. The full strength of the deep foundation element; and
2. The axial and shear forces and moments from the load combinations with overstrength factor in Section 12.4.3.2 of ASCE 7.

1810.3.7 Top of pile detailing at cutoffs. Where a minimum length for reinforcement or the extent of closely spaced confinement reinforcement is specified at the top of a deep foundation element, provisions shall be made so that those specified lengths or extents are maintained after cutoff.

~~1809.2~~ **Precast concrete piles.**

~~1809.2.4~~ **1810.3.8 General Precast concrete piles.** The materials, reinforcement and installation of Precast concrete piles shall conform to be designed and detailed in accordance with Sections 1809.2.1.1 through 1809.2.1.4 1810.3.8.1 through 1810.3.8.3.

~~1809.2.4.3~~ **1810.3.8.1 Reinforcement.** Longitudinal steel shall be arranged in a symmetrical pattern and be laterally tied with steel ties or wire spiral spaced center to center as follows:

1. At not more than 1 inch (25 mm) for the first five ties or spirals at each end; then
2. At not more than 4 inches (102 mm) apart, center to center, for a distance of the remainder of the first 2 feet (610 mm) from the ends of the pile each end; and then
3. At not more than 6 inches (152 mm) elsewhere except that at the ends of each pile, the first five ties or spirals shall be spaced 1 inch (25 mm) center to center.

The size gage of ties and spirals shall be as follows:

1. For piles having a diameter least horizontal dimension of 16 inches (406 mm) or less, wire shall not be smaller than 0.22 inch (5.6 mm) (No. 5 gage).
2. For piles having a diameter least horizontal dimension of more than 16 inches (406 mm) and less than 20 inches (508 mm), wire shall not be smaller than 0.238 inch (6 mm) (No. 4 gage).
3. For piles having a diameter least horizontal dimension of 20 inches (508 mm) and larger, wire shall not be smaller than 0.25 inch (6.4 mm) round or 0.259 inch (6.6 mm) (No. 3 gage).

~~1809.2.2~~ **1810.3.8.2 Precast nonprestressed piles.** Precast nonprestressed concrete piles shall ~~conform to~~ comply with the requirements of Sections 1809.2.2.1 through 1809.2.2.5 1810.3.8.2.1 through 1810.3.8.2.3.

~~1809.2.2.2~~ **1810.3.8.2.1 Minimum reinforcement.** The ~~minimum amount of~~ Longitudinal reinforcement shall be 0.8 percent of the concrete section and shall consist of at least four bars ~~consist of at least four bars with a minimum longitudinal reinforcement ratio of 0.008.~~

~~1809.2.2.2.1~~ **1810.3.8.2.2 Seismic reinforcement in Seismic Design Category Categories C through F.** ~~Where a For structures is assigned to Seismic Design Category C, D, E, or F in accordance with Section 1613, the following shall apply~~ precast nonprestressed piles shall be reinforced as specified in this section. The minimum longitudinal reinforcement with a minimum steel ratio of shall be 0.01 shall be provided throughout the length of precast concrete piles. Within three pile diameters of the bottom of the pile cap, the longitudinal reinforcement shall be confined with Transverse reinforcement shall consist of closed ties or spirals of with a minimum 3/8 inch (9.5 mm) diameter. Ties or spirals shall be provided at a maximum spacing of Spacing of transverse reinforcement shall not exceed the smaller of eight times the diameter of the smallest longitudinal bar not to exceed or, 6 inches (152 mm) within a distance of three times the least pile dimension from the bottom of the pile cap. Spacing of transverse reinforcement shall not exceed 6 inches (152 mm) throughout the remainder of the pile, the closed ties or spirals shall have a maximum spacing of 16 times the smallest longitudinal bar diameter, not to exceed 8 inches (203 mm).

~~1809.2.2.2.2~~ **1810.3.8.2.3 Additional seismic reinforcement in Seismic Design Category Categories D through, E or F.** ~~Where a For structures is assigned to Seismic Design Category D, E or F in accordance with Section 1613, the requirements for Seismic Design Category C in Section 1809.2.2.2.1 shall apply except as modified by this section. Transverse confinement reinforcement consisting of closed ties or equivalent spirals shall be provided in accordance with Sections 21.4.4.1, 21.4.4.2 and 21.4.4.3 of ACI 318 within three pile diameters of the bottom of the pile cap. For other than Site Class E or F, or liquefiable sites and where spirals are used as the transverse reinforcement, it shall be permitted to use a volumetric ratio of spiral reinforcement of not less than one-half that required by Section 21.4.4.1(a) of ACI 318~~ transverse reinforcement shall be in accordance with Section 1810.3.9.4.2.

~~1809.2.3~~ **1810.3.8.3 Precast prestressed piles.** Precast prestressed concrete piles shall ~~conform to~~ comply with the requirements of Sections 1809.2.3.1 through 1809.2.3.5 1810.3.8.3.1 through 1810.3.8.3.3.

~~1809.2.3.2~~ **1810.3.8.3.1 Design Effective prestress.** Precast prestressed piles shall be designed to resist stresses induced by handling and driving as well as by loads. The effective prestress in the pile shall not be less than 400 psi (2.76MPa) for piles up to 30 feet (9144 mm) in length, 550 psi (3.79 MPa) for piles up to 50 feet (15 240 mm) in length and 700 psi (4.83 MPa) for piles greater than 50 feet (15 240 mm) in length.

Effective prestress shall be based on an assumed loss of 30,000 psi (207 MPa) in the prestressing steel. The tensile stress in the prestressing steel shall not exceed the values specified in ACI 318.

~~1809.2.3.2.1~~ **1810.3.8.3.2 Design Seismic reinforcement in Seismic Design Category C.** ~~Where a For structures is assigned to Seismic Design Category C in accordance with Section 1613, the following shall apply~~ precast prestressed piles shall have transverse reinforcement in accordance with this section. The minimum volumetric ratio of spiral reinforcement shall not be less than 0.007 or the amount required by the following formula for the upper 20 feet (6096 mm) of the pile.

$$\rho_s = 0.12 f'_c / f_{yh} \quad (\text{Equation 18-4})$$

where:

f'_c = Specified compressive strength of concrete, psi (MPa)

f_{yh} = Yield strength of spiral reinforcement \leq 85,000 psi (586 MPa).

ρ_s = Spiral reinforcement index (vol. spiral/vol. core).

At least one-half the volumetric ratio required by Equation 18-4 shall be provided below the upper 20 feet (6096 mm) of the pile.

The pile cap connection by means of dowels as indicated in Section 1808.2.23.1 is permitted. Pile cap connection by means of developing pile reinforcing strand is permitted provided that the pile reinforcing strand results in a ductile connection.

1809.2.3.2.2 1810.3.8.3.3 Design Seismic reinforcement in Seismic Design Category Categories D through, E or F. ~~Where a~~ For structures is assigned to Seismic Design Category D, E or F in accordance with Section 1613, the requirements for Seismic Design Category C in Section 1809.2.3.2.1 shall be met, in addition to precast prestressed piles shall have transverse reinforcement in accordance with the following:

1. Requirements in ACI 318, Chapter 21, need not apply, unless specifically referenced.
2. Where the total pile length in the soil is 35 feet (10 668 mm) or less, the lateral transverse reinforcement in the ductile region shall occur through the length of the pile. Where the pile length exceeds 35 feet (10 668 mm), the ductile pile region shall be taken as the greater of 35 feet (10 668 mm) or the distance from the underside of the pile cap to the point of zero curvature plus three times the least pile dimension.
3. In the ductile region, the center-to-center spacing of the spirals or hoop reinforcement shall not exceed one-fifth of the least pile dimension, six times the diameter of the longitudinal strand, or 8 inches (203 mm), whichever is ~~smaller~~ smallest.
4. Circular spiral reinforcement shall be spliced by lapping one full turn and bending the end of ~~the~~ each spiral to a 90-degree hook or by use of a mechanical or welded splice complying with Sec. 12.14.3 of ACI 318.
5. Where the transverse reinforcement consists of circular spirals, the volumetric ratio of spiral transverse reinforcement in the ductile region shall comply with the following:

$$\rho_s = 0.25(f'_c / f_{yh})(A_g / A_{ch} - 1.0)[0.5 + 1.4P / (f'_c A_g)] \quad \text{(Equation 18-5)}$$

but not less than:

$$\rho_s = 0.12(f'_c / f_{yh}) [0.5 + 1.4P / (f'_c A_g)] \geq 0.12 f'_c / f_{yh} \quad \text{(Equation 18-6)}$$

and need not exceed:

$$\rho_s = 0.021 \quad \text{(Equation 18-7)}$$

where:

- A_g = Pile cross-sectional area, square inches (mm²).
- A_{ch} = Core area defined by spiral outside diameter, square inches (mm²).
- f'_c = Specified compressive strength of concrete, psi (MPa)
- f_{yh} = Yield strength of spiral reinforcement \leq 85,000 psi (586 MPa).
- P = Axial load on pile, pounds (kN), as determined from Equations 16-5 and ~~46-6~~ 16-7.
- ρ_s = Volumetric ratio (vol. spiral/ vol. core).

This required amount of spiral reinforcement is permitted to be obtained by providing an inner and outer spiral.

6. ~~When~~ Where transverse reinforcement consists of rectangular hoops and cross ties, the total cross-sectional area of lateral transverse reinforcement in the ductile region with spacing, s, and perpendicular ~~to~~ dimension, h_c , shall conform to:

$$A_{sh} = 0.3s h_c (f'_c / f_{yh})(A_g / A_{ch} - 1.0)[0.5 + 1.4P / (f'_c A_g)] \quad \text{(Equation 18-8)}$$

but not less than:

$$A_{sh} = 0.12s h_c (f'_c / f_{yh}) [0.5 + 1.4P / (f'_c A_g)] \quad \text{(Equation 18-9)}$$

where:

- f_{yh} = \leq 70,000 psi (483 MPa).
- h_c = Cross-sectional dimension of pile core measured center to center of hoop reinforcement, inch (mm).
- s = Spacing of transverse reinforcement measured along length of pile, inch (mm).
- A_{sh} = Cross-sectional area of tranverse reinforcement, square inches (mm²)
- f'_c = Specified compressive strength of concrete, psi (MPa)

The hoops and cross ties shall be equivalent to deformed bars not less than No. 3 in size. Rectangular hoop ends shall terminate at a corner with seismic hooks.

Outside of the length of the pile requiring transverse confinement reinforcing, the spiral or hoop reinforcing with a volumetric ratio not less than one-half of that required for transverse confinement reinforcing shall be provided.

1810.3.9 Cast-in-place deep foundations. Cast-in-place deep foundation elements shall be designed and detailed in accordance with Sections 1810.3.9.1 through 1810.3.9.6.

1810.3.9.1 Design cracking moment. The design cracking moment (M_n) for a cast-in-place deep foundation element not enclosed by a structural steel pipe or tube shall be determined using the following equation:

$$\phi M_n = 3\sqrt{f'_c} S_m \quad \text{(Equation 18-10)}$$

where:

$$f'_c = \text{Specified compressive strength of concrete or grout, psi (MPa)}$$

$$S_m = \text{Elastic section modulus, neglecting reinforcement and casing, in}^3 \text{ (mm}^3\text{)}$$

1810.3.9.2 Required reinforcement. Where subject to uplift or where the required moment strength determined using the load combinations of Section 1605.2 exceeds the design cracking moment determined in accordance with Section 1810.3.9.1, cast-in-place deep foundations not enclosed by a structural steel pipe or tube shall be reinforced.

1810.3.9.3 Placement of reinforcement. Except for steel dowels embedded 5 feet (1524 mm) or less in the pile and as provided in Section 1810.3.4, Reinforcement where required shall be assembled and tied together and shall be placed in the pile deep foundation element as a unit before the reinforced portion of the pile element is filled with concrete except in augered uncased cast-in-place piles. Tied reinforcement in augered uncased cast-in-place piles shall be placed after piles are concreted, while the concrete is still in a semifluid state.

Exceptions:

1. Steel dowels embedded 5 feet (1524 mm) or less shall be permitted to be placed after concreting, while the concrete is still in a semifluid state.
2. **1810.3.4 Reinforcement.** For piles deep foundation elements installed with a hollow-stem auger where full-length, tied reinforcement shall be placed after elements are concreted, while the concrete is still in a semifluid state. Longitudinal steel reinforcement is placed without lateral ties, the reinforcement shall be placed either through the hollow stem of the auger prior to filling the pile with concrete concreting or after concreting, while the concrete is still in a semifluid state. All pile reinforcement shall have a concrete cover of not less than 2.5 inches (64 mm).

Exception: Where physical constraints do not allow the placement of the longitudinal reinforcement prior to filling the pile with concrete or where partial-length longitudinal reinforcement is placed without lateral ties, the reinforcement is allowed to be placed after the piles are completely concreted but while concrete is still in a semifluid state.

3. For Group R-3 and U occupancies not exceeding two stories of light-frame construction, reinforcement is permitted to be placed after concreting, while the concrete is still in a semifluid state, and the concrete cover requirement is permitted to be reduced to 2 inches (51 mm), provided the construction method can be demonstrated to the satisfaction of the building official.

1812.4 1810.3.9.4 Reinforcement Seismic reinforcement. Except for steel dowels embedded 5 feet (1524 mm) or less in the pier, reinforcement where required shall be assembled and tied together and shall be placed in the pier hole as a unit before the reinforced portion of the pier is filled with concrete. Where a structure is assigned to Seismic Design Category C reinforcement shall be provided in accordance with Section 1810.3.9.4.1. Where a structure is assigned to Seismic Design Category D, E, or F reinforcement shall be provided in accordance with Section 1810.3.9.4.2.

Exception: Reinforcement is permitted to be wet set and the 2-1/2 inch (64 mm) concrete cover requirement be reduced to 2 inches (51 mm) for Group R-3 and U occupancies not exceeding two stories of light frame construction, provided the construction method can be demonstrated to the satisfaction of the building official.

Reinforcement shall conform to the requirements of Sections 1810.1.2.1 and 1810.1.2.2.

Exceptions:

1. ~~Isolated piers deep foundation elements supporting posts of Group R-3 and U occupancies not exceeding two stories of light-frame construction are~~ shall be permitted to be reinforced as required by rational analysis but with not less than a minimum of one No. 4 bar, without ties or spirals, when where detailed so the pier element is not subject to lateral loads and the soil is determined to be of adequate stiffness provides adequate lateral support in accordance with Section 1810.2.1.
2. ~~Isolated piers deep foundation elements supporting posts and bracing from decks and patios appurtenant to Group R-3 and U occupancies not exceeding two stories of light-frame construction are~~ shall be permitted to be reinforced as required by rational analysis but with not less than one No. 4 bar, without ties or spirals, when where the lateral load, E , to the top of the pier element does not exceed 200 pounds (890 N) and the soil is determined to be of adequate stiffness provides adequate lateral support in accordance with Section 1810.2.1.
3. ~~Piers Deep foundation elements supporting the concrete foundation wall of Group R-3 and U occupancies not exceeding two stories of light-frame construction are~~ shall be permitted to be reinforced as required by rational analysis but with not less than two No. 4 bars, without ties or spirals, when it can be shown the concrete pier will not rupture when designed for the maximum seismic load, E_{m1} , where the design cracking moment determined in accordance with Section 1810.3.9.1 exceeds the required moment strength determined using the load combinations with overstrength factor in Section 12.4.3.2 of ASCE 7 and the soil is determined to be of adequate stiffness provides adequate lateral support in accordance with Section 1810.2.1.
4. ~~Closed ties or spirals where required by Section 1810.1.2.2 1810.3.9.4.2 are~~ shall be permitted to be limited to the top 3 feet (914 mm) of the piers deep foundation elements 10 feet (3048 mm) or less in depth supporting Group R-3 and U occupancies of Seismic Design Category D, not exceeding two stories of light-frame construction.

1810.1.2.1 1810.3.9.4.1 Seismic reinforcement in Seismic Design Category C. ~~For Where a structures is assigned to Seismic Design Category C in accordance with Section 1613, the following shall apply~~ cast-in-place deep foundation elements shall be reinforced as specified in this section. Reinforcement shall be provided where required by analysis.

A minimum of four longitudinal bars, with a minimum longitudinal reinforcement ratio of 0.0025, shall be provided for uncased cast-in-place concrete drilled or augered piles, piers or caissons in the top throughout the minimum reinforced length of the element as defined below starting at the top of the element. The minimum reinforced length of the element shall be taken as the greatest of the following:

1. One-third of the pile element length;
2. A minimum length distance of 10 feet (3048 mm);
3. Three times the least element dimension; and
4. The distance from the top of the element to the point where the design cracking moment determined in accordance with Section 1810.3.9.1 exceeds the required moment strength determined using the load combinations of Section 1605.2. below the ground or that required by analysis, whichever length is greatest. The minimum reinforcement ratio, but no less than that ratio required by rational analysis, shall be continued throughout the flexural length of the pile. There shall be a minimum of four longitudinal bars with

Transverse reinforcement shall consist of closed ties (or equivalent spirals) of with a minimum 3/8 inch (9.5 mm) diameter provided at 16 longitudinal-bar diameter maximum spacing. Transverse confinement reinforcement with a maximum. Spacing of transverse reinforcement shall not exceed the smaller of 6 inches (152 mm) or 8-longitudinal-bar diameters, whichever is less, shall be provided within a distance equal to of three times the least pile element dimension of from the bottom of the pile cap. Spacing of transverse reinforcement shall not exceed 16 longitudinal bar diameters throughout the remainder of the reinforced length.

Exceptions:

1. The requirements of this section shall not apply to concrete cast in structural steel pipes or tubes.
2. A spiral-welded metal casing of a thickness not less than manufacturer's standard gage No. 14 gage (0.068 inch) is permitted to provide concrete confinement in lieu of the closed ties or spirals. Where used as such, the metal casing shall be protected against possible deleterious action due to soil constituents, changing water levels or other factors indicated by boring records of site conditions.

1810.1.2.2 1810.3.9.4.2 Seismic reinforcement in Seismic Design Category Categories D, E or through F. ~~For Where a structures is assigned to Seismic Design Category D, E or F in accordance with Section 1613, the requirements for Seismic Design Category C given above shall be met, in addition to the following~~ cast-in-place deep foundation elements shall be reinforced as specified in this section. Reinforcement shall be provided where required by analysis.

A minimum of four longitudinal bars, with a minimum longitudinal reinforcement ratio of 0.005 shall be provided for uncased cast-in-place drilled or augered concrete piles, piers or caissons in the top throughout the minimum reinforced length of the element as defined below starting at the top of the element. The minimum reinforced length of the element shall be taken as the greatest of the following:

1. One-half of the pile element length;
2. A minimum length distance of 10 feet (3048 mm);
3. Three times the least element dimension; and
4. The distance from the top of the element to the point where the design cracking moment determined in accordance with Section 1810.3.9.1 exceeds the required moment strength determined using the load combinations of Section 1605.2.

~~below ground or throughout the flexural length of the pile, whichever length is greatest. The flexural length shall be taken as the length of the pile to a point where the concrete section cracking moment strength multiplied by 0.4 exceeds the required moment strength at that point. There shall be a minimum of four longitudinal bars with transverse confinement reinforcement provided in the pile in accordance with Sections 21.4.4.1, 21.4.4.2 and 21.4.4.3 of ACI 318 within three times the least pile dimension of the bottom of the pile cap. A transverse spiral reinforcement ratio of not less than one-half of that required in Section 21.4.4.1(a) of ACI 318 for other than Class E, F or liquefiable sites is permitted. Tie spacing throughout the remainder of the concrete section shall not exceed 12 longitudinal bar diameters, one-half the least dimension of the section, nor 12 inches (305 mm). Ties shall be a minimum of No. 3 bars for piles with a least dimension up to 20 inches (508 mm), and No. 4 bars for larger piles.~~

Transverse reinforcement shall consist of closed ties or spirals no smaller than No. 3 bars for elements with a least dimension up to 20 inches (508 mm), and No. 4 bars for larger elements. Throughout the remainder of the reinforced length outside the regions with transverse confinement reinforcement, as specified in Section 1810.3.9.4.2.1 or 1810.3.9.4.2.2, the spacing of transverse reinforcement shall not exceed the least of the following:

1. 12 longitudinal bar diameters;
2. One-half the least dimension of the element; and
3. 12 inches (305 mm).

Exceptions:

1. The requirements of this section shall not apply to concrete cast in structural steel pipes or tubes.
2. **1810.5.4.1 Seismic reinforcement.** Where a structure is assigned to Seismic Design Category C, D, E or F in accordance with Section 1613, the reinforcement requirements for drilled or augered uncased piles in Section 1810.3.5 shall be met.

Exception: A spiral-welded metal casing of a thickness not less than manufacturer's standard gage No. 14 gage (0.068 inch) is permitted to provide concrete confinement in lieu of the closed ties or equivalent spirals required in an uncased concrete pile. Where used as such, the metal casing shall be protected against possible deleterious action due to soil constituents, changing water levels or other factors indicated by boring records of site conditions.

1810.3.9.4.2.1 Site Classes A through D. For Site Class A, B, C, or D sites, transverse confinement reinforcement shall be provided in the element in accordance with Sections 21.4.4.1, 21.4.4.2 and 21.4.4.3 of ACI 318 within three times the least element dimension of the bottom of the pile cap. A transverse spiral reinforcement ratio of not less than one-half of that required in Section 21.4.4.1(a) of ACI 318 shall be permitted.

1810.3.9.4.2.2 Site Classes E and F. For Site Class E or F sites, transverse confinement reinforcement shall be provided in the element in accordance with Sections 21.4.4.1, 21.4.4.2 and 21.4.4.3 of ACI 318 within seven times the least element dimension of the pile cap and within seven times the least element dimension of the interfaces of strata that are hard or stiff and strata that are liquefiable or are composed of soft to medium stiff clay.

1810.3.9.5 Belled bottoms drilled shafts. Where pier foundations drilled shafts are belled at the bottom, the edge thickness of the bell shall not be less than that required for the edge of footings. Where the sides of the bell slope at an angle less than 60 degrees (1 rad) from the horizontal, the effects of vertical shear shall be considered.

1810.3.9.6 Construction Socketed drilled shafts. Caisson piles shall consist of a shaft section of concrete-filled pipe extending to bedrock with an uncased socket drilled into the bedrock and filled with concrete. Socketed drilled shafts shall have a permanent pipe or tube casing that extends down to bedrock and an uncased socket drilled into the bedrock, both filled with concrete. The caisson pile Socketed drilled shafts shall have a full-length structural steel core or a stub core installed in the rock socket and extending into the pipe portion a distance equal to the socket depth.

1810.7.3 Design. The depth of the rock socket shall be sufficient to develop the full load-bearing capacity of the caisson pile element with a minimum safety factor of two, but the depth shall not be less than the outside diameter of the pipe or tube casing. The design of the rock socket is permitted to be predicated on the sum of the allowable load-bearing pressure on the bottom of the socket plus bond along the sides of the socket. ~~The minimum outside diameter of the caisson pile shall be 18 inches (457 mm), and the diameter of the rock socket shall be approximately equal to the inside diameter of the pile.~~

1810.7.4 Structural core. The gross cross-sectional area of the structural steel core shall not exceed 25 percent of the gross area of the caisson drilled shaft. ~~The minimum clearance between the structural core and the pipe shall be 2 inches (51 mm). Where cores are to be spliced, the ends shall be milled or ground to provide full contact and shall be full-depth welded.~~

1810.8 1810.3.10 (Supp) Micropiles. ~~Micropiles shall comply with the requirements of~~ be designed and detailed in accordance with Sections 1810.8.1 through 1810.8.5 1810.3.10.1 through 1810.3.10.4.

1810.8.1 1810.3.10.1 (Supp) Construction. ~~Micropiles shall consist of a grouted section reinforced with steel pipe or steel reinforcement. Micropiles shall develop their load-carrying capacity through by means of a bond zone in soil, bedrock or a combination of soil and bedrock. The steel pipe or steel reinforcement shall extend the full length of the micropile. Micropiles shall be grouted and have either a steel pipe or tube or steel reinforcement at every section along the length. It shall be permitted to transition from deformed reinforcing bars to steel pipe or tube reinforcement by extending the bars into the pipe or tube section by at least their tension development length.~~

1810.8.2 1810.3.10.2 (Supp) Materials. Grout shall have a specified compressive strength (f'_c) of not less than 4,000 psi (27.58 Mpa). The grout mix shall be designed and proportioned so as to produce a pumpable mixture. Reinforcement shall consist of deformed reinforcing bars in accordance with ASTM A 615 Grade 60 or 75 or ASTM A 722 Grade 150.

The steel pipe or tube shall have a minimum wall thickness of 3/16 inch (4.8 mm). Splices shall comply with Section ~~1808.2.7~~ 1810.3.6. The steel pipe or tube shall have a minimum yield strength ~~exceeding~~ of 45,000 psi (310 MPa) and a minimum elongation of 15 percent as shown by mill certifications or two coupon test samples per 40,000 pounds (18 160 kg) of pipe or tube.

1810.8.4 1810.3.10.3 (Supp) Reinforcement. For micropiles or portions thereof ~~piles~~ grouted inside a temporary or permanent casing or inside a hole drilled into bedrock or a hole drilled with grout, the steel pipe or tube or steel reinforcement shall be designed to carry at least 40 percent of the design compression load. Micropiles or portions thereof ~~piles~~ grouted in an open hole in soil without temporary or permanent casing and without suitable means of verifying the hole diameter during grouting shall be designed to carry the entire compression load in the reinforcing steel. Where a steel pipe or tube is used for reinforcement, the portion of the grout enclosed within the pipe is permitted to be included in the determination of the allowable stress in the grout.

1810.8.4.1 1810.3.10.4 (Supp) Seismic reinforcement. ~~Where a For structures is assigned to Seismic Design Category C, a permanent steel casing shall be provided from the top of the micropile down a minimum of 120 percent of the flexural length to the point of zero curvature. Where a For structures is assigned to Seismic Design D, E or F, the micropile shall be considered as an alternative system in accordance with Section 104.11. The alternative pile system design, supporting documentation and test data shall be submitted to the building official for review and approval.~~

1808.2.4 1810.3.11 Pile caps. Pile caps shall be of reinforced concrete, and shall include all elements to which ~~piles~~ vertical deep foundation elements are connected, including grade beams and mats. The soil immediately below the pile cap shall not be considered as carrying any vertical load. The tops of ~~piles~~ vertical deep foundation elements shall be embedded not less than 3 inches (76 mm) into pile caps and the caps shall extend at least 4 inches (102 mm) beyond the edges of ~~piles~~ the elements. The tops of ~~piles~~ elements shall be cut or chipped back to sound material before capping.

1808.2.23.1.4 1810.3.11.1 Connection to pile cap Seismic Design Categories C through F. ~~Concrete piles and concrete-filled steel pipe piles For structures assigned to Seismic Design Category C, D, E, or F in accordance with Section 1613, concrete deep foundation elements shall be connected to the pile cap by embedding the pile element reinforcement or field-placed dowels anchored in the concrete pile element into the pile cap for a distance equal to the their development length in accordance with ACI 318. It shall be permitted to connect precast prestressed piles to the pile cap by developing the element prestressing strands into the pile cap provided the connection is ductile. For deformed bars, the development length is the full development length for compression, or tension; in the case of uplift, without reduction in length for excess area reinforcement in accordance with Section 12.2.5 of ACI 318.~~

Alternative measures for laterally confining concrete and maintaining toughness and ductile-like behavior at the top of the ~~pile will element~~ shall be permitted provided the design is such that any hinging occurs in the confined region.

~~Ends of hoops, spirals and ties shall be terminated with seismic hooks, as defined in Section 21.1 of ACI 318 turned into the confined concrete core.~~ The minimum transverse steel ratio for confinement shall not be less than one-half of that required for columns.

For resistance to uplift forces, anchorage of steel pipe ~~(round HSS sections), concrete-filled steel pipe or pipes, tubes, or H-piles~~ to the pile cap shall be made by means other than concrete bond to the bare steel section. Concrete-filled steel pipes or tubes shall have reinforcement of not less than 0.01 times the cross-sectional area of the concrete fill developed into the cap and extending into the fill a length equal to two times the required cap embedment, but not less than the tension development length of the reinforcement.

Exception: ~~Anchorage of concrete-filled steel pipe piles is permitted to be accomplished using deformed bars developed into the concrete portion of the pile.~~

Splices of pile segments shall develop the full strength of the pile, but the splice need not develop the nominal strength of the pile in tension, shear and bending when it has been designed to resist axial and shear forces and moments from the load combinations of Section 1605.4.

~~1808.2.23.2.2~~ **1810.3.11.2 Connection to pile cap Seismic Design Categories D through F.** For piles required to resist structures assigned to Seismic Design Category D, E, or F in accordance with Section 1613, ~~deep foundation element resistance to uplift forces or provide rotational restraint, design of anchorage of piles into the pile cap shall be provided~~ shall be provided by anchorage into the pile cap, designed considering the combined effect of axial forces due to uplift and bending moments due to fixity to the pile cap. Anchorage shall develop a minimum of 25 percent of the strength of the ~~pile element~~ in tension. Anchorage into the pile cap shall be capable of developing the following:

1. In the case of uplift, the lesser ~~least~~ of the following: nominal tensile strength of the longitudinal reinforcement in a concrete ~~pile element~~; or the nominal tensile strength of a steel ~~pile element~~; or the ~~pile uplift soil nominal strength factored~~ frictional force developed between the element and the soil multiplied by 1.3; or ~~and~~ the axial tension force resulting from the load combinations of Section 1605.4.
2. In the case of rotational restraint, the lesser of ~~the following~~: the axial ~~and~~ force, shear forces, and bending moments resulting from the load combinations of Section 1605.4; or ~~and~~ development of the full axial, bending and shear nominal strength of the ~~pile element~~.

~~1808.2.23.2.3~~ **Flexural strength.** Where the vertical lateral-force-resisting elements are columns, the ~~grade beam or pile cap~~ flexural strengths shall exceed the column flexural strength. The connection between batter piles and ~~grade beams or pile caps~~ shall be designed to resist the nominal strength of the pile acting as a short column. Batter piles and their connection shall be capable of resisting forces and moments from the load combinations of Section 1605.4.

1810.3.12 Grade beams. For structures assigned to Seismic Design Category D, E, or F in accordance with Section 1613, grade beams shall comply with the provisions in Section 21.10.3 of ACI 318 for grade beams, ~~except where they have the capacity to resist the forces from the load combinations with overstrength factor in Section 12.4.3.2 of ASCE 7.~~

~~1808.2.23.4~~ **1810.3.13 (Supp) Seismic Design Category C Seismic ties.** Where a ~~For~~ structures is assigned to Seismic Design Category C, D, E, or F in accordance with Section 1613, ~~the following shall apply.~~ Individual ~~pile caps, piers or piles~~ deep foundations shall be interconnected by ties. Ties shall be capable of carrying, in tension and compression, a force equal to the product of the larger pile cap or column load times the seismic coefficient, S_{DS} , divided by 10 unless it can be demonstrated that equivalent restraint is provided by reinforced concrete beams within slabs on grade or reinforced concrete slabs on grade or confinement by competent rock, hard cohesive soils or very dense granular soils.

Exception: In Group R-3 and U occupancies of light-frame construction, ~~pier foundations~~ deep foundation elements supporting foundation walls, isolated interior posts detailed so the ~~pier element~~ is not subject to lateral loads, or exterior decks and patios are not subject to interconnection if it can be shown where the soils are of adequate stiffness, subject to the approval of the building official.

1810.4 Installation. Deep foundations shall be installed in accordance with Section 1810.4. Where a single deep foundation element comprises two or more sections of different materials or different types spliced together, each section shall satisfy the applicable conditions of installation.

~~4808.2.6~~ **1810.4.1 Structural integrity.** ~~Piers or piles~~ Deep foundation elements shall be installed in such a manner and sequence as to prevent distortion or damage that may adversely affect the structural integrity of ~~piles adjacent structures or of foundation elements~~ being installed or already in place and as to avoid compacting the surrounding soil to the extent that other foundation elements cannot be installed properly.

~~4809.2.2.4~~ **1810.4.1.1 Installation Compressive strength of precast concrete piles.** A precast concrete pile shall not be driven before the concrete has attained a compressive strength of at least 75 percent of the ~~28-day~~ specified compressive strength (f'_c), but not less than the strength sufficient to withstand handling and driving forces.

1810.4.1.2 Casing. Where cast-in-place deep foundation elements are formed through unstable soils and concrete is placed in an open-drilled hole, a casing shall be inserted in the hole prior to placing the concrete. Where the casing is withdrawn during concreting, the level of concrete shall be maintained above the bottom of the casing at a sufficient height to offset any hydrostatic or lateral soil pressure. Driven casings shall be mandrel driven their full length in contact with the surrounding soil.

~~4810.4.3~~ **1810.4.1.3 Installation Driving near uncased concrete.** ~~Piles~~ Deep foundation elements shall not be driven within six ~~pile element~~ diameters center to center in granular soils or within one-half the ~~pile element~~ length in cohesive soils of a ~~pile an uncased element~~ filled with concrete less than 48 hours old unless approved by the building official. If the concrete surface in any completed ~~pile element~~ rises or drops, the ~~pile element~~ shall be replaced. ~~Piles~~ Driven uncased deep foundation elements shall not be installed in soils that could cause ~~pile~~ heave.

~~4810.5.3~~ **1810.4.1.4 Installation Driving near cased concrete.** Steel shells shall be mandrel driven their full length in contact with the surrounding soil.

~~The steel shells shall be driven in such order and with such spacing as to ensure against distortion of or injury to piles already in place. A pile~~ Deep foundation elements shall not be driven within four and one-half average ~~pile~~ diameters of a ~~pile cased element~~ filled with concrete less than 24 hours old unless approved by the building official. Concrete shall not be placed in ~~steel shells~~ casings within heave range of driving.

~~4809.1.3~~ **1810.4.1.5 Defective timber piles.** Any substantial sudden increase in rate of penetration of a timber pile shall be investigated for possible damage. If the sudden increase in rate of penetration cannot be correlated to soil strata, the pile shall be removed for inspection or rejected.

~~4808.2.20~~ **1810.4.2 Identification.** ~~Pier or pile~~ Deep foundation materials shall be identified for conformity to the specified grade with this identity maintained continuously from the point of manufacture to the point of installation or shall be tested by an approved agency to determine conformity to the specified grade. The approved agency shall furnish an affidavit of compliance to the building official.

~~4808.2.24~~ **1810.4.3 Pier or pile Location plan.** A plan showing the location and designation of ~~piers or piles~~ deep foundation elements by an identification system shall be filed with the building official prior to installation of such ~~piers or piles elements~~. Detailed records for ~~piers or individual piles elements~~ shall bear an identification corresponding to that shown on the plan.

~~4808.2.43~~ **1810.4.4 Preexcavation.** The use of jetting, augering or other methods of preexcavation shall be subject to the approval of the building official. Where permitted, preexcavation shall be carried out in the same manner as used for ~~piers or piles~~ deep foundation elements subject to load tests and in such a manner that will not impair the carrying capacity of the ~~piers or piles elements~~ already in place or damage adjacent structures. ~~Pile~~ Element tips shall be driven below the preexcavated depth until the required resistance or penetration is obtained.

~~4808.2.45~~ **1810.4.5 Use of Vibratory drivers driving.** Vibratory drivers shall only be used to install ~~piles~~ deep foundation elements where the ~~pile element~~ load capacity is verified by load tests in accordance with Section ~~4808.2.8.3~~ 1810.3.3.1.2. The installation of production ~~piles elements~~ shall be controlled according to power consumption, rate of penetration or other approved means that ensure ~~pile element~~ capacities equal or exceed those of the test ~~piles elements~~.

~~4808.2.49~~ **1810.4.6 Heaved piles elements.** ~~Piles~~ Deep foundation elements that have heaved during the driving of adjacent ~~piles elements~~ shall be redriven as necessary to develop the required capacity and penetration, or the capacity of the ~~pile element~~ shall be verified by load tests in accordance with Section ~~4808.2.8.3~~ 1810.3.3.1.2.

1810.4.7 Enlarged base cast-in-place elements ~~1810.2.3 Installation.~~ Enlarged bases for cast-in-place deep foundation elements formed either by compacting concrete or by driving a precast base shall be formed in or driven into granular soils. ~~Piles~~ Such elements shall be constructed in the same manner as successful prototype test ~~piles~~

elements driven for the project. Pile Shafts extending through peat or other organic soil shall be encased in a permanent steel casing. Where a cased shaft is used, the shaft shall be adequately reinforced to resist column action or the annular space around the pile shaft shall be filled sufficiently to reestablish lateral support by the soil. Where pile heave occurs, the pile element shall be replaced unless it is demonstrated that the pile element is undamaged and capable of carrying twice its design load.

~~1810.3.3~~ **1810.4.8 Installation Hollow-stem augered, cast-in-place elements.** ~~Where pile shafts are formed through unstable soils and concrete is placed in an open drilled hole, a steel liner shall be inserted in the hole prior to placing the concrete. Where the steel liner is withdrawn during concreting, the level of concrete shall be maintained above the bottom of the liner at a sufficient height to offset any hydrostatic or lateral soil pressure.~~

Where concrete is placed by pumping through a hollow-stem auger, the auger shall be permitted to rotate in a clockwise direction during withdrawal. The auger shall be withdrawn in continuous increments. Concreting pumping pressures shall be measured and maintained high enough at all times to offset hydrostatic and lateral earth pressures. Concrete volumes shall be measured to ensure that the volume of concrete placed in each pile element is equal to or greater than the theoretical volume of the hole created by the auger. Where the installation process of any pile element is interrupted or a loss of concreting pressure occurs, the pile element shall be redrilled to 5 feet (1524 mm) below the elevation of the tip of the auger when the installation was interrupted or concrete pressure was lost and reformed. Augered cast-in-place piles elements shall not be installed within six pile diameters center to center of a pile an element filled with concrete less than 12 hours old, unless approved by the building official. If the concrete level in any completed pile element drops due to installation of an adjacent pile element, the pile element shall be replaced.

~~1810.7.6~~ **1810.4.9 Installation Socketed drilled shafts.** ~~The rock socket and pile pipe or tube casing of socketed drilled shafts shall be thoroughly cleaned of foreign materials before filling with concrete. Steel cores shall be bedded in cement grout at the base of the rock socket. Concrete shall not be placed through water except where a tremie or other approved method is used.~~

~~1810.8.5~~ **1810.4.10 Installation Micropiles.** ~~The pile Micropile deep foundation elements shall be permitted to be formed in a holes advanced by rotary or percussive drilling methods, with or without casing. The pile elements shall be grouted with a fluid cement grout. The grout shall be pumped through a tremie pipe extending to the bottom of the pile element until grout of suitable quality returns at the top of the pile element. The following requirements apply to specific installation methods:~~

1. For micropiles grouted inside a temporary casing, the reinforcing bars shall be inserted prior to withdrawal of the casing. The casing shall be withdrawn in a controlled manner with the grout level maintained at the top of the pile element to ensure that the grout completely fills the drill hole. During withdrawal of the casing, the grout level inside the casing shall be monitored to ~~check~~ verify that the flow of grout inside the casing is not obstructed.
2. For a micropile or portion thereof a pile grouted in an open drill hole in soil without temporary casing, the minimum design diameter of the drill hole shall be verified by a suitable device during grouting.
3. For micropiles designed for end bearing, a suitable means shall be employed to verify that the bearing surface is properly cleaned prior to grouting.
4. Subsequent micropiles shall not be drilled near piles elements that have been grouted until the grout has had sufficient time to harden.
5. Micropiles shall be grouted as soon as possible after drilling is completed.
6. For micropiles designed with a full length casing, the casing shall be pulled back to the top of the bond zone and reinserted or some other suitable means employed to assure grout coverage outside the casing.

~~1808.2.22~~ **1810.4.11 Special inspection.** ~~Special inspections in accordance with Sections 1704.8 and 1704.9 shall be provided for piles and piers driven and cast-in-place deep foundation elements, respectively.~~

~~1808.2.23.2~~ **Seismic Design Category D, E or F.** ~~Where a structure is assigned to Seismic Design Category D, E or F in accordance with Section 1613, the requirements for Seismic Design Category C given in Section 1808.2.23.1 shall be met, in addition to the following. Provisions of ACI 318, Section 21.10.4, shall apply when not in conflict with the provisions of Sections 1808 through 1812. Concrete shall have a specified compressive strength of not less than 3,000 psi (20.68 MPa) at 28 days.~~

Exceptions:

1. Group R or U occupancies of light-framed construction and two stories or less above grade plane are permitted to use concrete with a specified compressive strength of not less than 2,500 psi (17.2 MPa) at 28 days.

2. Detached one- and two-family dwellings of light-frame construction and two stories or less in height are not required to comply with the provisions of ACI 318, Section 21.10.4.
3. Section 21.10.4.4(a) of ACI 318 need not apply to concrete piles.

1809.2.3.1 Materials. ~~Prestress~~ steel shall conform to ASTM A 416. Concrete shall have a 28-day specified compressive strength (f'_c) of not less than 5,000 psi (34.48 MPa).

1810.5.4 Reinforcement. Reinforcement shall not be placed within 1 inch (25 mm) of the steel shell. ~~Reinforcing shall be required for unsupported pile lengths or where the pile is designed to resist uplift or unbalanced lateral loads.~~

1810.6.4 Reinforcement. ~~Reinforcement steel shall conform to Section 1810.1.2.~~ Reinforcement shall not be placed within 1 inch (25 mm) of the steel casing.

1810.7.2 Materials. ~~Pipe and steel cores shall conform to the material requirements in Section 1809.3. Pipes shall have a minimum wall thickness of 3/8 inch (9.5 mm) and shall be fitted with a suitable steel driving shoe welded to the bottom of the pipe.~~ Concrete shall have a 28-day specified compressive strength (f'_c) of not less than 4,000 psi (27.58 MPa). The concrete mix shall be designed and proportioned so as to produce a cohesive workable mix with a slump of 4 inches to 6 inches (102 mm to 152 mm).

2. Delete without substitution:

~~**1808.2.8 Allowable pier or pile loads.**~~

~~**1808.2.14 Installation sequence.** Piles shall be installed in such sequence as to avoid compacting the surrounding soil to the extent that other piles cannot be installed properly, and to prevent ground movements that are capable of damaging adjacent structures.~~

~~**1808.2.16 Pile driveability.** Pile cross sections shall be of sufficient size and strength to withstand driving stresses without damage to the pile, and to provide sufficient stiffness to transmit the required driving forces.~~

~~**1808.2.23 Seismic design of piers or piles.**~~

**SECTION 1809
DRIVEN PILE FOUNDATIONS**

~~**1809.1.4 Allowable stresses.** The allowable stresses shall be in accordance with the AF&PA NDS.~~

~~**1809.2 Precast concrete piles.**~~

~~**1809.2.1.4 Installation.** Piles shall be handled and driven so as not to cause injury or overstressing, which affects durability or strength.~~

~~**1809.2.2.1 Materials.** Concrete shall have a 28-day specified compressive strength (f'_c) of not less than 3,000 psi (20.68 MPa).~~

~~**1809.2.2.3 Allowable stresses.** The allowable compressive stress in the concrete shall not exceed 33 percent of the 28-day specified compressive strength (f'_c) applied to the gross cross-sectional area of the pile. The allowable compressive stress in the reinforcing steel shall not exceed 40 percent of the yield strength of the steel (f_y) or a maximum of 30,000 psi (207 MPa). The allowable tensile stress in the reinforcing steel shall not exceed 50 percent of the yield strength of the steel (f_y) or a maximum of 24,000 psi (165 MPa).~~

~~**1809.2.2.5 Concrete cover.** Reinforcement for piles that are not manufactured under plant conditions shall have a concrete cover of not less than 2 inches (51 mm).~~

~~Reinforcement for piles manufactured under plant control conditions shall have a concrete cover of not less than 1.25 inches (32 mm) for No. 5 bars and smaller, and not less than 1.5 inches (38 mm) for No. 6 through No. 11 bars except that longitudinal bars spaced less than 1.5 inches (38 mm) clear distance apart shall be considered bundled bars for which the minimum concrete cover shall be equal to that for the equivalent diameter of the bundled bars. Reinforcement for piles exposed to seawater shall have a concrete cover of not less than 3 inches (76 mm).~~

~~**1809.2.3.3 Allowable stresses.** The allowable design compressive stress, f_{e1} , in concrete shall be determined as follows:~~

$$f'_e = 0.33 f'_c - 0.27 f_{pe} \quad (\text{Equation 18-10})$$

where:

f'_c = The 28-day specified compressive strength of the concrete.

f_{pe} = The effective prestress stress on the gross section.

1809.2.3.4 Installation. A prestressed pile shall not be driven before the concrete has attained a compressive strength of at least 75 percent of the 28-day specified compressive strength (f'_c), but not less than the strength sufficient to withstand handling and driving forces.

1809.2.3.5 Concrete cover. Prestressing steel and pile reinforcement shall have a concrete cover of not less than 1-1/4 inches (32 mm) for square piles of 12 inches (305 mm) or smaller size and 1-1/2 inches (38 mm) for larger piles, except that for piles exposed to seawater, the minimum protective concrete cover shall not be less than 2-1/2 inches (64 mm).

1809.3 Structural steel piles. Structural steel piles shall conform to the requirements of Sections 1809.3.1 through 1809.3.4.

1809.3.2 Allowable stresses. The allowable axial stresses shall not exceed 35 percent of the minimum specified yield strength (F_y).

Exception: Where justified in accordance with Section 1808.2.10, the allowable axial stress is permitted to be increased above $0.35F_y$, but shall not exceed $0.5F_y$.

SECTION 1810 CAST-IN-PLACE CONCRETE PILE FOUNDATIONS

1810.1 General. The materials, reinforcement and installation of cast-in-place concrete piles shall conform to Sections 1810.1.1 through 1810.1.3.

1810.1.3 Concrete placement. Concrete shall be placed in such a manner as to ensure the exclusion of any foreign matter and to secure a full-sized shaft. Concrete shall not be placed through water except where a tremie or other approved method is used. When depositing concrete from the top of the pile, the concrete shall not be chuted directly into the pile but shall be poured in a rapid and continuous operation through a funnel hopper centered at the top of the pile.

1810.2 Enlarged base piles. Enlarged base piles shall conform to the requirements of Sections 1810.2.1 through 1810.2.5.

1810.2.2 Allowable stresses. The maximum allowable design compressive stress for concrete not placed in a permanent steel casing shall be 25 percent of the 28-day specified compressive strength (f'_c). Where the concrete is placed in a permanent steel casing, the maximum allowable concrete stress shall be 33 percent of the 28-day specified compressive strength (f'_c).

1810.2.4 Load-bearing capacity. Pile load-bearing capacity shall be verified by load tests in accordance with Section 1808.2.8.3.

1810.2.5 Concrete cover. The minimum concrete cover shall be 2-1/2 inches (64 mm) for uncased shafts and 1 inch (25 mm) for cased shafts.

1810.3 Drilled or augered uncased piles. Drilled or augered uncased piles shall conform to Sections 1810.3.1 through 1810.3.5.

1810.3.1 Allowable stresses. The allowable design stress in the concrete of drilled or augered uncased piles shall not exceed 33 percent of the 28-day specified compressive strength (f'_c). The allowable compressive stress of reinforcement shall not exceed 40 percent of the yield strength of the steel or 25,500 psi (175.8 MPa).

1810.3.5 Reinforcement in Seismic Design Category C, D, E or F. Where a structure is assigned to Seismic Design Category C, D, E or F in accordance with Section 1613, the corresponding requirements of Sections 1810.1.2.1 and 1810.1.2.2 shall be met.

~~1810.4 Driven uncased piles.~~ Driven uncased piles shall conform to Sections 1810.4.1 through 1810.4.4.

~~1810.4.1 Allowable stresses.~~ The allowable design stress in the concrete shall not exceed 25 percent of the 28-day specified compressive strength (f'_c) applied to a cross-sectional area not greater than the inside area of the drive casing or mandrel.

~~1810.4.2 Dimensions.~~ The pile length shall not exceed 30 times the average diameter. The minimum diameter shall be 12 inches (305 mm).

~~Exception:~~ The length of the pile is permitted to exceed 30 times the diameter, provided that the design and installation of the pile foundation is under the direct supervision of a registered design professional knowledgeable in the field of soil mechanics and pile foundations. The registered design professional shall certify to the building official that the piles were installed in compliance with the approved design.

~~1810.4.4 Concrete cover.~~ Pile reinforcement shall have a concrete cover of not less than 2.5 inches (64 mm), measured from the inside face of the drive casing or mandrel.

~~1810.5 Steel-cased piles.~~ Steel-cased piles shall comply with the requirements of Sections 1810.5.1 through 1810.5.4.

~~1810.6 Concrete-filled steel pipe and tube piles.~~ Concrete-filled steel pipe and tube piles shall conform to the requirements of Sections 1810.6.1 through 1810.6.5.

~~1810.6.1 Materials.~~ Steel pipe and tube sections used for piles shall conform to ASTM A 252 or ASTM A 283. Concrete shall conform to Section 1810.1.1. The maximum coarse aggregate size shall be 3/4 inch (19.1 mm).

~~1810.6.2 Allowable stresses.~~ The allowable design compressive stress in the concrete shall not exceed 33 percent of the 28-day specified compressive strength (f'_c). The allowable design compressive stress in the steel shall not exceed 35 percent of the minimum specified yield strength of the steel (F_y), provided F_y shall not be assumed greater than 36,000 psi (248 MPa) for computational purposes.

~~Exception:~~ Where justified in accordance with Section 1808.2.10, the allowable stresses are permitted to be increased to $0.50 F_y$.

~~1810.6.4.1 Seismic reinforcement.~~ Where a structure is assigned to Seismic Design Category C, D, E or F in accordance with Section 1613, the following shall apply. Minimum reinforcement no less than 0.01 times the cross-sectional area of the pile concrete shall be provided in the top of the pile with a length equal to two times the required cap embedment anchorage into the pile cap, but not less than the tension development length of the reinforcement. The wall thickness of the steel pipe shall not be less than 3/16 inch (5 mm).

~~1810.6.5 Placing concrete.~~ The placement of concrete shall conform to Section 1810.1.3, but is permitted to be chuted directly into smooth-sided pipes and tubes without a centering funnel hopper.

~~1810.7 Caisson piles.~~ Caisson piles shall conform to the requirements of Sections 1810.7.1 through 1810.7.6.

~~1810.7.5 Allowable stresses.~~ The allowable design compressive stresses shall not exceed the following: concrete, $0.33 f'_c$; steel pipe, $0.35 F_y$; and structural steel core, $0.50 F_y$.

~~1810.8.3 Allowable stresses.~~ The allowable compressive stress in the grout shall not exceed $0.33 f'_c$. The allowable compressive stress in the steel pipe and steel reinforcement shall not exceed the lesser of $0.4 F_y$ and 32,000 psi (220 Mpa). The allowable tensile stress in the steel reinforcement shall not exceed $0.60 F_y$. The allowable tensile stress in the cement grout shall be zero.

SECTION 1811 COMPOSITE PILES

~~1811.1 General.~~ Composite piles shall conform to the requirements of Sections 1811.2 through 1811.5.

~~1811.2 Design.~~ Composite piles consisting of two or more approved pile types shall be designed to meet the conditions of installation.

~~1811.3 Limitation of load.~~ The maximum allowable load shall be limited by the capacity of the weakest section incorporated in the pile.

~~1811.4 Splices.~~ Splices between concrete and steel or wood sections shall be designed to prevent separation both before and after the concrete portion has set, and to ensure the alignment and transmission of the total pile load. Splices shall be designed to resist uplift caused by upheaval during driving of adjacent piles, and shall develop the full compressive strength and not less than 50 percent of the tension and bending strength of the weaker section.

~~1811.5 Seismic reinforcement.~~ Where a structure is assigned to Seismic Design Category C, D, E or F in accordance with Section 1613, the following shall apply. Where concrete and steel are used as part of the pile assembly, the concrete reinforcement shall comply with that given in Sections 1810.1.2.1 and 1810.1.2.2 or the steel section shall comply with Section 1810.6.4.1.

SECTION 1812 PIER FOUNDATIONS

~~1812.1 General.~~ Isolated and multiple piers used as foundations shall conform to the requirements of Sections 1812.2 through 1812.10, as well as the applicable provisions of Section 1808.2.

~~1812.2 Lateral dimensions and height.~~ The minimum dimension of isolated piers used as foundations shall be 2 feet (610 mm), and the height shall not exceed 12 times the least horizontal dimension.

~~1812.3 Materials.~~ Concrete shall have a 28-day specified compressive strength (f'_c) of not less than 2,500 psi (17.24 MPa). Where concrete is placed through a funnel hopper at the top of the pier, the concrete mix shall be designed and proportioned so as to produce a cohesive workable mix having a slump of not less than 4 inches (102 mm) and not more than 6 inches (152 mm). Where concrete is to be pumped, the mix design including slump shall be adjusted to produce a pumpable concrete.

~~1812.5 Concrete placement.~~ Concrete shall be placed in such a manner as to ensure the exclusion of any foreign matter and to secure a full-sized shaft. Concrete shall not be placed through water except where a tremie or other approved method is used. When depositing concrete from the top of the pier, the concrete shall not be chuted directly into the pier but shall be poured in a rapid and continuous operation through a funnel hopper centered at the top of the pier.

~~1812.8 Concrete.~~ Where adequate lateral support is not provided, and the unsupported height to least lateral dimension does not exceed three, piers of plain concrete shall be designed and constructed as pilasters in accordance with ACI 318. Where the unsupported height to least lateral dimension exceeds three, piers shall be constructed of reinforced concrete, and shall conform to the requirements for columns in ACI 318.

Exception: Where adequate lateral support is furnished by the surrounding materials as defined in Section 1808.2.9, piers are permitted to be constructed of plain or reinforced concrete. The requirements of ACI 318 for bearing on concrete shall apply.

~~1812.9 Steel shell.~~ Where concrete piers are entirely encased with a circular steel shell, and the area of the shell steel is considered reinforcing steel, the steel shall be protected under the conditions specified in Section 1808.2.17. Horizontal joints in the shell shall be spliced to comply with Section 1808.2.7.

~~1812.10 Dewatering.~~ Where piers are carried to depths below water level, the piers shall be constructed by a method that will provide accurate preparation and inspection of the bottom, and the depositing or construction of sound concrete or other masonry in the dry.

Reason: Significant clarification, update, generalization, and simplification of the code requirements for deep foundations.

Reorganizes deep foundation requirements to eliminate repetition, fix conflicting definitions, and generalize and simplify requirements where possible. Most of the changes proposed are either purely editorial or nearly editorial. The substantive and nearly editorial changes are described herewith.

Definitions: The current definitions cause confusion and conflict. For instance, consider the definitions of "pier" and "pile". Some of the requirements for piers differ from those for piles, but the definitions only confuse matters. By the current definitions, piers must 1) be isolated, 2) be constructed of masonry or cast-in-place concrete, and 3) have a length of no more than 12 times the least horizontal dimension; piles must 1) be of concrete, wood, or steel either driven into the ground or cast in place, and 2) have a length exceeding 12 times the least horizontal dimension. As a result, foundation elements that have length less than 12 times the least horizontal dimension are **neither piers nor piles** if grouped or if constructed of wood, steel, or precast concrete. Several sections (such as 1808.2.5 and 1808.2.9.3) assume that piers are isolated, as the definition requires; Section 1812.1 addresses "isolated and multiple piers", which conflicts with the definition. The solution is, not to revise or add definitions but, to generalize and unify the requirements to the extent possible and then describe specific conditions of concern while

specifying the related requirements. In order to unify, generalize, and simplify the requirements, some minor substantive changes are produced. Where the substantive change is small but the improvement in clarity and consistency of application is great, such revisions aid the registered design professional, the building official, and the public. This change proposal groups all deep foundation systems together (by defining shallow foundations) and sets forth general rules for the analysis, design, detailing, and installation of deep foundations. Specific deep foundation types are defined only where the rules for that type are so many and so peculiar that providing verbal descriptions for scoping would become unmanageable.

The exceptions that appeared in Section 1808.2.1 are embodied in the overall revisions to the requirements for deep foundations.

In a related proposal the numbered list in Section 1810.1.1 is moved to the section for geotechnical investigations.

New Section 1810.1.3 is based on current requirements. Concrete elements with height no greater than three times the least horizontal dimension are pedestals (not pilasters) per ACI 318. The exception in current Section 1812.8 is not really an exception, as it describes a different case than that addressed in the text (laterally supported versus unsupported). The intent of that exception is carried forward in the proposed text since it permits use of unreinforced sections where lateral support is provided, moment demands are less than the design cracking moment, and seismic concerns do not govern.

Since one of the conditions of concern in Section 1810.2.1 is “fluid soils”, the revised text makes clear that the embedment required is the distance into either stiff soil or soft soil (not the distance below the ground surface). Although the terms “stiff soil” and “soft soil” are, strictly speaking, not (and never have been) defined in this code as related to this provision, they are in general agreement with the terms used in site classification (Section 1613.5.2, Site Classes D and E, respectively).

In new Section 1810.2.2 the first exception addresses a prime condition of what were previously termed “piers”—that is, permission to use isolated elements without additional lateral bracing.

New Sections 1810.2.4 and 1810.2.5 generalize requirements that were previously required for deep foundations of structures assigned to Seismic Design Category C, D, E, or F. This generalization is consistent with current practice and the recommendations of every published standard for deep foundations. Compliance is possible using traditional tables, formulas, or charts or using analysis methods that have been commonly employed for several decades.

New Section 1810.3.1.1 formalizes current practice as implied by the present text of Chapter 18 and as explicitly stated in other documents. The concrete design methods commonly employed no longer recognize allowable stress or working stress design. For many decades structural concrete design has employed the strength design method. However, there is a long tradition of using simple allowable stress design approaches for the proportioning of deep foundation elements (for both soil-foundation behavior and structural design). The proposed text is consistent with the design approaches specified in ACI 543 (Design, Manufacture, and Installation of Concrete Piles). Section 2.3 of that document reads (in part) as follows:

“Whereas axial compression may often be the primary mode of loading, concrete piles are also frequently subjected to axial tension, bending, and shear loadings as well as various combinations of loading, as noted in Section 2.2. Concrete piles must have adequate structural capacity for all modes and combinations of loading that they will experience. For combined flexure and thrust loadings, the structural adequacy can be evaluated more readily through the use of moment-thrust interaction diagrams and strength-design methods.

... Because of the historical use of allowable capacities and stresses in piling design, however, recommendations are also provided for allowable axial service capacities for concentrically loaded, laterally supported piles. The allowable service capacities P_a recommended in Section 2.3.3 are intended specifically for cases in which the soil provides full lateral support to the pile and where the applied forces cause no more than minor bending moments resulting from accidental eccentricities. Piles subjected to larger bending moments or with unsupported lengths must be treated as columns in accordance with ACI 318-95 and the provisions given in Sections 2.3.2, 2.3.4, and 2.3.5 of this report.”

Rather than treating composite elements in a different section, this proposal generalizes the requirement that each component of the composite element must comply with the applicable provisions of the code.

The proposed text uses the term “casing” in a manner consistent with current practice and use of the terms as defined in ACI 336.1 (Specification for the Construction of Drilled Piers). The term “casing” is appropriate where the element in question resists earth and water pressures. The term “liner” (which does not appear in this proposed text) applies where the element in question resists internal concrete pressures, but is “not designed for external earth and water pressures.” Chapter 18 of the IBC does not venture so far into construction methods as to address liners. The only prior occurrences of “liner” (Section 1810.3.3) are related to “hydrostatic and lateral soil pressure,” for which the term “casing” is more appropriate. Where the current text of Chapter 18 uses “shell” interchangeably with “casing”, this proposal uses “casing” consistently.

The proposed treatment of timber deep foundation elements is more consistent both internally and with respect to the reference codes and standards. The present definition of “timber pile,” which requires that the element be round and be placed tip first conflicts with the text that addresses sawn timber piles, which are square, and the reference standard (AF&PA NDS), which permits use of piles (tip first) or poles (butt first). New Section 1810.3.2.4 acknowledges use of both piles and poles.

Allowable stresses: The treatment of allowable stresses in this proposal is simple, clear, consistent, and even-handed as applied to deep foundation elements of different types. In generalizing and treating consistently, minor substantive changes result. The table below compares the allowable stresses specified in ACI 543, the 2006 IBC, and this proposal. For most types this proposal represents no change from the 2006 IBC. However, a few cases have changes of up to about 10 percent (which, practically speaking, is negligible). In the 2006 IBC, driven uncased piles and drilled or augered uncased piles have considerably different allowable stresses. This proposal splits the difference and is generally consistent with ACI 543. The real strength of the proposed approach is that it can be applied to other types of deep foundations without conflict, confusion, or question. Where the present text of Section 1808.2.3 is applied to “special types of piles” it is unclear which of the ten sets of allowable stresses should not be exceeded. Using the proposed text, which generalizes the treatment of allowable stresses, such questions have a ready, defensible answer.

Element type	ACI 543	2006 IBC	This proposal
Precast prestressed concrete piles	$0.33 f'_c - 0.27 f_{pc}$	$0.33 f'_c - 0.27 f_{pc}$	$0.33 f'_c - 0.27 f_{pc}$
Precast nonprestressed concrete piles	$0.33 f'_c$ $0.39 f_y$	$0.33 f'_c$ $0.4 f_y \leq 30,000 \text{ psi}$	$0.33 f'_c$ $0.4 f_y \leq 30,000 \text{ psi}$
Cast-in-place, uncased, plain	$0.29 f'_c$	$0.25 f'_c$	$0.3 f'_c$
Cast-in-place, uncased, reinforced DRIVEN	$0.28 f'_c$ $0.33 f_y$	$0.25 f'_c$	$0.3 f'_c$ $0.4 f_y \leq 30,000 \text{ psi}$
Cast-in-place, uncased, reinforced DRILLED or AUGERED	$0.28 f'_c$ $0.33 f_y$	$0.33 f'_c$ $0.4 f_y \leq 25,500 \text{ psi}$	$0.3 f'_c$ $0.4 f_y \leq 30,000 \text{ psi}$
Cast-in-place, cased	$0.32 f'_c$	$0.33 f'_c$	$0.33 f'_c$

Element type	ACI 543	2006 IBC	This proposal
Cast-in-place, special casing	$0.26(f'_c + 8.2t_s f_y/D)$ $\leq 0.4 f'_c$	$0.4 f'_c$	$0.4 f'_c$
Cast-in-place, structural steel pipe or tube	$0.37 f'_c$ $0.43 f_{yp}$	$0.33 f'_c$ $0.35 F_y \leq 12,600$ psi up to $0.5 F_y$	$0.33 f'_c$ $0.35 F_y \leq 16,000$ psi up to $0.5 F_y \leq 32,000$ psi
Caisson (socketed drilled shaft)	$0.37 f'_c$ $0.43 f_{yp}$	$0.33 f'_c$ $0.35 F_y$ (pipe or tube) $0.5 F_y$ (core)	$0.33 f'_c$ $0.35 F_y \leq 16,000$ psi up to $0.5 F_y \leq 32,000$ psi $0.5 F_y$ (core)
Structural steel elements	---	$0.35 F_y$ up to $0.5 F_y$	$0.35 F_y \leq 16,000$ psi up to $0.5 F_y \leq 32,000$ psi
Micropiles	---	$0.33 f'_c$ $0.4 f_y \leq 32,000$ psi $0.4 F_y \leq 32,000$ psi $0.6 f_y$ Tension	$0.33 f'_c$ $0.4 f_y \leq 30,000$ psi $0.4 F_y \leq 32,000$ psi $0.6 f_y$ Tension
Timber	---	In accordance with the AF&PA NDS	In accordance with the AF&PA NDS

The first requirement of new Section 1810.3.2.7 is consistent with current practice and the requirements of ACI 543 Table 2.2. The second requirement is moved from Section 1810.5.1; it is the sealed tip that produces a displacement pile with increased capacity.

In new Section 1810.3.3.1.2 the requirement for load testing of cast-in-place deep foundation elements with an enlarged base previously appeared in Section 1810.2.4.

For improved clarity of application and consistency with ASCE 7-05, seismic requirements are rewritten to avoid "cascading," which often led to confusion concerning scope. For instance, new Section 1810.3.8.2.2 applies to Seismic Design Categories C through F and new Section 1810.3.8.2.3 provides "additional" requirements for Seismic Design Categories D through F; in both cases the scope is clearly defined. In another instance it was possible to separate the requirements; Section 1810.3.8.3.2 applies to Seismic Design Category C and Section 1810.3.8.3.3 (with revised Equation 18-6) applies to Seismic Design Categories D through F.

The change at the end of new Section 1810.3.8.2.2 is editorial although it may not appear so. First, the 8 inch maximum spacing is changed to 6 inches since new Section 1810.3.8.1 specifies a maximum spacing of 6 inches for non-seismic cases. Then, the spacing of 16 longitudinal bar diameters can be eliminated since 16 times the smallest bar diameter (3/8") is no more stringent.

The change in new Section 1810.3.8.3.2 is editorial since Equation 18-4 produces a value greater than 0.007 where the minimum value of f'_c (5 ksi) is used with the maximum value of f_{yh} (85 ksi).

The revision to Equation 18-6 eliminates cascading requirements from the section above.

New Sections 1810.3.9.1 and 1810.3.9.1 clarify the present requirements, agree with the requirements of ACI 318-08, and allow elimination of the definition for flexural length. For both uncased and cased cast-in-place deep foundation elements (but not concrete filled pipes and tubes) reinforcement must be provided where moments exceed a reasonable lower bound for the capacity of the plain concrete section. In several sections of the 2006 IBC (and other related documents) that design cracking moment is taken as 0.4 times the "concrete section cracking moment strength." Section 9.5.2.3 of ACI 318 defines the cracking moment strength as 7.5 times the square root of f'_c times the elastic section modulus of the gross section ($0.4 \times 7.5 = 3$). Using Chapter 22 of ACI 318-08, one would take $\phi M_n = 0.6$ times 5.0 times the square root of f'_c times the elastic section modulus of the gross section ($0.6 \times 5.0 = 3$). The proposed text is consistent with the current requirement and paves the way for use of a reference standard in the future. The proposed sections are also used in place of the less clear phrase "not rupture" in Exception 3 of new

Section 1810.3.9.4. Editorial note: Where metric units are used, Equation 18-10 should be shown as $\phi M_n = 0.25 \sqrt{f'_c} S_m$.

The proposed revisions in new Section 1810.3.10.1 clarifies the intent to permit the pipe or tube casing to terminate above the bond zone, with deformed bar reinforcement continuing below. It also specifies a splice condition for that transition.

In new Section 1810.3.10.4 "120 percent of the flexural length" is changed to "the point of zero curvature" for two reasons. First, with the revisions related to design cracking moment, this is the only section that uses the current definition of flexural length (first point of zero lateral deflection). Second, the distance to the point of zero curvature, which is also used in new Section 1810.3.8.3.3, is approximately equal to 120 percent of the distance to the point of zero deflection.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Errata: Replace the entire proposal with the following:

Revise as follows:

SECTION ~~4808~~ 1802 PIER AND PILE DEFINITIONS

~~4808.4~~ **1802.1 Definitions.** The following words and terms shall, for the purposes of this ~~section~~ chapter, have the meanings shown herein.

DEEP FOUNDATION. A deep foundation is a foundation element that does not satisfy the definition of a shallow foundation.

DRILLED SHAFT. A drilled shaft is a cast-in-place deep foundation element constructed by drilling a hole (with or without permanent casing) into soil or rock and filling it with fluid concrete.

Socketed drilled shaft A socketed drilled shaft is a drilled shaft with a permanent pipe or tube casing that extends down to bedrock and an uncased socket drilled into the bedrock

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

MICROPILES. Micropiles are 12-inch (305 mm) diameter or less; A micropile is a bored, grouted-in-place piles incorporating steel pipe (casing) and/or steel reinforcement deep foundation element that develops its load-carrying capacity by means of a bond zone in soil, bedrock, or a combination of soil and bedrock.

SHALLOW FOUNDATION. A shallow foundation is an individual or strip footing, a mat foundation, a slab on grade foundation, or a similar foundation element.

FLEXURAL LENGTH. Flexural length is the length of the pile from the first point of zero lateral deflection to the underside of the pile cap or grade beam.

PIER FOUNDATIONS. Pier foundations consist of isolated masonry or cast-in-place concrete structural elements extending into firm materials. Piers are relatively short in comparison to their width, with lengths less than or equal to 12 times the least horizontal dimension of the pier. Piers derive their load-carrying capacity through skin friction, through end bearing, or a combination of both.

Belled piers. Belled piers are cast-in-place concrete piers constructed with a base that is larger than the diameter of the remainder of the pier. The belled base is designed to increase the load-bearing area of the pier in end bearing.

PILE FOUNDATIONS. Pile foundations consist of concrete, wood or steel structural elements either driven into the ground or cast in place. Piles are relatively slender in comparison to their length, with lengths exceeding 12 times the least horizontal dimension. Piles derive their load-carrying capacity through skin friction, through end bearing, or a combination of both.

Augered uncased piles. Augered uncased piles are constructed by depositing concrete into an uncased augered hole, either during or after the withdrawal of the auger.

Caisson piles. Caisson piles are cast-in-place concrete piles extending into bedrock. The upper portion of a caisson pile consists of a cased pile that extends to the bedrock. The lower portion of the caisson pile consists of an uncased socket drilled into the bedrock.

Concrete-filled steel pipe and tube piles. Concrete-filled steel pipe and tube piles are constructed by driving a steel pipe or tube section into the soil and filling the pipe or tube section with concrete. The steel pipe or tube section is left in place during and after the deposition of the concrete.

Driven uncased piles. Driven uncased piles are constructed by driving a steel shell into the soil to shore an unexcavated hole that is later filled with concrete. The steel casing is lifted out of the hole during the deposition of the concrete.

Enlarged base piles. Enlarged base piles are cast-in-place concrete piles constructed with a base that is larger than the diameter of the remainder of the pile. The enlarged base is designed to increase the load-bearing area of the pile in end bearing.

Steel-cased piles. Steel-cased piles are constructed by driving a steel shell into the soil to shore an unexcavated hole. The steel casing is left permanently in place and filled with concrete.

Timber piles. Timber piles are round, tapered timbers with small (tip) end embedded into the soil.

SECTION 1810 DEEP FOUNDATIONS

1808.2 Piers and piles—general requirements.

1808.2.1 Design. Piles are permitted to be designed in accordance with provisions for piers in Section 1808 and Sections 1812.3 through 1812.10 where either of the following conditions exists, subject to the approval of the building official:

1. Group R-3 and U occupancies not exceeding two stories of light frame construction, or
2. Where the surrounding foundation materials furnish adequate lateral support for the pile.

1810.1 General. Deep foundations shall be analyzed, designed, detailed, and installed in accordance with Sections 1810.1 through 1810.4.

1808.2.2 1810.1.1 General Geotechnical investigation. Pier and pile Deep foundations shall be designed and installed on the basis of a foundation investigation as defined in Section 1802, unless sufficient data upon which to base the design and installation is available. The investigation and report provisions of Section 1802 shall be expanded to include, but not be limited to, the following:

1. Recommended pier or pile types and installed capacities.
2. Recommended center-to-center spacing of piers or piles.
3. Driving criteria.
4. Installation procedures.
5. Field inspection and reporting procedures (to include procedures for verification of the installed bearing capacity where required).
6. Pier or pile load test requirements.
7. Durability of pier or pile materials.
8. Designation of bearing stratum or strata.
9. Reductions for group action, where necessary.

1808.2.4 1810.1.2 Use of existing piers or piles deep foundation elements. Piers or piles Deep foundation elements left in place where a structure has been demolished shall not be used for the support of new construction unless satisfactory evidence is submitted to the building official, which indicates that the piers or piles elements are sound and meet the requirements of this code. Such piers or piles elements shall be load tested or redriven to verify their capacities. The design load applied to such piers or piles elements shall be the lowest allowable load as determined by tests or redriving data.

1810.1.3 Deep foundation elements classified as columns. Deep foundation elements standing unbraced in air, water, or fluid soils shall be classified as columns and designed as such in accordance with the provisions of this code from their top down to the point where adequate lateral support is provided in accordance with Section 1810.2.1.

Exception: Where the unsupported height to least horizontal dimension of a cast-in-place deep foundation element does not exceed three, it shall be permitted to design and construct such an element as a pedestal in accordance with ACI 318.

1808.2.3 1810.1.4 Special types of piles deep foundations. The use of types of piles deep foundation elements not specifically mentioned herein is permitted, subject to the approval of the building official, upon the submission of acceptable test data, calculations and other information relating to the structural properties and load capacity of such piles elements. The allowable stresses for materials shall not in any case exceed the limitations specified herein.

1808.2.9 Lateral support.

1810.2 Analysis. The analysis of deep foundations for design shall be in accordance with Sections 1810.2.1 through 1810.2.5.

1808.2.9.1 1810.2.1 General Lateral support. Any soil other than fluid soil shall be deemed to afford sufficient lateral support to the pier or pile to prevent buckling of deep foundation elements and to permit the design of the pier or pile elements in accordance with accepted engineering practice and the applicable provisions of this code.

1808.2.9.2 Unbraced piles. Piles standing Where deep foundation elements stand unbraced in air, water, or in fluid soils, it shall be designed as columns in accordance with the provisions of this code. Such piles driven into firm ground can be considered permitted to consider them fixed and laterally supported at a point 5 feet (1524 mm) below the ground surface and in soft material at into stiff soil or 10 feet (3048 mm) below the ground surface into soft soil unless otherwise prescribed by the building official after a foundation investigation by an approved agency.

1808.2.5 1810.2.2 Stability. Piers or piles Deep foundation elements shall be braced to provide lateral stability in all directions. Three or more piles elements connected by a rigid cap shall be considered braced, provided that the piles elements are located in radial directions from the centroid of the group not less than 60 degrees (1 rad) apart. A two-pile two-element group in a rigid cap shall be considered to be braced along the axis connecting the two piles elements. Methods used to brace piers or piles deep foundation elements shall be subject to the approval of the building official.

Piles Deep foundation elements supporting walls shall be driven placed alternately in lines spaced at least 1 foot (305 mm) apart and located symmetrically under the center of gravity of the wall load carried, unless effective measures are taken to provide for eccentricity and lateral forces, or the wall piles foundation elements are adequately braced to provide for lateral stability. A single row of piles without lateral bracing is permitted for one- and two-family dwellings and lightweight construction not exceeding two stories above grade plane or 35 feet (10 668 mm) in building height, provided the centers of the piles are located within the width of the foundation wall.

Exceptions:

1. Isolated cast-in-place deep foundation elements without lateral bracing shall be permitted where the least horizontal dimension is no less than 2 feet (610 mm), adequate lateral support in accordance with Section 1810.2.1 is provided for the entire height and the height does not exceed 12 times the least horizontal dimension.
2. A single row of deep foundation elements without lateral bracing is permitted for one- and two-family dwellings and lightweight construction not exceeding two stories above grade plane or 35 feet (10 668 mm) in building height, provided the centers of the elements are located within the width of the supported wall.

1808.2.12 1810.2.3 Settlement analysis. The settlement of piers, individual piles or groups of piles a single deep foundation element or group thereof shall be estimated based on approved methods of analysis. The predicted settlement shall cause neither harmful distortion of, nor instability in, the structure, nor cause any stresses to exceed allowable values.

1808.2.23.1.2 1810.2.4 Design details Lateral loads. Pier or pile The moments, shears and lateral deflections used for design of deep foundation elements shall be established considering the nonlinear interaction of the shaft and soil, as recommended determined by a registered design professional. Where the ratio of the depth of embedment of the pile to pile diameter or width element to its least horizontal dimension is less than or equal to six, the pile may be assumed to be it shall be permitted to assume the element is rigid.

Pile group effects from soil on lateral pile nominal strength shall be included where pile center to center spacing in the direction of lateral force is less than eight pile diameters. Pile group effects on vertical nominal strength shall be included where pile center to center spacing is less than three pile diameters. The pile uplift soil nominal strength shall be taken as the pile uplift strength as limited by the frictional force developed between the soil and the pile.

Where a minimum length for reinforcement or the extent of closely spaced confinement reinforcement is specified at the top of the pier or pile, provisions shall be made so that these specified lengths or extents are maintained after pier or pile cutoff.

1808.2.23.2.1 1810.2.4.1 Design details for piers, piles and grade beams Seismic Design Categories D through F. Piers or piles For structures assigned to Seismic Design Category D, E, or F, deep foundation elements on Site Class E or F sites, as determined in Section 1613.5.2, shall be designed and constructed to withstand maximum imposed curvatures from earthquake ground motions and structure response. Curvatures shall include free-field soil strains modified for soil-pile foundation-structure interaction coupled with pier or pile foundation element deformations induced by lateral pier or pile resistance to structure seismic forces associated with earthquake loads imparted to the foundation by the structure.

Exception: Piers or piles Deep foundation elements that satisfy the following additional detailing requirements shall be deemed to comply with the curvature capacity requirements of this section.

1. Precast prestressed concrete piles detailed in accordance with Section 1808.2.3.2.2 1810.3.8.3.3.
2. Cast-in-place concrete piles deep foundation elements with a minimum longitudinal reinforcement ratio of 0.005 extending the full length of the pile element and detailed in accordance with Sections 21.4.4.1, 21.4.4.2 and 21.4.4.3 of ACI 318 as required by this Section 1810.3.9.4.2.2.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

~~Where constructed of nonprestressed concrete such piers or piles shall be designed and detailed in accordance with Sections 21.4.4.1, 21.4.4.2 and 21.4.4.3 of ACI 318 within seven pile diameters of the pile cap and within seven pile diameters of the interfaces of strata that are hard or stiff and strata that are liquefiable or are composed of soft to medium stiff clay.~~

~~Grade beams shall comply with the provisions in Section 21.10.3 of ACI 318 for grade beams, except where they have the capacity to resist the forces from the load combinations in Section 1605.4.~~

1810.2.5 Group effects. The analysis shall include group effects on lateral behavior where the center-to-center spacing of deep foundation elements in the direction of lateral force is less than eight times the least horizontal dimension of an element. The analysis shall include group effects on axial behavior where the center-to-center spacing of deep foundation elements is less than three times the least horizontal dimension of an element.

1810.3 Design and Detailing. Deep foundations shall be designed and detailed in accordance with Sections 1810.3.1 through 1810.3.12.

1810.3.1 Design conditions. Design of deep foundations shall include the design conditions specified in Sections 1810.3.1.1 through 1810.3.1.5, as applicable.

1810.3.1.1 Design methods for concrete elements. Where concrete deep foundations are laterally supported in accordance with Section 1810.2.1 for the entire height and applied forces cause bending moments no greater than those resulting from accidental eccentricities, structural design of the element using the load combinations of Section 1605.3 and the allowable stresses specified in this chapter shall be permitted. Otherwise, the structural design of concrete deep foundation elements shall use the load combinations of Section 1605.2 and approved strength design methods.

1810.3.1.2 Composite elements. Where a single deep foundation element comprises two or more sections of different materials or different types spliced together, each section of the composite assembly shall satisfy the applicable requirements of this code, and the maximum allowable load shall be limited by the capacity of the weakest section.

~~1808.2.8.8~~ **1810.3.1.3 Overloads on piers or piles Mislocation.** ~~The maximum compressive load on any pier or pile due to mislocation shall not exceed To resist the effects of mislocation, compressive overload of deep foundation elements to 110 percent of the allowable design load shall be permitted.~~

~~1809.2.1.4~~ **1810.3.1.4 Design and manufacture Driven piles.** Driven piles shall be designed and manufactured in accordance with accepted engineering practice to resist all stresses induced by handling, driving and service loads.

~~1840.5.4~~ **1810.3.1.5 Materials Casings.** Pile shells or Temporary and permanent casings shall be of steel and shall be sufficiently strong to resist collapse and sufficiently water tight to exclude any foreign materials during the placing of concrete. ~~Steel shells shall have a sealed tip with a diameter of not less than 8 inches (203 mm).~~ Where a permanent casing is considered reinforcing steel, the steel shall be protected under the conditions specified in Section 1810.3.2.5. Horizontal joints in the casing shall be spliced in accordance with Section 1810.3.6.

1810.3.2 Materials. The materials used in deep foundations elements shall satisfy the requirements of Sections 1810.3.2.1 through 1810.3.2.8, as applicable.

~~1840.2.4~~ **1810.3.2.1 Materials Concrete.** Where concrete is cast in a steel pipe or where an enlarged base is formed by compacting concrete, the maximum size for coarse aggregate for concrete shall be 3/4 inch (19.1 mm). Concrete to be compacted shall have a zero slump.

1810.3.2.1.1 Seismic hooks. For structures assigned to Seismic Design Category C, D, E, or F in accordance with Section 1613, the ends of hoops, spirals and ties used in concrete deep foundation elements shall be terminated with seismic hooks, as defined in Section 21.1 of ACI 318, and shall be turned into the confined concrete core.

1810.3.2.2 Prestressing steel. Prestressing steel shall conform to ASTM A 416.

~~1809.3.4~~ **1810.3.2.3 Materials Structural steel.** Structural steel piles, steel pipe and fully welded steel piles fabricated from plates shall conform to ASTM A 36, ASTM A 252, ASTM A 283, ASTM A 572, ASTM A 588, ASTM A 690, ASTM A 913 or ASTM A 992.

~~1809.4~~ **1810.3.2.4 Timber piles.** Timber piles deep foundation elements shall be designed as piles or poles in accordance with the AF&PA NDS.

~~1809.1.1~~ **Materials.** Round timber piles elements shall conform to ASTM D 25. Sawn timber piles elements shall conform to DOC PS-20.

~~1809.1.2~~ **1810.3.2.4.1 Preservative treatment.** Timber piles deep foundation elements used to support permanent structures shall be treated in accordance with this section unless it is established that the tops of the untreated timber piles elements will be below the lowest ground-water level assumed to exist during the life of the structure. Preservative and minimum final retention shall be in accordance with AWPA U1 (Commodity Specification E, Use Category 4C) for round timber piles elements and AWPA U1 (Commodity Specification A, Use Category 4B) for sawn timber piles elements. Preservative-treated timber piles elements shall be subject to a quality control program administered by an approved agency. Pile Element cutoffs shall be treated in accordance with AWPA M4.

~~1808.2.4.7~~ **1810.3.2.5 Protection of pile materials.** Where boring records or site conditions indicate possible deleterious action on pier or pile the materials used in deep foundation elements because of soil constituents, changing water levels or other factors, the pier or pile materials elements shall be adequately protected by materials, methods or processes approved by the building official. Protective materials shall be applied to the piles elements so as not to be rendered ineffective by driving installation. The effectiveness of such protective measures for the particular purpose shall have been thoroughly established by satisfactory service records or other evidence.

1810.3.2.6 Allowable stresses. The allowable stresses for materials used in deep foundation elements shall not exceed those specified in Table 1810.3.2.6.

**TABLE 1810.3.2.6
ALLOWABLE STRESSES FOR MATERIALS USED IN DEEP FOUNDATION ELEMENTS**

MATERIAL TYPE AND CONDITION	MAXIMUM ALLOWABLE STRESS^a
1. Concrete or grout in compression ^b <u>Cast-in-place with a permanent casing in accordance with Section 1810.3.2.7</u> <u>Cast-in-place in a pipe, tube, or other permanent casing</u> <u>Cast-in-place without a permanent casing</u> <u>Precast nonprestressed</u> <u>Precast prestressed</u>	$0.4 f'_c$ $0.33 f'_c$ $0.3 f'_c$ $0.33 f'_c$ $0.33 f'_c - 0.27 f_{pc}$
2. Nonprestressed reinforcement in compression	$0.4 f_y \leq 30,000$ psi
3. Structural steel in compression <u>Cores within concrete-filled pipes or tubes</u> <u>Pipes, tubes, or H-piles, where justified in accordance with Section 1810.3.2.8</u> <u>Pipes or tubes for micropiles</u> <u>Other pipes, tubes, or H-piles</u>	$0.5 F_y \leq 32,000$ psi $0.5 F_y \leq 32,000$ psi $0.4 F_y \leq 32,000$ psi $0.35 F_y \leq 16,000$ psi
5. Nonprestressed reinforcement in tension <u>Within micropiles</u> <u>Other conditions</u>	$0.6 f_y$ $0.5 f_y \leq 24,000$ psi
6. Structural steel in tension <u>Pipes, tubes, or H-piles, where justified in accordance with Section 1810.3.2.8</u> <u>Other pipes, tubes, or H-piles</u>	$0.5 F_y \leq 32,000$ psi $0.35 F_y \leq 16,000$ psi
7. Timber	In accordance with the AF&PA NDS

- a. f'_c is the specified compressive strength of the concrete or grout; f_{pc} is the compressive stress on the gross concrete section due to effective prestress forces only; f_y is the specified yield strength of reinforcement; F_y is the specified minimum yield stress of structural steel.
- b. The stresses specified apply to the gross cross-sectional area within the concrete surface. Where a temporary or permanent casing is used, the inside face of the casing shall be considered the concrete surface.

1810.5.2 1810.3.2.7 Allowable stresses increased allowable compressive stress for cased cast-in-place elements. The allowable design compressive stress in the concrete shall not exceed 33 percent of the 28-day specified compressive strength (f'_c). The allowable concrete compressive stress shall be $0.40 (f'_c)$ for that portion of the pile meeting the conditions specified in Sections 1810.5.2.1 through 1810.5.2.4. shall be permitted to be increased as specified in Table 1810.3.2.6 for those portions of permanently cased cast-in-place elements that satisfy the following conditions:

- The design shall not use the casing to resist any portion of the axial load imposed.
- The casing shall have a sealed tip and be mandrel driven.
- 1810.5.2.1 Shell thickness.** The thickness of the steel shell casing shall not be less than manufacturer's standard gage No. 14 gage (0.068 inch) (1.75 mm) minimum.
- 1810.5.2.2 Shell type.** The shell casing shall be seamless or provided with seams of strength equal to the basic material and be of a configuration that will provide confinement to the cast-in-place concrete.
- 1810.5.2.3 Strength.** The ratio of steel yield strength (F_y) to 28-day specified compressive strength (f'_c) shall not be less than six.
- 1810.5.2.4 Diameter.** The nominal pile diameter of the element shall not be greater than 16 inches (406 mm).

1808.2.40 1810.3.2.8 Use Justification of higher allowable pier or pile stresses. Use of allowable stresses greater than those specified for piers or for each pile type in Sections 1809 and 1810 are in Section 1810.3.2.6 shall be permitted where supporting data justifying such higher stresses is filed with the building official. Such substantiating data shall include:

- A soils investigation in accordance with Section 1802.; and
- Pier or pile Load tests in accordance with Section ~~1808.2.8.3~~ 1810.3.3.1.2, regardless of the load supported by the pier or pile element.

The design and installation of the pier or pile deep foundation elements shall be under the direct supervision of a registered design professional knowledgeable in the field of soil mechanics and pier or pile deep foundations who shall certify to the building official that the piers or piles elements as installed satisfy the design criteria.

1808.2.8.4 1810.3.3 Determination of allowable loads. The allowable axial and lateral loads on piers or piles deep foundation elements shall be determined by an approved formula, load tests or method of analysis.

1810.3.3.1 Allowable axial load. The allowable axial load on a deep foundation element shall be determined in accordance with Section 1810.3.3.1.

1808.2.8.2 1810.3.3.1.1 Driving criteria. The allowable compressive load on any pile driven deep foundation element where determined by the application of an approved driving formula shall not exceed 40 tons (356 kN). For allowable loads above 40 tons (356 kN), the wave equation method of analysis shall be used to estimate pile driveability of for both driving stresses and net displacement per blow at the ultimate load. Allowable loads shall be verified by load tests in accordance with Section ~~1808.2.8.3~~ 1810.3.3.1.2. The formula or wave equation load shall be determined for gravity-drop or power-actuated hammers and the hammer energy used shall be the maximum consistent with the size, strength and weight of the driven piles elements. The use of a follower is permitted only with the approval of the building official. The introduction of fresh hammer cushion or pile cushion material just prior to final penetration is not permitted.

1808.2.8.3 1810.3.3.1.2 Load tests. Where design compressive loads per pier or pile are greater than those permitted by Section 1808.2.40 or determined using the allowable stresses specified in Section 1810.3.2.6 where the design load for any pier or pile deep foundation element is in doubt, or where cast-in-place deep foundation elements have an enlarged base formed either by compacting concrete or by driving a precast base, control test piers or piles elements shall be tested in accordance with ASTM D 1143 or ASTM D 4945. At least one pier or pile element shall

be ~~test loaded~~ load tested in each area of uniform subsoil conditions. Where required by the building official, additional ~~piers or piles~~ piles elements shall be load tested where necessary to establish the safe design capacity. The resulting allowable loads shall not be more than one-half of the ultimate axial load capacity of the test ~~pier or pile~~ element as assessed by one of the published methods listed in Section ~~4808.2.8.3.4~~ 1810.3.3.1.3 with consideration for the test type, duration and subsoil. The ultimate axial load capacity shall be determined by a registered design professional with consideration given to tolerable total and differential settlements at design load in accordance with Section ~~4808.2.4.2~~ 1810.2.3. In subsequent installation of the balance of ~~deep~~ foundation piles elements, all ~~piles elements~~ piles elements shall be deemed to have a supporting capacity equal to that of the control pile element where such ~~piles elements~~ piles elements are of the same type, size and relative length as the test ~~pile element~~ element; are installed using the same or comparable methods and equipment as the test ~~pile element~~ element; are installed in similar subsoil conditions as the test ~~pile element~~ element; and, for driven ~~piles elements~~ piles elements, where the rate of penetration (e.g., net displacement per blow) of such ~~piles elements~~ piles elements is equal to or less than that of the test ~~pile element~~ element driven with the same hammer through a comparable driving distance.

~~4808.2.8.3.4~~ 1810.3.3.1.3 **Load test evaluation methods.** It shall be permitted to evaluate ~~pile~~ pile load tests ~~with~~ of deep foundation elements using any of the following methods:

1. Davisson Offset Limit.
2. Brinch-Hansen 90% Criterion.
3. Butler-Hoy Criterion.
4. Other methods approved by the building official.

~~4808.2.8.4~~ 1810.3.3.1.4 **Allowable frictional resistance.** The assumed frictional resistance developed by any ~~pier or~~ uncased cast-in-place pile ~~deep foundation element~~ shall not exceed one-sixth of the bearing value of the soil material at minimum depth as set forth in Table 1804.2, up to a maximum of 500 psf (24 kPa), unless a greater value is allowed by the building official ~~after~~ on the basis of a soil investigation as specified in Section 1802 is submitted or a greater value is substantiated by a load test in accordance with Section ~~4808.2.8.3~~ 1810.3.3.1.2. Frictional resistance and bearing resistance shall not be assumed to act simultaneously unless recommended by a soil investigation as specified in Section 1802.

~~4808.2.8.5~~ 1810.3.3.1.5 **Uplift capacity of a single deep foundation element.** Where required by the design, the uplift capacity of a single ~~pier or pile~~ deep foundation element shall be determined by an approved method of analysis based on a minimum factor of safety of three or by load tests conducted in accordance with ASTM D 3689. The maximum allowable uplift load shall not exceed the ultimate load capacity as determined in Section ~~4808.2.8.3~~ 1810.3.3.1.2 divided by a factor of safety of two.

1810.3.3.1.6 **Uplift capacity of grouped deep foundation elements.** For ~~pile groups~~ grouped deep foundation elements subjected to uplift, the allowable working uplift load for the group shall be the lesser of:

1. The proposed individual ~~pile~~ pile uplift working load times the number of ~~piles elements~~ piles elements in the group.
2. Two-thirds of the effective weight of the ~~pile~~ pile group and the soil contained within a block defined by the perimeter of the group and the length of the ~~pile element~~ element.

~~4808.2.8.6~~ 1810.3.3.1.7 **Load-bearing capacity.** ~~Piers, individual piles and groups of piles~~ Deep foundation elements shall develop ultimate load capacities of at least twice the design working loads in the designated load-bearing layers. Analysis shall show that no soil layer underlying the designated load-bearing layers causes the load-bearing capacity safety factor to be less than two.

~~4808.2.8.7~~ 1810.3.3.1.8 **Bent piers or piles** deep foundation elements. The load-bearing capacity of ~~piers or piles~~ deep foundation elements discovered to have a sharp or sweeping bend shall be determined by an approved method of analysis or by load testing a representative ~~pier or pile element~~ element.

~~4808.2.9.3~~ 1810.3.3.2 **Allowable lateral load.** Where required by the design, the lateral load capacity of a ~~pier, a single pile~~ deep foundation element or a ~~pile~~ group thereof shall be determined by an approved method of analysis or by lateral load tests to at least twice the proposed design working load. The resulting allowable load shall not be more than one-half of that test load that produces a gross lateral movement of 1 inch (25 mm) at the ground surface.

~~4808.2.14~~ 1810.3.4 **Piles in Subsiding areas soils.** Where ~~piles~~ deep foundation elements are installed through subsiding fills or other subsiding strata and derive support from underlying firmer materials, consideration shall be given to the downward frictional forces that may be imposed on the ~~piles elements~~ piles elements by the subsiding upper strata.

Where the influence of subsiding fills is considered as imposing loads on the ~~pile element~~ element, the allowable stresses specified in this chapter ~~are~~ shall be permitted to be increased where satisfactory substantiating data are submitted.

1810.3.5 **Dimensions of deep foundation elements.** The dimensions of deep foundation elements shall be in accordance with Sections 1810.3.5.1 through 1810.3.5.3, as applicable.

~~4809.2.1.2~~ 1810.3.5.1 **Minimum dimension Precast.** The minimum lateral dimension of precast concrete deep foundation elements shall be 8 inches (203 mm). Corners of square ~~piles elements~~ elements shall be chamfered.

1810.3.5.2 **Cast-in-place or grouted-in-place.** Cast-in-place and grouted-in-place deep foundation elements shall satisfy the requirements of this section.

1810.3.5.2.1 **Cased.** Cast-in-place deep foundation elements with a permanent casing shall have a nominal outside diameter of not less than 8 inches (203 mm).

~~4840.3.2~~ 1810.3.5.2.2 **Dimensions Uncased.** Cast-in-place deep foundation elements without a permanent casing shall have a diameter of not less than 12 inches (305 mm). The ~~pile element~~ element length shall not exceed 30 times the average diameter. ~~The minimum diameter shall be 12 inches (305 mm).~~

Exception: The length of the ~~pile element~~ element is permitted to exceed 30 times the diameter, provided ~~that~~ the design and installation of the ~~pile foundation deep foundations~~ pile foundation deep foundations are under the direct supervision of a registered design professional knowledgeable in the field of soil mechanics and ~~pile deep foundations~~ pile deep foundations. The registered design professional shall certify to the building official that the ~~piles elements~~ piles elements were installed in compliance with the approved construction documents.

1810.3.5.2.3 Micropiles. Micropiles shall have an outside diameter of 12 inches (305 mm) or less. There is no minimum diameter for micropiles.

1810.3.5.3 Steel. Steel deep foundation elements shall satisfy the requirements of this section.

1809.3.3 1810.3.5.3.1 Dimensions of H-piles. Sections of H-piles shall comply with the following:

1. The flange projections shall not exceed 14 times the minimum thickness of metal in either the flange or the web and the flange widths shall not be less than 80 percent of the depth of the section.
2. The nominal depth in the direction of the web shall not be less than 8 inches (203 mm).
3. Flanges and web shall have a minimum nominal thickness of 3/8 inch (9.5 mm).

1809.3.4 1810.3.5.3.2 Dimensions of Steel pipes piles and tubes. Steel pipe piles driven open ended pipes and tubes used as deep foundation elements shall have a nominal outside diameter of not less than 8 inches (203 mm). ~~The pipe~~ Where steel pipes or tubes are driven open-ended, they shall have a minimum of 0.34 square inch (219 mm²) of steel in cross section to resist each 1,000 foot-pounds (1356 Nm) of pile hammer energy, or shall have the equivalent strength for steels having a yield strength greater than 35,000 psi (241 MPa) or the wave equation analysis shall be permitted to be used to assess compression stresses induced by driving to evaluate if the pile section is appropriate for the selected hammer. Where a pipe or tube with wall thickness less than 0.179 inch (4.6 mm) is driven open ended, a suitable cutting shoe shall be provided. Concrete filled steel pipes or tubes in structures assigned to Seismic Design Category C, D, E, or F shall have a wall thickness of not less than 3/16 inch (5 mm). The pipe or tube casing for socketed drilled shafts shall have a nominal outside diameter of not less than 18 inches (457 mm), a wall thickness of not less than 3/8 inch (9.5 mm), and a suitable steel driving shoe welded to the bottom; the diameter of the rock socket shall be approximately equal to the inside diameter of the casing.

Exceptions:

1. There is no minimum diameter for steel pipes or tubes used in micropiles.
2. ~~1810.6.3 Minimum dimensions.~~ Piles shall have a nominal outside diameter of not less than 8 inches (203 mm) and a minimum wall thickness in accordance with Section 1809.3.4. For mandrel-driven pipes or tubes piles, the minimum wall thickness shall be 1/10 inch (2.5 mm).

1808.2.7 1810.3.6 Splices. Splices shall be constructed so as to provide and maintain true alignment and position of the component parts of the pier or pile deep foundation element during installation and subsequent thereto and shall be of adequate strength to transmit the vertical and lateral loads and moments occurring at the location of the splice during driving and under service loading. Where deep foundation elements of the same type are being spliced, splices shall develop not less than 50 percent of the least capacity of the pier or pile in bending strength of the weaker section. Where deep foundation elements of different materials or different types are being spliced, splices shall develop the full compressive strength and not less than 50 percent of the tension and bending strength of the weaker section. Where structural steel cores are to be spliced, the ends shall be milled or ground to provide full contact and shall be full-depth welded.

~~In addition,~~ Splices occurring in the upper 10 feet (3048 mm) of the embedded portion of the pier or pile an element shall be capable of resisting at allowable working stresses the moment and shear that would result from an assumed eccentricity of the pier or pile axial load of 3 inches (76 mm), or the pier or pile element shall be braced in accordance with Section 1808.2.5 1810.2.2 to other piers or piles deep foundation elements that do not have splices in the upper 10 feet (3048 mm) of embedment.

1810.3.6.1 Seismic Design Categories C through F. For structures assigned to Seismic Design Category C, D, E, or F, splices of deep foundation elements shall develop the lesser of the following:

1. The full strength of the deep foundation element; and
2. The axial and shear forces and moments from the load combinations with overstrength factor in Section 12.4.3.2 of ASCE 7.

1810.3.7 Top of pile detailing at cutoffs. Where a minimum length for reinforcement or the extent of closely spaced confinement reinforcement is specified at the top of a deep foundation element, provisions shall be made so that those specified lengths or extents are maintained after cutoff.

1809.2 Precast concrete piles.

1809.2.1 1810.3.8 General Precast concrete piles. ~~The materials, reinforcement and installation of Precast concrete piles shall conform to be designed and detailed in accordance with Sections 1809.2.1.1 through 1809.2.1.4 1810.3.8.1 through 1810.3.8.3.~~

1809.2.1.3 1810.3.8.1 Reinforcement. Longitudinal steel shall be arranged in a symmetrical pattern and be laterally tied with steel ties or wire spiral spaced center to center as follows:

1. At not more than 1 inch (25 mm) for the first five ties or spirals at each end; then
2. At not more than 4 inches (102 mm) apart, center to center, for a distance of the remainder of the first 2 feet (610 mm) from the ends of the pile each end; and then
3. At not more than 6 inches (152 mm) elsewhere except that at the ends of each pile, the first five ties or spirals shall be spaced 1 inch (25 mm) center to center.

The ~~size~~ gage of ties and spirals shall be as follows:

1. For piles having a ~~diameter~~ least horizontal dimension of 16 inches (406 mm) or less, wire shall not be smaller than 0.22 inch (5.6 mm) (No. 5 gage).
2. For piles having a ~~diameter~~ least horizontal dimension of more than 16 inches (406 mm) and less than 20 inches (508 mm), wire shall not be smaller than 0.238 inch (6 mm) (No. 4 gage).
3. For piles having a ~~diameter~~ least horizontal dimension of 20 inches (508 mm) and larger, wire shall not be smaller than 0.25 inch (6.4 mm) round or 0.259 inch (6.6 mm) (No. 3 gage).

1809.2.2 1810.3.8.2 Precast nonprestressed piles. ~~Precast nonprestressed concrete piles shall conform to~~ comply with the requirements of Sections 1809.2.2.1 through 1809.2.2.5 1810.3.8.2.1 through 1810.3.8.2.3.

1809.2.2.2 1810.3.8.2.1 Minimum reinforcement. The minimum amount of Longitudinal reinforcement shall be 0.8 percent of the concrete section and shall consist of at least four bars consist of at least four bars with a minimum longitudinal reinforcement ratio of 0.008.

1809.2.2.2.4 1810.3.8.2.2 Seismic reinforcement in Seismic Design Category Categories C through F. Where a For structures is assigned to Seismic Design Category C, D, E, or F in accordance with Section 1613, the following shall apply precast nonprestressed piles shall be reinforced as specified in this section. The minimum longitudinal reinforcement with a minimum steel ratio of shall be 0.01 shall be provided throughout the length of precast concrete piles. Within three pile diameters of the bottom of the pile cap, the longitudinal reinforcement shall be confined with Transverse reinforcement shall consist of closed ties or spirals of with a minimum 3/8 inch (9.5 mm) diameter. Ties or spirals shall be provided at a maximum spacing of Spacing of transverse reinforcement shall not exceed the smaller of eight times the diameter of the smallest longitudinal bar not to exceed or, 6 inches (152 mm) within a distance of three times the least pile dimension from the bottom of the pile cap. Spacing of transverse reinforcement shall not exceed 6 inches (152 mm) throughout the remainder of the pile, the closed ties or spirals shall have a maximum spacing of 16 times the smallest longitudinal bar diameter, not to exceed 8 inches (203 mm).

1809.2.2.2.2 1810.3.8.2.3 Additional seismic reinforcement in Seismic Design Category Categories D through, E or F. Where a For structures is assigned to Seismic Design Category D, E or F in accordance with Section 1613, the requirements for Seismic Design Category C in Section 1809.2.2.2.1 shall apply except as modified by this section. Transverse confinement reinforcement consisting of closed ties or equivalent spirals shall be provided in accordance with Sections 21.4.4.1, 21.4.4.2 and 21.4.4.3 of ACI 318 within three pile diameters of the bottom of the pile cap. For other than Site Class E or F, or liquefiable sites and where spirals are used as the transverse reinforcement, it shall be permitted to use a volumetric ratio of spiral reinforcement of not less than one-half that required by Section 21.4.4.1(a) of ACI 318 transverse reinforcement shall be in accordance with Section 1810.3.9.4.2.

1809.2.3 1810.3.8.3 Precast prestressed piles. Precast prestressed concrete piles shall conform to comply with the requirements of Sections 1809.2.3.1 through 1809.2.3.5 1810.3.8.3.1 through 1810.3.8.3.3.

1809.2.3.2 1810.3.8.3.1 Design Effective prestress. Precast prestressed piles shall be designed to resist stresses induced by handling and driving as well as by loads. The effective prestress in the pile shall not be less than 400 psi (2.76MPa) for piles up to 30 feet (9144 mm) in length, 550 psi (3.79 MPa) for piles up to 50 feet (15 240 mm) in length and 700 psi (4.83 MPa) for piles greater than 50 feet (15 240 mm) in length. Effective prestress shall be based on an assumed loss of 30,000 psi (207 MPa) in the prestressing steel. The tensile stress in the prestressing steel shall not exceed the values specified in ACI 318.

1809.2.3.2.4 1810.3.8.3.2 Design Seismic reinforcement in Seismic Design Category C. Where a For structures is assigned to Seismic Design Category C in accordance with Section 1613, the following shall apply precast prestressed piles shall have transverse reinforcement in accordance with this section. The minimum volumetric ratio of spiral reinforcement shall not be less than 0.007 or the amount required by the following formula for the upper 20 feet (6096 mm) of the pile.

$$\rho_s = 0.12 f'_c / f_{yh} \text{ (Equation 18-4)}$$

where:

- f'_c = Specified compressive strength of concrete, psi (MPa)
- f_{yh} = Yield strength of spiral reinforcement \leq 85,000 psi (586 MPa).
- ρ_s = Spiral reinforcement index (vol. spiral/vol. core).

At least one-half the volumetric ratio required by Equation 18-4 shall be provided below the upper 20 feet (6096 mm) of the pile.

The pile cap connection by means of dowels as indicated in Section 1809.2.23.1 is permitted. Pile cap connection by means of developing pile reinforcing strand is permitted provided that the pile reinforcing strand results in a ductile connection.

1809.2.3.2.2 1810.3.8.3.3 Design Seismic reinforcement in Seismic Design Category Categories D through, E or F. Where a For structures is assigned to Seismic Design Category D, E or F in accordance with Section 1613, the requirements for Seismic Design Category C in Section 1809.2.3.2.1 shall be met, in addition to precast prestressed piles shall have transverse reinforcement in accordance with the following:

1. Requirements in ACI 318, Chapter 21, need not apply, unless specifically referenced.
2. Where the total pile length in the soil is 35 feet (10 668 mm) or less, the lateral transverse reinforcement in the ductile region shall occur through the length of the pile. Where the pile length exceeds 35 feet (10 668 mm), the ductile pile region shall be taken as the greater of 35 feet (10 668 mm) or the distance from the underside of the pile cap to the point of zero curvature plus three times the least pile dimension.
3. In the ductile region, the center-to-center spacing of the spirals or hoop reinforcement shall not exceed one-fifth of the least pile dimension, six times the diameter of the longitudinal strand, or 8 inches (203 mm), whichever is smaller smallest.
4. Circular spiral reinforcement shall be spliced by lapping one full turn and bending the end of the each spiral to a 90-degree hook or by use of a mechanical or welded splice complying with Sec. 12.14.3 of ACI 318.
5. Where the transverse reinforcement consists of circular spirals, the volumetric ratio of spiral transverse reinforcement in the ductile region shall comply with the following:

$$\rho_s = 0.25(f'_c / f_{yh})(A_g / A_{ch} - 1.0)[0.5 + 1.4P/(f'_c A_g)] \text{ (Equation 18-5)}$$

but not less than:

$$\rho_s = 0.12(f'_c / f_{yh}) [0.5 + 1.4P/(f'_c A_g)] \geq 0.12 f'_c / f_{yh} \text{ (Equation 18-6)}$$

and need not exceed:

$$\rho_s = 0.021 \text{ (Equation 18-7)}$$

where:

- A_g = Pile cross-sectional area, square inches (mm²).
- A_{ch} = Core area defined by spiral outside diameter, square inches (mm²).

- f'_c = Specified compressive strength of concrete, psi (MPa)
 f_{yh} = Yield strength of spiral reinforcement \leq 85,000 psi (586 MPa).
 P = Axial load on pile, pounds (kN), as determined from Equations 16-5 and ~~46-6~~ 16-7.
 ρ_s = Volumetric ratio (vol. spiral/ vol. core).

This required amount of spiral reinforcement is permitted to be obtained by providing an inner and outer spiral.

6. ~~When~~ Where transverse reinforcement consists of rectangular hoops and cross ties, the total cross-sectional area of lateral transverse reinforcement in the ductile region with spacing, s , and perpendicular to dimension, h_c , shall conform to:

$$A_{sh} = 0.3s h_c (f'_c / f_{yh})(A_g / A_{ch} - 1.0)[0.5 + 1.4P / (f'_c A_g)] \quad \text{(Equation 18-8)}$$

but not less than:

$$A_{sh} = 0.12s h_c (f'_c / f_{yh}) [0.5 + 1.4P / (f'_c A_g)] \quad \text{(Equation 18-9)}$$

where:

- f_{yh} = \leq 70,000 psi (483 MPa).
 h_c = Cross-sectional dimension of pile core measured center to center of hoop reinforcement, inch (mm).
 s = Spacing of transverse reinforcement measured along length of pile, inch (mm).
 A_{sh} = Cross-sectional area of transverse reinforcement, square inches (mm²)
 f'_c = Specified compressive strength of concrete, psi (MPa)

The hoops and cross ties shall be equivalent to deformed bars not less than No. 3 in size. Rectangular hoop ends shall terminate at a corner with seismic hooks.

Outside of the length of the pile requiring transverse confinement reinforcing, the spiral or hoop reinforcing with a volumetric ratio not less than one-half of that required for transverse confinement reinforcing shall be provided.

1810.3.9 Cast-in-place deep foundations. Cast-in-place deep foundation elements shall be designed and detailed in accordance with Sections 1810.3.9.1 through 1810.3.9.6.

1810.3.9.1 Design cracking moment. The design cracking moment (M_n) for a cast-in-place deep foundation element not enclosed by a structural steel pipe or tube shall be determined using the following equation:

$$\phi M_n = 3\sqrt{f'_c S_m} \quad \text{(Equation 18-10)}$$

where:

- f'_c = Specified compressive strength of concrete or grout, psi (MPa)
 S_m = Elastic section modulus, neglecting reinforcement and casing, in³ (mm³)

1810.3.9.2 Required reinforcement. Where subject to uplift or where the required moment strength determined using the load combinations of Section 1605.2 exceeds the design cracking moment determined in accordance with Section 1810.3.9.1, cast-in-place deep foundations not enclosed by a structural steel pipe or tube shall be reinforced.

1810.3.9.3 Placement of reinforcement. Except for steel dowels embedded 5 feet (1524 mm) or less in the pile and as provided in Section 1810.3.4, reinforcement where required shall be assembled and tied together and shall be placed in the pile deep foundation element as a unit before the reinforced portion of the pile element is filled with concrete, except in augered uncased cast-in-place piles. Tied reinforcement in augered uncased cast-in-place piles shall be placed after piles are concreted, while the concrete is still in a semifluid state.

Exceptions:

1. Steel dowels embedded 5 feet (1524 mm) or less shall be permitted to be placed after concreting, while the concrete is still in a semifluid state.
2. **1810.3.4 Reinforcement.** For piles deep foundation elements installed with a hollow-stem auger where full-length, tied reinforcement shall be placed after elements are concreted, while the concrete is still in a semifluid state. Longitudinal steel reinforcement is placed without lateral ties, the reinforcement shall be placed either through the hollow stem of the auger prior to filling the pile with concrete concreting or after concreting, while the concrete is still in a semifluid state. All pile reinforcement shall have a concrete cover of not less than 2.5 inches (64 mm).

Exception: Where physical constraints do not allow the placement of the longitudinal reinforcement prior to filling the pile with concrete or where partial-length longitudinal reinforcement is placed without lateral ties, the reinforcement is allowed to be placed after the piles are completely concreted but while concrete is still in a semifluid state.

3. For Group R-3 and U occupancies not exceeding two stories of light-frame construction, reinforcement is permitted to be placed after concreting, while the concrete is still in a semifluid state, and the concrete cover requirement is permitted to be reduced to 2 inches (51 mm), provided the construction method can be demonstrated to the satisfaction of the building official.

1810.3.9.4 Reinforcement seismic reinforcement. Except for steel dowels embedded 5 feet (1524 mm) or less in the pier, reinforcement where required shall be assembled and tied together and shall be placed in the pier hole as a unit before the reinforced portion of the pier is filled with concrete. Where a structure is assigned to Seismic Design Category C reinforcement shall be provided in accordance with Section 1810.3.9.4.1. Where a structure is assigned to Seismic Design Category D, E, or F reinforcement shall be provided in accordance with Section 1810.3.9.4.2.

Exception: Reinforcement is permitted to be wet set and the 2-1/2 inch (64 mm) concrete cover requirement be reduced to 2 inches (51 mm) for Group R-3 and U occupancies not exceeding two stories of light-frame construction, provided the construction method can be demonstrated to the satisfaction of the building official.

Reinforcement shall conform to the requirements of Sections 1810.1.2.1 and 1810.1.2.2.

Exceptions:

1. Isolated ~~piers deep foundation elements~~ supporting posts of Group R-3 and U occupancies not exceeding two stories of light-frame construction ~~are shall be~~ permitted to be reinforced as required by rational analysis but ~~with~~ not less than a ~~minimum of~~ one No. 4 bar, without ties or spirals, ~~when where~~ detailed so the ~~pier element~~ is not subject to lateral loads and the soil is ~~determined to be of adequate stiffness provides adequate lateral support in accordance with Section 1810.2.1.~~
2. Isolated ~~piers deep foundation elements~~ supporting posts and bracing from decks and patios appurtenant to Group R-3 and U occupancies not exceeding two stories of light-frame construction ~~are shall be~~ permitted to be reinforced as required by rational analysis but ~~with~~ not less than one No. 4 bar, without ties or spirals, ~~when where~~ the lateral load, E , to the top of the ~~pier element~~ does not exceed 200 pounds (890 N) and the soil is ~~determined to be of adequate stiffness provides adequate lateral support in accordance with Section 1810.2.1.~~
3. ~~Piers Deep foundation elements~~ supporting the concrete foundation wall of Group R-3 and U occupancies not exceeding two stories of light-frame construction ~~are shall be~~ permitted to be reinforced as required by rational analysis but ~~with~~ not less than two No. 4 bars, without ties or spirals, ~~when it can be shown the concrete pier will not rupture when designed for the maximum seismic load, E_{max} , where the design cracking moment determined in accordance with Section 1810.3.9.1 exceeds the required moment strength determined using the load combinations with overstrength factor in Section 12.4.3.2 of ASCE 7 and the soil is determined to be of adequate stiffness provides adequate lateral support in accordance with Section 1810.2.1.~~
4. Closed ties or spirals where required by Section ~~1810.1.2.2 1810.3.9.4.2~~ ~~are shall be~~ permitted to be limited to the top 3 feet (914 mm) of the ~~piers deep foundation elements~~ 10 feet (3048 mm) or less in depth supporting Group R-3 and U occupancies of Seismic Design Category D, not exceeding two stories of light-frame construction.

1810.1.2.4 1810.3.9.4.1 Seismic reinforcement in Seismic Design Category C. ~~For Where a structure is assigned to Seismic Design Category C in accordance with Section 1613, the following shall apply~~ cast-in-place deep foundation elements shall be reinforced as specified in this section. Reinforcement shall be provided where required by analysis.

A ~~minimum of four longitudinal bars, with a minimum longitudinal reinforcement ratio of 0.0025, shall be provided for uncased cast-in-place concrete drilled or augered piles, piers or caissons in the top throughout the minimum reinforced length of the element as defined below starting at the top of the element. The minimum reinforced length of the element shall be taken as the greatest of the following:~~

1. ~~One-third of the pile element length;~~
2. ~~A minimum length distance of 10 feet (3048 mm);~~
3. ~~Three times the least element dimension; and~~
4. ~~The distance from the top of the element to the point where the design cracking moment determined in accordance with Section 1810.3.9.1 exceeds the required moment strength determined using the load combinations of Section 1605.2, below the ground or that required by analysis, whichever length is greatest. The minimum reinforcement ratio, but no less than that ratio required by rational analysis, shall be continued throughout the flexural length of the pile. There shall be a minimum of four longitudinal bars with~~

~~Transverse reinforcement shall consist of closed ties (or equivalent spirals) of with a minimum 3/8 inch (9.5 mm) diameter provided at 16-longitudinal bar diameter maximum spacing. Transverse confinement reinforcement with a maximum. Spacing of transverse reinforcement shall not exceed the smaller of 6 inches (152 mm) or 8-longitudinal-bar diameters, whichever is less, shall be provided within a distance equal to of three times the least pile element dimension of from the bottom of the pile cap. Spacing of transverse reinforcement shall not exceed 16 longitudinal bar diameters throughout the remainder of the reinforced length.~~

Exceptions:

1. ~~The requirements of this section shall not apply to concrete cast in structural steel pipes or tubes.~~
2. ~~A spiral-welded metal casing of a thickness not less than manufacturer's standard gage No. 14 gage (0.068 inch) is permitted to provide concrete confinement in lieu of the closed ties or spirals. Where used as such, the metal casing shall be protected against possible deleterious action due to soil constituents, changing water levels or other factors indicated by boring records of site conditions.~~

1810.1.2.2 1810.3.9.4.2 Seismic reinforcement in Seismic Design Category Categories D, E or through F. ~~For Where a structure is assigned to Seismic Design Category D, E or F in accordance with Section 1613, the requirements for Seismic Design Category C given above shall be met, in addition to the following~~ cast-in-place deep foundation elements shall be reinforced as specified in this section. Reinforcement shall be provided where required by analysis.

A ~~minimum of four longitudinal bars, with a minimum longitudinal reinforcement ratio of 0.005 shall be provided for uncased cast-in-place drilled or augered concrete piles, piers or caissons in the top throughout the minimum reinforced length of the element as defined below starting at the top of the element. The minimum reinforced length of the element shall be taken as the greatest of the following:~~

1. ~~One-half of the pile element length;~~
2. ~~A minimum length distance of 10 feet (3048 mm);~~
3. ~~Three times the least element dimension; and~~
4. ~~The distance from the top of the element to the point where the design cracking moment determined in accordance with Section 1810.3.9.1 exceeds the required moment strength determined using the load combinations of Section 1605.2.~~

~~below ground or throughout the flexural length of the pile, whichever length is greatest. The flexural length shall be taken as the length of the pile to a point where the concrete section cracking moment strength multiplied by 0.4 exceeds the required moment strength at that point. There shall be a minimum of four longitudinal bars with transverse confinement reinforcement provided in the pile in accordance with Sections 21.4.4.1, 21.4.4.2 and 21.4.4.3 of ACI 318 within three times the least pile dimension of the bottom of the pile cap. A transverse spiral reinforcement ratio of not less than one-half of that required in Section 21.4.4.1(a) of ACI 318 for other than Class E, F or liquefiable sites is permitted. Tie spacing throughout the remainder of the concrete section shall not exceed 12-longitudinal-bar diameters, one-half the least dimension of the section, nor 12 inches (305 mm). Ties shall be a minimum of No. 3 bars for piles with a least dimension up to 20 inches (508 mm), and No. 4 bars for larger piles.~~

~~Transverse reinforcement shall consist of closed ties or spirals no smaller than No. 3 bars for elements with a least dimension up to 20 inches (508 mm), and No. 4 bars for larger elements. Throughout the remainder of the reinforced length outside the regions with transverse confinement reinforcement, as specified in Section 1810.3.9.4.2.1 or 1810.3.9.4.2.2, the spacing of transverse reinforcement shall not exceed the least of the following:~~

1. 12 longitudinal bar diameters;
2. One-half the least dimension of the element; and
3. 12 inches (305 mm).

Exceptions:

1. The requirements of this section shall not apply to concrete cast in structural steel pipes or tubes.
2. ~~1810.5.4.1 Seismic reinforcement.~~ Where a structure is assigned to Seismic Design Category C, D, E or F in accordance with Section 1613, the reinforcement requirements for drilled or augered uncased piles in Section 1810.3.5 shall be met.

Exception: A spiral-welded metal casing of a thickness not less than manufacturer's standard gage No. 14 gage (0.068 inch) is permitted to provide concrete confinement in lieu of the closed ties or ~~equivalent spirals required in an uncased concrete pile.~~ Where used as such, the metal casing shall be protected against possible deleterious action due to soil constituents, changing water levels or other factors indicated by boring records of site conditions.

1810.3.9.4.2.1 Site Classes A through D. For Site Class A, B, C, or D sites, transverse confinement reinforcement shall be provided in the element in accordance with Sections 21.4.4.1, 21.4.4.2 and 21.4.4.3 of ACI 318 within three times the least element dimension of the bottom of the pile cap. A transverse spiral reinforcement ratio of not less than one-half of that required in Section 21.4.4.1(a) of ACI 318 shall be permitted.

1810.3.9.4.2.2 Site Classes E and F. For Site Class E or F sites, transverse confinement reinforcement shall be provided in the element in accordance with Sections 21.4.4.1, 21.4.4.2 and 21.4.4.3 of ACI 318 within seven times the least element dimension of the pile cap and within seven times the least element dimension of the interfaces of strata that are hard or stiff and strata that are liquefiable or are composed of soft to medium stiff clay.

~~1812.6~~ **1810.3.9.5 Belled bottoms drilled shafts.** Where pier foundations drilled shafts are belled at the bottom, the edge thickness of the bell shall not be less than that required for the edge of footings. Where the sides of the bell slope at an angle less than 60 degrees (1 rad) from the horizontal, the effects of vertical shear shall be considered.

~~1810.7.1~~ **1810.3.9.6 Construction Socketed drilled shafts.** ~~Caisson piles shall consist of a shaft section of concrete filled pipe extending to bedrock with an uncased socket drilled into the bedrock and filled with concrete.~~ Socketed drilled shafts shall have a permanent pipe or tube casing that extends down to bedrock and an uncased socket drilled into the bedrock, both filled with concrete. ~~The caisson pile~~ Socketed drilled shafts shall have a full-length structural steel core or a stub core installed in the rock socket and extending into the pipe portion a distance equal to the socket depth.

~~1810.7.3~~ **Design.** The depth of the rock socket shall be sufficient to develop the full load-bearing capacity of the ~~caisson pile element~~ with a minimum safety factor of two, but the depth shall not be less than the outside diameter of the pipe ~~or tube casing~~. The design of the rock socket is permitted to be predicated on the sum of the allowable load-bearing pressure on the bottom of the socket plus bond along the sides of the socket. ~~The minimum outside diameter of the caisson pile shall be 18 inches (457 mm), and the diameter of the rock socket shall be approximately equal to the inside diameter of the pile.~~

~~1810.7.4~~ **Structural core.** The gross cross-sectional area of the structural steel core shall not exceed 25 percent of the gross area of the ~~caisson drilled shaft~~. The minimum clearance between the structural core and the pipe shall be 2 inches (51 mm). ~~Where cores are to be spliced, the ends shall be milled or ground to provide full contact and shall be full depth welded.~~

~~1810.8~~ **1810.3.10 [Supp] Micropiles.** Micropiles shall ~~comply with the requirements of~~ be designed and detailed in accordance with Sections 1810.8.1 through 1810.8.5 ~~1810.3.10.1 through 1810.3.10.4.~~

~~1810.8.1~~ **1810.3.10.1 [Supp] Construction.** ~~Micropiles shall consist of a grouted section reinforced with steel pipe or steel reinforcement.~~ Micropiles shall develop their load-carrying capacity ~~through by means of a bond zone in soil, bedrock or a combination of soil and bedrock.~~ ~~The steel pipe or steel reinforcement shall extend the full length of the micropile.~~ Micropiles shall be grouted and have either a steel pipe or tube or steel reinforcement at every section along the length. It shall be permitted to transition from deformed reinforcing bars to steel pipe or tube reinforcement by extending the bars into the pipe or tube section by at least their tension development length.

~~1810.8.2~~ **1810.3.10.2 [Supp] Materials.** ~~Grout shall have a specified compressive strength (f'_c) of not less than 4,000 psi (27.58 Mpa). The grout mix shall be designed and proportioned so as to produce a pumpable mixture.~~ Reinforcement shall consist of deformed reinforcing bars in accordance with ASTM A 615 Grade 60 or 75 or ASTM A 722 Grade 150.

The steel pipe ~~or tube~~ shall have a minimum wall thickness of 3/16 inch (4.8 mm). Splices shall comply with Section ~~1808.2.7~~ 1810.3.6. The steel pipe ~~or tube~~ shall have a minimum yield strength ~~exceeding~~ of 45,000 psi (310 MPa) and a minimum elongation of 15 percent as shown by mill certifications or two coupon test samples per 40,000 pounds (18 160 kg) of pipe ~~or tube~~.

~~1810.8.4~~ **1810.3.10.3 [Supp] Reinforcement.** For ~~micropiles or portions thereof~~ piles grouted inside a temporary or permanent casing or inside a hole drilled into bedrock or a hole drilled with grout, the steel pipe ~~or tube~~ or steel reinforcement shall be designed to carry at least 40 percent of the design compression load. ~~Micropiles or portions thereof~~ piles grouted in an open hole in soil without temporary or permanent casing and without suitable means of verifying the hole diameter during grouting shall be designed to carry the entire compression load in the reinforcing steel. Where a steel pipe ~~or tube~~ is used for reinforcement, the portion of the grout enclosed within the pipe is permitted to be included in the determination of the allowable stress in the grout.

~~1810.8.4.1~~ **1810.3.10.4 [Supp] Seismic reinforcement.** ~~Where a~~ For structures is assigned to Seismic Design Category C, a permanent steel casing shall be provided from the top of the ~~micropile~~ down a ~~minimum of 120 percent of the flexural length to the point of zero curvature.~~ ~~Where a~~ For structures is assigned to Seismic Design D, E or F, the ~~micropile~~ shall be considered as an alternative system in accordance with Section 104.11. The alternative ~~pile~~ system design, supporting documentation and test data shall be submitted to the building official for review and approval.

~~1808.2.4~~ **1810.3.11 Pile caps.** Pile caps shall be of reinforced concrete, and shall include all elements to which ~~piles~~ vertical deep foundation elements are connected, including grade beams and mats. The soil immediately below the pile cap shall not be considered as carrying any vertical load. The tops of ~~piles~~ vertical deep foundation elements shall be embedded not less than 3 inches (76 mm) into pile caps and the caps shall extend at least 4 inches (102 mm) beyond the edges of ~~piles~~ the elements. The tops of ~~piles~~ elements shall be cut ~~or chipped~~ back to sound material before capping.

1808.2.23.1.4 1810.3.11.1 Connection to pile cap Seismic Design Categories C through F. Concrete piles and concrete-filled steel pipe piles For structures assigned to Seismic Design Category C, D, E, or F in accordance with Section 1613, concrete deep foundation elements shall be connected to the pile cap by embedding the pile element reinforcement or field-placed dowels anchored in the concrete pile element into the pile cap for a distance equal to the their development length in accordance with ACI 318. It shall be permitted to connect precast prestressed piles to the pile cap by developing the element prestressing strands into the pile cap provided the connection is ductile. For deformed bars, the development length is the full development length for compression, or tension, in the case of uplift, without reduction in length for excess area reinforcement in accordance with Section 12.2.5 of ACI 318. Alternative measures for laterally confining concrete and maintaining toughness and ductile-like behavior at the top of the pile will element shall be permitted provided the design is such that any hinging occurs in the confined region.

Ends of hoops, spirals and ties shall be terminated with seismic hooks, as defined in Section 21.1 of ACI 318 turned into the confined concrete core. The minimum transverse steel ratio for confinement shall not be less than one-half of that required for columns.

For resistance to uplift forces, anchorage of steel pipe (round HSS sections), concrete-filled steel pipe or pipes, tubes, or H-piles to the pile cap shall be made by means other than concrete bond to the bare steel section. Concrete-filled steel pipes or tubes shall have reinforcement of not less than 0.01 times the cross-sectional area of the concrete fill developed into the cap and extending into the fill a length equal to two times the required cap embedment, but not less than the tension development length of the reinforcement.

Exception: Anchorage of concrete-filled steel pipe piles is permitted to be accomplished using deformed bars developed into the concrete portion of the pile.

Splices of pile segments shall develop the full strength of the pile, but the splice need not develop the nominal strength of the pile in tension, shear and bending when it has been designed to resist axial and shear forces and moments from the load combinations of Section 1605.4.

1808.2.23.2.2 1810.3.11.2 Connection to pile cap Seismic Design Categories D through F. For piles required to resist structures assigned to Seismic Design Category D, E, or F in accordance with Section 1613, deep foundation element resistance to uplift forces or provide rotational restraint, design of anchorage of piles into the pile cap shall be provided shall be provided by anchorage into the pile cap, designed considering the combined effect of axial forces due to uplift and bending moments due to fixity to the pile cap. Anchorage shall develop a minimum of 25 percent of the strength of the pile element in tension. Anchorage into the pile cap shall be capable of developing the following:

1. In the case of uplift, the lesser least of the following: nominal tensile strength of the longitudinal reinforcement in a concrete pile element; or the nominal tensile strength of a steel pile element; or the pile uplift soil nominal strength factored frictional force developed between the element and the soil multiplied by 1.3; or and the axial tension force resulting from the load combinations of Section 1605.4.
2. In the case of rotational restraint, the lesser of the following: the axial and force, shear forces, and bending moments resulting from the load combinations of Section 1605.4; or and development of the full axial, bending and shear nominal strength of the pile element.

1808.2.23.2.3 Flexural strength. Where the vertical lateral-force-resisting elements are columns, the grade beam or pile cap flexural strengths shall exceed the column flexural strength. The connection between batter piles and grade beams or pile caps shall be designed to resist the nominal strength of the pile acting as a short column. Batter piles and their connection shall be capable of resisting forces and moments from the load combinations of Section 1605.4.

1810.3.12 Grade beams. For structures assigned to Seismic Design Category D, E, or F in accordance with Section 1613, grade beams shall comply with the provisions in Section 21.10.3 of ACI 318 for grade beams, except where they have the capacity to resist the forces from the load combinations with overstrength factor in Section 12.4.3.2 of ASCE 7.

1808.2.23.4 1810.3.13 [Supp] Seismic Design Category C Seismic ties. Where a For structures is assigned to Seismic Design Category C, D, E, or F in accordance with Section 1613, the following shall apply. Individual pile caps, piers or piles deep foundations shall be interconnected by ties. Ties shall be capable of carrying, in tension and compression, a force equal to the product of the larger pile cap or column load times the seismic coefficient, S_{DS} , divided by 10 unless it can be demonstrated that equivalent restraint is provided by reinforced concrete beams within slabs on grade or reinforced concrete slabs on grade or confinement by competent rock, hard cohesive soils or very dense granular soils.

Exception: In Group R-3 and U occupancies of light-frame construction, pier foundations deep foundation elements supporting foundation walls, isolated interior posts detailed so the pier element is not subject to lateral loads, or exterior decks and patios are not subject to interconnection if it can be shown where the soils are of adequate stiffness, subject to the approval of the building official.

1810.4 Installation. Deep foundations shall be installed in accordance with Section 1810.4. Where a single deep foundation element comprises two or more sections of different materials or different types spliced together, each section shall satisfy the applicable conditions of installation.

1808.2.6 1810.4.1 Structural integrity. Piers or piles Deep foundation elements shall be installed in such a manner and sequence as to prevent distortion or damage that may adversely affect the structural integrity of piles adjacent structures or of foundation elements being installed or already in place and as to avoid compacting the surrounding soil to the extent that other foundation elements cannot be installed properly.

1809.2.2.4 1810.4.1.1 Installation Compressive strength of precast concrete piles. A precast concrete pile shall not be driven before the concrete has attained a compressive strength of at least 75 percent of the 28-day specified compressive strength (f'_c), but not less than the strength sufficient to withstand handling and driving forces.

1810.4.1.2 Casing. Where cast-in-place deep foundation elements are formed through unstable soils and concrete is placed in an open-drilled hole, a casing shall be inserted in the hole prior to placing the concrete. Where the casing is withdrawn during concreting, the level of concrete shall be maintained above the bottom of the casing at a sufficient height to offset any hydrostatic or lateral soil pressure. Driven casings shall be mandrel driven their full length in contact with the surrounding soil.

1840.4.3 1810.4.1.3 Installation Driving near uncased concrete. Piles Deep foundation elements shall not be driven within six pile element diameters center to center in granular soils or within one-half the pile element length in cohesive soils of a pile an uncased element filled with concrete less than 48 hours old unless approved by the building official. If the concrete surface in any completed pile element rises or drops, the pile element shall be replaced. Piles Driven uncased deep foundation elements shall not be installed in soils that could cause pile heave.

1840.5.3 1810.4.1.4 Installation Driving near cased concrete. Steel shells shall be mandrel driven their full length in contact with the surrounding soil.

The steel shells shall be driven in such order and with such spacing as to ensure against distortion of or injury to piles already in place. A pile Deep foundation elements shall not be driven within four and one-half average pile diameters of a pile cased element filled with concrete less than 24 hours old unless approved by the building official. Concrete shall not be placed in steel shells casings within heave range of driving.

1809.4.3 1810.4.1.5 Defective timber piles. Any substantial sudden increase in rate of penetration of a timber pile shall be investigated for possible damage. If the sudden increase in rate of penetration cannot be correlated to soil strata, the pile shall be removed for inspection or rejected.

1808.2.20 1810.4.2 Identification. ~~Pier or pile~~ Deep foundation materials shall be identified for conformity to the specified grade with this identity maintained continuously from the point of manufacture to the point of installation or shall be tested by an approved agency to determine conformity to the specified grade. The approved agency shall furnish an affidavit of compliance to the building official.

1808.2.24 1810.4.3 Pier or pile Location plan. A plan showing the location and designation of ~~piers or piles~~ deep foundation elements by an identification system shall be filed with the building official prior to installation of such ~~piers or piles~~ elements. Detailed records for ~~piers or individual piles~~ elements shall bear an identification corresponding to that shown on the plan.

1808.2.43 1810.4.4 Preexcavation. The use of jetting, augering or other methods of preexcavation shall be subject to the approval of the building official. Where permitted, preexcavation shall be carried out in the same manner as used for ~~piers or piles~~ deep foundation elements subject to load tests and in such a manner that will not impair the carrying capacity of the ~~piers or piles~~ elements already in place or damage adjacent structures. Pile Element tips shall be driven below the preexcavated depth until the required resistance or penetration is obtained.

1808.2.45 1810.4.5 Use of Vibratory drivers driving. Vibratory drivers shall only be used to install piles deep foundation elements where the pile element load capacity is verified by load tests in accordance with Section ~~1808.2.8.3~~ 1810.3.3.1.2. The installation of production piles elements shall be controlled according to power consumption, rate of penetration or other approved means that ensure pile element capacities equal or exceed those of the test piles elements.

1808.2.49 1810.4.6 Heaved piles elements. Piles Deep foundation elements that have heaved during the driving of adjacent piles elements shall be redriven as necessary to develop the required capacity and penetration, or the capacity of the pile element shall be verified by load tests in accordance with Section ~~1808.2.8.3~~ 1810.3.3.1.2.

1810.4.7 Enlarged base cast-in-place elements 1810.2.3 Installation. Enlarged bases for cast-in-place deep foundation elements formed either by compacting concrete or by driving a precast base shall be formed in or driven into granular soils. ~~Piles~~ Such elements shall be constructed in the same manner as successful prototype test piles elements driven for the project. ~~Pile~~ Shafts extending through peat or other organic soil shall be encased in a permanent steel casing. Where a cased shaft is used, the shaft shall be adequately reinforced to resist column action or the annular space around the pile-shaft shall be filled sufficiently to reestablish lateral support by the soil. Where pile heave occurs, the pile element shall be replaced unless it is demonstrated that the pile element is undamaged and capable of carrying twice its design load.

1810.3.3 1810.4.8 Installation Hollow-stem augered, cast-in-place elements. ~~Where pile shafts are formed through unstable soils and concrete is placed in an open drilled hole, a steel liner shall be inserted in the hole prior to placing the concrete. Where the steel liner is withdrawn during concreting, the level of concrete shall be maintained above the bottom of the liner at a sufficient height to offset any hydrostatic or lateral soil pressure.~~

Where concrete is placed by pumping through a hollow-stem auger, the auger shall be permitted to rotate in a clockwise direction during withdrawal. The auger shall be withdrawn in continuous increments. Concreting pumping pressures shall be measured and maintained high enough at all times to offset hydrostatic and lateral earth pressures. Concrete volumes shall be measured to ensure that the volume of concrete placed in each pile element is equal to or greater than the theoretical volume of the hole created by the auger. Where the installation process of any pile element is interrupted or a loss of concreting pressure occurs, the pile element shall be redrilled to 5 feet (1524 mm) below the elevation of the tip of the auger when the installation was interrupted or concrete pressure was lost and reformed. Augered cast-in-place piles elements shall not be installed within six pile diameters center to center of a pile an element filled with concrete less than 12 hours old, unless approved by the building official. If the concrete level in any completed pile element drops due to installation of an adjacent pile element, the pile element shall be replaced.

1810.7.6 1810.4.9 Installation Socketed drilled shafts. The rock socket and pile pipe or tube casing of socketed drilled shafts shall be thoroughly cleaned of foreign materials before filling with concrete. Steel cores shall be bedded in cement grout at the base of the rock socket. ~~Concrete shall not be placed through water except where a tremie or other approved method is used.~~

1810.8.5 1810.4.10 Installation Micropiles. The pile Micropile deep foundation elements shall be permitted to be formed in a holes advanced by rotary or percussive drilling methods, with or without casing. The pile elements shall be grouted with a fluid cement grout. The grout shall be pumped through a tremie pipe extending to the bottom of the pile element until grout of suitable quality returns at the top of the pile element. The following requirements apply to specific installation methods:

1. For micropiles grouted inside a temporary casing, the reinforcing bars shall be inserted prior to withdrawal of the casing. The casing shall be withdrawn in a controlled manner with the grout level maintained at the top of the pile element to ensure that the grout completely fills the drill hole. During withdrawal of the casing, the grout level inside the casing shall be monitored to ~~check~~ verify that the flow of grout inside the casing is not obstructed.
2. For a micropile or portion thereof ~~a pile~~ grouted in an open drill hole in soil without temporary casing, the minimum design diameter of the drill hole shall be verified by a suitable device during grouting.
3. For micropiles designed for end bearing, a suitable means shall be employed to verify that the bearing surface is properly cleaned prior to grouting.
4. Subsequent micropiles shall not be drilled near piles elements that have been grouted until the grout has had sufficient time to harden.
5. Micropiles shall be grouted as soon as possible after drilling is completed.
6. For micropiles designed with a full length casing, the casing shall be pulled back to the top of the bond zone and reinserted or some other suitable means employed to assure grout coverage outside the casing.

1808.2.22 1810.4.11 Special inspection. Special inspections in accordance with Sections 1704.8 and 1704.9 shall be provided for piles and piers driven and cast-in-place deep foundation elements, respectively.

1808.2.23.2 Seismic Design Category D, E or F. Where a structure is assigned to Seismic Design Category D, E or F in accordance with Section 1613, the requirements for Seismic Design Category C given in Section 1808.2.23.1 shall be met, in addition to the following. Provisions of ACI 318, Section 21.10.4, shall apply when not in conflict with the provisions of Sections 1808 through 1812. Concrete shall have a specified compressive strength of not less than 3,000 psi (20.68 MPa) at 28 days.

Exceptions:

1. Group R or U occupancies of light-framed construction and two stories or less above grade plane are permitted to use concrete with a specified compressive strength of not less than 2,500 psi (17.2 MPa) at 28 days.
2. Detached one- and two-family dwellings of light-frame construction and two stories or less in height are not required to comply with the provisions of ACI 318, Section 21.10.4.
3. Section 21.10.4.4(a) of ACI 318 need not apply to concrete piles.

1809.2.3.1 Materials. Prestressing steel shall conform to ASTM A 416. Concrete shall have a 28-day specified compressive strength (f'_c) of not less than 5,000 psi (34.48 MPa).

1810.5.4 Reinforcement. Reinforcement shall not be placed within 1 inch (25 mm) of the steel shell. Reinforcing shall be required for unsupported pile lengths or where the pile is designed to resist uplift or unbalanced lateral loads.

1810.6.4 Reinforcement. Reinforcement steel shall conform to Section 1810.1.2. Reinforcement shall not be placed within 1 inch (25 mm) of the steel casing.

1810.7.2 Materials. Pipe and steel cores shall conform to the material requirements in Section 1809.3. Pipes shall have a minimum wall thickness of 3/8 inch (9.5 mm) and shall be fitted with a suitable steel driving shoe welded to the bottom of the pipe. Concrete shall have a 28-day specified compressive strength (f'_c) of not less than 4,000 psi (27.58 MPa). The concrete mix shall be designed and proportioned so as to produce a cohesive workable mix with a slump of 4 inches to 6 inches (102 mm to 152 mm).

Delete without substitution:

~~**1808.2.8 Allowable pier or pile loads.**~~

~~**1808.2.14 Installation sequence.** Piles shall be installed in such sequence as to avoid compacting the surrounding soil to the extent that other piles cannot be installed properly, and to prevent ground movements that are capable of damaging adjacent structures.~~

~~**1808.2.16 Pile driveability.** Pile cross sections shall be of sufficient size and strength to withstand driving stresses without damage to the pile, and to provide sufficient stiffness to transmit the required driving forces.~~

~~**1808.2.23 Seismic design of piers or piles.**~~

**SECTION 1809
DRIVEN PILE FOUNDATIONS**

~~**1809.1.4 Allowable stresses.** The allowable stresses shall be in accordance with the AF&PA NDS.~~

~~**1809.2 Precast concrete piles.**~~

~~**1809.2.1.4 Installation.** Piles shall be handled and driven so as not to cause injury or overstressing, which affects durability or strength.~~

~~**1809.2.2.1 Materials.** Concrete shall have a 28-day specified compressive strength (f'_c) of not less than 3,000 psi (20.68 MPa).~~

~~**1809.2.2.3 Allowable stresses.** The allowable compressive stress in the concrete shall not exceed 33 percent of the 28-day specified compressive strength (f'_c) applied to the gross cross-sectional area of the pile. The allowable compressive stress in the reinforcing steel shall not exceed 40 percent of the yield strength of the steel (f_y) or a maximum of 30,000 psi (207 MPa). The allowable tensile stress in the reinforcing steel shall not exceed 50 percent of the yield strength of the steel (f_y) or a maximum of 24,000 psi (165 MPa).~~

~~**1809.2.2.5 Concrete cover.** Reinforcement for piles that are not manufactured under plant conditions shall have a concrete cover of not less than 2 inches (51 mm).~~

~~Reinforcement for piles manufactured under plant control conditions shall have a concrete cover of not less than 1.25 inches (32 mm) for No. 5 bars and smaller, and not less than 1.5 inches (38 mm) for No. 6 through No. 11 bars except that longitudinal bars spaced less than 1.5 inches (38 mm) clear distance apart shall be considered bundled bars for which the minimum concrete cover shall be equal to that for the equivalent diameter of the bundled bars. Reinforcement for piles exposed to seawater shall have a concrete cover of not less than 3 inches (76 mm).~~

~~**1809.2.3.3 Allowable stresses.** The allowable design compressive stress, f_e , in concrete shall be determined as follows:~~

~~$$f_e = 0.33 f'_c - 0.27 f_{pe} \quad \text{(Equation 18-10)}$$~~

~~where:~~

~~f'_c = The 28-day specified compressive strength of the concrete.~~

~~f_{pe} = The effective prestress stress on the gross section.~~

~~**1809.2.3.4 Installation.** A prestressed pile shall not be driven before the concrete has attained a compressive strength of at least 75 percent of the 28-day specified compressive strength (f'_c), but not less than the strength sufficient to withstand handling and driving forces.~~

~~**1809.2.3.5 Concrete cover.** Prestressing steel and pile reinforcement shall have a concrete cover of not less than 1-1/4 inches (32 mm) for square piles of 12 inches (305 mm) or smaller size and 1-1/2 inches (38 mm) for larger piles, except that for piles exposed to seawater, the minimum protective concrete cover shall not be less than 2-1/2 inches (64 mm).~~

~~**1809.3 Structural steel piles.** Structural steel piles shall conform to the requirements of Sections 1809.3.1 through 1809.3.4.~~

1809.3.2 Allowable stresses. The allowable axial stresses shall not exceed 35 percent of the minimum specified yield strength (F_y).

Exception: Where justified in accordance with Section 1808.2.10, the allowable axial stress is permitted to be increased above $0.35F_y$, but shall not exceed $0.5F_y$.

SECTION 1810 CAST-IN-PLACE CONCRETE PILE FOUNDATIONS

1810.1 General. The materials, reinforcement and installation of cast-in-place concrete piles shall conform to Sections 1810.1.1 through 1810.1.3.

1810.1.3 Concrete placement. Concrete shall be placed in such a manner as to ensure the exclusion of any foreign matter and to secure a full-sized shaft. Concrete shall not be placed through water except where a tremie or other approved method is used. When depositing concrete from the top of the pile, the concrete shall not be chuted directly into the pile but shall be poured in a rapid and continuous operation through a funnel hopper centered at the top of the pile.

1810.2 Enlarged base piles. Enlarged base piles shall conform to the requirements of Sections 1810.2.1 through 1810.2.5.

1810.2.2 Allowable stresses. The maximum allowable design compressive stress for concrete not placed in a permanent steel casing shall be 25 percent of the 28-day specified compressive strength (f'_c). Where the concrete is placed in a permanent steel casing, the maximum allowable concrete stress shall be 33 percent of the 28-day specified compressive strength (f'_c).

1810.2.4 Load-bearing capacity. Pile load-bearing capacity shall be verified by load tests in accordance with Section 1808.2.8.3.

1810.2.5 Concrete cover. The minimum concrete cover shall be 2-1/2 inches (64 mm) for uncased shafts and 1 inch (25 mm) for cased shafts.

1810.3 Drilled or augered uncased piles. Drilled or augered uncased piles shall conform to Sections 1810.3.1 through 1810.3.5.

1810.3.1 Allowable stresses. The allowable design stress in the concrete of drilled or augered uncased piles shall not exceed 33 percent of the 28-day specified compressive strength (f'_c). The allowable compressive stress of reinforcement shall not exceed 40 percent of the yield strength of the steel or 25,500 psi (175.8 MPa).

1810.3.5 Reinforcement in Seismic Design Category C, D, E or F. Where a structure is assigned to Seismic Design Category C, D, E or F in accordance with Section 1613, the corresponding requirements of Sections 1810.1.2.1 and 1810.1.2.2 shall be met.

1810.4 Driven uncased piles. Driven uncased piles shall conform to Sections 1810.4.1 through 1810.4.4.

1810.4.1 Allowable stresses. The allowable design stress in the concrete shall not exceed 25 percent of the 28-day specified compressive strength (f'_c) applied to a cross-sectional area not greater than the inside area of the drive casing or mandrel.

1810.4.2 Dimensions. The pile length shall not exceed 30 times the average diameter. The minimum diameter shall be 12 inches (305 mm).

Exception: The length of the pile is permitted to exceed 30 times the diameter, provided that the design and installation of the pile foundation is under the direct supervision of a registered design professional knowledgeable in the field of soil mechanics and pile foundations. The registered design professional shall certify to the building official that the piles were installed in compliance with the approved design.

1810.4.4 Concrete cover. Pile reinforcement shall have a concrete cover of not less than 2.5 inches (64 mm), measured from the inside face of the drive casing or mandrel.

1810.5 Steel-cased piles. Steel-cased piles shall comply with the requirements of Sections 1810.5.1 through 1810.5.4.

1810.6 Concrete-filled steel pipe and tube piles. Concrete-filled steel pipe and tube piles shall conform to the requirements of Sections 1810.6.1 through 1810.6.5.

1810.6.1 Materials. Steel pipe and tube sections used for piles shall conform to ASTM A 252 or ASTM A 283. Concrete shall conform to Section 1810.1.1. The maximum coarse aggregate size shall be 3/4 inch (19.1 mm).

1810.6.2 Allowable stresses. The allowable design compressive stress in the concrete shall not exceed 33 percent of the 28-day specified compressive strength (f'_c). The allowable design compressive stress in the steel shall not exceed 35 percent of the minimum specified yield strength of the steel (F_y), provided F_y shall not be assumed greater than 36,000 psi (248 MPa) for computational purposes.

Exception: Where justified in accordance with Section 1808.2.10, the allowable stresses are permitted to be increased to $0.50 F_y$.

1810.6.4.1 Seismic reinforcement. Where a structure is assigned to Seismic Design Category C, D, E or F in accordance with Section 1613, the following shall apply. Minimum reinforcement no less than 0.01 times the cross-sectional area of the pile concrete shall be provided in the top of the pile with a length equal to two times the required cap embedment anchorage into the pile cap, but not less than the tension development length of the reinforcement. The wall thickness of the steel pipe shall not be less than 3/16 inch (5 mm).

1810.6.5 Placing concrete. The placement of concrete shall conform to Section 1810.1.3, but is permitted to be chuted directly into smooth-sided pipes and tubes without a centering funnel hopper.

1810.7 Caisson piles. Caisson piles shall conform to the requirements of Sections 1810.7.1 through 1810.7.6.

1810.7.5 Allowable stresses. The allowable design compressive stresses shall not exceed the following: concrete, $0.33 f'_c$; steel pipe, $0.35 F_y$; and structural steel core, $0.50 F_y$.

1810.8.3 Allowable stresses. The allowable compressive stress in the grout shall not exceed $0.33 f'_c$. The allowable compressive stress in the steel pipe and steel reinforcement shall not exceed the lesser of $0.4 F_y$ and 32,000 psi (220 Mpa). The allowable tensile stress in the steel reinforcement shall not exceed $0.60 F_y$. The allowable tensile stress in the cement grout shall be zero.

SECTION 1811 COMPOSITE PILES

1811.1 General. Composite piles shall conform to the requirements of Sections 1811.2 through 1811.5.

1811.2 Design. Composite piles consisting of two or more approved pile types shall be designed to meet the conditions of installation.

1811.3 Limitation of load. The maximum allowable load shall be limited by the capacity of the weakest section incorporated in the pile.

1811.4 Splices. Splices between concrete and steel or wood sections shall be designed to prevent separation both before and after the concrete portion has set, and to ensure the alignment and transmission of the total pile load. Splices shall be designed to resist uplift caused by upheaval during driving of adjacent piles, and shall develop the full compressive strength and not less than 50 percent of the tension and bending strength of the weaker section.

1811.5 Seismic reinforcement. Where a structure is assigned to Seismic Design Category C, D, E or F in accordance with Section 1613, the following shall apply. Where concrete and steel are used as part of the pile assembly, the concrete reinforcement shall comply with that given in Sections 1810.1.2.1 and 1810.1.2.2 or the steel section shall comply with Section 1810.6.4.1.

SECTION 1812 PIER FOUNDATIONS

1812.1 General. Isolated and multiple piers used as foundations shall conform to the requirements of Sections 1812.2 through 1812.10, as well as the applicable provisions of Section 1808.2.

1812.2 Lateral dimensions and height. The minimum dimension of isolated piers used as foundations shall be 2 feet (610 mm), and the height shall not exceed 12 times the least horizontal dimension.

1812.3 Materials. Concrete shall have a 28-day specified compressive strength (f'_c) of not less than 2,500 psi (17.24 MPa). Where concrete is placed through a funnel hopper at the top of the pier, the concrete mix shall be designed and proportioned so as to produce a cohesive workable mix having a slump of not less than 4 inches (102 mm) and not more than 6 inches (152 mm). Where concrete is to be pumped, the mix design including slump shall be adjusted to produce a pumpable concrete.

1812.5 Concrete placement. Concrete shall be placed in such a manner as to ensure the exclusion of any foreign matter and to secure a full-sized shaft. Concrete shall not be placed through water except where a tremie or other approved method is used. When depositing concrete from the top of the pier, the concrete shall not be chuted directly into the pier but shall be poured in a rapid and continuous operation through a funnel hopper centered at the top of the pier.

1812.8 Concrete. Where adequate lateral support is not provided, and the unsupported height to least lateral dimension does not exceed three, piers of plain concrete shall be designed and constructed as pilasters in accordance with ACI 318. Where the unsupported height to least lateral dimension exceeds three, piers shall be constructed of reinforced concrete, and shall conform to the requirements for columns in ACI 318.

Exception: Where adequate lateral support is furnished by the surrounding materials as defined in Section 1808.2.9, piers are permitted to be constructed of plain or reinforced concrete. The requirements of ACI 318 for bearing on concrete shall apply.

1812.9 Steel shell. Where concrete piers are entirely encased with a circular steel shell, and the area of the shell steel is considered reinforcing steel, the steel shall be protected under the conditions specified in Section 1808.2.17. Horizontal joints in the shell shall be spliced to comply with Section 1808.2.7.

1812.10 Dewatering. Where piers are carried to depths below water level, the piers shall be constructed by a method that will provide accurate preparation and inspection of the bottom, and the depositing or construction of sound concrete or other masonry in the dry.

Committee Action:

Approved as Modified

Modify proposal as follows:

1810.3.1.2 Composite elements. Where a single deep foundation element comprises two or more sections of different materials or different types spliced together, each section of the composite assembly shall satisfy the applicable requirements of this code, and the maximum allowable load in each section shall be limited by the structural capacity of the weakest that section.

**TABLE 1810.3.2.6
ALLOWABLE STRESSES FOR MATERIALS USED IN DEEP FOUNDATION ELEMENTS**

MATERIAL TYPE AND CONDITION	MAXIMUM ALLOWABLE STRESS ^a
1. Concrete or grout in compression ^b Cast-in-place with a permanent casing in accordance with Section 1810.3.2.7 Cast-in-place in a pipe, tube, or other permanent casing, <u>or rock</u> Cast-in-place without a permanent casing Precast nonprestressed Precast prestressed	0.4 f'_c 0.33 f'_c 0.3 f'_c 0.33 f'_c 0.33 f'_c - 0.27 f_{pc}
2. Nonprestressed reinforcement in compression	0.4 $f_y \leq 30,000$ psi
3. Structural steel in compression Cores within concrete-filled pipes or tubes Pipes, tubes, or H-piles, where justified in accordance with Section 1810.3.2.8 Pipes or tubes for micropiles Other pipes, tubes, or H-piles	0.5 $F_y \leq 32,000$ psi 0.5 $F_y \leq 32,000$ psi 0.4 $F_y \leq 32,000$ psi 0.35 $F_y \leq 16,000$ psi
4. Nonprestressed reinforcement in tension Within micropiles Other conditions	0.6 f_y 0.5 $f_y \leq 24,000$ psi
5. Structural steel in tension Pipes, tubes, or H-piles, where justified in accordance with Section 1810.3.2.8 Other pipes, tubes, or H-piles	0.5 $F_y \leq 32,000$ psi 0.35 $F_y \leq 16,000$ psi
6. Timber	In accordance with the AF&PA NDS

- a. f'_c is the specified compressive strength of the concrete or grout; f_{pc} is the compressive stress on the gross concrete section due to effective prestress forces only; f_y is the specified yield strength of reinforcement; F_y is the specified minimum yield stress of structural steel.
- b. The stresses specified apply to the gross cross-sectional area within the concrete surface. Where a temporary or permanent casing is used, the inside face of the casing shall be considered the concrete surface.

1810.3.2.7 Increased allowable compressive stress for cased cast-in-place elements. The allowable compressive stress in the concrete shall be permitted to be increased as specified in Table 1810.3.2.6 for those portions of permanently cased cast-in-place elements that satisfy all of the following conditions:

- The design shall not use the casing to resist any portion of the axial load imposed.
- The casing shall have a sealed tip and be mandrel driven.
- The thickness of the casing shall not be less than manufacturer's standard gage No. 14 (0.068 inch) (1.75 mm).
- The casing shall be seamless or provided with seams of strength equal to the basic material and be of a configuration that will provide confinement to the cast-in-place concrete.
- The ratio of steel yield strength (F_y) to specified compressive strength (f'_c) shall not be less than six.
- The nominal diameter of the element shall not be greater than 16 inches (406 mm).

1810.3.3.1 Allowable axial load. The allowable axial load on a deep foundation element shall be determined in accordance with Sections 1810.3.3.1.1 through 1810.3.3.1.8.

1810.3.3.1.4 Allowable frictional resistance. The assumed frictional resistance developed by any uncased cast-in-place deep foundation element shall not exceed one-sixth of the bearing value of the soil material at minimum depth as set forth in Table 4804.2 1806.2, up to a maximum of 500 psf (24 kPa), unless a greater value is allowed by the building official on the basis of a soil investigation as specified in Section 1802 is submitted or a greater value is substantiated by a load test in accordance with Section 1810.3.3.1.2. Frictional resistance and bearing resistance shall not be assumed to act simultaneously unless recommended by a soil investigation as specified in Section 1802.

1810.3.5.2.3 Micropiles. Micropiles shall have an outside diameter of 12 inches (305 mm) or less. ~~There is no minimum diameter for micropiles. The minimum diameter set forth elsewhere in Section 1810.3.5 shall not apply to micropiles.~~

1810.3.6 Splices. Splices shall be constructed so as to provide and maintain true alignment and position of the component parts of the deep foundation element during installation and subsequent thereto and shall be ~~of adequate strength designed to transmit the vertical and lateral loads resist the axial and shear forces~~ and moments occurring at the location of the splice during driving and ~~for design load combinations under service loading~~. Where deep foundation elements of the same type are being spliced, splices shall develop not less than 50 percent of the bending strength of the weaker section. Where deep foundation elements of different materials or different types are being spliced, splices shall develop the full compressive strength and not less than 50 percent of the tension and bending strength of the weaker section. Where structural steel cores are to be spliced, the ends shall be milled or ground to provide full contact and shall be full-depth welded.

Splices occurring in the upper 10 feet (3048 mm) of the embedded portion of an element shall be ~~capable of designed to resisting~~ at allowable working stresses the moment and shear that would result from an assumed eccentricity of the axial load of 3 inches (76 mm), or the element shall be braced in accordance with Section 1810.2.2 to other deep foundation elements that do not have splices in the upper 10 feet (3048 mm) of embedment.

1810.3.10.1 [Supp] Construction. Micropiles shall develop their load-carrying capacity by means of a bond zone in soil, bedrock or a combination of soil and bedrock. Micropiles shall be grouted and have either a steel pipe or tube or steel reinforcement at every section along the length. It shall be permitted to transition from deformed reinforcing bars to steel pipe or tube reinforcement by extending the bars into the pipe or tube section by at least their tension development length in accordance with ACI 318.

1810.4.8 Hollow-stem augered, cast-in-place elements. Where concrete or grout is placed by pumping through a hollow-stem auger, the auger shall be permitted to rotate in a clockwise direction during withdrawal. ~~As the auger is shall be withdrawn at a steady rate or in increments not to exceed 1 foot (305 mm), in continuous increments.~~ concreting or grouting pumping pressures shall be measured and maintained high enough at all times to offset hydrostatic and lateral earth pressures. Concrete or grout volumes shall be measured to ensure that the volume of concrete or grout placed in each element is equal to or greater than the theoretical volume of the hole created by the auger. Where the installation process of any element is interrupted or a loss of concreting or grouting pressure occurs, the element shall be redrilled to 5 feet (1524 mm) below the elevation of the tip of the auger when the installation was interrupted or concrete or grout pressure was lost and reformed. Augered cast-in-place elements shall not be installed within six diameters center to center of an element filled with concrete or grout less than 12 hours old, unless approved by the building official. If the concrete or grout level in any completed element drops due to installation of an adjacent element, the element shall be replaced.

(Portions of proposal not shown remain unchanged)

Committee Reason: This proposal is part of the coordinated series of Chapter 18 reformatting code changes. It provides a necessary reorganization regarding deep foundations and fills in some holes in the current requirements. The modification provides correlation with section numbers resulting from the action taken on S147-07/08 and makes the terminology consistent throughout these sections. The modification of Section 1810.3.1.2 clarifies the assessment of composite deep foundation element. The modification to Section 1810.4.8 allows grout as well as concrete in hollow-stem augered elements.

AM

Code Change No: S161-07/08

Original Proposal

Section: 1808.2.8.5

Proponent: Edwin T. Huston, Smith & Huston, Inc., representing National Council of Structural Engineering Associations

Revise as follows:

1808.2.8.5 Uplift capacity. Where required by the design, the uplift capacity of a single pier or pile shall be determined by an approved method of analysis based on a minimum factor of safety of three or by load tests conducted in accordance with ASTM D 3689. The maximum allowable uplift load shall not exceed the ultimate load capacity as determined in Section 1808.2.8.3 divided by a factor of safety of two.

Exception: Where uplift is due to wind or seismic loading, the minimum factor of safety shall be 2 where capacity is determined by analysis and 1.5 where capacity is determined by load tests.

For pile groups subjected to uplift, the allowable working uplift load for the group shall be the lesser of:

1. The proposed individual pile uplift working load times the number of piles in the group.
2. Two-thirds of the effective weight of the pile group and the soil contained within a block defined by the perimeter of the group and the length of the pile.

Reason: Code update and consistency. Changes the required factor of safety for uplift where uplift is due to wind or seismic loading. The revision is generally consistent with the long-standing practice of permitting wind or seismic loads that are four-thirds of those for sustained loads.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This code change adds an exception for the uplift capacity for wind and seismic effects that is consistent with current practice.

Assembly Action:

None

Code Change No: **S162-07/08**

Original Proposal

Section: 1808.2.8.5

Proponent: Edwin T. Huston, Smith & Huston, Inc., representing National Council of Structural Engineering Associations

Revise as follows:

1808.2.8.5 Uplift capacity. Where required by the design, the uplift capacity of a single pier or pile shall be determined by an approved method of analysis based on a minimum factor of safety of three or by load tests conducted in accordance with ASTM D 3689. The maximum allowable uplift load shall not exceed the ultimate load capacity as determined in Section 1808.2.8.3, using the results of load tests conducted in accordance with ASTM D 3689, divided by a factor of safety of two. For pile groups subjected to uplift, the allowable working uplift load for the group shall be calculated by an approved method of analysis. Where the deep foundation elements in the group are placed at a spacing of at least 2.5 times the least horizontal dimension of the largest single element, the allowable working uplift load for the group is permitted to be calculated as the lesser of:

1. The proposed individual pile uplift working load times the number of piles in the group.
2. Two-thirds of the effective weight of the pile group and the soil contained within a block defined by the perimeter of the group and the length of the pile.

Reason: Code clarification and update. Clarifies the safety factor applied to results of load tests in accordance with ASTM D 3689. Allows more precise calculation of uplift capacity.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1808.2.8.5 Uplift capacity. Where required by the design, the uplift capacity of a single pier or pile shall be determined by an approved method of analysis based on a minimum factor of safety of three or by load tests conducted in accordance with ASTM D 3689. The maximum allowable uplift load shall not exceed the ultimate load capacity as determined in Section 1808.2.8.3, using the results of load tests conducted in accordance with ASTM D 3689, divided by a factor of safety of two. For pile groups subjected to uplift, the allowable working uplift load for the group shall be calculated by an approved method of analysis. Where the deep foundation elements in the group are placed at a center-to-center spacing of at least 2.5 times the least horizontal dimension of the largest single element, the allowable working uplift load for the group is permitted to be calculated as the lesser of:

1. The proposed individual pile uplift working load times the number of piles in the group.
2. Two-thirds of the effective weight of the pile group and the soil contained within a block defined by the perimeter of the group and the length of the pile.

Committee Reason: This proposal provides a limitation on the use of the provision to determine uplift capacity of a pile. The modification makes a clarification regarding the minimum pile spacing.

Assembly Action:

None

Final Hearing Results

AM

Code Change No: **S163-07/08**

Original Proposal

Section: 1808.2.8.8

Proponent: Edwin T. Huston, Smith & Huston, Inc., representing National Council of Structural Engineering Associations

Revise as follows:

1808.2.8.8 Overloads on piers or piles. The foundation or superstructure shall be designed to resist the effects of the mislocation of any deep foundation element by no less than 3 inches (76 mm). The maximum compressive load on any pier or pile due to mislocation shall not exceed 110 percent of the allowable design load.

Reason: Code update and consistency. Proper design of deep foundations must recognize the significance of permitted construction tolerances. The effects of mislocation are recognized in the current text of Chapter 18 in Section 1808.2.8.8 (which permits slight overload due to mislocation) and Section 1808.2.7 (which requires that splices be designed for accidental eccentricity). This change formalizes the requirement to consider mislocation. The effects of mislocation can be resisted by flexure and axial load in vertical deep foundation elements, flexure in pile caps, or resistance in the superstructure above. This proposed change permits any of these approaches.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This change gives the designer a necessary notification to consider the effects of mislocation of piles or piers. This will make designs conform to normal construction tolerances.

Assembly Action:

None

AS

Code Change No: **S164-07/08**

Original Proposal

Section: 1808.2.9.2

Proponent: Edwin T. Huston, Smith & Huston, Inc., representing National Council of Structural Engineering Associations

Revise as follows:

1808.2.9.2 Unbraced piles. Piles standing unbraced in air, water or in fluid soils shall be designed as columns in accordance with the provisions of this code. Such piles driven into firm ground can be considered fixed and laterally supported at 5 feet (1524 mm) below the ground surface and in soft material at 10 feet (3048 mm) below the ground surface unless otherwise approved prescribed by the building official on the basis of after a foundation geotechnical investigation by a registered design professional an approved agency.

Reason: Code update. Revises the process to be consistent with practice. Building officials do not prescribe the depth of embedment needed for lateral support; they approve such depths on the basis of geotechnical investigations.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This aligns the code provision to be more consistent with current practice for unbraced piles.

Assembly Action:

None

Original Proposal

Section: 1808.2.9.2

Proponent: Edwin T. Huston, Smith & Huston, Inc., representing National Council of Structural Engineering Associations

Revise as follows:

1808.2.9.2 Unbraced piles. Piles standing unbraced in air, water or in fluid soils shall be designed as columns in accordance with the provisions of this code. Such piles driven into firm ground can be considered ~~fixed and~~ laterally supported at 5 feet (1524 mm) below the ground surface and in soft material at 10 feet (3048 mm) below the ground surface unless otherwise prescribed by the building official after a foundation investigation by an approved agency.

Reason: Code update. Fixity should be considered explicitly as is common in practice. Explicit consideration of fixity may be based on formulas and charts from the literature (such as in NAVFAC design manuals) or on p-y analysis (using LPILE or similar programs).

While it is reasonable to assume that piles are laterally supported where embedded in firm or soft soil, it is not reasonable to assume them to have flexural fixity with the distances of embedment indicated. Firm and soft soil conditions vary considerably. Also, the stiffness of the deep foundation element plays a critical role in assessing fixity. For typical deep foundation elements with diameters of 14 to 48 inches in soil profiles associated with Site Classes A, B, C, D, and E, the depth to fixity may vary from a low of about 3 feet to a high of about 20 feet.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This item clarifies the intent of the provision for unbraced piles. The consideration of pile fixity would be considered normal practice in evaluating lateral restraint.

Assembly Action:

None

Code Change No: **S166-07/08**

Original Proposal

Sections: 1808.2.9.3, 1808.2.12

Proponent: Edwin T. Huston, Smith & Huston, Inc., representing National Council of Structural Engineering Associations

Revise as follows:

1808.2.9.3 Allowable lateral load. Where required by the design, the lateral load capacity of a pier, a single pile or a pile group shall be determined by an approved method of analysis or by lateral load tests to at least twice the proposed design working load. The resulting allowable load shall not be more than one-half of the that test load that produces a gross lateral movement of 1 inch (25 mm) at the lower of the top of foundation element and the ground surface, unless it can be shown that the predicted lateral movement shall cause neither harmful distortion of, nor instability in, the structure, nor cause any element to be loaded beyond its capacity.

1808.2.12 Settlement analysis. The settlement of piers, individual piles or groups of piles shall be estimated based on approved methods of analysis. The predicted settlement shall cause neither harmful distortion of, nor instability in, the structure, nor cause any element to be loaded beyond its capacity ~~stresses to exceed allowable values.~~

Reason: Code clarification and update. Clarifies that the lateral drift criterion applies to both analysis and testing. Allows demonstration of different lateral drift criteria in a manner similar to that for settlement. Revises the text related to settlement for better consistency with modern design techniques (which are not limited to allowable stress design).

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal clarifies determination of pile lateral capacity by providing guidance with respect to the lateral movement criterion.

Assembly Action:

None

Final Hearing Results

AS

Code Change No: S167-07/08

Original Proposal

Sections: 1808.2.10, 1810.3.2, 1810.4.2

Proponent: Edwin T. Huston, Smith & Huston, Inc., representing National Council of Structural Engineering Associations

Revise as follows:

1808.2.10 Use of higher allowable pier or pile stresses. Allowable stresses greater than those specified for piers or for each pile type in Sections 1809 and 1810 are permitted where supporting data justifying such higher stresses is filed with the building official. Such substantiating data shall include:

1. A soils investigation in accordance with Section 1802.
2. Pier or pile load tests in accordance with Section 1808.2.8.3, regardless of the load supported by the pier or pile.

The design and installation of the pier or pile foundation shall be under the direct supervision of a registered design professional knowledgeable in the field of soil mechanics and pier or pile foundations who shall ~~certify~~ submit a report to the building official stating that the piers or piles as installed satisfy the design criteria.

1810.3.2 Dimensions. The pile length shall not exceed 30 times the average diameter. The minimum diameter shall be 12 inches (305 mm).

Exception: The length of the pile is permitted to exceed 30 times the diameter, provided that the design and installation of the pile foundation are under the direct supervision of a registered design professional knowledgeable in the field of soil mechanics and pile foundations. The registered design professional shall ~~certify~~ submit a report to the building official stating that the piles were installed in compliance with the approved construction documents.

1810.4.2 Dimensions. The pile length shall not exceed 30 times the average diameter. The minimum diameter shall be 12 inches (305 mm).

Exception: The length of the pile is permitted to exceed 30 times the diameter, provided that the design and installation of the pile foundation is under the direct supervision of a registered design professional knowledgeable in the field of soil mechanics and pile foundations. The registered design professional shall ~~certify~~ submit a report to the building official stating that the piles were installed in compliance with the approved design.

Reason: For legal and professional practice reasons, changes requirements for registered design professional to "certify" to "report".

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal appropriately replaces the term certify with a requirement to submit reports, since certify often means sealing by a register design professional under state law.

Assembly Action:

None

Code Change No: **S168-07/08**

Original Proposal

Section: 1808.2.23.1.1

Proponent: Edwin T. Huston, Smith & Huston, Inc., representing National Council of Structural Engineering Associations

Revise as follows:

1808.2.23.1.1 Connection to pile cap. Concrete piles and concrete-filled steel pipe piles shall be connected to the pile cap by embedding the pile reinforcement or field-placed dowels anchored in the concrete pile in the pile cap for a distance equal to the development length. For deformed bars, the development length is the full development length for compression or tension, in the case of uplift, without reduction in length for excess area. Alternative measures for laterally confining concrete and maintaining toughness and ductile-like behavior at the top of the pile will be permitted provided the design is such that any hinging occurs in the confined region.

Ends of hoops, spirals and ties shall be terminated with seismic hooks, as defined in Section 21.1 of ACI 318, turned into the confined concrete core. The minimum transverse steel ratio for confinement shall not be less than one-half of that required for columns.

For resistance to uplift forces, anchorage of steel pipe (round HSS sections), concrete-filled steel pipe or H-piles to the pile cap shall be made by means other than concrete bond to the bare steel section.

Exception: Anchorage of concrete-filled steel pipe piles is permitted to be accomplished using deformed bars developed into the concrete portion of the pile.

Splices of pile segments shall develop the full strength of the pile, but the splice need not develop the nominal strength of the pile in tension, shear and bending when it has been designed to resist axial and shear forces and moments from the load combinations of Section 1605.4.

Where this chapter requires detailing of concrete deep foundation elements in accordance with Section 21.4.4.1 of ACI 318, compliance with Equation (10-5) of ACI 318 shall not be required.

Reason: Relaxes an overly restrictive code requirement. Proper design for deep foundation elements differs from that for columns in several respects.

First, axial compression is severely limited by the capacity of the soil-foundation interface (as reflected by code limits to a small fraction of the concrete compressive strength). The purpose of ACI 318 Equation (10-5) is to provide significant residual compressive strength for concentrically loaded spiral columns subjected to very large axial compression.

“ACI 318 Section R10.9.3 — The effect of spiral reinforcement in increasing the load-carrying strength of the concrete within the core is not realized until the column has been subjected to a load and deformation sufficient to cause the concrete shell outside the core to spall off. The amount of spiral reinforcement required by Eq. (10-5) is intended to provide additional load-carrying strength for concentrically loaded columns equal to or slightly greater than the strength lost when the shell spalls off.”

Second, the concern driving transverse confinement reinforcement for deep foundations is flexural ductility. The commentary to ACI 318 explains both the reason to provide confinement reinforcement for deep foundation elements and the result achieved by compliance with Equation (21-2).

“R21.10.4.4 — During earthquakes, piles can be subjected to extremely **high flexural demands** at points of discontinuity, especially just below the pile cap and near the base of a soft or loose soil deposit. The 1999 code requirement for confinement reinforcement at the top of the pile is based on numerous failures observed at this location in recent earthquakes. Transverse reinforcement is required in this region to provide **ductile performance**. ...”

“ACI 318 R21.4.4 — ... Eq. (21-2) and (21-4) govern for large-diameter columns, and are intended to **ensure adequate flexural curvature capacity in yielding regions**.”

Third, the concrete cover required for uncased deep foundation elements is much greater than that for columns. As a result, application of Eq. (10-5) to deep foundation elements results in amounts of transverse reinforcement that are unwarranted and often un-placable as shown in the comparison below. The calculations use typical material properties, bar sizes, and minimum cover and also illustrate the effect of the permitted reduction in transverse reinforcement ratio for Site Classes A, B, C, and D. It can be seen that application of Eq. (10-5) produces transverse reinforcement spacing that is difficult or even impossible to implement (even where the reduction applies). The problem is especially pronounced for small diameter elements as the ratio of gross area to core area results in Eq. (10-5) controlling by a factor of 5 to 8. Where those elements are augercast (as is often the case for small diameter uncased cast-in-place deep foundations) it is nearly impossible to place properly a reinforcement cage with #5 spiral at 2.5" o.c.

*#6 bars; #8 for D > 20"

maximum spacing controls bracketed values

In a related proposal Section 1808.2.12.1.1 is split up and reorganized. Should both proposals be accepted this new text is intended to appear as Section 1810.3.2.1.2 with the title "ACI 318 Equation (10-5)."

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This makes a necessary correction to the code requirements for deep foundations by relaxing an overly restrictive code requirement, because pile capacity is controlled by soil confinement rather than concrete spalling.

Assembly Action:

None

Final Hearing Results

S168-07/08

AS

Code Change No: S169-07/08

Original Proposal

Section: 1810.1.1

Proponent: Edwin T. Huston, Smith & Huston, Inc., representing National Council of Structural Engineering Associations

Revise as follows:

1810.1.1 Materials. Concrete shall have a 28-day specified compressive strength (f'_c) of not less than 2,500 psi (17.24 MPa). Where concrete is placed through a funnel hopper at the top of the pile, the concrete mix shall be designed and proportioned so as to produce a cohesive workable mix having a slump of not less than 4 inches (102 mm) and not more than ~~6 8~~ inches (~~152 204~~ mm). Where concrete is to be pumped, the mix design including slump shall be adjusted to produce a pumpable concrete.

Reason: Code update. Section 2.4.3 of ACI 336.1-01 (Specification for the Construction of Drilled Piers) specifies a slump of 4 to 6 inches for dry method placement uncased or with permanent casing and 6 to 8 inches for dry method placement with temporary casing. Since both methods of placement are permitted by the IBC, the range of permitted slumps should be stated accordingly.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal corrects an oversight by expanding the range of permitted concrete slumps in drilled piers to match current practice.

Assembly Action:

None

Final Hearing Results

S169-07/08

AS

Code Change No: S170-07/08

Original Proposal

Sections: 1810.7.1, 1810.7.4

Proponent: Edwin T. Huston, Smith & Huston, Inc., representing Council of Structural Engineering Associations

Revise as follows:

1810.7.1 Construction. Caisson piles shall consist of a shaft section of concrete-filled pipe extending to bedrock with an uncased socket drilled into the bedrock and filled with concrete. The caisson pile shall have reinforcement or a full-length structural steel core for the length as indicated by an approved method of analysis, or a stub core installed in the rock socket and extending into the pipe portion a distance equal to the socket depth.

1810.7.4 Structural core. Where a structural steel core is used, The gross cross-sectional area of the ~~structural steel core~~ shall not exceed 25 percent of the gross area of the caisson. The minimum clearance between the structural core and the pipe shall be 2 inches (51 mm). Where cores are to be spliced, the ends shall be milled or ground to provide full contact and shall be full-depth welded.

Reason: Code update and consistency. Socketed drilled shafts often employ reinforcement instead of structural core sections. This common construction is widely acknowledged. For instance, ACI 336.3 (Design and Construction of Drilled Piers) reads as follows:

“3.6-- Piers socketed in rock

This type of pier is socketed into rock to a depth of one to six times the diameter of the pier for the purpose of developing high service loading capacity. The drilled pier consists of a heavy wall permanent casing fitted with a cutting shoe and seated into the top of rock. A steel core or heavy reinforcing cage is encased in the concrete which extends into the rock socket. A column cap is designed to transfer loads from the superstructure to one or more rock socketed piers. The pier is designed to support all load in the rock.”

Analysis is required to determine the appropriate distance to extend reinforcement or a structural steel core from the socket into the pipe or tube casing.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This code change updates requirements for drilled piers to match industry practice. The use of reinforcement rather than a structural core is widely acknowledged.

Assembly Action:

None

Final Hearing Results

Code Change No: S171-07/08

Original Proposal

Sections: 1818.1, 1813 (New)

Proponent: Robert M. Hoyt, Hoyt Engineering, PC, Representing Deep Foundations Institute Committee on Helical Foundations and Tiebacks, Deep Foundations Institute

1. Add new test as follows:

1808.1 Definitions. The following words and terms shall, for the purposes of this section, have the meanings shown herein.

PILE FOUNDATIONS. Pile foundations consist of concrete, wood or steel structural elements either driven into the ground or cast in place. Piles are relatively slender in comparison to their length, with lengths exceeding 12 times the least horizontal dimension. Piles derive their load-carrying capacity through skin friction, end bearing or a combination of both.

HELICAL PILE. Manufactured steel foundation pile consisting of a central shaft and one or more helical bearing plates. A helical pile is installed by rotating into the ground. Each helical bearing plate is formed into a screw thread with a uniform defined pitch.

**SECTION 1813
HELICAL PILE FOUNDATIONS**

1813.1 General. Helical pile foundations shall conform to the requirements of Sections 1813.2 through 1813.7.

1813.2 Dimensions. Dimensions of the central shaft and the number, size and thicknesses of helical bearing plates shall be sufficient to support the service loads, as listed in an ICC-ES evaluation report or as determined by a licensed design professional experienced in geotechnical engineering and the design of foundations utilizing helical piles.

1813.3 Design and manufacture. Helical piles shall be designed and manufactured in accordance with accepted engineering practice to resist all stresses induced by installation into the ground and service loads. When compliance of helical piles with Section 1813.2 is based on an ICC-ES evaluation, a copy of the evaluation report shall be provided to the building department.

1813.4 Allowable stresses. The allowable design stress, F_a , in the steel components of the pile shall not exceed the least value of the following:

$$F_a = 0.6 F_y \text{ or } 0.5 F_u \quad \text{(Equation 18-11)}$$

where:

F_y = yield strength of the steel

F_u = ultimate strength of the steel

1813.5 Allowable loads

1813.5.1 Allowable axial load. The allowable axial design load, Q_a , of helical piles shall be limited to the least value associated with the interaction of the pile with the soil, the strength of the pile shaft, the strength of the shaft couplings, the strength of the helical bearing plates, or the strength of the joint between the helical bearing plates and the shaft, as listed in an ICC-ES evaluation report or as determined by a licensed design professional experienced in such evaluations.

1813.5.2 Allowable lateral load. The allowable lateral design load, P_a , of helical piles shall be limited to the least value associated with the interaction of the pile with the soil, the strength of the pile shaft, or the strength of the shaft couplings, as listed in an ICC-ES evaluation report or as determined by a licensed design professional experienced in such evaluations of helical piles.

1813.6 Special inspection. Special inspections in accordance with Section 1704.8 are required, as prescribed in Section 1808.2.22. The records submitted to the building official shall include, in addition to the records specified in 1704.8, installation equipment used; pile shaft dimensions, helix configuration and material grades; torsional resistance vs. embedment length; and such other installation data as the special inspector may deem appropriate.

1813.7 Installation. Helical piles shall be installed to specified embedment depth and torsional resistance criteria as stated in an applicable ICC-ES evaluation report or as determined by a licensed design professional experienced in geotechnical engineering and the design of foundations utilizing helical piles. The torque applied during installation shall not exceed the maximum allowable installation torque of the helical pile as listed in an applicable ICC-ES evaluation report or, in the absence of such a report, as recommended by the helical pile manufacturer.

Reason: The purpose of this proposal is to add provisions addressing the design and installation of helical pile foundations. Helical piles are not currently listed and their design and installation are not currently addressed in the Code. Helical pile foundations are becoming more and more common in civil construction. Proposed new Section 1813 contains specifications for the design and installation of helical pile foundations. The section will extend the coverage of the code to an increasingly popular but currently un-regulated type of deep foundation. The proposed definition, design and installation provisions conform to newly adopted ICC-ES AC358.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposal to add helical pile foundations to Chapter 18 is a good concept and the committee has no objection in principle. The language used, such as references to ICC-ES evaluation reports, is an indicator that this change needs work. The committee recommends submitting a public comment with a modified proposal.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment:

Commenter-s Reason: As stated in the floor modification submitted during the hearing, design engineers and building officials are in great need of a code standard and guide line for evaluating helical piles.

Commenter's Reason: Eliminates inappropriate references to ICC-ES documents, while making the requirements consistent therewith. Locates special inspection requirements in Chapter 17, and presents those requirements in a manner consistent with that for other foundations systems. Coordinates with the NCSEA proposals that totally reorganize Chapter 18.

Commenter's Reason- Buchanan, Craig, Davidson and Gray: As stated in the floor modification submitted during the hearing, design engineers and building officials are in great need of a code standard and guide line for evaluating helical piles

Commenter's Reason – Bobbitt: Change language to eliminate reference to ICC documents and to simplify language.

Commenter-s Reason – Hermanson, Paap, Perko, Pinkleton, Shipman, John, and Shipman, Mary: Eliminates inappropriate references to ICC-ES documents, while making the requirements consistent therewith. Locates special inspection requirements in Chapter 17, and presents those requirements in a manner consistent with that for other foundations systems. Coordinates with the NCSEA proposals that totally reorganize Chapter 18.

Commenter-s Reason – Neal: Eliminates inappropriate references to ICC-ES documents, while making the requirements consistent therewith. Locates special inspection requirements in Chapter 17, and presents those requirements in a manner consistent with that for other foundations systems. Coordinates with the NCSEA proposals that totally reorganize Chapter 18.

Helical piers are a reliable and time tested deep foundations when installed by a certified installer. The system is virtually self-testing and provides predictable and reliable results when installed correctly. For these reasons requirements for this system should be consistent with code requirements or other foundation systems.

Replace proposal as follows:

1802.1 Definitions. The following words and terms shall, for the purposes of this chapter, have the meanings shown herein.

HELICAL PILE. Manufactured steel deep foundation element consisting of a central shaft and one or more helical bearing plates. A helical pile is installed by rotating it into the ground. Each helical bearing plate is formed into a screw thread with a uniform defined pitch.

1810.3.1 Design conditions. Design of deep foundations shall include the design conditions specified in Sections 1810.3.1.1 through ~~1810.3.1.5~~ 1810.3.1.6, as applicable.

1810.3.1.5 Helical Piles. Helical piles shall be designed and manufactured in accordance with accepted engineering practice to resist all stresses induced by installation into the ground and service loads.

[Renumber subsequent sections]

**TABLE 1810.3.2.6
 ALLOWABLE STRESSES FOR MATERIALS USED IN DEEP FOUNDATION ELEMENTS**

MATERIAL TYPE AND CONDITION	MAXIMUM ALLOWABLE STRESS ^a
3. Structural steel in compression Cores within concrete-filled pipes or tubes Pipes, tubes, or H-piles, where justified in accordance with Section 1810.3.2.8 Pipes or tubes for micropiles Other pipes, tubes, or H-piles <u>Helical piles</u>	$0.5 F_y \leq 32,000$ psi $0.5 F_y \leq 32,000$ psi $0.4 F_y \leq 32,000$ psi $0.35 F_y \leq 16,000$ psi $0.6 F_y \leq 0.5 F_u$
5. Structural steel in tension Pipes, tubes, or H-piles, where justified in accordance with Section 1810.3.2.8 Other pipes, tubes, or H-piles <u>Helical piles</u>	$0.5 F_y \leq 32,000$ psi $0.35 F_y \leq 16,000$ psi $0.6 F_y \leq 0.5 F_u$

(Portions of table not shown remain unchanged)

- a. f'_c is the specified compressive strength of the concrete or grout; f_{pc} is the compressive stress on the gross concrete section due to effective prestress forces only; f_y is the specified yield strength of reinforcement; F_y is the specified minimum yield stress of structural steel; F_u is the specified minimum tensile stress of structural steel.
- b. The stresses specified apply to the gross cross-sectional area within the concrete surface. Where a temporary or permanent casing is used, the inside face of the casing shall be considered the concrete surface.

1810.3.3.1 Allowable axial load. The allowable axial load on a deep foundation element shall be determined in accordance with Section 1810.3.3.1.1 through 1810.3.3.1.89.

1810.3.3.1.9 Helical piles. The allowable axial design load, P_a , of helical piles shall be determined as follows:

$$P_a = 0.5 P_u \quad \text{(Equation 18-4)}$$

where P_u is the least value of:

- P_u = sum of the areas of the helical bearing plates times the ultimate bearing capacity of the soil or rock comprising the bearing stratum
 P_u = ultimate capacity determined from well documented correlations with installation torque
 P_u = ultimate capacity determined from load tests
 P_u = ultimate axial capacity of pile shaft
 P_u = ultimate axial capacity of pile shaft couplings
 P_u = sum of the ultimate axial capacity of helical bearing plates affixed to pile

1810.3.5.3 Steel. Steel deep foundation elements shall satisfy the requirements of this section.

1810.3.5.3.3 Helical piles. Dimensions of the central shaft and the number, size and thicknesses of helical bearing plates shall be sufficient to support the design loads.

1810.4 Installation. Deep foundations shall be installed in accordance with Section 1810.4. Where a single deep foundation element comprises two or more sections of different materials or different types spliced together, each section shall satisfy the applicable conditions of installation.

1810.4.10 Helical piles. Helical piles shall be installed to specified embedment depth and torsional resistance criteria as determined by a registered design professional. The torque applied during installation shall not exceed the maximum allowable installation torque of the helical pile.

1810.4.4011 Special inspection. Special inspections in accordance with Sections 1704.8 and 1704.9 shall be provided for driven and cast-in-place deep foundation elements, respectively. Special inspections in accordance with Section 1704.10 shall be provided for helical piles.

2. Add new text as follows:

1704.10 Helical Pile Foundations. Special inspections shall be performed continuously during installation of helical pile foundations. The information recorded shall include installation equipment used, pile dimensions, tip elevations, final depth, final installation torque, and other pertinent installation data as required by the registered design professional in responsible charge. The approved geotechnical report and the documents prepared by the registered design professional shall be used to determine compliance.

[Renumber subsequent sections]

Final Hearing Results

S171-07/08

AMPC

Code Change No: **S172-07/08**

Original Proposal

Sections: 1904.2 (New), 1904.2.1, 1904.2.2, 1904.2.3, 1904.3, 1904.4, 1904.5 (New), 1907.7, 1907.7.1, 1907.7.2, 1907.7.3, 1907.7.4, 1907.7.5 (New), 1907.7.6, 1907.7.7, 1908, 1909.6.1, 1909.6.3, 1912.1, Table 1704.3, 1708.3

Proponent: Joseph J. Messersmith, Jr. PE, Portland Cement Association; Daniel Falconer, PE, American Concrete Institute

1. Add new text as follows:

1904.2 Exposure categories and classes. Concrete shall be assigned to exposure classes based on:

1. Exposure to freezing and thawing in a moist condition or deicer chemicals;
2. Exposure to sulfates in water or soil;
3. Exposure to water where the concrete is intended to have low permeability; and
4. Exposure to chlorides from deicing chemicals, salt, salt water, brackish water, seawater or spray from these sources, where the concrete has steel reinforcement.

2. Delete without substitution:

~~**1904.2 Freezing and thawing exposures.** Concrete that will be exposed to freezing and thawing, deicing chemicals or other exposure conditions as defined below shall comply with Sections 1904.2.1 through 1904.2.3.~~

~~**1904.2.1 Air entrainment.** Concrete exposed to freezing and thawing or deicing chemicals shall be air entrained in accordance with ACI 318, Section 4.2.1:~~

3. Revise as follows:

~~**1904.2.2**~~ **1904.3 (Supp) Concrete properties.** Concrete that will be subject to the following exposures mixtures shall conform to the ~~corresponding~~ most restrictive maximum water-cementitious materials ratios and minimum specified concrete compressive strength requirements of ACI 318, Section 4.2.2. ~~4.3;~~ based on the exposure classes assigned in Section 1904.2.

- ~~1. Concrete intended to have low permeability where exposed to water;~~
- ~~2. Concrete exposed to freezing and thawing in a moist condition or deicer chemicals; or~~
- ~~3. Corrosion protection of reinforcement in concrete exposed to chlorides from deicing chemicals, salt, salt water, brackish water, seawater, or spray from these sources.~~

Exception: For occupancies and appurtenances thereto in Group R occupancies that are in buildings less than four stories above grade plane, normal-weight aggregate concrete ~~shall~~ is permitted to comply with the requirements of Table 1904.2.2(2) based on the weathering classification (freezing and thawing) determined from Figure 1904.2.2 in lieu of the requirements of ACI 318, Table 4.3.1.a.

~~In addition, concrete that will be exposed to deicing chemicals shall conform to the limitation of Section 1904.2.3.~~

~~**1904.2**~~ **1904.4 Freezing and thawing exposures.** Concrete that will be exposed to freezing and thawing, in the presence of moisture, with or without deicing chemicals being present, ~~or other exposure conditions as defined below~~ shall comply with Sections ~~1904.2.1 through 1904.2.3~~ 1904.4.1 and 1904.4.2.

~~**1904.2.1**~~ **1904.4.1 Air entrainment.** Concrete exposed to freezing and thawing ~~or deicing chemicals~~ while moist shall be air entrained in accordance with ACI 318, Section ~~4.2.1~~ 4.4.1:

~~**1904.2.3**~~ **1904.4.2 Deicing chemicals.** For concrete exposed to freezing and thawing in the presence of moisture and deicing chemicals, the maximum weight of fly ash, other pozzolans, silica fume or slag that is included in the concrete shall not exceed the percentages of the total weight of cementitious materials permitted by ACI 318, Section ~~4.2.3~~ 4.4.2.

4. Delete without substitution:

~~**1904.3 Sulfate exposures.** Concrete that will be exposed to sulfate-containing solutions or soils shall comply with the maximum water-cementitious materials ratios and/or minimum specified compressive strength and be made with the appropriate type of cement in accordance with the provisions of ACI 318, Section 4.3.~~

~~**1904.4 Corrosion protection of reinforcement.** Reinforcement in concrete shall be protected from corrosion and exposure to chlorides in accordance with ACI 318, Section 4.4.~~

5. Add new text as follows:

1904.5 Alternative cementitious materials for sulfate exposure. Alternative combinations of cementitious materials for use in sulfate-resistant concrete to those listed in ACI 318, Table 4.3.1.b shall be permitted in accordance with ACI 318, Section 4.5.1.

6. Revise as follows:

1907.7 Concrete protection for reinforcement. The minimum specified concrete cover for reinforcement shall comply with Sections 1907.7.1 through 1907.7.7.

1907.7.1 Cast-in-place concrete (nonprestressed). Minimum specified concrete cover shall be provided for reinforcement in nonprestressed, cast-in-place concrete construction in accordance with ACI 318, Section 7.7.1.

1907.7.2 Cast-in-place concrete (prestressed). The minimum specified concrete cover for prestressed and nonprestressed reinforcement, ducts and end fittings in cast-in-place prestressed concrete shall comply with ACI 318, Section 7.7.2.

1907.7.3 Precast concrete (manufactured under plant control conditions). The minimum specified concrete cover for prestressed and nonprestressed reinforcement, ducts and end fittings in precast concrete manufactured under plant control conditions shall comply with ACI 318, Section 7.7.3.

1907.7.4 Bundled bars. The minimum specified concrete cover for bundled bars shall comply with ACI 318, Section 7.7.4.

1907.7.5 Headed shear stud reinforcement. For headed shear stud reinforcement, the minimum specified concrete cover shall comply with ACI 318, Section 7.7.5.

~~1907.7.5~~ **1907.7.6 Corrosive environments.** In corrosive environments or other severe exposure conditions, prestressed and nonprestressed reinforcement shall be provided with additional protection in accordance with ACI 318, Section ~~7.7.5~~ 7.7.6.

~~1907.7.6~~ **1907.7.7 Future extensions.** Exposed reinforcement, inserts and plates intended for bonding with future extensions shall be protected from corrosion.

~~1907.7.7~~ **1907.7.8 Fire protection.** When this code requires a thickness of cover for fire protection greater than the minimum concrete cover specified in Section 1907.7, such greater thickness shall be used specified.

1908.1 General. The text of ACI 318 shall be modified as indicated in Sections 1908.1.1 through ~~1908.1.16~~ 1908.1.9.

7. Delete without substitution:

~~1908.1.1 ACI 318, Section 10.5.~~ Modify ACI 318, Section 10.5, by adding new Section 10.5.5 to read as follows:

~~10.5.5—In structures assigned to Seismic Design Category B, beams in ordinary moment frames forming part of the seismic-force-resisting system shall have at least two main flexural reinforcing bars continuously top and bottom throughout the beam and continuous through or developed within exterior columns or boundary elements.~~

~~1908.1.2 ACI 318, Section 11.11.~~ Modify ACI 318, Section 11.11, by changing its title to read as shown below and by adding new Section 11.11.3 to read as follows:

~~11.11—Special provisions for columns.~~

~~11.11.3—In structures assigned to Seismic Design Category B, columns of ordinary moment frames having a clear height to maximum-plan-dimension ratio of five or less shall be designed for shear in accordance with 21.12.3.~~

8. Revise as follows:

~~1908.1.3~~ **1908.1.1 ACI 318, Section 21.4 2.2.** Modify existing definitions and add the following definitions to ACI 318, Section 21.4 2.2.

9. Add new definition as follows:

SPECIAL STRUCTURAL WALL. A cast-in-place or precast wall complying with the requirements of 21.2.3 through 21.2.7, 21.10, and 21.11, as applicable, in addition to the requirements for ordinary reinforced concrete structural walls or ordinary precast structural walls, as applicable. Where ASCE 7 refers to a “special reinforced concrete structural wall,” it shall be deemed to mean a “special structural wall.”

1908.1.4 1908.1.2 ACI 318, Section 21.2.4 21.1.1. Modify ACI 318 Sections 21.2.1.2, 21.2.1.3 and 21.2.1.4 21.1.1.3 through 21.1.1.5, to read as follows:

10. Delete and substitute as follows:

~~21.2.1.2 – For structures assigned to Seismic Design Category A or B, provisions of Chapters 1 through 18 and 22 shall apply except as modified by the provisions of this chapter. Where the design seismic loads are computed using provisions for intermediate or special concrete systems, the requirements of Chapter 21 for intermediate or special systems, as applicable, shall be satisfied.~~

~~21.2.1.3 – For structures assigned to Seismic Design Category C, intermediate or special moment frames, intermediate precast structural walls or ordinary or special reinforced concrete structural walls shall be used to resist seismic forces induced by earthquake motions. Where the design seismic loads are computed using provisions for special concrete systems, the requirements of Chapter 21 for special systems, as applicable, shall be satisfied.~~

~~21.2.1.4 – For structures assigned to Seismic Design Category D, E or F, special moment frames, special reinforced concrete structural walls, diaphragms and trusses and foundations complying with 21.2 through 21.10 or intermediate precast structural walls complying with 21.13 shall be used to resist forces induced by earthquake motions. Members not proportioned to resist earthquake forces shall comply with 21.11.~~

21.1.1.3 – Structures assigned to SDC B shall comply with Chapters 1 through 19 and 22. For a structure assigned to SDC B using ordinary moment frames as part of the seismic-force resisting system, the provisions of 21.1.2 and 21.2 shall apply. For a structure assigned to SDC B and using intermediate or special systems, the applicable provisions of 21.1.3 through 21.1.7, and 21.3 through 21.10 shall also apply.

21.1.1.4 – Structures assigned to SDC C shall comply with Chapters 1 through 19, and the seismic-force-resisting system shall be intermediate or special moment frames, intermediate precast structural walls, or ordinary reinforced concrete or special structural walls. For a structure assigned to SDC C and using intermediate moment frames as part of the seismic-force-resisting system the provisions of 21.1.2 and 21.3 shall apply. For a structure assigned to SDC C and using special moment frames, or intermediate precast or special structural walls, the applicable provisions of 21.1.3 through 21.1.7, and 21.4 through 21.10 shall also apply. Any structure assigned to SDC C shall satisfy 21.1.8. Except for footings, pedestals and basement walls in accordance with 22.10 or as permitted by the International Building Code, structural elements of plain concrete are prohibited.

21.1.1.5 – Structures assigned to SDC D, E or F shall comply with Chapters 1 through 19, and the seismic-force-resisting system shall be special moment frames, intermediate precast structural walls, or special structural walls. For a structure assigned to SDC D, E, or F, the provisions of 21.1.2 through 21.1.8 and 21.4 through 21.13 shall apply. Except for footings, pedestals and basement walls in accordance with 22.10 or as permitted by the International Building Code, structural elements of plain concrete are prohibited.

11. Delete without substitution:

1908.1.5 ACI 318, Section 21.2.5. Modify ACI 318, Section 21.2.5, by renumbering as Section 21.2.5.1 and adding new Section 21.2.5.2 to read as follows:

~~21.2.5 – Reinforcement in members resisting earthquake-induced forces.~~

~~21.2.5.1 – Except as permitted in 21.2.5.2, reinforcement resisting earthquake-induced flexural and axial forces in frame members and in structural wall boundary elements shall comply with ASTM A 706. ASTM A 615, Grades 40 and 60 reinforcement, shall be permitted in these members if (a) the actual yield strength based on mill tests does not exceed the specified yield, f_y , strength by more than 18,000 psi (124 MPa) [retests shall not exceed this value by more than an additional 3,000 psi (21 MPa)], and (b) the ratio of the actual tensile strength to the actual yield strength is not less than 1.25. For computing shear strength, the value of f_{yt} for transverse reinforcement, including spiral reinforcement, shall not exceed 60,000 psi (414 MPa).~~

~~21.2.5.2 – Prestressing steel shall be permitted in flexural members of frames, provided the average prestress, f_{pc} , calculated for an area equal to the member's shortest cross-sectional dimension multiplied by the perpendicular dimension shall be the lesser of 700 psi (4.83 MPa) or $f_c/6$ at locations of nonlinear action where prestressing steel is used in members of frames.~~

1908.1.6 ACI 318, Section 21.2. Modify ACI 318, Section 21.2, by adding new Section 21.2.9 to read as follows:

~~21.2.9—Anchorages for unbonded post-tensioning tendons resisting earthquake induced forces in structures assigned to Seismic Design Category C, D, E or F shall withstand, without failure, 50 cycles of loading ranging between 40 and 85 percent of the specified tensile strength of the prestressing steel.~~

1908.1.7 ACI 318, Section 21.3. Modify ACI 318, Section 21.3, by adding new Section 21.3.2.5 to read as follows:

~~21.3.2.5—Unless the special moment frame is qualified for use through structural testing as required by 21.6.3, for flexural members prestressing steel shall not provide more than one quarter of the strength for either positive or negative moment at the critical section in a plastic hinge location and shall be anchored at or beyond the exterior face of a joint.~~

12. Revise as follows:

1908.1.13 1908.1.3 ACI 318, Section 21.13 21.4. Modify ACI 318, Section 21.13, by renumbering Section 21.13.3 to become 21.13.4 and adding new Sections 21.13.3, 21.13.5 and 21.13.6 Section 21.4, by renumbering Section 21.4.3 to become 21.4.4 and adding new Sections 21.4.3, 21.4.5 and 21.4.6 to read as follows:

~~21.13.3 21.4.3—Except for Type 2 mechanical splices, connection elements~~ Connections that are designed to yield shall be capable of maintaining 80 percent of their design strength at the deformation induced by the design displacement ~~or shall use Type 2 mechanical splices.~~

~~21.13.4 21.4.4—~~ Elements of the connection that are not designed to yield shall develop at least 1.5 Sy.

~~21.13.5 21.4.5—~~ Wall piers not designed as part of a moment frame shall have transverse reinforcement designed to resist the shear forces determined from ~~21.12.3 21.3.3~~. Spacing of transverse reinforcement shall not exceed 8 inches (203 mm). Transverse reinforcement shall be extended beyond the pier clear height for at least 12 inches (305 mm).

Exceptions:

1. Wall piers that satisfy ~~21.14 21.13~~.
2. Wall piers along a wall line within a story where other shear wall segments provide lateral support to the wall piers and such segments have a total stiffness of at least six times the sum of the stiffnesses of all the wall piers.

~~21.13.6 21.4.6—~~ Wall segments with a horizontal length-to-thickness ratio less than 2.5 shall be designed as columns.

1908.1.8 1908.1.4 ACI 318, Section 21.7 21.9 Modify ACI 318, Section 21.7 21.9, by adding new Section 21.7.10 21.9.10 to read as follows:

~~21.7.10 21.9.10—~~ Wall piers and wall segments.

~~21.7.10.1 21.9.10.1—~~ Wall piers not designed as a part of a special moment frame shall have transverse reinforcement designed to satisfy the requirements in ~~21.7.10.2 21.9.10.2~~.

Exceptions:

1. Wall piers that satisfy ~~21.14 21.13~~.
2. Wall piers along a wall line within a story where other shear wall segments provide lateral support to the wall piers and such segments have a total stiffness of at least six times the sum of the stiffness of all the wall piers.

~~21.7.10.2 21.9.10.2—~~ Transverse reinforcement with seismic hooks at both ends shall be designed to resist the shear forces determined from ~~21.4.5.1 21.6.5.1~~. Spacing of transverse reinforcement shall not exceed 6 inches (152 mm). Transverse reinforcement shall be extended beyond the pier clear height for at least 12 inches (305 mm).

~~21.7.10.3 21.9.10.3—~~ Wall segments with a horizontal length-to-thickness ratio less than 2.5 shall be designed as columns.

1908.1.9 1908.1.5 ACI 318, Section 21.8 21.10. Modify ACI 318, Section ~~21.8.4 21.10.2~~, to read as follows:

~~21.8.4~~ 21.10.2 – Special structural walls constructed using precast concrete shall satisfy all the requirements of ~~21.7~~ 21.9 for cast-in-place special structural walls in addition to Sections ~~21.13.2 through 21.13.4~~ 21.4.2 through 21.4.4.

1908.1.10 1908.1.6 **ACI 318, Section 21.10.1.4** 21.12.1.1. Modify ACI 318, Section ~~21.10.1.4~~ 21.12.1.1, to read as follows:

~~21.10.1.4~~ 21.12.1.1– Foundations resisting earthquake-induced forces or transferring earthquake-induced forces between a structure and the ground shall comply with the requirements of Section ~~21.10~~ 21.12 and other applicable provisions of ACI 318 *unless modified by Chapter 18 of the International Building Code*.

13. Delete without substitution:

1908.1.11 **ACI 318, Section 21.11**. Modify ACI 318, Section ~~21.11.2.2~~ to read as follows:

~~21.11.2.2~~—Members with factored gravity axial forces exceeding $(A_g f_c/10)$ shall satisfy ~~21.4.3, 21.4.4.1(c), 21.4.4.3 and 21.4.5~~. The maximum longitudinal spacing of ties shall be so for the full column height. Spacing, so, shall not exceed the smaller of six diameters of the smallest longitudinal bar enclosed and 6 inches (152 mm). Lap splices of longitudinal reinforcement in such members need not satisfy ~~21.4.3.2~~ in structures where the seismic-force-resisting system does not include special moment frames.

Section 1908.1.12 **ACI 318, Section 21.12.5**. Modify ACI 318, Section ~~21.12.5~~, by adding new Section ~~21.12.5.6~~ to read as follows:

~~21.12.5.6~~—Columns supporting reactions from discontinuous stiff members, such as walls, shall be designed for the special load combinations in Section ~~1605.4~~ of the International Building Code and shall be provided with transverse reinforcement at the spacing, so, as defined in ~~21.12.5.2~~ over their full height beneath the level at which the discontinuity occurs. This transverse reinforcement shall be extended above and below the column as required in ~~21.4.4.5~~.

14. Revise as follows:

1908.1.14 1908.1.7 **ACI 318, Section 22.6**. Modify ACI 318, Section ~~22.6~~, by adding new Section ~~22.6.7~~ to read:

~~22.6.7~~ – *Detailed plain concrete structural walls.*

~~22.6.7.1~~ – *Detailed plain concrete structural walls are walls conforming to the requirements of ordinary structural plain concrete walls and 22.6.7.2.*

~~22.6.7.2~~ - *Reinforcement shall be provided as follows:*

(a) *Vertical reinforcement of at least 0.20 square inch (129 mm²) in cross-sectional area shall be provided continuously from support to support at each corner, at each side of each opening and at the ends of walls. The continuous vertical bar required beside an opening is permitted to substitute for one of the two No. 5 bars required by 22.6.6.5.*

(b) *Horizontal reinforcement at least 0.20 square inch (129 mm²) in cross-sectional area shall be provided:*

- 1. Continuously at structurally connected roof and floor levels and at the top of walls;*
- 2. At the bottom of load-bearing walls or in the top of foundations where doweled to the wall; and*
- 3. At a maximum spacing of 120 inches (3048mm).*

Reinforcement at the top and bottom of openings, where used in determining the maximum spacing specified in Item 3 above, shall be continuous in the wall.

1908.1.15 1908.1.8 **ACI 318, Section 22.10**. Delete ACI 318, Section ~~22.10~~, and replace with the following:

~~22.10~~ – *Plain concrete in structures assigned to Seismic Design Category C, D, E or F.*

~~22.10.1~~ – *Structures assigned to Seismic Design Category C, D, E or F shall not have elements of structural plain concrete, except as follows:*

(a) Structural plain concrete basement, foundation or other walls below the base are permitted in detached one- and two-family dwellings three stories or less in height constructed with stud-bearing walls. In dwellings assigned to Seismic Design Category D or E, the height of the wall shall not exceed 8 feet (2438 mm), the thickness shall not be less than 7 1/2 inches (190 mm), and the wall shall retain no more than 4 feet (1219 mm) of unbalanced fill. Walls shall have reinforcement in accordance with 22.6.6.5.

(b) Isolated footings of plain concrete supporting pedestals or columns are permitted, provided the projection of the footing beyond the face of the supported member does not exceed the footing thickness.

Exception: In detached one- and two-family dwellings three stories or less in height, the projection of the footing beyond the face of the supported member is permitted to exceed the footing thickness.

(c) Plain concrete footings supporting walls are permitted, provided the footings have at least two continuous longitudinal reinforcing bars. Bars shall not be smaller than No. 4 and shall have a total area of not less than 0.002 times the gross cross-sectional area of the footing. For footings that exceed 8 inches (203 mm) in thickness, a minimum of one bar shall be provided at the top and bottom of the footing. Continuity of reinforcement shall be provided at corners and intersections.

Exceptions:

1. In detached one- and two-family dwellings three stories or less in height and constructed with stud-bearing walls, plain concrete footings without longitudinal reinforcement supporting walls are permitted.
2. For foundation systems consisting of a plain concrete footing and a plain concrete stem wall, a minimum of one bar shall be provided at the top of the stem wall and at the bottom of the footing.
3. Where a slab on ground is cast monolithically with the footing, one No. 5 bar is permitted to be located at either the top of the slab or bottom of the footing.

15. Delete without substitution:

~~1908.1.16 (Supp) ACI 318, Section D.3.3. Modify ACI 318, Sections D.3.3.2 through D.3.3.5 to read as follows:~~

~~D.3.3.2 B In structures assigned to Seismic Design Category C, D, E or F, post-installed anchors for use under D.2.3 shall have passed the Simulated Seismic Tests of ACI 355.2.~~

~~D.3.3.3 B In structures assigned to Seismic Design Category C, D, E or F, the design strength of anchors shall be taken as $0.75nN_n$ and $0.75nV_n$, where n is given in D.4.4 or D.4.5, and N_n and V_n are determined in accordance with D.4.1.~~

~~D.3.3.4 B In structures assigned to Seismic Design Category C, D, E or F, anchors shall be designed to be governed by tensile or shear strength of a ductile steel element, unless D.3.3.5 is satisfied.~~

~~**Exception:** Anchors in concrete designed to support nonstructural components in accordance with ASCE 7 Section 13.4.2 need not satisfy Section D.3.3.4.~~

~~D.3.3.5 B Instead of D.3.3.4, the attachment that the anchor is connecting to the structure shall be designed so that the attachment will undergo ductile yielding at a load level corresponding to anchor forces not greater than the design strength of anchor specified in D.3.3.3, or the minimum design strength of the anchor shall be at least 2.5 times the factored forces transmitted by the attachment.~~

~~**Exception:** Anchors in concrete designed to support nonstructural components in accordance with ASCE 7 Section 13.4.2 need not satisfy Section D.3.3.5.~~

16. Add new text as follows:

1908.1.9 ACI 318, Section D.4.2.2. Modify ACI 318, Sections D.4.2.2 to read as follows:

D.4.2.2 – The concrete breakout strength requirements for anchors shall be considered satisfied by the design procedure of D.5.2 and D.6.2.

17. Revise as follows:

1909.6.1 Basement walls. The thickness of exterior basement walls and foundation walls shall be not less than 7 1/2 inches (191 mm). ~~Structural plain concrete exterior basement walls shall be exempt from the requirements for special exposure conditions of Section 1904.2.2.~~

1909.6.3 Openings in walls. Not less than ~~two~~ one No. 5 ~~bars~~ bar shall be provided around window ~~and~~ door and similar sized openings. ~~Such bars~~ The bar shall ~~extend at least 24 inches (610 mm) beyond~~ be anchored to develop f_y in tension at the corners of openings.

1912.1 Scope. The provisions of this section shall govern the strength design of anchors installed in concrete for purposes of transmitting structural loads from one connected element to the other. Headed bolts, headed studs and hooked (J- or L-) bolts cast in concrete and expansion anchors and undercut anchors installed in hardened concrete shall be designed in accordance with Appendix D of ACI 318 as modified by Section ~~1908.1.16~~ 1908.1.9, provided they are within the scope of Appendix D.

Exception: ~~Where the basic concrete breakout strength in tension of a single anchor, N_b , is determined in accordance with Equation (D-7), the concrete breakout strength requirements of Section D.4.2.2 shall be considered satisfied by the design procedures of Sections D.5.2 and D.6.2 for anchors exceeding 2 inches (51 mm) in diameter or 25 inches (635 mm) tensile embedment depth.~~

The strength design of anchors that are not within the scope of Appendix D of ACI 318, and as amended ~~above~~ in Section 1908.1.9, shall be in accordance with an approved procedure.

**TABLE 1704.3
REQUIRED VERIFICATION AND INSPECTION OF STEEL CONSTRUCTION**

VERIFICATION AND INSPECTION	CONTINUOUS	PERIODIC	REFERENCED STANDARD ^a	IBC REFERENCE
5. Inspection of welding:	—	—		
a. Structural Steel:				
1) Complete and partial penetration groove welds.	X	—	AWS D1.1	1704.3.1
2) Multipass fillet welds	X	—		
3) Single-pass fillet welds > 5/16"	X	—		
4) Single-pass fillet welds ≤ 5/16"	—	X		
5) Floor and roof deck welds.	—	X	AWS D1.3	—

1) Verification of weldability of reinforcing steel other than ASTM A706	—	X	AWS D1.4 ACI 318: 3.5.2	—
2) Reinforcing steel-resisting flexural and axial forces in intermediate and special moment frames, and boundary elements of special reinforced structural walls of concrete shear walls and shear reinforcement.	X	—		
3) Shear reinforcement.	X	—		
4) Other reinforcing steel	—	X		

(Portions of table and footnotes not shown remain unchanged)

1708.3 Reinforcing and prestressing steel. Certified mill test reports shall be provided for each shipment of reinforcing steel used to resist flexural, shear and axial forces in reinforced concrete intermediate frames, special moment frames and boundary elements of special ~~reinforced structural walls of~~ concrete or special reinforced masonry shear walls. Where ASTM A 615 reinforcing steel is used to resist earthquake-induced flexural and axial forces in special moment frames and in wall boundary elements of shear walls in structures assigned to Seismic Design Category D, E or F, as determined in Section 1613, the testing requirements of ACI 318 shall be met. Where ASTM A 615 reinforcing steel is to be welded, chemical tests shall be performed to determine weldability in accordance with Section 3.5.2 of ACI 318.

18. Add update to referenced standard as follows:

ACI

318-~~05~~08 Building Code Requirements for Structural Concrete

Reason: Item 1: The changes proposed are necessary to update the concrete provisions to be consistent with the provisions of ACI 318-08.

Item 2: The changes proposed are necessary to update or delete as necessary, the modifications to ACI 318 for consistency with the provisions of ACI 318-08. The following modifications are being deleted because the modifications have been incorporated into ACI 318-08. Changes to individual sections are indicated below. Section numbers cited are based on the number in the 2006 IBC, unless noted otherwise.

1908.1.1 – This modification has been incorporated into ACI 318-08, Section 21.2.2.

1908.1.2 – This modification has been incorporated into ACI 318-08, Section 21.2.3.

1908.1.3 – The definition of “special structural wall” from ACI 318-08 has been included and modified for the following reasons. In ACI 318-05, a “special reinforced concrete structural wall” was a cast-in-place wall, and a separate definition applied to a “special precast structural wall.” Under ACI 318-08, the definition of “special precast structural wall” has been deleted, and the former definition of “special reinforced concrete structural wall” has been revised to “special structural wall” which is now defined as “a cast-in-place or precast wall.” The modification to the ACI 318-08 definition of special structural wall, by adding another sentence, is necessary since ASCE 7-05 Table 12.2-1 – Design Coefficients and Factors for Seismic Force-Resisting Systems – uses the ACI 318-05 term “special reinforced concrete structural wall.” In addition, it does not mention “special structural wall.” Therefore, the sentence is being added to coordinate new terminology used in ACI 318-08 with that used in ASCE 7-05.

1980.1.4 - These modifications to ACI 318-08 are necessary because ACI 318-08 does not indicate the seismic-force-resisting systems permitted in the various seismic design categories.

1908.1.5 – This modification has been incorporated into ACI 318-08, Section 21.5.2.5(a).

1908.1.6 – This modification has been incorporated into ACI 318-08, Section 21.5.2.5(d).

1908.1.7 – This modification has been incorporated into ACI 318-08, Section 21.5.2.5(c).

1908.1.11 - This modification has been incorporated into ACI 318-08, Section 21.13.3.2 since it only references 21.6.3.1 and does not reference 21.6.3.2.

1908.1.12 – This modification has been incorporated into ACI 318-08, Section 21.3.5.6.

1908.1.16 – This modification has been incorporated into ACI 318-08, Section D.3.3.

1908.1.9 (new) – This modification to Section D.4.2.2 of ACI 318 is already in Section 1912.1 as an exception. It is being relocated to Section 1908 to consolidate all ACI 318 modifications in one section. Also, see “reason” for item 4.

All other proposed changes are necessary because Chapter 21 of ACI 318-08 has been reformatted which resulted in section numbers being changed.

Item 3: The changes proposed are necessary to update the structural plain concrete provisions to be consistent with the provisions of ACI 318-08.

Item 4: The changes proposed are necessary because the modification to ACI 318-05 in Section 1908.1.16 has been incorporated into ACI 318-08; therefore, the modification is no longer needed. In addition, the modification to ACI 318, Section D.4.2.2 in the exception is being relocated to Section 1908.1.9.

Item 5 – For consistency with the change in ACI 318-08 from “special reinforced concrete structural wall” to “Special structural wall.” Also, see reason for item 1, Section 1908.1.3.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Errata: In item 3 correct new section numbers as follows:

~~4904.2~~ **1904.4 Freezing and thawing exposures.** Concrete that will be exposed to freezing and thawing, in the presence of moisture, with or without deicing chemicals being present, or other exposure conditions as defined below shall comply with Sections ~~4904.2.1 through 1904.2.3~~ **1904.4.1 and 1904.4.2.**

~~4904.2.1~~ **1904.4.1 Air entrainment.** Concrete exposed to freezing and thawing ~~or deicing chemicals while moist~~ shall be air entrained in accordance with ACI 318, Section ~~4.2.1~~ **4.4.1:**

In item 9 correct to read as follows:

~~4908.1.4~~ **1908.1.2 ACI 318**, Section ~~21.2.1~~ **21.1.1.** Modify ACI 318 Sections ~~21.2.1.2, 21.2.1.3 and 21.2.1.4~~ **21.1.1.3 through 21.1.1.5,** to read as follows:

Revise item 10 to read as follows:

21.1.1.3 – Structures assigned to SDC B shall comply with Chapters 1 through 19 and 22. For a structure assigned to SDC B using ordinary moment frames as part of the seismic-force resisting system, the provisions of 21.1.2 and 21.2 shall apply. For a structure assigned to SDC B and using intermediate or special systems, the applicable provisions of 21.1.3 through 21.1.7, and 21.3 through 21.10 shall also apply.

21.1.1.4 – Structures assigned to SDC C shall comply with Chapters 1 through 19, and the seismic-force-resisting system shall be intermediate or special moment frames, intermediate precast structural walls, or ordinary reinforced concrete or special structural walls. For a structure assigned to SDC C and using intermediate moment frames as part of the seismic-force-resisting system the provisions of 21.1.2 and 21.3 shall apply. For a structure assigned to SDC C and using special moment frames, or intermediate precast or special structural walls, the applicable provisions of 21.1.3 through 21.1.7, and 21.4 through 21.10 shall also apply. Any structure assigned to SDC C shall satisfy 21.1.8. Except for footings, pedestals and basement walls in accordance with 22.10 or as permitted by the International Building Code, structural elements of plain concrete are prohibited.

21.1.1.5 – Structures assigned to SDC D, E or F shall comply with Chapters 1 through 19, and the seismic-force-resisting system shall be special moment frames, intermediate precast structural walls, or special structural walls. For a structure assigned to SDC D, E, or F, the provisions of 21.1.2 through 21.1.8 and 21.4 through 21.13 shall apply. Except for footings, pedestals and basement walls in accordance with 22.10 or as permitted by the International Building Code, structural elements of plain concrete are prohibited.

In item 17 revise to read as follows:

1912.1 Scope. The provisions of this section shall govern the strength design of anchors installed in concrete for purposes of transmitting structural loads from one connected element to the other. Headed bolts, headed studs and hooked (J- or L-) bolts cast in concrete and expansion anchors and undercut anchors installed in hardened concrete shall be designed in accordance with Appendix D of ACI 318 as modified by Section ~~4908.1.4~~ **1908.1.9**, provided they are within the scope of Appendix D.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

Exception: Where the basic concrete breakout strength in tension of a single anchor, N_b , is determined in accordance with Equation (D-7), the concrete breakout strength requirements of Section D.4.2.2 shall be considered satisfied by the design procedures of Sections D.5.2 and D.6.2 for anchors exceeding 2 inches (51 mm) in diameter or 25 inches (635 mm) tensile embedment depth.

The strength design of anchors that are not within the scope of Appendix D of ACI 318, and as amended above in Section 1908.1.9, shall be in accordance with an approved procedure.

Add update to referenced standard as follows:

ACI
318-0508 Building Code Requirements for Structural Concrete

Committee Action:

Approved as Modified

Modify proposal as follows:

1904.2 Exposure categories and classes. Concrete shall be assigned to exposure classes in accordance with ACI 318, Section 4.2 based on:

1. Exposure to freezing and thawing in a moist condition or deicer chemicals;
2. Exposure to sulfates in water or soil;
3. Exposure to water where the concrete is intended to have low permeability; and
4. Exposure to chlorides from deicing chemicals, salt, salt water, brackish water, seawater or spray from these sources, where the concrete has steel reinforcement.

SPECIAL STRUCTURAL WALL. A cast-in-place or precast wall complying with the requirements of 21.2.3 through 21.2.7, 21.10, and 21.11 21.1.3 through 21.1.7, 21.9 and 21.10, as applicable, in addition to the requirements for ordinary reinforced concrete structural walls or ordinary precast structural walls, as applicable. Where ASCE 7 refers to a "special reinforced concrete structural wall," it shall be deemed to mean a "special structural wall."

1908.1.2 ACI 318, Section 21.1.1. Modify ACI 318 Sections 21.1.1.3 through 21.1.1.5 and 21.1.1.7 to read as follows:

~~21.1.1.3 — Structures assigned to SDC B shall comply with Chapters 1 through 19 and 22. For a structure assigned to SDC B using ordinary moment frames as part of the seismic force-resisting system, the provisions of 21.1.2 and 21.2 shall apply. For a structure assigned to SDC B and using intermediate or special systems, the applicable provisions of 21.1.3 through 21.1.7, and 21.3 through 21.10 shall also apply.~~

~~21.1.1.3 — Structures assigned to Seismic Design Category A shall satisfy requirements of Chapters 1 to 19 and 22; Chapter 21 does not apply. Structures assigned to Seismic Design Category B, C, D, E, or F also shall satisfy 21.1.1.4 through 21.1.1.8, as applicable. Except for structural elements of plain concrete complying with Section 1908.1.8 of the International Building Code, structural elements of plain concrete are prohibited in structures assigned to Seismic Design Category C, D, E or F.~~

~~21.1.1.4 — Structures assigned to SDC C shall comply with Chapters 1 through 19, and the seismic force-resisting system shall be intermediate or special moment frames, intermediate precast structural walls, or ordinary reinforced concrete or special structural walls. For a structure assigned to SDC C and using intermediate moment frames as part of the seismic force-resisting system the provisions of 21.1.2 and 21.3 shall apply. For a structure assigned to SDC C and using special moment frames, or intermediate precast or special structural walls, the applicable provisions of 21.1.3 through 21.1.7, and 21.4 through 21.10 shall also apply. Any structure assigned to SDC C shall satisfy 21.1.8. Except for footings, pedestals and basement walls in accordance with 22.10 or as permitted by the International Building Code, structural elements of plain concrete are prohibited.~~

~~21.1.1.5 — Structures assigned to SDC D, E or F shall comply with Chapters 1 through 19, and the seismic force-resisting system shall be special moment frames, intermediate precast structural walls, or special structural walls. For a structure assigned to SDC D, E, or F, the provisions of 21.1.2 through 21.1.8 and 21.4 through 21.13 shall apply. Except for footings, pedestals and basement walls in accordance with 22.10 or as permitted by the International Building Code, structural elements of plain concrete are prohibited.~~

~~21.1.1.7 — Structural systems designated as part of the seismic-force-resisting system shall be restricted to those permitted by ASCE 7. Except for Seismic Design Category A, for which Chapter 21 does not apply, the following provision shall be satisfied for each structural system designated as part of the seismic-force-resisting system, regardless of the Seismic Design Category.~~

- (a) Ordinary moment frames shall satisfy 21.2.
- (b) Ordinary reinforced concrete structural walls and ordinary precast structural walls need not satisfy any provisions in Chapter 21.
- (c) Intermediate moment frames shall satisfy 21.3.
- (d) Intermediate precast structural walls shall satisfy 21.4.
- (e) Special moment frames shall satisfy 21.5 through 21.8.
- (f) Special structural wall shall satisfy 21.9.

~~Special structural walls constructed using precast concrete shall satisfy 21.10.~~

~~All special moment frames and special structural walls shall also satisfy 21.1.3 through 21.1.7.~~

1908.1.9 ACI 318, Section D.3.3. Modify ACI 318, Sections D.3.3.4 and D.3.3.5 to read as follows:

D.3.3.4 Anchors shall be designed to be governed by the steel strength of a ductile steel element as determined in accordance with D.5.1 and D.6.1, unless either D.3.3.5 or D.3.3.6 is satisfied.

Exception: Anchors in concrete designed to support nonstructural components in accordance with ASCE 7 Section 13.4.2 need not satisfy Section D.3.3.4.

D.3.3.5 Instead of D.3.3.4, the attachment that the anchor is connecting to the structure shall be designed so that the attachment will undergo ductile yielding at a force level corresponding to anchor forces not greater than the design strength of anchor specified in D.3.3.3.

Exception: *Anchors in concrete designed to support nonstructural components in accordance with ASCE 7 Section 13.4.2 need not satisfy Section D.3.3.5.*

1908.1.9 1908.1.10 ACI 318, Section D.4.2.2. Modify ACI 318, Section D.4.2.2 to read as follows:

D.4.2.2 – The concrete breakout strength requirements *for anchors* shall be considered satisfied by the design procedure of D.5.2 and D.6.2.
1912.1 Scope. The provisions of this section shall govern the strength design of anchors installed in concrete for purposes of transmitting structural loads from one connected element to the other. Headed bolts, headed studs and hooked (J- or L-) bolts cast in concrete and expansion anchors and undercut anchors installed in hardened concrete shall be designed in accordance with Appendix D of ACI 318 as modified by Section 1908.1.9 and 1908.10, provided they are within the scope of Appendix D.

The strength design of anchors that are not within the scope of Appendix D of ACI 318, and as amended in Section 1908.1.9 and 1908.1.10, shall be in accordance with an approved procedure.

(Portions of proposal not shown remain unchanged)

Committee Reason: This change updates the concrete provisions of the code to coordinate with the latest edition of the ACI 318 concrete standard. The modification updates section references to reflect the final published version of the 2008 edition of ACI 318. Similarly the modifications to Section 1908.1.2 reflect changes made after submittal of this proposal in the related portions of ACI 318 Chapter 21 based on public comments that ACI received. The modification also retains current section 1908.1.16, renumbered as 1908.1.9, in order to retain needed modifications that were added to the IBC in the 2006/2007 code cycle.

Assembly Action:

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Further modify proposal as follows:

1908.1.10 ACI 318, Section D.4.2.2. Modify ACI 318, Section D.4.2.2:

~~D.4.2.2 – The concrete breakout strength requirements *for anchors* shall be considered satisfied by the design procedure of D.5.2 and D.6.2.~~

D.4.2.2 – The concrete breakout strength requirements for anchors in tension shall be considered satisfied by the design procedure of D.5.2 provided Equation D-8 is not used for anchor embedments exceeding 25 inches. The concrete breakout strength requirements for anchors in shear with diameters not exceeding 2 inches shall be considered satisfied by the design procedure of D.6.2. For anchors in shear with diameters exceeding 2 inches, shear anchor reinforcement shall be provided in accordance with the procedures of D.6.2.9.

Commenter's Reason: Beginning with the 2000 code, the IBC has taken exception to the ACI 318 Appendix D scope limitation on the applicability of the concrete breakout strength equations. Since that time, additional information has become available on this issue. While there is some evidence that the predicted concrete breakout strength for anchors in tension as given by Eq. (D-7) can safely be extended to anchors with embedment depths exceeding 25 in., there is strong evidence that the breakout strength procedure in D.6.2 is unconservative for very large diameter anchors loaded in shear towards a free edge. It is therefore imperative that this exception be removed from the text of the code. The proposal above provides the necessary text. It disallows the use of the alternate, less conservative prediction of concrete breakout strength in tension given by Eq. (D-8) for embedments exceeding 25 in., and it notes that the equations in D.6.2 can only be used to satisfy the concrete breakout strength requirements in shear for anchor diameters not exceeding 2 in. Where larger anchor diameters are used and where concrete edge breakout would otherwise control the anchor strength, it is still possible to use anchor reinforcement in accordance with ACI 318-08 D.6.2.9.

Final Hearing Results

S172-07/08

AMPC

Code Change No: **S173-07/08**

Original Proposal

Section: 1908.1.16

Proponent: John W. Lawson, SE, representing the Structural Engineers Association of California Seismology Tilt-up Subcommittee; David L. McCormick, SE, representing the Structural Engineers Association of California Existing Building Tilt-up Subcommittee

Revise as follows:

1908.1.16 (Supp) ACI 318, Section D.3.3. Modify ACI 318, Sections D.3.3.2 through D.3.3.5 to read as follows:

D.3.3.2 - *In structures assigned to Seismic Design Category C, D, E or F, post-installed anchors for use under D.2.3 shall have passed the Simulated Seismic Tests of ACI 355.2.*

D.3.3.3 - *In structures assigned to Seismic Design Category C, D, E or F, the design strength of anchors shall be taken as $0.75\Phi N_n$ and $0.75\Phi V_n$, where Φ is given in D.4.4 or D.4.5, and N_n and V_n are determined in accordance with D.4.1.*

D.3.3.4 - *In structures assigned to Seismic Design Category C, D, E or F, anchors shall be designed to be governed by tensile or shear strength of a ductile steel element, unless D.3.3.5 is satisfied.*

Exceptions:

1. *Anchors in concrete designed to support nonstructural components in accordance with ASCE 7 Section 13.4.2 need not satisfy Section D.3.3.4.*
2. *Concrete wall anchorage designed to the forces of ASCE 7 Equation 12.11-1 need not satisfy Section D.3.3.4.*

D.3.3.5 - *Instead of D.3.3.4, the attachment that the anchor is connecting to the structure shall be designed so that the attachment will undergo ductile yielding at a load level corresponding to anchor forces not greater than the design strength of anchor specified in D.3.3.3, or the minimum design strength of the anchor shall be at least 2.5 times the factored forces transmitted by the attachment.*

Exceptions:

1. *Anchors in concrete designed to support nonstructural components in accordance with ASCE 7 Section 13.4.2 need not satisfy Section D.3.3.5.*
2. *Concrete wall anchorage designed to the forces of ASCE 7 Equation 12.11-1 need not satisfy Section D.3.3.5.*

Reason: Purpose: To remove the requirements for anchorage ductility at concrete wall anchorage already designed for maximum expected seismic forces.

Background: Following the 1994 Northridge earthquake, surveys of damage to concrete and masonry buildings with flexible roof diaphragms revealed that very limited amounts of wall anchorage ductility was present to resist the induced forces. Brittle tensile failures in steel wall anchorage straps were especially troublesome. In addition, boundary nailing in plywood diaphragms tore out of the plywood edges due to wall anchorage elongation. New code provisions were introduced into the 1997 UBC to address the nonductile wall anchorage behavior observed in the Northridge earthquake.

1997 UBC Section 1633.2.8.1 was chiefly written to address many of the wall anchorage issues spotlighted in the Northridge earthquake. The lack of observed ductility and the need for greater anchorage strength were the reasons behind Section 1633.2.8.1 Items 1 and 4. Wall anchorage forces to flexible diaphragms in Seismic Zones 3 & 4 were increased 50% ($a_p=1.5$) and steel elements had an additional 1.4 force multiplier.

The intent of Section 1633.2.8.1 (items 1, 4, and 5) was for the wall anchorage system to resist brittle failure when subjected to maximum expected roof accelerations. Based on observations of Northridge earthquake damage, it was deemed best to resist brittle failure through the use of significantly higher design forces in conjunction with anticipated material overstrength instead of any reliance on ductility. As a result, material-specific load factors were introduced to provide a uniform level of protection against brittle failure (1.4 steel, 0.85 wood, 1.0 concrete/masonry). This approach is well documented in the 1999 SEAOC Recommended Lateral Force Requirements and Commentary (The Blue Book) [Reference C108.2.8.1].

As further evidence of the intent of these wall anchorage provisions, the 1999 SEAOC Blue Book Commentary states that the reduced R_p value for nonductile and shallow anchorage does not apply to wall anchorage designed using this overstrength approach of Section 1633.2.8.1 [Reference C108.2.8.1].

Current Provisions: In the development of ASCE 7-05, the intent was to maintain the same wall anchorage equation between the 1997 UBC and ASCE 7-05 for flexible diaphragms in high seismic zones. The wall anchorage provisions of ASCE 7-05 Section 12.11.2.1 are directly incorporated from the 1997 UBC Section 1633.2.8.1. Substituting $C_a = 0.4S_{DS}$ (2003 NEHRP Commentary), it can be confirmed that Eq. 12.11-1 is generally equivalent to the 1997 UBC.

Through an unrelated parallel effort, ACI 318-05 Appendix D Sections D.3.3.4 and D.3.3.5 require anchorage ductility in moderate and high seismic zones. ACI's ductility requirement conflicts with the intent behind Section 12.11.2.1 at wall anchorage situations. Furthermore, 2006 IBC Section 1908.1.16 allows an additional 2.5 load factor on top of ASCE forces in lieu of the ACI ductility requirement. This stacking of load factors on top of load factors and ductility requirements is in conflict with the original intent of the wall anchorage provisions.

To summarize, the 1997 UBC and subsequent ASCE 7-05 implement very high wall anchorage force levels to achieve uniform protection against brittle failure without reliance upon ductility. This was achieved using a rational approach considering inherent overstrength. Through the incorporation of ACI 318 Appendix D, anchorage ductility requirements were inadvertently added to these special wall anchorage situations in conflict with the original intent of the provisions. Furthermore, the 2006 IBC force multiplier of 2.5 is redundant to the original force increase behind the UBC and ASCE wall anchorage provisions.

Impact to Design & Construction: Achieving anchorage ductility under ACI 318 Appendix D is very difficult for tilt-up construction with flexible diaphragms. For the ductility condition to be met, steel anchor strength must be weaker than the concrete breakout strength. Because tilt-up walls are inherently thin slender wall designs, anchor embedment depth is limited, making it difficult to increase. In several parametric studies, it is apparent that the ductility provision encourages smaller diameter steel anchors or thicker concrete walls for deeper embedments. Neither of these approaches seems beneficial.

Another unintended consequence of providing ductile anchorage is the potential elongation of the steel causing boundary nailing at plywood diaphragms to tear out of the sheathing edges under maximum seismic force levels. Similar concerns exist for edge welding along steel deck diaphragms at the wall panels.

Using the 2006 IBC 1908.1.16 alternative, the forces are increased to an extreme level due to the 2.5-times load increase previously mentioned. In several parametric studies, this results in a larger number of thin anchors rods spread out over a larger connection area. Spreading these anchor rods out will likely result in non-uniform anchorage force distribution, and instead concentrate the forces over the closest few rods, potentially resulting in a progressive rod failure.

California Universities for Research in Earthquake Engineering (CUREE), Richmond, California. 1998.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1908.1.16 (Supp) ACI 318, Section D.3.3. Modify ACI 318, Sections D.3.3.2 through D.3.3.5 to read as follows:

D.3.3.2 - *In structures assigned to Seismic Design Category C, D, E or F*, post-installed anchors for use under D.2.3 shall have passed the Simulated Seismic Tests of ACI 355.2.

D.3.3.3 - *In structures assigned to Seismic Design Category C, D, E or F*, the design strength of anchors shall be taken as $0.75\Phi N_n$ and $0.75\Phi V_n$, where Φ is given in D.4.4 or D.4.5, and N_n and V_n are determined in accordance with D.4.1.

D.3.3.4 - *In structures assigned to Seismic Design Category C, D, E or F*, anchors shall be designed to be governed by tensile or shear strength of a ductile steel element, unless D.3.3.5 is satisfied.

Exceptions:

1. *Anchors in concrete designed to support nonstructural components in accordance with ASCE 7 Section 13.4.2 need not satisfy Section D.3.3.4.*
2. ~~*Concrete wall anchorage designed to the forces of Wall anchors with design strengths equal to or greater than the force determined in accordance with ASCE 7 Equation 12.11-1 or 12.14-10 need not satisfy Section D.3.3.4.*~~

D.3.3.5 - Instead of D.3.3.4, the attachment that the anchor is connecting to the structure shall be designed so that the attachment will undergo ductile yielding at a load level corresponding to anchor forces not greater than the design strength of anchor specified in D.3.3.3, *or the minimum design strength of the anchor shall be at least 2.5 times the factored forces transmitted by the attachment.*

Exceptions:

1. *Anchors in concrete designed to support nonstructural components in accordance with ASCE 7 Section 13.4.2 need not satisfy Section D.3.3.5.*
2. ~~*Concrete wall anchorage designed to the forces of Wall anchors with design strengths equal to or greater than the force determined in accordance with ASCE 7 Equation 12.11-1 or 12.14-10 need not satisfy Section D.3.3.5.*~~

Committee Reason: This proposal is necessary to improve concrete wall anchorage constructability and provide coordination with the overstrength load combinations. The modification adds a reference to the comparable requirement under the simplified procedure of ASCE 7. The modification also resolves a potential problem by making the exception applicable when the design force is equal to or greater than the value obtained by these equations.

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Joseph J. Messersmith, Jr., P.E., Portland Cement Association, requests Approval as Modified by this Public Comment.

Further modify the proposal as follows:

1908.1.16 (Supp) ACI 318, Section D.3.3. Modify ACI 318, Sections D.3.3.2 through D.3.3.5 to read as follows:

D.3.3.2 - In structures assigned to Seismic Design Category C, D, E or F, post-installed anchors for use under D.2.3 shall have passed the Simulated Seismic Tests of ACI 355.2.

D.3.3.3 - In structures assigned to Seismic Design Category C, D, E or F, the design strength of anchors shall be taken as $0.75\Phi N_n$ and $0.75\Phi V_n$, where Φ is given in D.4.4 or D.4.5, and N_n and V_n are determined in accordance with D.4.1.

D.3.3.4 - In structures assigned to Seismic Design Category C, D, E or F, anchors shall be designed to be governed by tensile or shear strength of a ductile steel element, unless D.3.3.5 is satisfied.

Exceptions:

1. Anchors in concrete designed to support nonstructural components in accordance with ASCE 7 Section 13.4.2 need not satisfy Section D.3.3.4.
2. ~~Wall~~ Anchors designed to resist wall out-of-plane forces with design strengths equal to or greater than the force determined in accordance with ASCE 7 Equation 12.11-1 or 12.14-10 need not satisfy Section D.3.3.4.

D.3.3.5 - Instead of D.3.3.4, the attachment that the anchor is connecting to the structure shall be designed so that the attachment will undergo ductile yielding at a load level corresponding to anchor forces not greater than the design strength of anchor specified in D.3.3.3, or the minimum design strength of the anchor shall be at least 2.5 times the factored forces transmitted by the attachment.

Exceptions:

1. Anchors in concrete designed to support nonstructural components in accordance with ASCE 7 Section 13.4.2 need not satisfy Section D.3.3.5.
2. ~~Wall~~ Anchors designed to resist wall out-of-plane forces with design strengths equal to or greater than the force determined in accordance with ASCE 7 Equation 12.11-1 or 12.14-10 need not satisfy Section D.3.3.5.

Commenter's Reason: Upon further review of the modified version of S173 following the Palm Springs hearings, it was felt that the provisions may be incorrectly interpreted to apply to any anchor in a wall, which is not the intent. The revised wording should make it clear that the provisions are intended for anchors providing resistance to wall out-of-plane anchorage forces prescribed in ASCE 7.

Based on the forgoing, you are urged to vote in favor of the motion that will be made to further modify the proposal as indicated above.

Final Hearing Results

AMPC

Code Change No: S174-07/08

Original Proposal

Sections: 1405.9, 1405.5.2, 1405.9, 1604.3.4, 1704.5, 1704.5.1 through 1704.5.3, Table 1704.5.1, Table 1704.5.3, 1708.1.1 through 1708.1.4, 1812.7, 2101.2.2 through 2101.2.6, 2106.1 through 2106.1.1.3, 2106.3, 2016.1.1.3.1, 2106.1.1.3.2, 2106.2, 2106.3, 2106.4, 2106.5, 2106.6, 2107.1 through 2107.8 through 2108.4, 2109.1, 2109.2.3.1, 2109.7.3, Chapter 35

Proponent: Phillip Samblanet, The Masonry Society

1. Revise as follows:

1405.5 Anchored masonry veneer. Anchored masonry veneer shall comply with the provisions of Sections 1405.5, 1405.6, 1405.7 and 1405.8 and Sections 6.1 and 6.2 of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5.

1405.5.1 Tolerances. Anchored masonry veneers in accordance with Chapter 14 are not required to meet the tolerances in Article 3.3 G1 of ~~ACI 530.1/ASCE 6/TMS 602~~ TMS 602/ACI 530.1/ASCE 6.

1405.5.2 (Supp) Seismic requirements. Anchored masonry veneer located in Seismic Design Category C, D, E or F shall conform to the requirements of Section 6.2.2.10 of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5. Anchored masonry veneer located in Seismic Design Category D shall also conform to the requirements of Section 6.2.2.10.3.3 of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5.

1405.9 Adhered masonry veneer. Adhered masonry veneer shall comply with the applicable requirements in Section 1405.9.1 and Sections 6.1 and 6.3 of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5.

1604.3.4 Masonry. The deflection of masonry structural members shall not exceed that permitted by ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5.

1704.5 Masonry construction. Masonry construction shall be inspected and evaluated in accordance with the requirements of Sections 1704.5.1 through 1704.5.3, depending on the classification of the building or structure or nature of the occupancy, as defined by this code.

Exception: Special inspections shall not be required for:

1. Empirically designed masonry, glass unit masonry or masonry veneer designed by Section 2109, 2110 or Chapter 14, respectively, or by Chapter 5, 7 or 6 of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5, respectively, when they are part of structures classified as Occupancy Category I, II or III in accordance with Section 1604.5.
2. Masonry foundation walls constructed in accordance with Table 1805.5(1), 1805.5(2), 1805.5(3) or 1805.5(4).
3. Masonry fireplaces, masonry heaters or masonry chimneys installed or constructed in accordance with Section 2111, 2112 or 2113, respectively.

1704.5.1 Empirically designed masonry, glass unit masonry and masonry veneer in Occupancy Category IV. The minimum special inspection program for empirically designed masonry, glass unit masonry or masonry veneer designed by Section 2109, 2110 or Chapter 14, respectively, or by Chapter 5, 7 or 6 of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5, respectively, in structures classified as Occupancy Category IV, in accordance with Section 1604.5, shall comply with Table 1704.5.1.

**TABLE 1704.5.1

(Portions of table not shown remain unchanged)

1708.1.1 Empirically designed masonry and glass unit masonry in Occupancy Category I, II or III. For masonry designed by Section 2109 or 2110 or by Chapter 5 or 7 of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5 in structures classified as Occupancy Category I, II or III, in accordance with Section 1604.5, certificates of compliance used in masonry construction shall be verified prior to construction.

1708.1.2 Empirically designed masonry and glass unit masonry in Occupancy Category IV. The minimum testing and verification prior to construction for masonry designed by Section 2109 or 2110 or by Chapter 5 or 7 of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5 in structures classified as Occupancy Category IV, in accordance with Section 1604.5, shall comply with the requirements of Table 1708.1.2.

1708.1.3 Engineered masonry in Occupancy Category I, II or III. The minimum testing and verification prior to construction for masonry designed by Section 2107 or 2108 or by chapters other than Chapter 5, 6 or 7 of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5 in structures classified as Occupancy Category I, II or III, in accordance with Section 1604.5, shall comply with Table 1708.1.2.

1708.1.4 Engineered masonry in Occupancy Category IV. The minimum testing and verification prior to construction for masonry designed by Section 2107 or 2108 or by chapters other than Chapter 5, 6 or 7 of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5 in structures classified as Occupancy Category IV, in accordance with Section 1604.5, shall comply with Table 1708.1.4.

1805.5.2.2 Masonry foundation walls. Masonry foundation walls shall comply with the following:

1. Vertical reinforcement shall have a minimum yield strength of 60,000 psi (414 MPa).

2. The specified location of the reinforcement shall equal or exceed the effective depth distance, d , noted in Tables 1805.5(2), 1805.5(3) and 1805.5(4) and shall be measured from the face of the exterior (soil) side of the wall to the center of the vertical reinforcement. The reinforcement shall be placed within the tolerances specified in ACI 530.1/ASCE 6/TMS 402, Article 3.4 B7 TMS 602/ACI 530.1/ASCE 6, Article 3.3 B.8 of the specified location.

(Portions not shown remain unchanged)

1812.7 Masonry. Where the unsupported height of foundation piers exceeds six times the least dimension, the allowable working stress on piers of unit masonry shall be reduced in accordance with ACI 530/ASCE 5/TMS 402 TMS 402/ACI 530/ASCE 5.

2101.2.2 (Supp) Strength design. Masonry designed by the strength design method shall comply with the provisions of Sections 2106 and 2108, except that autoclaved aerated concrete (AAC) masonry shall comply with the provisions of Section 2106, Section 1613.6.3 and Chapter 1 and Appendix A of ACI 530/ASCE 5/TMS 402 TMS 402/ACI 530/ASCE 5.

2101.2.3 Prestressed masonry. Prestressed masonry shall be designed in accordance with Chapters 1 and 4 of ACI 530/ASCE 5/TMS 402 TMS 402/ACI 530/ASCE 5 and Section 2106. Special inspection during construction shall be provided as set forth in Section 1704.5.

2101.2.4 Empirical design. Masonry designed by the empirical design method shall comply with the provisions of Sections 2106 and 2109 or Chapter 5 of ACI 530/ASCE 5/TMS 402 TMS 402/ACI 530/ASCE 5.

2101.2.5 Glass unit masonry. Glass unit masonry shall comply with the provisions of Section 2110 or Chapter 7 of ACI 530/ASCE 5/TMS 402 TMS 402/ACI 530/ASCE 5.

2101.2.6 Masonry veneer. Masonry veneer shall comply with the provisions of Chapter 14 or Chapter 6 of ACI 530/ASCE 5/TMS 402 TMS 402/ACI 530/ASCE 5.

2103.13.6 Prestressing tendons. Prestressing tendons shall conform to one of the following standards:

1. Wire ASTM A 421
2. Low-relaxation wire ASTM A 421
3. Strand ASTM A 416
4. Low-relaxation strand ASTM A 416
5. Bar ASTM A 722

Exceptions:

1. Wire, strands and bars not specifically listed in ASTM A 421, ASTM A 416 or ASTM A 722 are permitted, provided they conform to the minimum requirements in ASTM A 421, ASTM A 416 or ASTM A 722 and are approved by the architect/engineer.
2. Bars and wires of less than 150 kips per square inch (ksi) (1034 MPa) tensile strength and conforming to ASTM A 82, ASTM A 510, ASTM A 615, ASTM A 996 or ASTM A 706 are permitted to be used as prestressed tendons, provided that:
 - 2.1. The stress relaxation properties have been assessed by tests according to ASTM E 328 for the maximum permissible stress in the tendon.
 - 2.2. Other nonstress-related requirements of ACI 530/ASCE 5/TMS 402 TMS 402/ACI 530/ASCE 5, Chapter 4, addressing prestressing tendons are met.

2103.13.7 Corrosion protection. Corrosion protection for prestressing tendons shall comply with the requirements of ACI 530.1/ASCE 6/TMS 602 TMS 602/ACI 530.1/ASCE 6, Article 2.4G. Corrosion protection for prestressing anchorages, couplers and end blocks shall comply with the requirements of ACI 530.1/ASCE 6/TMS 602 TMS 602/ACI 530.1/ASCE 6, Article 2.4H. Corrosion protection for carbon steel accessories used in exterior wall construction or interior walls exposed to a mean relative humidity exceeding 75 percent shall comply with either Section 2103.13.7.2 or 2103.13.7.3. Corrosion protection for carbon steel accessories used in interior walls exposed to a mean relative humidity equal to or less than 75 percent shall comply with either Section 2103.13.7.1, 2103.13.7.2 or 2103.13.7.3.

2104.1 Masonry construction. Masonry construction shall comply with the requirements of Sections 2104.1.1 through 2104.5 and with ACI 530.1/ASCE 6/TMS 602 TMS 602/ACI 530.1/ASCE 6.

2104.1.1 Tolerances. Masonry, except masonry veneer, shall be constructed within the tolerances specified in ~~ACI 530.1/ASCE 6/TMS 602~~ TMS 602/ACI 530.1/ASCE 6.

2104.3 Cold weather construction. The cold weather construction provisions of ~~ACI 530.1/ASCE 6/TMS 602~~ TMS 602/ACI 530.1/ASCE 6, Article 1.8 C, or the following procedures shall be implemented when either the ambient temperature falls below 40°F (4°C) or the temperature of masonry units is below 40°F (4°C).

2104.4 Hot weather construction. The hot weather construction provisions of ~~ACI 530.1/ASCE 6/TMS 602~~ TMS 602/ACI 530.1/ASCE 6, Article 1.8 D, or the following procedures shall be implemented when the temperature or the temperature and wind-velocity limits of this section are exceeded.

2106.1 Seismic design requirements for masonry. Masonry structures and components shall comply with the requirements in Section ~~4.14.2.2~~ 1.17.4.3.2 and Section ~~4.14.3, 4.14.4, 4.14.5, 4.14.6 or 4.14.7~~ 1.17.4.1, 1.17.4.2, 1.17.4.3, 1.17.4.4, or 1.17.4.5 of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5 depending on the structure's seismic design category as determined in Section 1613. All masonry walls, unless isolated on three edges from in-plane motion of the basic structural systems, shall be considered to be part of the seismic-force-resisting system. In addition, the following requirements shall be met.

2106.1.1 Basic seismic-force-resisting system. Buildings relying on masonry shear walls as part of the basic seismic-force-resisting system shall comply with Section ~~4.14.2.2~~ 1.17.4.3.2 of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5 or with Section 2106.1.1.1, 2106.1.1.2 or 2106.1.1.3.

2. Delete without substitution as follows:

~~2106.1.1.1 Ordinary plain prestressed masonry shear walls.~~ ~~Ordinary plain prestressed masonry shear walls shall comply with the requirements of Chapter 4 of ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5.

~~2106.1.1.2 Intermediate prestressed masonry shear walls.~~ ~~Intermediate prestressed masonry shear walls shall comply with the requirements of Section 4.14.2.2.4 of ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5 and shall be designed by Chapter 4, Section 4.4.3, of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5 for flexural strength and by Section 3.3.4.1.2 of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5 for shear strength. Sections ~~4.14.2.2.5, 3.3.3.5 and 3.3.4.3.2(c)~~ of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5 shall be applicable for reinforcement. Flexural elements subjected to load reversals shall be symmetrically reinforced. The nominal moment strength at any section along a member shall not be less than one-fourth the maximum moment strength. The cross-sectional area of bonded tendons shall be considered to contribute to the minimum reinforcement in Section ~~4.14.2.2.4~~ of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5. Tendons shall be located in cells that are grouted the full height of the wall.

~~2106.1.1.3 Special prestressed masonry shear walls.~~ ~~Special prestressed masonry shear walls shall comply with the requirements of Section 4.14.2.2.5 of ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5 and shall be designed by Chapter 4, Section 4.4.3, of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5 for flexural strength and by Section 3.3.4.1.2 of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5 for shear strength. Sections ~~4.14.2.2.5(a), 3.3.3.5 and 3.3.4.3.2(c)~~ of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5 shall be applicable for reinforcement. Flexural elements subjected to load reversals shall be symmetrically reinforced. The nominal moment strength at any section along a member shall not be less than one-fourth the maximum moment strength. The cross-sectional area of bonded tendons shall be considered to contribute to the minimum reinforcement in Section ~~4.14.2.2.5~~ of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5.

~~2106.1.1.3.1 Prestressing tendons.~~ ~~Prestressing tendons shall consist of bars conforming to ASTM A 722.~~

~~2106.1.1.3.2 Grouting.~~ ~~All cells of the masonry wall shall be grouted.~~

3. Revise as follows:

2106.3 Seismic Design Category B. Structures assigned to Seismic Design Category B shall conform to the requirements of Section ~~4.14.4~~ 1.17.4.2 of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5 and to the additional requirements of this section.

2106.4 Design Category C. Structures assigned to Seismic Design Category C shall conform to the requirements of Section 2106.3, Section ~~4.14.5~~ 1.17.4.3 of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5 and the additional requirements of this section.

2106.5 Additional requirements for structures in Seismic Design Category D. Structures assigned to Seismic Design Category D shall conform to the requirements of Section 2106.4, Section 4.4.6 1.17.4.4 of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5 and the additional requirements of this section.

2106.6 Additional requirements for structures in Seismic Design Category E or F. Structures assigned to Seismic Design Category E or F shall conform to the requirements of Section 2106.5 and Section 4.4.7 1.17.4.5 of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5.

2107.1 General. The design of masonry structures using allowable stress design shall comply with Section 2106 and the requirements of Chapters 1 and 2 of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5 except as modified by Sections 2107.2 through 2107.8.

2107.2 ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5, **Section 2.1.2, load combinations.** Delete Section 2.1.2.1.

2107.3 ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5, **Section 2.1.3, design strength.** Delete Sections 2.1.3.4 through 2.1.3.4.3.

2107.4 ~~2107.3~~ ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5, **Section 2.1.6, columns.** Add the following text to Section 2.1.6:

2.1.6.6 Light-frame construction. Masonry columns used only to support light-frame roofs of carports, porches, sheds or similar structures with a maximum area of 450 square feet (41.8 m²) assigned to Seismic Design Category A, B or C are permitted to be designed and constructed as follows:

1. Concrete masonry materials shall be in accordance with Section 2103.1 of the *International Building Code*. Clay or shale masonry units shall be in accordance with Section 2103.2 of the *International Building Code*.
2. The nominal cross-sectional dimension of columns shall not be less than 8 inches (203 mm).
3. Columns shall be reinforced with not less than one No. 4 bar centered in each cell of the column.
4. Columns shall be grouted solid.
5. Columns shall not exceed 12 feet (3658 mm) in height.
6. Roofs shall be anchored to the columns. Such anchorage shall be capable of resisting the design loads specified in Chapter 16 of the *International Building Code*.
7. Where such columns are required to resist uplift loads, the columns shall be anchored to their footings with two No. 4 bars extending a minimum of 24 inches (610 mm) into the columns and bent horizontally a minimum of 15 inches (381 mm) in opposite directions into the footings. One of these bars is permitted to be the reinforcing bar specified in Item 3 above. The total weight of a column and its footing shall not be less than 1.5 times the design uplift load.

2107.5 ~~2107.4~~ ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5, **Section 2.1.10.7.1.4** 2.1.9.7.1.1, **lap splices.** Modify Section ~~2.1.10.7.1.4~~ 2.1.9.7.1.1 as follows:

~~2.1.10.7.1.4~~ 2.1.9.7.1.1 The minimum length of lap splices for reinforcing bars in tension or compression,

$$l_d = 0.002d_b f_s$$

(Equation 21-2)

For SI: $l_d = 0.29d_b f_s$

but not less than 12 inches (305 mm). In no case shall the length of the lapped splice be less than 40 bar diameters.

where:

d_b = Diameter of reinforcement, inches (mm).

f_s = Computed stress in reinforcement due to design loads, psi (MPa).

In regions of moment where the design tensile stresses in the reinforcement are greater than 80 percent of the allowable steel tension stress, F_s , the lap length of splices shall be increased not less than 50 percent of the minimum required length. Other equivalent means of stress transfer to accomplish the same 50 percent increase shall be permitted.

Where epoxy coated bars are used, lap length shall be increased by 50 percent.

2107.6 ~~2107.5~~ ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5, **Section 2.1.10.7** 2.1.9.7, **splices of reinforcement.** Modify Section ~~2.1.10.7~~ 2.1.9.7 as follows:

~~2.1.10.7~~ ~~2.1.9.7~~ Splices of reinforcement. Lap splices, welded splices or mechanical splices are permitted in accordance with the provisions of this section. All welding shall conform to AWS D1.4. Reinforcement larger than No. 9 (M #29) shall be spliced using mechanical connections in accordance with Section 2.1.10.7.3.

2107.7 2107.6 ~~ACI 530/ASCE 5/TMS 402 TMS 402/ACI 530/ASCE 5~~, **Section 2.3.6, maximum bar size.** Add the following to Chapter 2:

2.3.6 Maximum bar size. The bar diameter shall not exceed one-eighth of the nominal wall thickness and shall not exceed one-quarter of the least dimension of the cell, course or collar joint in which it is placed.

2107.8 2107.7 ~~ACI 530/ASCE 5/TMS 402 TMS 402/ACI 530/ASCE 5~~, **Section 2.3.7, maximum reinforcement percentage.** Add the following text to Chapter 2:

2.3.7 Maximum reinforcement percentage. Special reinforced masonry shear walls having a shear span ratio, M/Vd , equal to or greater than 1.0 and having an axial load, P , greater than $0.05 f_m A_n$ that are subjected to in-plane forces shall have a maximum reinforcement ratio, ρ_{max} , not greater than that computed as follows:

$$\rho_{max} = \frac{nf'_m}{2f_y \left(n + \frac{f_y}{f'_m} \right)} \quad \text{(Equation 21-3)}$$

The maximum reinforcement ratio does not apply in the out-of-plane direction.

2108.1 General. The design of masonry structures using strength design shall comply with Section 2106 and the requirements of Chapters 1 and 3 of ~~ACI 530/ASCE 5/TMS 402 TMS 402/ACI 530/ASCE 5~~, except as modified by Sections 2108.2 through 2108.4.

Exception: AAC masonry shall comply with the requirements of Chapter 1 and Appendix A of ~~ACI 530/ASCE 5/TMS 402 TMS 402/ACI 530/ASCE 5~~.

2108.2 ~~ACI 530/ASCE 5/TMS 402 TMS 402/ACI 530/ASCE 5~~, **Section 3.3.3.3 development.** Add the following text to Section 3.3.3.3:

The required development length of reinforcement shall be determined by Equation (3-15), but shall not be less than 12 inches (305 mm) and need not be greater than $72 d_b$.

2108.3 ~~ACI 530/ASCE 5/TMS 402 TMS 402/ACI 530/ASCE 5~~, **Section 3.3.3.4, splices.** Modify items (b) and (c) of Section 3.3.3.4 as follows:

3.3.3.4 (b). A welded splice shall have the bars butted and welded to develop at least 125 percent of the yield strength, f_y , of the bar in tension or compression, as required. Welded splices shall be of ASTM A 706 steel reinforcement. Welded splices shall not be permitted in plastic hinge zones of intermediate or special reinforced walls or special moment frames of masonry.

3.3.3.4 (c). Mechanical splices shall be classified as Type 1 or 2 according to Section 21.2.6.1 of ACI 318. Type 1 mechanical splices shall not be used within a plastic hinge zone or within a beam-column joint of intermediate or special reinforced masonry shear walls or special moment frames. Type 2 mechanical splices are permitted in any location within a member.

2108.4 ~~ACI 530/ASCE 5/TMS 402 TMS 402/ACI 530/ASCE 5~~, **Section 3.3.3.5, maximum areas of flexural tensile reinforcement.** Add the following text to Section 3.3.3.5:

3.3.3.5.5 For special prestressed masonry shearwalls, strain in all prestressing steel shall be computed to be compatible with a strain in the extreme tension reinforcement equal to five times the strain associated with the reinforcement yield stress, f_y . The calculation of the maximum reinforcement shall consider forces in the prestressing steel that correspond to these calculated strains.

2109.1 General. Empirically designed masonry shall conform to this chapter or Chapter 5 of ~~ACI 530/ASCE 5/TMS 402 TMS 402/ACI 530/ASCE 5~~.

2109.2.3.1 Strength. Dry-stacked, surface-bonded concrete masonry walls shall be of adequate strength and proportions to support all superimposed loads without exceeding the allowable stresses listed in Table 2109.2.3.1. Allowable stresses not specified in Table 2109.2.3.1 shall comply with the requirements of ~~ACI 530/ASCE 5/TMS 402 TMS 402/ACI 530/ASCE 5~~.

2109.7.3 Floor and roof anchorage. Floor and roof diaphragms providing lateral support to masonry shall comply with the live loads in Section 1607.3 and shall be connected to the masonry in accordance with Sections 2109.7.3.1 through 2109.7.3.3. Roof loading shall be determined in accordance with Chapter 16 and, when net uplift occurs, uplift shall be resisted entirely by an anchorage system designed in accordance with the provisions of Sections 2.1 and 2.3, Sections 3.1 and 3.3 or Chapter 4 of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5.

4. Revise Chapter 35 as follows:

ACI

ACI 530-~~05~~ 08 Building Code Requirements for Masonry Structures
ACI 530.1-~~05~~ 08 Specifications for Masonry Structures

ASCE/SEI

ASCE/SEI 5-~~05~~ 08 Building Code Requirements for Masonry Structures
ASCE/SEI 6-~~05~~ 08 Specifications for Masonry Structures

TMS

TMS 402-~~05~~ 08 Building Code Requirements for Masonry Structures
TMS 602-~~05~~ 08 Specification for Masonry Structures

Reason: The purpose of this code change proposal is editorial and it updates references for the design and construction of masonry from the 2005 editions of ACI 530-05/ASCE 5-05/TMS 402-05 (Building Code Requirements for Masonry Structures) to TMS 402-08/ACI 530-08/ASCE 5-08 and ACI 530.1-05/ASCE 6-05/TMS 602-05 (Specification for Masonry Structures) to TMS 602-08/ACI 530.1-08/ASCE 6-08. This code change proposal is one of several to harmonize the design and construction requirements for masonry within the IBC with those in the reference standard. A complete list of revisions incorporated into the reference standards is available for download at www.masonrystandards.org.

With the publication of the 2008 edition of the Building Code Requirements for Masonry Structures and Specification for Masonry Structures, The Masonry Society (TMS) has become the lead sponsoring organization of the Masonry Standards Joint Committee (MSJC), which is charged with reviewing and maintaining the provisions in the referenced standards. As such, the official designation of these standards has changed from ACI 530/ASCE 5/TMS 402 to TMS 402/ACI 530/ASCE 5 and from ACI 530.1/ASCE 6/TMS 602 to TMS 602/ACI 530.1/ASCE 6 as reflected in the above proposed modifications.

Numerous sections references are proposed based on changes in the referenced standards. No intent is made to change the technical content of the IBC by these revisions. The deletion of requirements in 2106.1.1 reflect that consistent requirements have been added into the 2008 TMS 402/ACI 530/ASCE 5.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Errata: Add updates to referenced standards as follows:

ACI

ACI 530-~~05~~ 08 Building Code Requirements for Masonry Structures
ACI 530.1-~~05~~ 08 Specifications for Masonry Structures

ASCE/SEI

ASCE/SEI 5-~~05~~ 08 Building Code Requirements for Masonry Structures
ASCE/SEI 6-~~05~~ 08 Specifications for Masonry Structures

TMS

TMS 402-~~05~~ 08 Building Code Requirements for Masonry Structures
TMS 602-~~05~~ 08 Specification for Masonry Structures

Committee Action:

Approved as Modified

Modify proposal as follows:

2106.1 Seismic design requirements for masonry. Masonry structures and components shall comply with the requirements in Section ~~4.4.7.4.3.2~~ 1.17.2 and 1.17.3 and 1.17.4.1, 1.17.4.2, 1.17.4.3, 1.17.4.4, or 1.17.4.5 of TMS 402/ACI 530/ASCE 5 depending on the structure's seismic design category as determined in Section 1613. All masonry walls, unless isolated on three edges from in-plane motion of the basic structural systems, shall be considered to be part of the seismic-force-resisting system. In addition, the following requirements shall be met.

2106.1.1 Basic seismic-force-resisting system. Buildings relying on masonry shear walls as part of the basic seismic-force-resisting system shall comply with Section ~~1.17.4.3.2~~ 1.17.3.2 of TMS 402/ACI 530/ASCE 5 or with Section 2106.1.1.1, 2106.1.1.2 or 2106.1.1.3.

(Portions of proposal not shown remain unchanged)

Committee Reason: These revisions to the masonry code requirements are necessary to maintain consistency with the latest edition of the MSJC code and specification. The modification correlates section references with the published version of the standard.

Assembly Action:

Original Proposal

Sections: 2101.2.2 through 2101.3, 2102, 2103.8, Table 2103.8(1), Table 2103.8(2), 2103.11, 2103.11.1 through 2103.12, 2103.13, 2103.13.1 through 2103.13.8, 2104.1 through 2104.1.2, 2104.1.2.1 through 2104.1.2.7, 2104.1.5, 2104.1.7 through 2104.1.8, 2104.2, 2104.3, 2104.3.1 through 2104.3.3.5, 2104.4, 2104.4.1 through 2104.5, 2105.2.2.1.1, Table 2105.2.2.1.1, 2105.2.2.1.2, 2105.2.2.1.3, 2106.1, 2106.1.1 through 2106.6, 2107.1, 2107.2, 2107.4, 2107.5, 2107.6, 2107.7, 2107.8, 2108.1 through 2108.3, 2310.8.4, 2109(New) through 2110 (New), Chapter 35

Proponent: Jason Thompson, National Concrete Masonry Association, representing Masonry Alliance for Codes and Standards

1. Revise as follows:

2101.2.2 (Supp) Strength design. Masonry designed by the strength design method shall comply with the provisions of Sections 2106 and 2108, except that autoclaved aerated concrete (AAC) masonry shall comply with the provisions of Section 2106, Section 1613.6.3 and Chapter 1 and Appendix A of TMS 402/ACI 530/ASCE 5.

2101.2.3 Prestressed masonry. Prestressed masonry shall be designed in accordance with Chapters 1 and 4 of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5 and Section 2106. Special inspection during construction shall be provided as set forth in Section 1704.5.

2101.2.4 Empirical design. Masonry designed by the empirical design method shall comply with the provisions of Sections 2106 and 2109 or Chapter 5 of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5.

2101.2.5 Glass unit masonry. Glass unit masonry shall comply with the provisions of Section 2110 or Chapter 7 of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5.

2101.2.6 Masonry veneer. Masonry veneer shall comply with the provisions of Chapter 14 or Chapter 6 of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5.

2101.3 Construction documents. The construction documents shall show all of the items required by this code including the following:

1. Specified size, grade, type and location of reinforcement, anchors and wall ties.
2. Reinforcing bars to be welded and welding procedure.
3. Size and location of structural elements.
4. Provisions for dimensional changes resulting from elastic deformation, creep, shrinkage, temperature and moisture.
5. Loads used in the design of masonry.
6. Specified compressive strength of masonry at stated ages or stages of construction for which masonry is designed, except where specifically exempted by this code.
7. Details of anchorage of masonry to structural members, frames, and other construction, including the type, size, and location of connectors.
8. Size and location of conduits, pipes, and sleeves.
9. The minimum level of testing and inspection as defined in Chapter 17, or an itemized testing and inspection program that meets or exceeds the requirements of Chapter 17.

2. Delete without substitution:

SECTION 2102
DEFINITIONS AND NOTATIONS

BOND REINFORCING. The adhesion between steel reinforcement and mortar or grout.

BUTTRESS. A projecting part of a masonry wall built integrally therewith to provide lateral stability.

COLUMN, MASONRY. An isolated vertical member whose horizontal dimension measured at right angles to its thickness does not exceed three times its thickness and whose height is at least four times its thickness.

COMPOSITE ACTION. Transfer of stress between components of a member designed so that in resisting loads, the combined components act together as a single member.

COMPOSITE MASONRY. Multiwythe masonry members acting with composite action.

DIAPHRAGM. A roof or floor system designed to transmit lateral forces to shear walls or other lateral load-resisting elements.

EFFECTIVE HEIGHT. For braced members, the effective height is the clear height between lateral supports and is used for calculating the slenderness ratio. The effective height for unbraced members is calculated in accordance with engineering mechanics.

HEADER (Bonder). A masonry unit that connects two or more adjacent wythes of masonry.

MEAN DAILY TEMPERATURE. The average daily temperature of temperature extremes predicted by a local weather bureau for the next 24 hours.

PLASTIC HINGE. The zone in a structural member in which the yield moment is anticipated to be exceeded under loading combinations that include earthquakes.

3. Revise as follows:

NOTATIONS

A_n = Net cross-sectional area of masonry, square inches (mm^2).

b = Effective width of rectangular member or width of flange for T and I sections, inches (mm).

f_y = Specified yield stress of the reinforcement or the anchor bolt, psi (MPa).

L_w = Length of wall, inches (mm).

l_{de} = Embedment length of reinforcement, inches (mm).

P_w = Weight of wall tributary to section under consideration, pounds (N).

t = Specified wall thickness dimension or the least lateral dimension of a column, inches (mm).

V_n = Nominal shear strength, pounds (N).

V_u = Required shear strength due to factored loads, pounds (N).

W = Wind load, or related internal moments in forces.

γ = Reinforcement size factor.

ρ_n = Ratio of distributed shear reinforcement on plane perpendicular to plane of A_{mv} .

ρ_{max} = Maximum reinforcement ratio.

ϕ = Strength reduction factor.

P = The applied load at failure, pounds (N).

S_l = Thickness of the test specimen measured parallel to the direction of load, inches (mm).

S_w = Width of the test specimen measured parallel to the loading cylinder, inches (mm).

2103.8 Mortar. Mortar for use in masonry construction shall conform to ASTM C 270 and shall conform to the proportion specifications of Table 2103.8(1) or the property specifications of Table 2103.8(2). Type S or N mortar conforming to ASTM C 270 shall be used for glass unit masonry. The amount of water used in mortar for glass unit masonry shall be adjusted to account for the lack of absorption. Retempering of mortar for glass unit masonry shall not be permitted after initial set. Unused mortar shall be discarded within 2½ hours after initial mixing, except that unused mortar for glass unit masonry shall be discarded within 1½ hours after initial mixing.

4. Delete without substitution:

	S	1,800	75	18
	N	750	75	20 ^d
	O	350	75	20 ^d

For SI: 1 inch = 25.4 mm, 1 pound per square inch = 6.895kPa.

- a. This aggregate ratio (measured in damp, loose condition) shall not be less than $2\frac{1}{4}$ and not more than 3 times the sum of the separate volumes of cementitious materials.
- b. Average of three 2-inch cubes of laboratory-prepared mortar, in accordance with ASTM C 270.
- c. When structural reinforcement is incorporated in cement-lime or mortar cement mortars, the maximum air content shall not exceed 12 percent.
- d. When structural reinforcement is incorporated in masonry cement mortar, the maximum air content shall not exceed 18 percent.

5. Revise as follows:

2103.11 Mortar for AAC masonry. Thin-bed mortar for AAC masonry shall comply with Article 2.1 C.1 of TMS 602/ACI 530.1/ASCE 6 Section 2103.11.1. Mortar for leveling courses of AAC masonry shall comply with Section 2103.11.2. Mortar used for the leveling courses of AAC masonry shall comply with Article 2.1 C.2 of TMS 602/ACI 530.1/ASCE 6.

6. Delete without substitution:

2103.11.1 Thin-bed mortar for AAC masonry. Thin-bed mortar for AAC masonry shall be specifically manufactured for use with AAC masonry. Testing to verify mortar properties shall be conducted by the thin-bed mortar manufacturer and confirmed by an independent testing agency:

1. ~~The compressive strength of thin-bed mortar, as determined by ASTM C 109, shall meet or exceed the strength of the AAC masonry units.~~
2. ~~The shear strength of thin-bed mortar shall meet or exceed the shear strength of the AAC masonry units for wall assemblages tested in accordance with ASTM E 519.~~
3. ~~The flexural tensile strength of thin-bed mortar shall not be less than the modulus of rupture of the masonry units. Flexural strength shall be determined by testing in accordance with ASTM E 72 (transverse load test), ASTM E 518 Method A (flexural bond strength test) or ASTM C 1072 (flexural bond strength test).~~
 - 3.1. ~~For conducting flexural strength tests in accordance with ASTM E 518, at least five test specimens shall be constructed as stack-bonded prisms at least 32 inches (810 mm) high. The type of mortar specified by the AAC unit manufacturer shall be used.~~
 - 3.2. ~~For flexural strength tests in accordance with ASTM C 1072, test specimens shall be constructed as stack-bonded prisms comprised with at least three bed joints. A total of at least five joints shall be tested using the type of mortar specified by the AAC unit manufacturer.~~
4. ~~The splitting tensile strength of AAC masonry assemblages composed of two AAC masonry units bonded with one thin-bed mortar joint shall be determined in accordance with ASTM C 1006 and shall equal or exceed $2.4 \sqrt{f_{AAC}}$.~~

7. Revise as follows:

2103.12 Grout. Grout shall comply with Article 2.1 C.1 of TMS 602/ACI 530.1/ASCE 6, conform to Table 2103.12 or to ASTM C 476. When grout conforms to ASTM C 476, the grout shall be specified by proportion requirements or property requirements.

8. Delete without substitution:

2103.12 Grout. Grout shall conform to Table 2103.12 or to ASTM C 476. When grout conforms to ASTM C 476, the grout shall be specified by proportion requirements or property requirements.

**TABLE 2103.12
GROUT PROPORTIONS BY VOLUME FOR
MASONRY CONSTRUCTION**

TYPE	PARTS BY VOLUME OF PORTLAND CEMENT OR BLENDED CEMENT	PARTS BY VOLUME OF HYDRATED LIME OR LIME PUTTY	AGGREGATE, MEASURED IN A DAMP, LOOSE CONDITION	
			Fine	Coarse
Fine Grout	4	$0\frac{1}{40}$	$2\frac{1}{4}$ —3 times the sum of the volumes of the cementitious materials	—
Coarse Grout	4	$0\frac{1}{40}$	$2\frac{1}{4}$ —3 times the sum of the volumes of the cementitious materials	1—2 times the sum of the volumes of the cementitious materials

9. Revise as follows:

2103.13 Metal reinforcement and accessories. Metal reinforcement and accessories shall conform to Sections 2103.13.1 through 2103.13.8 Article 2.4 of TMS 602/ACI 530.1/ASCE 6 Where unidentified reinforcement is approved for use, not less than three tension and three bending tests shall be made on representative specimens of the reinforcement from each shipment and grade of reinforcing steel proposed for use in the work.

10. Delete without substitutions:

2103.13.1 Deformed reinforcing bars. Deformed reinforcing bars shall conform to one of the following standards: ASTM A 615 for deformed and plain billet steel bars for concrete reinforcement; ASTM A 706 for low-alloy steel deformed bars for concrete reinforcement; ASTM A 767 for zinc-coated reinforcing steel bars; ASTM A 775 for epoxy-coated reinforcing steel bars; and ASTM A 996 for rail and axle steel deformed bars for concrete reinforcement.

2103.13.2 Joint reinforcement. Joint reinforcement shall comply with ASTM A 951. The maximum spacing of cross wires in ladder-type joint reinforcement and point of connection of cross wires to longitudinal wires of truss-type reinforcement shall be 16 inches (400 mm).

2103.13.3 Deformed reinforcing wire. Deformed reinforcing wire shall conform to ASTM A 496.

2103.13.4 Wire fabric. Wire fabric shall conform to ASTM A 185 for plain steel welded wire fabric for concrete reinforcement or ASTM A 497 for welded deformed steel wire fabric for concrete reinforcement.

2103.13.5 Anchors, ties and accessories. Anchors, ties and accessories shall conform to the following standards: ASTM A 36 for structural steel; ASTM A 82 for plain steel wire for concrete reinforcement; ASTM A 185 for plain steel welded wire fabric for concrete reinforcement; ASTM A 240 for chromium and chromium-nickel stainless steel plate, sheet and strip; ASTM A 307 Grade A for anchor bolts; ASTM A 480 for flat rolled stainless and heat resisting steel plate, sheet and strip; and ASTM A 1008 for cold-rolled carbon steel sheet.

2103.13.6 Prestressing tendons. Prestressing tendons shall conform to one of the following standards:

1. Wire—ASTMA421
2. Low relaxation wire—ASTMA421
3. Strand—ASTMA416
4. Low relaxation strand—ASTMA416
5. Bar—ASTMA722

Exceptions:

1. Wire, strands and bars not specifically listed in ASTM A 421, ASTM A 416 or ASTM A 722 are permitted, provided they conform to the minimum requirements in ASTM A 421, ASTM A 416 or ASTM A 722 and are approved by the architect/engineer.
2. Bars and wires of less than 150 kips per square inch (ksi) (1034 MPa) tensile strength and conforming to ASTM A 82, ASTM A 510, ASTM A 615, ASTM A 996 or ASTM A 706 are permitted to be used as prestressed tendons, provided that:
 - 2.1. The stress relaxation properties have been assessed by tests according to ASTM E 328 for the maximum permissible stress in the tendon.
 - 2.2. Other nonstress-related requirements of ACI 530/ASCE 5/TMS 402, Chapter 4, addressing prestressing tendons are met.

2103.13.7 Corrosion protection. Corrosion protection for prestressing tendons shall comply with the requirements of ACI 530.1/ASCE 6/TMS 602, Article 2.4G. Corrosion protection for prestressing anchorages, couplers and end blocks shall comply with the requirements of ACI 530.1/ASCE 6/TMS 602, Article 2.4H. Corrosion protection for carbon steel accessories used in exterior wall construction or interior walls exposed to a mean relative humidity exceeding 75 percent shall comply with either Section 2103.13.7.2 or 2103.13.7.3. Corrosion protection for carbon steel accessories used in interior walls exposed to a mean relative humidity equal to or less than 75 percent shall comply with either Section 2103.13.7.1, 2103.13.7.2 or 2103.13.7.3.

2103.13.7.1 Mill galvanized. Mill galvanized coatings shall be applied as follows:

1. For joint reinforcement, wall ties, anchors and inserts, a minimum coating of 0.1 ounce per square foot (31g/m^2) complying with the requirements of ASTM A 641 shall be applied.
2. For sheet metal ties and sheet metal anchors, a minimum coating complying with Coating Designation G-60 according to the requirements of ASTM A 653 shall be applied.
3. For anchor bolts, steel plates or bars not exposed to the earth, weather or a mean relative humidity exceeding 75 percent, a coating is not required.

2103.13.7.2 Hot-dipped galvanized. Hot-dipped galvanized coatings shall be applied after fabrication as follows:

1. For joint reinforcement, wall ties, anchors and inserts, a minimum coating of 1.5 ounces per square foot (458g/m^2) complying with the requirements of ASTM A 153, Class B shall be applied.
2. For sheet metal ties and anchors, the requirements of ASTM A 153, Class B shall be met.
3. For steel plates and bars, the requirements of either ASTM A 123 or ASTM A 153, Class B shall be met.

2103.13.7.3 Epoxy coatings. Carbon steel accessories shall be epoxy coated as follows:

1. For joint reinforcement, the requirements of ASTM A 884, Class A, Type 1 having a minimum thickness of 7 mils (175 μm) shall be met.
2. For wire ties and anchors, the requirements of ASTM A 899, Class C having a minimum thickness of 20 mils (508 μm) shall be met.
3. For sheet metal ties and anchors, a minimum thickness of 20 mils (508 μm) per surface shall be provided or a minimum thickness in accordance with the manufacturer's specification shall be provided.

2103.13.8 Tests. Where unidentified reinforcement is approved for use, not less than three tension and three bending tests shall be made on representative specimens of the reinforcement from each shipment and grade of reinforcing steel proposed for use in the work.

11. Revise as follows:

2104.1 Masonry construction. Masonry construction shall comply with the requirements of Sections 2104.1.1 through 2104.5 and with ACI 530.1/ASCE 6/TMS 602 TMS 602/ACI 530.1/ASCE 6.

2104.1.1 Tolerances. Masonry, except masonry veneer, shall be constructed within the tolerances specified in ACI 530.1/ASCE 6/TMS 602 TMS 602/ACI 530.1/ASCE 6.

2104.1.2 Placing mortar and units. Placement of mortar, grout, and clay, concrete, glass, and AAC masonry and concrete units shall comply with Sections 2104.1.2.1, 2104.1.2.2, 2104.1.2.3 and 2104.1.2.5. Placement of mortar and glass unit masonry shall comply with Sections 2104.1.2.4 and 2104.1.2.5. Placement of thin bed mortar and AAC masonry shall comply with Section 2104.1.2.6 TMS 602/ACI 530.1/ASCE 6.

12. Delete without substitution:

2104.1.2.1 Bed and head joints. Unless otherwise required or indicated on the construction documents, head and bed joints shall be $\frac{3}{8}$ inch (9.5 mm) thick, except that the thickness of the bed joint of the starting course placed over foundations shall not be less than $\frac{1}{4}$ inch (6.4 mm) and not more than $\frac{1}{4}$ inch (19.1 mm).

2104.1.2.1.1 Open-end units. Open-end units with beveled ends shall be fully grouted. Head joints of open-end units with beveled ends need not be mortared. The beveled ends shall form a grout key that permits grouts within $\frac{5}{8}$ inch (15.9 mm) of the face of the unit. The units shall be tightly butted to prevent leakage of the grout.

2104.1.2.2 Hollow units. Hollow units shall be placed such that face shells of bed joints are fully mortared. Webs shall be fully mortared in all courses of piers, columns, pilasters, in the starting course on foundations where adjacent cells or cavities are to be grouted, and where otherwise required. Head joints shall be mortared a minimum distance from each face equal to the face shell thickness of the unit.

2104.1.2.3 Solid units. Unless otherwise required or indicated on the construction documents, solid units shall be placed in fully mortared bed and head joints. The ends of the units shall be completely buttered. Head joints shall not be filled by slushing with mortar. Head joints shall be constructed by shoving mortar tight against the adjoining unit. Bed joints shall not be furrowed deep enough to produce voids.

2104.1.2.4 Glass unit masonry. Glass units shall be placed so head and bed joints are filled solidly. Mortar shall not be furrowed. Unless otherwise required, head and bed joints of glass unit masonry shall be $\frac{1}{4}$ inch (6.4 mm) thick, except that vertical joint thickness of radial panels shall not be less than $\frac{1}{8}$ inch (3.2 mm). The bed joint thickness tolerance shall be minus $\frac{1}{16}$ inch (1.6 mm) and plus $\frac{1}{8}$ inch (3.2 mm). The head joint thickness tolerance shall be plus or minus $\frac{1}{8}$ inch (3.2 mm).

2104.1.2.5 Placement in mortar. Units shall be placed while the mortar is soft and plastic. Any unit disturbed to the extent that the initial bond is broken after initial positioning shall be removed and relaid in fresh mortar.

2104.1.2.6 Thin bed mortar and AAC masonry units. AAC masonry construction shall begin with a leveling course of masonry meeting the requirements of Section 2104.1.2. Subsequent courses of AAC masonry units shall be laid with thin bed mortar using a special notched trowel manufactured for use with thin bed mortar to spread the mortar so that it completely fills the bed joints. Unless otherwise specified, the head joints shall be similarly filled. Joints in AAC masonry shall be approximately $\frac{1}{16}$ inch (1.5 mm) and shall be formed by striking on the ends and tops of AAC masonry units with a rubber mallet. Minor adjustments in unit position shall be made while the mortar is still soft and plastic by tapping it into the proper position. Minor sanding of the exposed faces of AAC masonry shall be permitted to provide a smooth and plumb surface.

~~2104.1.2.7 Grouted masonry.~~ Between grout pours, a horizontal construction joint shall be formed by stopping all wythes at the same elevation and with the grout stopping a minimum of $1\frac{1}{2}$ inches (38 mm) below a mortar joint, except at the top of the wall. Where bond beams occur, the grout pour shall be stopped a minimum of $\frac{1}{2}$ inch (12.7 mm) below the top of the masonry.

13. Revise as follows:

~~2104.1.3 Installation of wall ties.~~ The ends of wall ties shall be embedded in mortar joints. Wall tie ends shall engage outer face shells of hollow units by at least $\frac{1}{2}$ inch (12.7 mm). Wire wall ties shall be embedded at least $1\frac{1}{2}$ inches (38 mm) into the mortar bed of solid masonry units or solid-grouted hollow units. Wall ties shall not be bent after being embedded in grout or mortar. Wall ties shall be installed in accordance with TMS 602/ACI 530.1/ASCE 6.

2104.1.5 Lintels. The design for lintels shall be in accordance with the masonry design provisions of either Section 2107 or 2108. Minimum length of end support shall be 4 inches (102 mm).

14. Delete without substitution:

~~2104.1.7 Masonry protection.~~ The top of unfinished masonry work shall be covered to protect the masonry from the weather.

~~2104.1.8 Weep holes.~~ Weep holes provided in the outside wythe of masonry walls shall be at a maximum spacing of 33 inches (838 mm) on center (o.c.). Weep holes shall not be less than $\frac{3}{16}$ inch (4.8 mm) in diameter.

15. Delete and substitute as follows:

~~2104.2 Corbeled masonry.~~ Except for corbels designed per Section 2107 or 2108, the following shall apply:

- ~~1. Corbels shall be constructed of solid masonry units.~~
- ~~2. The maximum corbeled projection beyond the face of the wall shall not exceed:~~
 - ~~2.1. One-half of the wall thickness for multiwythe walls bonded by mortar or grout and wall ties or masonry headers or~~
 - ~~2.2. One-half the wythe thickness for single wythe walls, masonry bonded hollow walls, multiwythe walls with open collar joints and veneer walls.~~
- ~~3. The maximum projection of one unit shall not exceed:~~
 - ~~3.1. One-half the nominal unit height of the unit or~~
 - ~~3.2. One-third the nominal thickness of the unit or wythe.~~
- ~~4. The back surface of the corbelled section shall remain within 1 inch (25 mm) of plane.~~

2104.2 Corbeled masonry. Corbeled masonry shall comply with the requirements of Section 1.12 of TMS 402/ACI 530/ASCE 5.

16. Revise as follows:

2104.3 Cold weather construction. The cold weather construction provisions of ACI 530.1/ASCE 6/TMS 602 TMS 602/ACI 530.1/ASCE 6, Article 1.8 C, or the following procedures shall be implemented when either the ambient temperature falls below 40°F (4°C) or the temperature of masonry units is below 40°F (4°C).

17. Delete without substitution:

~~2104.3.1 Preparation.~~

- ~~1. Temperatures of masonry units shall not be less than 20°F (-7°C) when laid in the masonry. Masonry units containing frozen moisture, visible ice or snow on their surface shall not be laid.~~
- ~~2. Visible ice and snow shall be removed from the top surface of existing foundations and masonry to receive new construction. These surfaces shall be heated to above freezing, using methods that do not result in damage.~~

~~2104.3.2 Construction.~~ The following requirements shall apply to work in progress and shall be based on ambient temperature.

2104.3.2.1 Construction requirements for temperatures between 40°F (4°C) and 32°F (0°C). The following construction requirements shall be met when the ambient temperature is between 40°F (4°C) and 32°F (0°C):

1. ~~Glass unit masonry shall not be laid.~~
2. ~~Water and aggregates used in mortar and grout shall not be heated above 140°F (60°C).~~
3. ~~Mortar sand or mixing water shall be heated to produce mortar temperatures between 40°F (4°C) and 120°F (49°C) at the time of mixing. When water and aggregates for grout are below 32°F (0°C), they shall be heated.~~

2104.3.2.2 Construction requirements for temperatures between 32°F (0°C) and 25°F (-4°C). The requirements of Section 2104.3.2.1 and the following construction requirements shall be met when the ambient temperature is between 32°F (0°C) and 25°F (-4°C):

1. ~~The mortar temperature shall be maintained above freezing until used in masonry.~~
2. ~~Aggregates and mixing water for grout shall be heated to produce grout temperature between 70°F (21°C) and 120°F (49°C) at the time of mixing. Grout temperature shall be maintained above 70°F (21°C) at the time of grout placement.~~
3. ~~Heat AAC masonry units to a minimum temperature of 40°F (4°C) before installing thin-bed mortar.~~

2104.3.2.3 Construction requirements for temperatures between 25°F (-4°C) and 20°F (-7°C). The requirements of Sections 2104.3.2.1 and 2104.3.2.2 and the following construction requirements shall be met when the ambient temperature is between 25°F (-4°C) and 20°F (-7°C):

1. ~~Masonry surfaces under construction shall be heated to 40°F (4°C).~~
2. ~~Wind breaks or enclosures shall be provided when the wind velocity exceeds 15 miles per hour (mph) (24 km/h).~~
3. ~~Prior to grouting, masonry shall be heated to a minimum of 40°F (4°C).~~

2104.3.2.4 Construction requirements for temperatures below 20°F (-7°C). The requirements of Sections 2104.3.2.1, 2104.3.2.2 and 2104.3.2.3 and the following construction requirement shall be met when the ambient temperature is below 20°F (-7°C): Enclosures and auxiliary heat shall be provided to maintain air temperature within the enclosure to above 32°F (0°C).

2104.3.3 Protection. The requirements of this section and Sections 2104.3.3.1 through 2104.3.3.5 apply after the masonry is placed and shall be based on anticipated minimum daily temperature for grouted masonry and anticipated mean daily temperature for ungrouted masonry.

2104.3.3.1 Glass unit masonry. The temperature of glass unit masonry shall be maintained above 40°F (4°C) for 48 hours after construction.

2104.3.3.2 AAC masonry. The temperature of AAC masonry shall be maintained above 32°F (0°C) for the first 4 hours after thin-bed mortar application.

2104.3.3.3 Protection requirements for temperatures between 40°F (4°C) and 25°F (-4°C). When the temperature is between 40°F (4°C) and 25°F (-4°C), newly constructed masonry shall be covered with a weather-resistive membrane for 24 hours after being completed.

2104.3.3.4 Protection requirements for temperatures between 25°F (-4°C) and 20°F (-7°C). When the temperature is between 25°F (-4°C) and 20°F (-7°C), newly constructed masonry shall be completely covered with weather-resistive insulating blankets, or equal protection, for 24 hours after being completed. The time period shall be extended to 48 hours for grouted masonry, unless the only cement in the grout is Type III portland cement.

2104.3.3.5 Protection requirements for temperatures below 20°F (-7°C). When the temperature is below 20°F (-7°C), newly constructed masonry shall be maintained at a temperature above 32°F (0°C) for at least 24 hours after being completed by using heated enclosures, electric heating blankets, infrared lamps or other acceptable methods. The time period shall be extended to 48 hours for grouted masonry, unless the only cement in the grout is Type III portland cement.

18. Revise as follows:

2104.4 Hot weather construction. The hot weather construction provisions of ACI 530.1/ASCE 6/TMS 602 TMS 602/ACI 530.1/ASCE 6, Article 1.8 D, or the following procedures shall be implemented when the temperature or the temperature and wind-velocity limits of this section are exceeded ambient air temperature exceeds 100°F (37.8°C), or exceeds 90°F (32.2°C) with a wind velocity greater than 8 mph (12.9 km/hr).

19. Delete without substitution:

2104.4.1 Preparation. The following requirements shall be met prior to conducting masonry work.

2104.4.1.1 Temperature. When the ambient temperature exceeds 100°F (38°C), or exceeds 90°F (32°C) with a wind velocity greater than 8 mph (3.5 m/s):

1. ~~Necessary conditions and equipment shall be provided to produce mortar having a temperature below 120°F (49°C).~~
2. ~~Sand piles shall be maintained in a damp, loose condition.~~

2104.4.1.2 Special conditions. When the ambient temperature exceeds 115°F (46°C), or 105°F (40°C) with a wind velocity greater than 8 mph (3.5 m/s), the requirements of Section 2104.4.1.1 shall be implemented, and materials and mixing equipment shall be shaded from direct sunlight.

2104.4.2 Construction. The following requirements shall be met while masonry work is in progress.

2104.4.2.1 Temperature. When the ambient temperature exceeds 100°F (38°C), or exceeds 90°F (32°C) with a wind velocity greater than 8 mph (3.5 m/s):

1. ~~The temperature of mortar and grout shall be maintained below 120°F (49°C).~~
2. ~~Mixers, mortar transport containers and mortar boards shall be flushed with cool water before they come into contact with mortar ingredients or mortar.~~
3. ~~Mortar consistency shall be maintained by retempering with cool water.~~
4. ~~Mortar shall be used within 2 hours of initial mixing.~~
5. ~~Thin-bed mortar shall be spread no more than 4 feet (1219 mm) ahead of AAC masonry units.~~
6. ~~AAC masonry units shall be placed within one minute after spreading thin-bed mortar.~~

2104.4.2.2 Special conditions. When the ambient temperature exceeds 115°F (46°C), or exceeds 105°F (40°C) with a wind velocity greater than 8 mph (3.5 m/s), the requirements of Section 2104.4.2.1 shall be implemented and cool mixing water shall be used for mortar and grout. The use of ice shall be permitted in the mixing water prior to use. Ice shall not be permitted in the mixing water when added to the other mortar or grout materials.

2104.4.3 Protection. When the mean daily temperature exceeds 100°F (38°C) or exceeds 90°F (32°C) with a wind velocity greater than 8 mph (3.5 m/s), newly constructed masonry shall be fog sprayed until damp at least three times a day until the masonry is three days old.

2104.5 Wetting of brick. Brick (clay or shale) at the time of laying shall require wetting if the unit's initial rate of water absorption exceeds 30 grams per 30 square inches (19 355 mm²) per minute or 0.035 ounce per square inch (1 g/645mm²) per minute, as determined by ASTM C 67.

20. Revise as follows:

2105.2.2.1.1 Clay masonry. The compressive strength of masonry shall be determined based on the strength of the units and the type of mortar specified using Table 2105.2.2.1.1, provided:

1. ~~Units conform to~~ are sampled and tested to verify conformance with ASTM C 62, ASTM C 216 or ASTM C 652.
2. Thickness of bed joints does not exceed 5/8 inch (15.9 mm).
3. For grouted masonry, the grout meets one of the following requirements:
 - 3.1. Grout conforms to ~~ASTM C 476 Article 2.2 of TMS 602/ACI 530.1/ASCE 6.~~
 - 3.2. Minimum grout compressive strength equals or exceeds f_m but not less than 2,000 psi (13.79MPa). The compressive strength of grout shall be determined in accordance with ASTM C 1019.

**TABLE 2105.2.2.1.1
COMPRESSIVE STRENGTH OF CLAY MASONRY**

NET AREA COMPRESSIVE STRENGTH OF CLAY MASONRY UNITS (psi)		NET AREA COMPRESSIVE STRENGTH OF MASONRY (psi)
Type M or S mortar	Type N mortar	
1,700	2,100	1,000
3,350	4,150	1,500
4,950	6,200	2,000
6,600	8,250	2,500
8,250	10,300	3,000
9,900	—	3,500
13,200/11,500	—	4,000

For SI: 1 pound per square inch = 0.00689MPa.

2105.2.2.1.2 Concrete masonry. The compressive strength of masonry shall be determined based on the strength of the unit and type of mortar specified using Table 2105.2.2.1.2, provided:

1. Units conform to are sampled and tested to verify conformance with ASTM C 55 or ASTM C 90 and are sampled and tested in accordance with ASTM C 140.
2. Thickness of bed joints does not exceed $\frac{5}{8}$ inch (15.9 mm).
3. For grouted masonry, the grout meets one of the following requirements:
 - 3.1. Grout conforms to ASTM C 476 Article 2.2 of TMS 602/ACI 530.1/ASCE 6.
 - 3.2. Minimum grout compressive strength equals or exceeds f_m but not less than 2,000 psi (13.79 MPa). The compressive strength of grout shall be determined in accordance with ASTM C 1019.

2105.2.2.1.3 AAC masonry. The compressive strength of AAC masonry shall be based on the strength of the AAC masonry unit only and the following shall be met:

1. Units conform to ASTM C 1386.
2. Thickness of bed joints does not exceed 1/8 inch (3.2 mm).
3. For grouted masonry, the grout meets one of the following requirements:
 - 3.1. Grout conforms to ASTM C 476 Article 2.2 of TMS 602/ACI 530.1/ASCE 6.
 - 3.2. Minimum grout compressive strength equals or exceeds f_{AAC} but not less than 2,000 psi (13.79 MPa). The compressive strength of grout shall be determined in accordance with ASTM C 1019.

21. Delete and substitute:

2106.1 Seismic design requirements for masonry. Masonry structures and components shall comply with the requirements in Section 1.14.2.2 and Section 1.14.3, 1.14.4, 1.14.5, 1.14.6 or 1.14.7 of ACI 530/ASCE 5/TMS 402 depending on the structure's seismic design category as determined in Section 1613. All masonry walls, unless isolated on three edges from in-plane motion of the basic structural systems, shall be considered to be part of the seismic force-resisting system. In addition, the following requirements shall be met.

2106.1 Seismic design requirements for masonry. Masonry structures and components shall comply with the requirements in Section 1.17 of TMS 402/ACI 530/ASCE 5 depending on the structure's seismic design category as determined in Section 1613.

22. Delete without substitution:

2106.1.1 Basic seismic force-resisting system. Buildings relying on masonry shear walls as part of the basic seismic force-resisting system shall comply with Section 1.14.2.2 of ACI 530/ASCE 5/TMS 402 or with Section 2106.1.1.1, 2106.1.1.2 or 2106.1.1.3.

2106.1.1.1 Ordinary plain prestressed masonry shear walls. Ordinary plain prestressed masonry shear walls shall comply with the requirements of Chapter 4 of ACI 530/ASCE 5/TMS 402.

2106.1.1.2 Intermediate prestressed masonry shear walls. Intermediate prestressed masonry shear walls shall comply with the requirements of Section 1.14.2.2.4 of ACI 530/ASCE 5/TMS 402 and shall be designed by Chapter 4, Section 4.4.3, of ACI 530/ASCE 5/TMS 402 for flexural strength and by Section 3.3.4.1.2 of ACI 530/ASCE 5/TMS 402 for shear strength. Sections 1.14.2.2.5, 3.3.3.5 and 3.3.4.3.2(c) of ACI 530/ASCE 5/TMS 402 shall be applicable

for reinforcement. Flexural elements subjected to load reversals shall be symmetrically reinforced. The nominal moment strength at any section along a member shall not be less than one-fourth the maximum moment strength. The cross-sectional area of bonded tendons shall be considered to contribute to the minimum reinforcement in Section 1.14.2.2.4 of ACI 530/ASCE 5/TMS 402. Tendons shall be located in cells that are grouted the full height of the wall.

2106.1.1.3 Special prestressed masonry shear walls. Special prestressed masonry shear walls shall comply with the requirements of Section 1.14.2.2.5 of ACI 530/ASCE 5/TMS 402 and shall be designed by Chapter 4, Section 4.4.3, of ACI 530/ASCE 5/TMS 402 for flexural strength and by Section 3.3.4.1.2 of ACI 530/ASCE 5/TMS 402 for shear strength. Sections 1.14.2.2.5(a), 3.3.3.5 and 3.3.4.3.2(c) of ACI 530/ASCE 5/TMS 402 shall be applicable for reinforcement. Flexural elements subjected to load reversals shall be symmetrically reinforced. The nominal moment strength at any section along a member shall not be less than one-fourth the maximum moment strength. The cross-sectional area of bonded tendons shall be considered to contribute to the minimum reinforcement in Section 1.14.2.2.5 of ACI 530/ASCE 5/TMS 402.

2106.1.1.3.1 Prestressing tendons. Prestressing tendons shall consist of bars conforming to ASTM A 722.

2106.1.1.3.2 Grouting. All cells of the masonry wall shall be grouted.

2106.2 Anchorage of masonry walls. Masonry walls shall be anchored to the roof and floors that provide lateral support for the wall in accordance with Section 1604.8.2.

2106.3 Seismic Design Category B. Structures assigned to Seismic Design Category B shall conform to the requirements of Section 1.14.4 of ACI 530/ASCE 5/TMS 402 and to the additional requirements of this section.

2106.3.1 Masonry walls not part of the lateral force-resisting system. Masonry partition walls, masonry screen walls and other masonry elements that are not designed to resist vertical or lateral loads, other than those induced by their own mass, shall be isolated from the structure so that the vertical and lateral forces are not imparted to these elements. Isolation joints and connectors between these elements and the structure shall be designed to accommodate the design story drift.

2106.4 Additional requirements for structures in Seismic Design Category C. Structures assigned to Seismic Design Category C shall conform to the requirements of Section 2106.3, Section 1.14.5 of ACI 530/ASCE 5/TMS 402 and the additional requirements of this section.

2106.4.1 Design of discontinuous members that are part of the lateral force-resisting system. Columns and pilasters that are part of the lateral force-resisting system and that support reactions from discontinuous stiff members such as walls shall be provided with transverse reinforcement spaced at no more than one-fourth of the least nominal dimension of the column or pilaster. The minimum transverse reinforcement ratio shall be 0.0015. Beams supporting reactions from discontinuous walls or frames shall be provided with transverse reinforcement spaced at no more than one-half of the nominal depth of the beam. The minimum transverse reinforcement ratio shall be 0.0015.

2106.5 Additional requirements for structures in Seismic Design Category D. Structures assigned to Seismic Design Category D shall conform to the requirements of Section 2106.4, Section 1.14.6 of ACI 530/ASCE 5/TMS 402 and the additional requirements of this section.

2106.5.1 Loads for shear walls designed by the allowable stress design method. When calculating in-plane shear or diagonal tension stresses by the allowable stress design method, shear walls that resist seismic forces shall be designed to resist 1.5 times the seismic forces required by Chapter 16. The 1.5 multiplier need not be applied to the overturning moment.

2106.5.2 Shear wall shear strength. For a shear wall whose nominal shear strength exceeds the shear corresponding to development of its nominal flexural strength, two shear regions exist.

For all cross sections within a region defined by the base of the shear wall and a plane at a distance L_w above the base of the shear wall, the nominal shear strength shall be determined by Equation 21-1.

$$V_n = A_{vn} f_y$$

(Equation 21-1)

The required shear strength for this region shall be calculated at a distance $L_w/2$ above the base of the shear wall, but not to exceed one-half story height. For the other region, the nominal shear strength of the shear wall shall be determined from Section 2108.

2106.6 Additional requirements for structures in Seismic Design Category E or F. Structures assigned to Seismic Design Category E or F shall conform to the requirements of Section 2106.5 and Section 1.14.7 of ACI 530/ASCE 5/TMS 402.

23. Revise as follows:

2107.1 General. The design of masonry structures using allowable stress design shall comply with Section 2106 and the requirements of Chapters 1 and 2 of ACI 530/ASCE 5/TMS 402 TMS 402/ACI 530/ASCE 5 except as modified by Sections 2107.2 through ~~2107.8~~ 2107.5.

2107.2 ACI 530/ASCE 5/TMS 402 TMS 402/ACI 530/ASCE 5, Section 2.1.2, load combinations. Delete Section 2.1.2.1.

24. Delete without substitution:

2107.3 ACI 530/ASCE 5/TMS 402, Section 2.1.3, design strength. Delete Sections 2.1.3.4 through 2.1.3.4.3.

2107.4 ACI 530/ASCE 5/TMS 402, Section 2.1.6, columns. Add the following text to Section 2.1.6:
2.1.6.6 Light frame construction. Masonry columns used only to support light frame roofs of carports, porches, sheds or similar structures with a maximum area of 450 square feet (41.8 m²) assigned to Seismic Design Category A, B or C are permitted to be designed and constructed as follows:

1. Concrete masonry materials shall be in accordance with Section 2103.1 of the *International Building Code*.
Clay or shale masonry units shall be in accordance with Section 2103.2 of the *International Building Code*.
2. The nominal cross-sectional dimension of columns shall not be less than 8 inches (203 mm).
3. Columns shall be reinforced with not less than one No. 4 bar centered in each cell of the column.
4. Columns shall be grouted solid.
5. Columns shall not exceed 12 feet (3658 mm) in height.
6. Roofs shall be anchored to the columns. Such anchorage shall be capable of resisting the design loads specified in Chapter 16 of the *International Building Code*.
7. Where such columns are required to resist uplift loads, the columns shall be anchored to their footings with two No. 4 bars extending a minimum of 24 inches (610 mm) into the columns and bent horizontally a minimum of 15 inches (381 mm) in opposite directions into the footings. One of these bars is permitted to be the reinforcing bar specified in Item 3 above. The total weight of a column and its footing shall not be less than 1.5 times the design uplift load.

25. Revise as follows:

2107.5 ~~2107.3~~ ACI 530/ASCE 5/TMS 402 TMS 402/ACI 530/ASCE 5, Section 2.1.10.7.1.1, lap splices. Modify Section 2.1.10.7.1.4 2.1.9.7.1.1 as follows:

~~2.1.10.7.1.4~~ 2.1.9.7.1.1 The minimum length of lap splices for reinforcing bars in tension or compression, l_d , shall be

$$l_d = 0.002d_b f_s \quad \text{(Equation 21-2 ~~21-1~~)}$$

For SI: $l_d = 0.29d_b f_s$

but not less than 12 inches (305 mm). In no case shall the length of the lapped splice be less than 40 bar diameters.

where:

d_b = Diameter of reinforcement, inches (mm).

f_s = Computed stress in reinforcement due to design loads, psi (MPa).

In regions of moment where the design tensile stresses in the reinforcement are greater than 80 percent of the allowable steel tension stress, F_s , the lap length of splices shall be increased not less than 50 percent of the minimum required length. Other equivalent means of stress transfer to accomplish the same 50 percent increase shall be permitted. Where epoxy coated bars are used, lap length shall be increased by 50 percent.

~~2107.6~~ ~~2107.4~~ ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5, Section 2.1.10.7 ~~2.1.9.7~~, splices of reinforcement. Modify Section 2.1.10.7 as follows:

2.1.10.7 ~~2.1.9.7~~ Splices of reinforcement. Lap splices, welded splices or mechanical splices are permitted in accordance with the provisions of this section. All welding shall conform to AWS D1.4. Welded splices shall be of ASTM A 706 steel reinforcement. Reinforcement larger than No. 9 (M #29) shall be spliced using mechanical connections in accordance with Section 2.1.10.7.3.

~~2107.7~~ ~~2107.5~~ ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5, Section 2.3.6, maximum bar size. Add the following to Chapter 2:

2.3.6 Maximum bar size. The bar diameter shall not exceed one-eighth of the nominal wall thickness and shall not exceed one-quarter of the least dimension of the cell, course or collar joint in which it is placed.

26. Delete without substitution:

~~2107.8~~ ~~ACI 530/ASCE 5/TMS 402~~, Section 2.3.7, maximum reinforcement percentage. Add the following text to Chapter 2:

2.3.7 Maximum reinforcement percentage. Special reinforced masonry shear walls having a shear span ratio, M/Vd , equal to or greater than 1.0 and having an axial load, P , greater than $0.05 f_m A_n$, that are subjected to in-plane forces shall have a maximum reinforcement ratio, ρ_{max} , not greater than that computed as follows:

$$\rho_{max} = \frac{n f'_m}{2 f_y \left(n + \frac{f_y}{f'_m} \right)} \quad \text{(Equation 21-3)}$$

The maximum reinforcement ratio does not apply in the out-of-plane direction.

27. Revise as follows:

2108.1 General. The design of masonry structures using strength design shall comply with Section 2106 and the requirements of Chapters 1 and 3 of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5, except as modified by Sections 2108.2 through 2108.4.

Exception: AAC masonry shall comply with the requirements of Chapter 1 and Appendix A of ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5.

~~2108.2~~ ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5, Section 3.3.3.3 development. Add the following text to Section 3.3.3.3:

The required development length of reinforcement shall be determined by Equation (3-15), but shall not be less than 12 inches (305 mm) and need not be greater than $72 d_b$.

~~2108.3~~ ~~ACI 530/ASCE 5/TMS 402~~ TMS 402/ACI 530/ASCE 5, Section 3.3.3.4, splices. Modify items (b) and (c) of Section 3.3.3.4 as follows:

3.3.3.4 (b). A welded splice shall have the bars butted and welded to develop at least 125 percent of the yield strength, f_y , of the bar in tension or compression, as required. Welded splices shall be of ASTM A 706 steel reinforcement. Welded splices shall not be permitted in plastic hinge zones of intermediate or special reinforced walls or special moment frames of masonry. 3.3.3.4 (c). Mechanical splices shall be classified as Type 1 or 2 according to Section 21.2.6.1 of ACI 318. Type 1 mechanical splices shall not be used within a plastic hinge zone or within a beam-column joint of intermediate or special reinforced masonry shear walls or special moment frames. Type 2 mechanical splices are permitted in any location within a member.

28. Delete without substitution:

~~2108.4~~ ~~ACI 530/ASCE 5/TMS 402~~, Section 3.3.3.5, maximum areas of flexural tensile reinforcement. Add the following text to Section 3.3.3.5:

~~3.3.3.5.5 For special prestressed masonry shear walls, strain in all prestressing steel shall be computed to be compatible with a strain in the extreme tension reinforcement equal to five times the strain associated with the reinforcement yield stress, f_y . The calculation of the maximum reinforcement shall consider forces in the prestressing steel that correspond to these calculated strains.~~

29. Delete Section 2109 in its entirety and substitute as follows:

SECTION 2109
EMPIRICAL DESIGN OF MASONRY

2109.1 General. Empirically designed masonry shall conform to the requirements of Chapter 5 of TMS 402/ACI 530/ASCE 5, except where otherwise noted in this section.

2109.1.1 Limitations. The use of empirical design of masonry shall be limited as noted in Section 5.1.2 of TMS 402/ACI 530/ASCE 5. In buildings that exceed one or more of the limitations of Section 5.1.2 of TMS 402/ACI 530/ASCE 5, masonry shall be designed in accordance with the engineered design provisions of Section 2101.2.1, 2101.2.2, or 2101.2.3 or the foundation wall provisions of Section 1805.5.

2109.2 Surface-bonded walls. Dry-stacked, surface-bonded concrete masonry walls shall comply with the requirements of Chapter 5 of TMS 402/ACI 530/ASCE 5, except where otherwise noted in this section.

2109.2.1 Strength. Dry-stacked, surface-bonded concrete masonry walls shall be of adequate strength and proportions to support all superimposed loads without exceeding the allowable stresses listed in Table 2109.2.1. Allowable stresses not specified in Table 2109.2.1 shall comply with the requirements of TMs 402/ACI 530/ASCE 5.

TABLE 2109.2.1
ALLOWABLE STRESS GROSS CROSS-SECTIONAL AREA
FOR DRY-STACKED, SURFACE-BONDED CONCRETE MASONRY WALLS

<u>DESCRIPTION</u>	<u>MAXIMUM ALLOWABLE STRESS (psi)</u>
Compression standard block	45
Flexural tension	
Horizontal span	30
Vertical span	18
Shear	10

For SI: 1 pound per square inch = 0.006895MPa.

2109.2.2 Construction. Construction of dry-stacked, surface-bonded masonry walls, including stacking and leveling of units, mixing and application of mortar and curing and protection shall comply with ASTM C 946.

2109.3 Adobe construction. Adobe construction shall comply with this section and shall be subject to the requirements of this code for Type V construction, Chapter 5 of TMS 402/ACI 530/ASCE 5, and this section.

2109.3.1 Unstabilized adobe.

2109.3.1.1 Compressive strength. Adobe units shall have an average compressive strength of 300 psi (2068 kPa) when tested in accordance with ASTM C 67. Five samples shall be tested and no individual unit is permitted to have a compressive strength of less than 250 psi (1724 kPa).

2109.3.1.2 Modulus of rupture. Adobe units shall have an average modulus of rupture of 50 psi (345 kPa) when tested in accordance with the following procedure. Five samples shall be tested and no individual unit shall have a modulus of rupture of less than 35 psi (241 kPa).

2109.3.1.2.1 Support conditions. A cured unit shall be simply supported by 2-inch-diameter (51 mm) cylindrical supports located 2 inches (51 mm) in from each end and extending the full width of the unit.

2109.3.1.2.2 Loading conditions. A 2-inch-diameter (51 mm) cylinder shall be placed at midspan parallel to the supports.

2109.3.1.2.3 Testing procedure. A vertical load shall be applied to the cylinder at the rate of 500 pounds per minute (37 N/s) until failure occurs.

2109.3.1.2.4 Modulus of rupture determination. The modulus of rupture shall be determined by the equation:

$$f_r = 3 PL_s / 2S_w (S_t^2) \quad \text{(Equation 21-2)}$$

where, for the purposes of this section only:

S_w = Width of the test specimen measured parallel to the loading cylinder, inches (mm).

f_r = Modulus of rupture, psi (MPa).

L_s = Distance between supports, inches (mm).

S_t = Thickness of the test specimen measured parallel to the direction of load, inches (mm).

P = The applied load at failure, pounds (N).

2109.3.1.3 Moisture content requirements. Adobe units shall have a moisture content not exceeding 4 percent by weight.

2109.3.1.4 Shrinkage cracks. Adobe units shall not contain more than three shrinkage cracks and any single shrinkage crack shall not exceed 3 inches (76 mm) in length or 1/8 inch (3.2 mm) in width.

2109.3.2 Stabilized adobe.

2109.3.2.1 Material requirements. Stabilized adobe shall comply with the material requirements of unstabilized adobe in addition to Sections 2109.3.2.1.1 and 2109.3.2.1.2.

2109.3.2.1.1 Soil requirements. Soil used for stabilized adobe units shall be chemically compatible with the stabilizing material.

2109.3.2.1.2 Absorption requirements. A 4-inch (102 mm) cube, cut from a stabilized adobe unit dried to a constant weight in a ventilated oven at 212°F to 239°F (100°C to 115°C), shall not absorb more than 2 1/2 percent moisture by weight when placed upon a constantly water-saturated, porous surface for seven days. A minimum of five specimens shall be tested and each specimen shall be cut from a separate unit.

2109.3.3 Allowable stress. The allowable compressive stress based on gross cross-sectional area of adobe shall not exceed 30 psi (207 kPa).

2109.3.3.1 Bolts. Bolt values shall not exceed those set forth in Table 2109.3.3.1.

**TABLE 2109.3.3.1
ALLOWABLE SHEAR ON BOLTS IN ADOBE MASONRY**

DIAMETER OF BOLTS (inches)	MINIMUM EMBEDMENT (inches)	SHEAR (pounds)
1/2		
5/8	12	200
3/4	15	300
7/8	18	400
1	21	500
1 1/8	24	600

For SI: 1 inch = 25.4 mm, 1 pound = 4.448 N.

2109.3.4 Construction.

2109.3.4.1 General.

2109.3.4.1.1 Height restrictions. Adobe construction shall be limited to buildings not exceeding one story, except that two-story construction is allowed when designed by a registered design professional.

2109.3.4.1.2 Mortar restrictions. Mortar for stabilized adobe units shall comply with Chapter 21 or adobe soil. Adobe soil used as mortar shall comply with material requirements for stabilized adobe. Mortar for unstabilized adobe shall be portland cement mortar.

2109.3.4.1.3 Mortar joints. Adobe units shall be laid with full head and bed joints and in full running bond.

2109.3.4.1.4 Parapet walls. Parapet walls constructed of adobe units shall be waterproofed.

2109.3.4.2 Wall thickness. The minimum thickness of exterior walls in one-story buildings shall be 10 inches (254 mm). The walls shall be laterally supported at intervals not exceeding 24 feet (7315 mm). The minimum thickness of interior load-bearing walls shall be 8 inches (203 mm). In no case shall the unsupported height of any wall constructed of adobe units exceed 10 times the thickness of such wall.

2109.3.4.3 Foundations.

2109.3.4.3.1 Foundation support. Walls and partitions constructed of adobe units shall be supported by foundations or footings that extend not less than 6 inches (152 mm) above adjacent ground surfaces and are constructed of solid masonry (excluding adobe) or concrete. Footings and foundations shall comply with Chapter 18.

2109.3.4.3.2 Lower course requirements. Stabilized adobe units shall be used in adobe walls for the first 4 inches (102 mm) above the finished first-floor elevation.

2109.3.4.4 Isolated piers or columns. Adobe units shall not be used for isolated piers or columns in a load-bearing capacity. Walls less than 24 inches (610 mm) in length shall be considered isolated piers or columns.

2109.3.4.5 Tie beams. Exterior walls and interior load-bearing walls constructed of adobe units shall have a continuous tie beam at the level of the floor or roof bearing and meeting the following requirements.

2109.3.4.5.1 Concrete tie beams. Concrete tie beams shall be a minimum depth of 6 inches (152 mm) and a minimum width of 10 inches (254 mm). Concrete tie beams shall be continuously reinforced with a minimum of two No. 4 reinforcing bars. The ultimate compressive strength of concrete shall be at least 2,500 psi (17.2 MPa) at 28 days.

2109.3.4.5.2 Wood tie beams. Wood tie beams shall be solid or built up of lumber having a minimum nominal thickness of 1 inch (25 mm), and shall have a minimum depth of 6 inches (152 mm) and a minimum width of 10 inches (254 mm). Joints in wood tie beams shall be spliced a minimum of 6 inches (152 mm). No splices shall be allowed within 12 inches (305 mm) of an opening. Wood used in tie beams shall be approved naturally decay-resistant or pressure-treated wood.

2109.3.4.6 Exterior finish. Exterior walls constructed of unstabilized adobe units shall have their exterior surface covered with a minimum of two coats of portland cement plaster having a minimum thickness of 3/4 inch (19.1 mm) and conforming to ASTM C 926. Lathing shall comply with ASTM C 1063. Fasteners shall be spaced at 16 inches (406 mm) o.c. maximum. Exposed wood surfaces shall be treated with an approved wood preservative or other protective coating prior to lath application.

2109.3.4.7 Lintels. Lintels shall be considered structural members and shall be designed in accordance with the applicable provisions of Chapter 16.

30. Delete Section 2110 in its entirety and substitute as follows:

SECTION 2110 **GLASS UNIT MASONRY**

2110.1 General. Glass unit masonry construction shall comply with Chapter 7 of TMS 402/ACI 530/ASCE 5 and this section.

2110.1.1 Limitations. Solid or hollow approved glass block shall not be used in fire walls, party walls, fire barriers, fire partitions or smoke barriers, or for load-bearing construction. Such blocks shall be erected with mortar and reinforcement in metal channel-type frames, structural frames, masonry or concrete recesses, embedded panel anchors as provided for both exterior and interior walls or other approved joint materials. Wood strip framing shall not be used in walls required to have a fire-resistance rating by other provisions of this code.

Exceptions:

1. Glass-block assemblies having a fire protection rating of not less than 3/4 hour shall be permitted as opening protectives in accordance with Section 715 in fire barriers, fire partitions, and smoke barriers that have a required fire-resistance rating of 1 hour or less and do not enclose exit stairways, exit ramps, or exit passageways.
2. Glass-block assemblies as permitted in Section 404.5, Exception 2.

31. Revise Chapter 35 as follows:

ACI

ACI 530-~~05~~ 08 Building Code Requirements for Masonry Structures

ACI 530.1-~~05~~ 08 Specifications for Masonry Structures

ASCE/SEI

ASCE/SEI 5-~~05~~ 08 Building Code Requirements for Masonry Structures

ASCE/SEI 6-~~05~~ 08 Specifications for Masonry Structures

TMS

TMS 402-~~05~~ 08 Building Code Requirements for Masonry Structures

TMS 602-~~05~~ 08 Specification for Masonry Structures

Reason: The primary purpose of this code change proposal is to update the existing reference standards for the design and construction of masonry from the 2005 editions to the 2008 editions. The revisions proposed in this code change, while relatively minor in nature, reflect revisions incorporated into the 2008 edition of the Building Code Requirements for Masonry Structures and Specification for Masonry Structures. This code change proposal is one of several to harmonize the design and construction requirements for masonry within the IBC with those in the reference standard. A complete list of revisions incorporated into the referenced standards is available for download at www.masonrystandards.org.

An editorial change to the titles of ACI 530.1 and ASCE/SEI 6 as shown in Chapter 35 is also proposed.

With the publication of the 2008 edition of the Building Code Requirements for Masonry Structures and Specification for Masonry Structures, The Masonry Society (TMS) has become the lead sponsoring organization of the Masonry Standards Joint Committee (MSJC), which is charged with reviewing and maintaining the provisions in the referenced standards. As such, the official designation of these standards has changed from ACI 530/ASCE 5/TMS 402 to TMS 402/ACI 530/ASCE 5 and from ACI 530.1/ASCE 6/TMS 602 to TMS 602/ACI 530.1/ASCE 6 as reflected in the above proposed modifications.

The additional information proposed to be included in Section 2101.3 simply reflect revisions to the reference standards regarding the minimum information to be included on the construction documents. The proposed additions are consistent in intent with existing requirements in Chapters 1 and 16 as well as other material chapters.

The remainder of the changes proposed herein remove provisions transcribed into the IBC from the MSJC standards. While this series of changes may appear substantive, it is instead intended to be editorial as the provisions proposed for removal are already contained in the reference standards. For several years the ICC has been moving toward removing provisions transcribed into the body of the I-Codes, and where applicable, referencing a governing standard. This change proposes just that, with the one exception related to Section 2105. The provisions of this section are retained for the benefit of inspectors and regulators.

Some have voiced a concern in the past that by removing provisions from the IBC it forces them to purchase numerous reference standards. In the case of the masonry design and construction provisions, this statement would be true regardless of whether the transcribed provisions proposed to be removed by this change proposal were accepted or not as only a very small fraction of the MSJC provisions are transcribed. It can be argued that maintaining the transcribed provisions in the current form is a disservice to the safety and welfare of the general public; who may assume or are told that this Chapter contains to complete body of information related to masonry construction, materials, and design. Whether one assumes the role of contractor, designer, building official, inspector, plan checker, or specifier, they still must have the reference document to perform their tasks.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Errata: Add updates to referenced standards as follows:

ACI

ACI 530-~~05~~08 Building Code Requirements for Masonry Structures

ACI 530.1-~~05~~08 Specifications for Masonry Structures

ASCE/SEI

ASCE/SEI 5-~~05~~08 Building Code Requirements for Masonry Structures

ASCE/SEI 6-~~05~~08 Specifications for Masonry Structures

TMS

TMS 402-~~05~~08 Building Code Requirements for Masonry Structures

TMS 602-~~05~~08 Specification for Masonry Structures

Committee Action:

Approved as Modified

Modify proposal as follows:

2103.12 Grout. Grout shall comply with Article ~~2-4-C-4~~ 2.2 of TMS 602/ACI 530.1/ASCE 6.

(Portions of proposal not shown remain unchanged)

Committee Reason: These revisions to the masonry code requirements are necessary to maintain consistency with the latest edition of the MSJC code and specification and this approval is consistent with other actions concerning updates to the masonry provisions. This proposal appropriately maintains masonry QC requirements in the IBC. The modification correlates section references with the published version of the

standard. The committee has a concern with item 8 in Section 2102.3, requiring the size and location of conduits, pipes and sleeves to be shown on the construction documents. Some believe this could have unintended consequences and hope the MSJC can address this item. The committee also indicated that should a conflict arise as a result of another masonry related code change, it is the committee's preference that this proposal should govern.

Assembly Action:

None

AM

Code Change No: S176-07/08

Original Proposal

Sections: 2101.2, 2101.3, Chapter 35

Proponent: Jason Thompson, National Concrete Masonry Association, representing Masonry Alliance for Codes and Standards

1. Revise as follows:

2101.2.2 (Supp) Strength design. Masonry designed by the strength design method shall comply with the provisions of Sections 2106 and 2108, except that AAC masonry shall comply with the provisions of Section 2106, Section 1613.6.3, and Chapter 1 and Appendix A of TMS 402/ACI 530/ASCE 5/TMS 402.

2101.2.3 Prestressed masonry. Prestressed masonry shall be designed in accordance with Chapters 1 and 4 of TMS 402/ACI 530/ASCE 5/TMS 402 and Section 2106. Special inspection during construction shall be provided as set forth in Section 1704.5.

2101.2.4 Empirical design. Masonry designed by the empirical design method shall comply with the provisions of Sections 2106 and 2109 or Chapter 5 of TMS 402/ACI 530/ASCE 5/TMS 402.

2101.2.5 Glass unit masonry. Glass unit masonry shall comply with the provisions of Section 2110 or Chapter 7 of TMS 402/ACI 530/ASCE 5/TMS 402.

2101.2.6 Masonry veneer. Masonry veneer shall comply with the provisions of Chapter 14 or Chapter 6 of TMS 402/ACI 530/ASCE 5/TMS 402.

2101.3 Construction documents. The construction documents shall show all of the items required by this code including the following:

1. Specified size, grade, type and location of reinforcement, anchors and wall ties.
2. Reinforcing bars to be welded and welding procedure.
3. Size and location of structural elements.
4. Provisions for dimensional changes resulting from elastic deformation, creep, shrinkage, temperature and moisture.
5. Loads used in the design of masonry.
6. Specified compressive strength of masonry at stated ages or stages of construction for which masonry is designed, except where specifically exempted by this code.
7. Details of anchorage of masonry to structural members, frames, and other construction, including the type, size, and location of connectors.
8. Size and location of conduits, pipes, and sleeves.
9. The minimum level of testing and inspection as defined in Chapter 17, or an itemized testing and inspection program that meets or exceeds the requirements of Chapter 17.

2. Revise Chapter 35 as follows:

ACI

ACI 530-05 08 Building Code Requirements for Masonry Structures
ACI 530.1-05 08 Specifications for Masonry Structures

ASCE/SEI

ASCE/SEI 5-05 08 Building Code Requirements for Masonry Structures
ASCE/SEI 6-05 08 Specifications for Masonry Structures

TMS

TMS 402-05 08 Building Code Requirements for Masonry Structures
TMS 602-05 08 Specification for Masonry Structures

Reason: The primary purpose of this code change proposal is to update the existing reference standards for the design and construction of masonry from the 2005 editions to the 2008 editions. The revisions proposed in this code change, while relatively minor in nature, reflect revisions incorporated into the 2008 edition of the Building Code Requirements for Masonry Structures and Specification for Masonry Structures. This code change proposal is one of several to harmonize the design and construction requirements for masonry within the IBC with those in the reference standard. A complete list of revisions incorporated into the referenced standards is available for download at www.masonrystandards.org.

An editorial change to the titles of ACI 530.1 and ASCE/SEI 6 as shown in Chapter 35 is also proposed.

With the publication of the 2008 edition of the Building Code Requirements for Masonry Structures and Specification for Masonry Structures, The Masonry Society (TMS) has become the lead sponsoring organization of the Masonry Standards Joint Committee (MSJC), which is charged with reviewing and maintaining the provisions in the referenced standards. As such, the official designation of these standards has changed from ACI 530/ASCE 5/TMS 402 to TMS 402/ACI 530/ASCE 5 and from ACI 530.1/ASCE 6/TMS 602 to TMS 602/ACI 530.1/ASCE 6 as reflected in the above proposed modifications.

The additional information proposed to be included in Section 2101.3 simply reflect revisions to the reference standards regarding the minimum information to be included on the construction documents. The proposed additions are consistent in intent with existing requirements in Chapters 1 and 16 as well as other material chapters.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Errata: Add updates to referenced standards as follows:

ACI

ACI 530-0508 Building Code Requirements for Masonry Structures

ASCE/SEI

ASCE/SEI 5-0508 Building Code Requirements for Masonry Structures

TMS

TMS 402-0508 Building Code Requirements for Masonry Structures

Committee Action:

Approved as Submitted

Committee Reason: These revisions to Section 2101 are necessary to maintain consistency with the latest edition of the MSJC code.

Assembly Action:

None

Final Hearing Results

S176-07/08

AS

Code Change No: **S177-07/08**

Original Proposal

Sections: 2103.2, 2103.8, Table 2103.8(2), 2103.13 (New), 2103.13.4, 2106.13.6, Chapter 35 (New)

Proponent: Jason Thompson, National Concrete Masonry Association, representing Masonry Alliance for Codes and Standards

1. Revise as follows:

2103.2 (Supp) Clay or shale masonry units. Clay or shale masonry units shall conform to the following standards: ASTM C 34 for structural clay load-bearing wall tile; ASTM C 56 for structural clay nonload-bearing wall tile; ASTM C 62 for building brick (solid masonry units made from clay or shale); ASTM C 1088 for solid units of thin veneer brick; ASTM C 126 for ceramic-glazed structural clay facing tile, facing brick and solid masonry units; ASTM C 212 for structural clay facing tile; ASTM C 216 for facing brick (solid masonry units made from clay or shale); ASTM C 652 for hollow brick (hollow masonry units made from clay or shale); ~~and~~ or ASTM C 1405 for glazed brick (single-fired solid brick units).

Exception: Structural clay tile for nonstructural use in fireproofing of structural members and in wall furring shall not be required to meet the compressive strength specifications. The fire-resistance rating shall be determined in accordance with ASTM E 119 or UL 263 and shall comply with the requirements of Table 602.

2103.8 Mortar. Mortar for use in masonry construction shall conform to ASTM C 270 ~~and~~ or shall conform to the proportion specifications of Table 2103.8(1) or the property specifications of Table 2103.8(2). Type S or N mortar conforming to ASTM C 270 shall be used for glass unit masonry. The amount of water used in mortar for glass unit masonry shall be adjusted to account for the lack of absorption. Retempering of mortar for glass unit masonry shall not be permitted after initial set. Unused mortar shall be discarded within 2½ hours after initial mixing, except that unused mortar for glass unit masonry shall be discarded within 1½ hours after initial mixing.

TABLE 2103.8(2) MORTAR PROPERTIES^a

For SI: 1 inch = 25.4 mm, 1 pound per square inch = 6.895kPa.

- a. This aggregate ratio (measured in damp, loose condition) shall not be less than 21/4 and not more than ~~3~~ 3½ times the sum of the separate volumes of cementitious materials.
- b. Average of three 2-inch cubes of laboratory-prepared mortar, in accordance with ASTM C 270.
- c. When structural reinforcement is incorporated in cement-lime or mortar cement mortars, the maximum air content shall not exceed 12 percent.
- d. When structural reinforcement is incorporated in masonry cement mortar, the maximum air content shall not exceed 18 percent.

(Portions of table not shown remain unchanged)

2103.13 Self-consolidating grout. Materials used in self-consolidating grout shall conform to ASTM C 476. The minimum compressive strength of self-consolidating grout shall be 2,000 psi (13.79 MPa) at 28 days when tested in accordance with ASTM C 1019. Self-consolidating grout shall have a slump flow of 24 in. to 30 in. (610 mm to 762 mm) determined in accordance with ASTM C 1611. The Visual Stability Index (VSI) of self-consolidating grout shall be less than or equal to 1 when determined in accordance with ASTM C 1611, Appendix X.1. The addition of admixtures to self-consolidating grout in the field shall not be permitted. Self-consolidating grout shall not be used in AAC masonry construction unless the requirements of Article 1.6 E of TMS 602/ACI 530.1/ASCE 6 are met.

(Renumber subsequent sections)

~~2103.13.4~~ **2103.14.4 Welded wire fabric.** Welded wire fabric shall conform to ASTM A 185 for plain steel-welded wire fabric for concrete reinforcement or ASTM A 497 for welded deformed steel wire fabric for concrete reinforcement.

~~2103.13.6~~ **2103.14.6 Prestressing tendons.** Prestressing tendons shall conform to one of the following standards:

1. Wire ASTM A 421
2. Low-relaxation wire ASTM A 421
3. Strand ASTM A 416
4. Low-relaxation strand ASTM A 416
5. Bar ASTM A 722

Exceptions:

1. Wire, strands and bars not specifically listed in ASTM A 421, ASTM A 416 or ASTM A 722 are permitted, provided they conform to the minimum requirements in ASTM A 421, ASTM A 416 or ASTM A 722 and are approved by the architect/engineer.
2. Bars and wires of less than 150 kips per square inch (ksi) (1034 MPa) tensile strength and conforming to ASTM A 82, ASTM A 510, ASTM A 615, ASTM A 996 or ASTM A 706 are permitted to be used as prestressed tendons, provided that:
 - 2.1. The stress relaxation properties have been assessed by tests according to ASTM E 328 for the maximum permissible stress in the tendon.
 - ~~2.2. Other nonstress-related requirements of ACI 530/ASCE 5/TMS 402, Chapter 4, addressing prestressing tendons are met.~~

2. Add standard to Chapter 35 as follows:

ASTM

C 1611/C 1611M-05 Standard Test Method for Slump Flow of Self-Consolidating Concrete

Reason: The revisions proposed in this code change reflect editorial and substantive revisions incorporated into the 2008 edition of the Building Code Requirements for Masonry Structures (TMS 402/ACI 530/ASCE 5), commonly referred to as the Masonry Standard Joint Committee (MSJC) Code. This code change proposal is one of several to harmonize the design and construction requirements for masonry within the IBC with those in the reference standard. A complete list of revisions incorporated into the reference standard is available for download at www.masonrystandards.org.

The majority of these proposed revisions are editorial in nature. Specific substantive revisions proposed above include:

- 1) Replacing Table 2103.8(1). The existing table in the IBC is incorrect due apparently to a transcription error. The proposed Table 2103.8(1) correctly identifies the proportion requirements in accordance with ASTM C 270.
- 2) Self-consolidating grout is proposed to be added with requirements identical to those adopted by TMS 602/ACI 530.1/ASCE 6. Research documenting the performance of self-consolidating grout in masonry construction is available at: <http://www.ncma.org/research/reports/MR31.pdf>
<http://www.ncma.org/research/reports/MR29.pdf>
- 3) The requirement stating "Other nonstress-related requirements of ACI 530/ASCE 5/TMS 402, Chapter 4, addressing prestressing tendons are met." is proposed for deletion as it was from the reference document. The MSJC felt that this statement was too vague to be consistently enforced and was effectively stipulated redundant corrosion protection requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A review of the standard(s) proposed for inclusion in the code, ASTM C 1611, for compliance with ICC criteria for referenced standards given in Section 3.6 of Council Policy #CP 28 will be posted on the ICC website on or before January 15, 2008.

Public Hearing Results

Note: The following analysis was not in the Code Change Proposal book but was posted on the ICC website.

Analysis: Review of proposed new standard ASTM C 1611/C 1611M-05 indicated that, in the opinion of ICC Staff, the standard did comply with ICC standards criteria.

Committee Action:

Approved as Submitted

Committee Reason: In addition to coordinating portions of Section 2103 with the MSJC code, this proposal adds requirements for self-consolidating grout that include reference to the appropriate ASTM standard.

Assembly Action:

None

AS

Code Change No: **S178-07/08**

Original Proposal

Section: 2103.8, Table 2103.8(1), Table 2103.8(2), Chapter 35

Proponent: Phillip J. Samblanet, The Masonry Society

1. Revise as follows:

2103.8 Mortar. ~~Except for mortars listed in Sections 2103.9, 2103.10, and 2103.11, mortar for use in masonry construction shall conform to ASTM C 270 and Articles 2.1 and 2.6 A of TMS 602/ACI 530.1/ASCE 6. shall conform to the proportion specifications of Table 2103.8(1) or the property specifications of Table 2103.8(2). Type S or N mortar shall be used for glass unit masonry. The amount of water used in mortar for glass unit masonry shall be adjusted to account for the lack of absorption. Retempering of mortar for glass unit masonry shall not be permitted after initial set. Unused mortar shall be discarded within 2 1/2 hours after initial mixing, except that unused mortar for glass unit masonry shall be discarded within 1 1/2 hours after initial mixing.~~

2. Delete without substitution:

~~TABLE 2103.8(1) MORTAR PROPORTIONS~~

~~TABLE 2103.8(2) MORTAR PROPERTIES^a~~

3. Revise Chapter 35 as follows:

ACI

ACI 530-~~05~~ 08 Building Code Requirements for Masonry Structures
ACI 530.1-~~05~~ 08 Specifications for Masonry Structures

ASCE/SEI

ASCE/SEI 5-~~05~~ 08 Building Code Requirements for Masonry Structures
ASCE/SEI 6-~~05~~ 08 Specifications for Masonry Structures

TMS

TMS 402-~~05~~ 08 Building Code Requirements for Masonry Structures
TMS 602-~~05~~ 08 Specification for Masonry Structures

Reason: This change is intended to simplify and clarify the IBC, while correcting errors made in transcription of ASTM requirements into the IBC.

The provisions in this section are no longer consistent with those ASTM C 270 and TMS 602/ACI 530.1/ASCE 6 and are considered incorrect by masonry experts. For example, Tables 2103.8(2) was found to be in error by ICC Structural Masonry Special Inspectors Examination Committee recently, when someone taking the test appealed a question that is consistent with the IBC, but not ASTM C 270 (the issue in question is the amount of sand that is permitted. ASTM C270 allows 3 ½ parts while the IBC limits it to 3 parts). Because of this typographical error, the IBC inadvertently restricts the use of common mortar mixes.

Transcription of requirements is not needed as users already must understand the reference standards. Moreover the transcription causes confusion when inspectors, building officials, designers, and others must try to determine if minor differences occur between the IBC and the referenced standards, and whether these minor differences are intentional or accidental, and whether any differences are important. Because ASTM C 270 and TMS 402/ACI 530.1/ASCE 6 are already required, these transcribed provisions are proposed to be deleted for clarity and brevity, while avoiding confusion between the differences in the provisions.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Errata: Add updates to referenced standards:

ACI

ACI 530.1-~~05~~08 Specifications for Masonry Structures

ASCE/SEI

ASCE/SEI 6-0508 Specifications for Masonry Structures

TMS

TMS 602-0508 Specification for Masonry Structures

Committee Action:

Approved as Modified

Modify proposal as follows:

2103.8 Mortar. ~~Except for mortars listed in Sections 2103.9, 2103.10, and 2103.11, Mortar for use in masonry construction shall conform to ASTM C 270 and Articles 2.1 and 2.6 A of TMS 602/ACI 530.1/ASCE 6, except for mortars listed in Sections 2103.9, 2103.10, and 2103.11.~~

Committee Reason: This proposal resolves conflicts between the IBC table and referenced standards by replacing the IBC requirement with a reference to the MSJC Specification. The modification rearranges the wording of Section 2103.8 that lists mortars not addressed by the MSJC Specification.

Assembly Action:

None

AM

Code Change No: S180-07/08

Original Proposal

Table 1708.1.2, Table 1708.1.4, 2103.12, Table 2103.12, 2105.2.2.1, Chapter 35

Proponent: Phillip J. Samblanet, The Masonry Society

1. Revise tables as follows:

**TABLE 1708.1.2
LEVEL 1 QUALITY ASSURANCE
MINIMUM TESTS AND SUBMITTALS**

Certificates of compliance used in masonry construction.

Verification of f_m and f_{AAC} prior to construction, except where specifically exempted by this code.

Verification of slump flow and visual stability index of self-consolidating grout as delivered to the site in accordance with Article 1.5.B.1.b.3 of TMS 602/ACI 530.1/ASCE 6.

**TABLE 1708.1.4
LEVEL 2 QUALITY ASSURANCE
MINIMUM TESTS AND SUBMITTALS**

Certificates of compliance used in masonry construction.

Verification of f_m and f_{AAC} prior to construction and every 5,000 square feet during construction.

Verification of proportions of materials in premixed or preblended mortar prestressing grout and grout other than self-consolidating grout as delivered to the site.

Verification of slump flow and visual stability index of self-consolidating grout as delivered to the site in accordance with Article 1.5.B.1.b.3 of TMS 602/ACI 530.1/ASCE 6.

2103.12 Grout. Grout shall conform to ~~Table 2103.12~~ Articles 2.2, 2.6 B and 3.5 of TMS 602/ ACI 530.1/ASCE 6 or to ASTM C 476. ~~When grout conforms to ASTM C 476, the grout shall be specified by proportion requirements or property requirements.~~

2. Delete table without substitution:

TABLE 2103.12
GROUT PROPORTIONS BY VOLUME FOR
MASONRY CONSTRUCTION

3. Revise as follows:

2105.2.2.1.1 Clay masonry. The compressive strength of masonry shall be determined based on the strength of the units and the type of mortar specified using Table 2105.2.2.1.1, provided:

1. Units conform to ASTM C 62, ASTM C 216 or ASTM C 652 and are sampled and tested in accordance with ASTM C 67.
2. Thickness of bed joints does not exceed 5/8 inch (15.9 mm).
3. For grouted masonry, the grout meets one of the following requirements:
 - 3.1. Grout conforms to ASTM C 476 or Article 2.2 of TMS 602/ACI 530.1/ASCE 6.
 - 3.2. Minimum grout compressive strength equals or exceeds f'_m but not less than 2,000 psi (13.79MPa). The compressive strength of grout shall be determined in accordance with ASTM C 1019.

2105.2.2.1.2 Concrete masonry. The compressive strength of masonry shall be determined based on the strength of the unit and type of mortar specified using Table 2105.2.2.1.2, provided:

1. Units conform to ASTM C 55 or ASTM C 90 and are sampled and tested in accordance with ASTM C 140.
2. Thickness of bed joints does not exceed 5/8 inch (15.9 mm).
3. For grouted masonry, the grout meets one of the following requirements:
 - 3.1. Grout conforms to ASTM C 476 or Article 2.2 of TMS 602/ACI 530.1/ASCE 6.
 - 3.2. Minimum grout compressive strength equals or exceeds f'_m but not less than 2,000 psi (13.79 MPa). The compressive strength of grout shall be determined in accordance with ASTM C 1019.

2105.2.2.1.3 AAC masonry. The compressive strength of AAC masonry shall be based on the strength of the AAC masonry unit only and the following shall be met:

1. Units conform to ASTM C 1386.
2. Thickness of bed joints does not exceed 1/8 inch (3.2 mm).
3. For grouted masonry, the grout meets one of the following requirements:
 - 3.1. Grout conforms to ASTM C 476 or Article 2.2 of TMS 602/ACI 530.1/ASCE 6.
 - 3.2. Minimum grout compressive strength equals or exceeds f'_{AAC} but not less than 2,000 psi (13.79 MPa). The compressive strength of grout shall be determined in accordance with ASTM C 1019.

4. Revise Chapter 35 as follows:**ACI**

ACI 530-05 08 Building Code Requirements for Masonry Structures

ACI 530.1-05 08 Specifications for Masonry Structures

ASCE/SEI

ASCE/SEI 5-05 08 Building Code Requirements for Masonry Structures

ASCE/SEI 6-05 08 Specifications for Masonry Structures

TMS

TMS 402-05 08 Building Code Requirements for Masonry Structures

TMS 602-05 08 Specification for Masonry Structures

Reason: Self consolidating grout is increasingly being used for reinforced masonry because of its exceptional flowing properties that allow the grout to flow through confined spaces easily, while maintaining the integrity of the mix. This change incorporates the use of self-consolidating grout when the requirements of TMS 602/ACI 530.1/ASCE 6 are met.

Other minor changes that are being made include:

- The second sentence of this Section 2103.12 is being proposed for deletion because it is not needed. ASTM C 476 only has two procedures to specify grout – by proportion and by property. Thus noting this here, is redundant.
- Table 2103.13 is also being proposed to be deleted because it is redundant with ASTM C 476, and leaving it here confusing inspectors and building officials as to the differences between the tables. This has been an issue for the ICC/TMS Structural Masonry Special Inspectors Examination Committee.

- While the change is focused on self-consolidating grout, the “Minimum Test and Submittal” requirements in Table 1708.1.4 are also being updated to:
 - include verification for proportions of prestressing grout as required by TMS 602/ACI 530.1/ASCE 6
 - clarify the requirements for mortar so that verification in this table is directed at proportions of premixed mortar because Table 1704.5.3 already requires verification of proportions of site mixed mortars.

The end result of this change is to update the IBC to permit the use of self consolidating grout but only when the requirements of TMS 602/ACI 530.1/ASCE 6 are met, while clarifying other portions of the Code related to grout materials and requirements. The resulting provisions simplify the Code for inspectors and building officials so they know what needs to be done for both traditional grout and for the increasingly used self-consolidating grout.

This proposal may in fact decrease the cost of construction by allowing the use of self-consolidating grout.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Errata: Add updates to referenced standards as follows:

ACI
ACI 530.1-~~05~~08 Specifications for Masonry Structures

ASCE/SEI
ASCE/SEI 6-~~05~~08 Specifications for Masonry Structures

TMS
TMS 602-~~05~~08 Specification for Masonry Structures

Committee Action:

Approved as Submitted

Committee Reason: This proposal adds the appropriate QA requirements for self-consolidating grout and is consistent with the action taken on S177-07/08.

Assembly Action:

None

Final Hearing Results

S180-07/08

AS

Code Change No: S181-07/08

Original Proposal

Section: 2103.13.6

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing himself

Revise as follows:

2103.13.6 Prestressing tendons. Prestressing tendons shall conform to one of the following standards:

- a. Wire ASTM A 421
- b. Low-relaxation wire ASTM A 421
- c. Strand ASTM A 416
- d. Low-relaxation strand ASTM A 416
- e. Bar ASTM A 722

Exceptions:

1. Wire, strands and bars not specifically listed in ASTM A 421, ASTM A 416 or ASTM A 722 are permitted, provided they conform to the minimum requirements in ASTM A 421, ASTM A 416 or ASTM A 722 and are approved by the ~~architect/engineer~~ registered design professional.

2. Bars and wires of less than 150 kips per square inch (ksi) (1034 MPa) tensile strength and conforming to ASTM A 82, ASTM A 510, ASTM A 615, ASTM A 996 or ASTM A 706 are permitted to be used as prestressed tendons, provided that:
 - 2.1. The stress relaxation properties have been assessed by tests according to ASTM E 328 for the maximum permissible stress in the tendon.
 - 2.2. Other nonstress-related requirements of ACI 530/ASCE 5/TMS 402, Chapter 4, addressing prestressing tendons are met.

Reason: The change is proposed for consistency with the use of “registered design professional” elsewhere in the 2006 IBC (approximately 50 code sections). Section 2103.13.6 is the only instance of “architect/engineer” in the 2006 IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This change to “registered design professional” is an appropriate correction to the code terminology.

Assembly Action:

None

Final Hearing Results

S181-07/08

AS

Code Change No: **S183-07/08**

Original Proposal

Section: 2104.1.2.7

Proponent: Jason Thompson, National Concrete Masonry Association, representing Masonry Alliance for Codes and Standards

Revise as follows:

2104.1.2.7 Grouted masonry. ~~Between grout pours, a horizontal construction joint shall be formed by stopping all wythes at the same elevation and with the grout stopping a minimum of 1 1/2 inches (38 mm) below a mortar joint, except at the top of the wall. Where bond beams occur, the grout pour shall be stopped a minimum of 1/2 inch (12.7 mm) below the top of the masonry. When grouting, form grout keys between grout pours in accordance with the following:~~

1. Form a grout key by terminating the grout a minimum of 1 1/2 in. (38.1 mm) below a mortar joint at vertically grouted spaces.
2. Form a grout key between grout lifts when the first lift is permitted to set prior to placement of the subsequent lift.
3. At beams, terminate the grout pour in the course above or the course below the beam and form a grout key. Completely fill the beam except form a grout key at vertically reinforced cells.

Reason: The revisions proposed in this code change reflect editorial and substantive revisions incorporated into the 2008 edition of the Building Code Requirements for Masonry Structures (TMS 402/ACI 530/ASCE 5), commonly referred to as the Masonry Standard Joint Committee (MSJC) Code. This code change proposal is one of several to harmonize the design and construction requirements for masonry within the IBC with those in the reference standard. A complete list of revisions incorporated into the reference standard is available for download at www.masonrystandards.org.

Specific substantive revisions proposed above include:

Section 2104.1.2.7 is revised to reflect changes incorporated into the reference standard. The requirements are largely the same, but the proposed revision does not require a grout key to be formed when subsequent lifts are placed prior to the previous lifts setting. The resulting language is believed to be clearer and less problematic to enforce and interpret in the field.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: These revised grouted masonry requirements provide consistency with the latest edition of the MSJC code and this approval is consistent with other actions concerning updates to the masonry provisions.

Assembly Action:

None

Final Hearing Results

AS

Code Change No: **S185-07/08**

Original Proposal

Sections: 2105.2.2.1.1, Table 2105.2.2.1.1, 2105.2.2.1.2, 2105.2.2.1.3

Proponent: Jason Thompson, National Concrete Masonry Association, representing Masonry Alliance for Codes and Standards

Revise as follows:

2105.2.2.1.1 Clay masonry. The compressive strength of masonry shall be determined based on the strength of the units and the type of mortar specified using Table 2105.2.2.1.1, provided:

1. Units ~~conform to~~ are sampled and tested to verify conformance with ASTM C 62, ASTM C 216 or ASTM C 652 ~~and are sampled and tested in accordance with ASTM C 67.~~
2. Thickness of bed joints does not exceed 5/8 inch (15.9 mm).
3. For grouted masonry, the grout meets one of the following requirements:
 - 3.1. Grout conforms to ~~ASTM C 476~~ Article 2.2 of TMS 602/ACI 530.1/ASCE 6.
 - 3.2. Minimum grout compressive strength equals or exceeds *f_m* but not less than 2,000 psi (13.79MPa). The compressive strength of grout shall be determined in accordance with ASTM C 1019.

**TABLE 2105.2.2.1.1
COMPRESSIVE STRENGTH OF CLAY MASONRY**

NET AREA COMPRESSIVE STRENGTH OF CLAY MASONRY UNITS (psi)		NET AREA COMPRESSIVE STRENGTH OF MASONRY (psi)
Type M or S mortar	Type N mortar	
1,700	2,100	1,000
3,350	4,150	1,500
4,950	6,200	2,000
6,600	8,250	2,500
8,250	10,300	3,000
9,900	—	3,500
13,200-11,500	—	4,000

For SI: 1 pound per square inch = 0.00689MPa.

2105.2.2.1.2 Concrete masonry. The compressive strength of masonry shall be determined based on the strength of the unit and type of mortar specified using Table 2105.2.2.1.2, provided:

1. Units ~~conform to~~ are sampled and tested to verify conformance with ASTM C 55 or ASTM C 90 ~~and are sampled and tested in accordance with ASTM C 140.~~

2. Thickness of bed joints does not exceed 5/8 inch (15.9 mm).
3. For grouted masonry, the grout meets one of the following requirements:
 - 3.1. Grout conforms to ~~ASTM C 476~~ Article 2.2 of TMS 602/ACI 530.1/ASCE 6.
 - 3.2. Minimum grout compressive strength equals or exceeds f_m but not less than 2,000 psi (13.79 MPa). The compressive strength of grout shall be determined in accordance with ASTM C 1019.

2105.2.2.1.3 AAC masonry. The compressive strength of AAC masonry shall be based on the strength of the AAC masonry unit only and the following shall be met:

1. Units conform to ASTM C 1386.
2. Thickness of bed joints does not exceed 1/8 inch (3.2 mm).
3. For grouted masonry, the grout meets one of the following requirements:
 - 3.1. Grout conforms to ~~ASTM C 476~~ Article 2.2 of TMS 602/ACI 530.1/ASCE 6.
 - 3.2. Minimum grout compressive strength equals or exceeds f_{AAC} but not less than 2,000 psi (13.79 MPa). The compressive strength of grout shall be determined in accordance with ASTM C 1019.

Reason: The revisions proposed in this code change reflect editorial and substantive revisions incorporated into the 2008 edition of the Building Code Requirements for Masonry Structures (TMS 402/ACI 530/ASCE 5), commonly referred to as the Masonry Standard Joint Committee (MSJC) Code. This code change proposal is one of several to harmonize the design and construction requirements for masonry within the IBC with those in the reference standard. A complete list of revisions incorporated into the reference standard is available for download at www.masonrystandards.org.

The majority of these proposed revisions are editorial in nature. Specific substantive revisions proposed above include:

- 1) The minimum unit compressive strength for clay masonry construction in Table 2105.2.2.1.1 is changed from 13,200 psi to 11,500 psi. The value of 13,200 psi was found to be an error in the unit strength method of verifying the masonry compressive strength. As detailed in the MSJC commentary, the equation derived for the unit strength correlation table is:

$$f_u = \frac{f'_m / 1.22 - 400}{B}$$

Where $B = 0.2$ for Type N mortar and $B = 0.25$ for Type S or M mortar. For an f'_m value of 4,000 psi, the unit strength using a Type M or S mortar is indeed 11,500 psi.

- 2) Changing the reference from ASTM C 476 to Article 2.2 of the MSJC standard will help to ensure that subsequent restrictions on the use of the unit strength method in grouted masonry construction that are imposed by the referenced standard are in inadvertently overlooked.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This code change provides clearer, more concise wording of the masonry QA requirements as well as consistency with the latest the MSJC specification.

Assembly Action:

None

Final Hearing Results

S185-07/08

AS

Code Change No: S193-07/08

Original Proposal

Sections: 2111.3, 2111.4, 2113.3, 2113.4

Proponent: Jim W. Sealy, FAIA, and Perry A. Haviland, FAIA, Building Seismic Safety Council of the National Institute of Building Sciences, representing FEMA/BSSC Code Resource Support Committee

Revise as follows:

2111.3 Seismic reinforcing. Masonry or concrete fireplaces shall be constructed, anchored, supported and reinforced as required in this chapter. In Seismic Design Category C or D, masonry and concrete fireplaces shall be reinforced and anchored as detailed in Sections 2111.3.1, 2111.3.2, 2111.4 and 2111.4.1 for chimneys serving fireplaces. In Seismic Design Category A, or B or C, reinforcement and seismic anchorage is not required. In Seismic Design Category E or F, masonry and concrete chimneys shall be reinforced in accordance with the requirements of Sections 2101 through 2108.

2111.4 Seismic anchorage. Masonry and concrete chimneys in Seismic Design Category C or D shall be anchored at each floor, ceiling or roof line more than 6 feet (1829 mm) above grade, except where constructed completely within the exterior walls. Anchorage shall conform to the following requirements.

2113.3 Seismic reinforcing. Masonry or concrete chimneys shall be constructed, anchored, supported and reinforced as required in this chapter. In Seismic Design Category C or D, masonry and concrete chimneys shall be reinforced and anchored as detailed in Sections 2113.3.1, 2113.3.2 and 2113.4. In Seismic Design Category A, or B or C, reinforcement and seismic anchorage is not required. In Seismic Design Category E or F, masonry and concrete chimneys shall be reinforced in accordance with the requirements of Sections 2101 through 2108.

2113.4 Seismic anchorage. Masonry and concrete chimneys and foundations in Seismic Design Category C or D shall be anchored at each floor, ceiling or roof line more than 6 feet (1829 mm) above grade, except where constructed completely within the exterior walls. Anchorage shall conform to the following requirements.

Reason: The purpose of this change is to extend the IBC provisions for reinforcing and anchorage of masonry and concrete fireplaces and chimneys to Seismic Design Category C. Many unreinforced masonry chimneys have been damaged during moderate earthquakes that have occurred in Seismic Design Category C locations such as the Nisqually Washington Earthquake (2001), Borah Peak Idaho Earthquake (1983) and the Coalinga California Earthquake (1983), damaged many unreinforced chimneys. In the case of the Borah Peak earthquake, a loss of life occurred due to the collapse of a masonry chimney at a dwelling ("The Boarah Peak, Idaho, Earthquake of October 18, 1983," *Earthquake Spectra* 2, No. 1, November 1985: 1-248).

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: Masonry chimneys are the most vulnerable part of a residence in an earthquake. Extending the current requirements to include Seismic Design Category C is a prudent measure.

Assembly Action:

None

Original Proposal

Sections: 2111.8; IRC R1001.8

Proponent: Jim Buckley, Buckley Rumford Co., representing Masonry Alliance for Codes and Standards (MACS) & Clay Flue Lining Institute (CFLI)

THESE PROPOSALS ARE ON THE AGENDA OF THE IBC STRUCTURAL AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Revise as follows:

2111.8 Smoke chamber walls. Smoke chamber walls shall be constructed of solid masonry units, hollow masonry units grouted solid, stone or concrete. The total minimum thickness of front, back and side walls shall be 8 inches (203 mm) of solid masonry. The inside surface shall be parged smooth with refractory mortar conforming to ASTM C 199. ~~Corbelling of masonry units shall not leave unit cores exposed to the inside of the smoke chamber. The inside surface of corbeled masonry shall be parged smooth. Where no lining is provided, the total minimum thickness of front, back and sidewalls shall be 8 inches (203 mm) of solid masonry.~~ When a lining of firebrick at least 2 inches (51 mm) thick, or a lining of vitrified clay at least 5/8 inch (15.9 mm) thick, is provided, the total minimum thickness of front, back and sidewalls shall be 6 inches (152 mm) of solid masonry, including the lining. Firebrick shall conform to ASTM ~~C 27~~ or ASTM C 1261 and shall be laid with refractory mortar conforming to ASTM C 199. Vitrified clay linings shall conform to ASTM C 315.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R1001.8 Smoke chamber. Smoke chamber walls shall be constructed of solid masonry units, hollow masonry units grouted solid, stone or concrete. The total minimum thickness of front, back and side walls shall be 8 inches (203 mm) of solid masonry. The inside surface shall be parged smooth with refractory mortar conforming to ASTM C 199. ~~Corbelling of masonry units shall not leave unit cores exposed to the inside of the smoke chamber.~~ When a lining of firebrick at least 2 inches (51 mm) thick, or a lining of vitrified clay at least 5/8 inch (16 mm) thick, is provided, the total minimum thickness of front, back and side walls shall be 6 inches (152 mm) of solid masonry, including the lining. Firebrick shall conform to ASTM ~~C 27~~ or C 1261 and shall be laid with medium duty refractory mortar conforming to ASTM C 199. Vitrified clay linings shall conform to ASTM C 315. ~~Where no lining is provided, the total minimum thickness of front, back and side walls shall be 8 inches (203 mm) of solid masonry. When the inside surface of the smoke chamber is formed by corbeled masonry, the inside surface shall be parged smooth.~~

Reason: To require at least some liner able to withstand 1800 degrees F as required of all the other fireplace and chimney lining materials. Cores in corbelled masonry will be covered if the smoke chamber is required to be parged with refractory mortar anyway. Also to reference appropriate ASTM standards.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing Results

PART I – IBC STRUCTURAL

Committee Action:

Approved as Submitted

Committee Reason: This proposal promotes better integrity for masonry fireplaces, by specifying minimum requirements for the fireplace smoke chamber.

Assembly Action:

None

**PART II – IRC B/E
Committee Action:**

Approved as Submitted

Committee Reason: This change adds parging to the smoke chamber. Also provides cover for cores in corbelled units.

Assembly Action:

None

Final Hearing Results

**S194-07/08, Part I AS
S194-07/08, Part II AS**

Code Change No: S198-07/08

Original Proposal

Sections: 2113.11.1; IRC R1003.11.1

Proponent: Jim Buckley, Buckley Rumford Co., representing Masonry Alliance for Codes and Standards (MACS) & Clay Flue Lining Institute (CFLI)

THESE PROPOSALS ARE ON THE AGENDA OF THE IBC STRUCTURAL AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Revise as follows:

2113.11.1 Residential-type appliances (general). Flue lining systems shall comply with one of the following:

1. Clay flue lining complying with the requirements of ASTM C 315, ~~or equivalent.~~
2. Listed chimney lining systems complying with UL 1777.
3. Factory-built chimneys or chimney units listed for installation within masonry chimneys.
4. Other approved materials that will resist corrosion, erosion, softening or cracking from flue gases and condensate at temperatures up to 1,800°F (982°C).

PART II – IRC BUILDING/ENERGY

Revise as follows:

R1003.11.1 Residential-type appliances (general). Flue lining systems shall comply with one of the following:

1. Clay flue lining complying with the requirements of ASTM C 315 ~~or equivalent.~~
2. Listed chimney lining systems complying with UL 1777.
3. Factory-built chimneys or chimney units listed for installation within masonry chimneys.
4. Other approved materials that will resist corrosion, erosion, softening or cracking from flue gases and condensate at temperatures up to 1,800°F (982°C)

Reason: What's "equivalent"? Just meet the standard.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

**PART I – IBC STRUCTURAL
Committee Action:**

Approved as Submitted

Committee Reason: This code change removes unnecessary wording. Equivalency is already allowed by Section 104.11 of the code.

Assembly Action:

None

**PART II – IRC B/E
Committee Action:****Approved as Submitted****Committee Reason:** This change deletes the redundant term "or equivalent". Section R104.11 of the code already permits alternate materials.**Assembly Action:****None****Final Hearing Results**

S198-07/08, Part I	AS
S198-07/08, Part II	AS

Code Change No: S201-07/08**Original Proposal****Section: 2203****Proponent:** Bonnie Manley, American Iron and Steel Institute, representing American Institute of Steel Construction**1. Revise as follows:**

2203.1 Identification. Identification of structural steel members shall comply with the requirements contained in AISC 360. Other steel furnished for structural load-carrying purposes shall be properly identified for conformity to the ordered grade in accordance with the specified ASTM standard or other specification and the provisions of this chapter. Steel that is not readily identifiable as to grade from marking and test records shall be tested to determine conformity to such standards.

2203.2 Protection. Painting of structural steel members shall comply with the requirements contained in AISC 360. Individual structural members and assembled panels of cold-formed steel construction, except where fabricated of approved corrosion-resistant steel or of steel having a corrosion-resistant or other approved coating, shall be protected against corrosion with an approved coat of paint, enamel or other approved protection.

Reason: *Section 2203.1:* This modification, similar to the first sentence of Section 2203.2, clarifies that the identification of structural steel members should be in accordance with the requirements of AISC 360, *Specification for Structural Steel Buildings*. In particular, AISC 360, Section M5.5 addresses the identification of steel.

Section 2203.2: This modification clarifies that it is the defined term, "structural steel members," that is to be in accordance with AISC 360. The term is defined in Section 2202.1 and includes rolled steel structural shapes other than cold-formed steel or steel joist members. The remainder of the paragraph is unchanged.

Cost Impact: The code change proposal will not increase the cost of construction.**Public Hearing Results****Committee Action:****Approved as Submitted****Committee Reason:** This change adopts the material-specific approach of the recognized material standard for identifying structural steel members.**Assembly Action:****None****Final Hearing Results**

S201-07/08	AS
-------------------	-----------

Code Change No: S202-07/08

Original Proposal

Section: 2203

Proponent: Bonnie Manley, American Iron and Steel Institute, representing American Iron and Steel Institute

Revise as follows:

2203.1 Identification. Identification of cold-formed steel members shall comply with the requirements contained in AISI S100. Identification of cold-formed steel light frame construction shall also comply with the requirements contained in AISI S200. Other steel furnished for structural load-carrying purposes shall be properly identified for conformity to the ordered grade in accordance with the specified ASTM standard or other specification and the provisions of this chapter. Steel that is not readily identifiable as to grade from marking and test records shall be tested to determine conformity to such standards.

2203.2 Protection. Painting of structural steel shall comply with the requirements contained in AISC 360. Individual structural members and assembled panels of cold-formed steel construction, except where fabricated of approved corrosion-resistant steel or of steel having a corrosion-resistant or other approved coating, shall be protected against corrosion with an approved coat of paint, enamel or other approved protection in accordance with the requirements contained in AISI S100. Protection of cold-formed steel light frame construction shall also comply with the requirements contained in AISI S200.

Reason: *Section 2203.1:* This modification clarifies that the identification of cold-formed steel members should be in accordance with the requirements of AISI S100. In particular, AISI S100, Section A addresses the identification of cold-formed steel. This change also clarifies that cold-formed steel light frame construction should be identified in accordance with the additional requirements of AISI S200, Section A5.

Section 2203.2: This modification clarifies that the protection of cold-formed steel members should be in accordance with the general requirements of AISI S100. In particular, AISI S100, Section A addresses the protection of cold-formed steel from corrosion. This change also clarifies that cold-formed steel light frame construction should be protected in accordance with the additional requirements of AISI S200, Section A4

The primary reason for making these recommendations is to clarify right upfront in Chapter 22 that there are accepted consensus standards that govern the identification and protection of cold formed steel and cold-formed steel light frame construction.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Errata: Correct Section 2203.2 to read as follows:

2203.2 Protection. Painting of structural steel shall comply with the requirements contained in AISC 360. Individual structural members and assembled panels of cold-formed steel construction, except where fabricated of approved corrosion-resistant steel or of steel having a corrosion-resistant or other approved coating, shall be protected against corrosion with an approved coat of paint, enamel or other approved protection in accordance with the requirements contained in AISI S100. Protection of cold-formed steel light frame construction shall also comply with the requirements contained in AISI S200.

Committee Action:

Approved as Submitted

Committee Reason: This code change clarifies the identification and protection of cold-formed steel members by adding references to the applicable material standard.

Assembly Action:

None

Final Hearing Results

S202-07/08

AS

Code Change No: **S204-07/08**

Original Proposal

Sections: 1604.3.3, 2203.2, 2206.1, 2206.5, Chapter 35 (New)

Proponent: Bonnie Manley, American Iron and Steel Institute, representing Steel Joist Institute

1. Revise as follows:

1604.3.3 Steel. The deflection of steel structural members shall not exceed that permitted by AISC 360, AISI-NAS, AISI-General, AISI-Truss, ASCE 3, ASCE 8, SJI CJ-1.0, SJI JG-1.1, SJI K-1.1 or SJI LH/DLH-1.1, as applicable.

2203.2 Protection. Painting of structural steel shall comply with the requirements contained in AISC 360. Painting of open-web steel joists and joist girders shall comply with the requirements of SJI CJ-1.0, SJI JG-1.1, SJI K-1.1, and SJI LH/DLH-1.1. Individual structural members and assembled panels of cold-formed steel construction, except where fabricated of approved corrosion-resistant steel or of steel having a corrosion-resistant or other approved coating, shall be protected against corrosion with an approved coat of paint, enamel or other approved protection.

2206.1 General. The design, manufacture and use of open web steel joists and joist girders shall be in accordance with one of the following Steel Joist Institute (SJI) specifications:

1. SJI CJ-1.0
- ~~2~~4. SJI K-1.1
- ~~3~~2. SJI LH/DLH-1.1
- ~~4~~3. SJI JG-1.1

Where required, the seismic design of buildings shall be in accordance with the additional provisions of Section 2205.2 or 2210.5.

2206.5 Certification. At completion of manufacture fabrication, the steel joist manufacturer shall submit a certificate of compliance in accordance with Section 1704.2.2 stating that work was performed in accordance with approved construction documents and with SJI standard specifications.

2. Add standard to Chapter 35 as follows:

Steel Joist Institute

CJ-1.0 —06 Standard Specification for Composite Steel Joists, CJ-Series

Reason: Published in May 2006 as an ANSI standard, this new specification covers the load and resistance factor design (LRFD), manufacture, and use of simply-supported open web composite steel joists, CJ-Series. Specifically, this standard includes the following requirements on the limits of deflection for composite steel joists:

SJI CJ-1.0:

104.10 DEFLECTION

The deflection due to the design live load shall not exceed the following:

Floors: 1/360 of span.

Roofs: 1/360 of span where a plaster ceiling is attached or suspended.
1/240 of span for all other cases.

The specifying professional shall give due consideration to the effects of deflection, both short and long term, and vibration in the selection of composite joists. All deflection calculations should account for the inherent flexibility of the open web configuration.

This code change adds a new reference document to IBC Section 2206.1. Published in May 2006 as an ANSI standard, this new SJI specification covers the load and resistance factor design (LRFD), manufacture, and use of simply-supported open web composite steel joists, CJ-Series.

The modification in IBC Section 2206.5 corrects the terminology. SJI prefers not to use the word "fabrication" in regard to joist products. They are a manufactured product.

Currently, Section 2203.2 does not address the "protection" of joists and joist girders. Since the SJI specifications cover this topic for each type of joist and joist girder, references to the SJI specifications have been added to this section to aid the user.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Note: The following analysis was not in the Code Change Proposal book but was posted on the ICC website.

Analysis: Review of proposed new standard SJI CJ-1.0-06 indicated that, in the opinion of ICC Staff, the standard did comply with ICC standards criteria.

Committee Action: **Approved as Submitted**

Committee Reason: It is appropriate to reference the new standard for composite steel joists. This proposal also clarifies the protection requirements for open web steel joist and joist girders by referring directly to the applicable material standards.

Assembly Action: **None**

Final Hearing Results

S204-07/08

AS

Code Change No: S205-07/08

Original Proposal

Section: 2208.1, Chapter 35

Proponent: Victor D. Azzi, PhD, PE, Consulting Structural Engineer, representing Rack Manufacturers Institute

Revise as follows:

2208.1 Storage racks. The design, testing and utilization of industrial steel storage racks shall be in accordance with the *RMI/ANSI MH 16.1 Specification for the Design, Testing and Utilization of Industrial Steel Storage Racks*. Racks in the scope of this specification include industrial pallet racks, movable shelf racks and stacker racks made of cold-formed or hot-rolled steel structural members. Such rack types also include push-back rack, pallet-flow rack, case-flow rack pick modules, rack supported platforms, and the storage rack portion of any rack structure that acts as support for the exterior walls and roof, except as noted; and ~~does not apply to~~ other types of racks, such as drive-in and drive-through racks, cantilever racks, or portable racks or rack buildings. Where required, the seismic design of storage racks shall be in accordance with the provisions of Section 15.5.3 of ASCE 7.

Revise Chapter 35 as follows:

Rack Manufacturing Institute

RMI/ANSI MH 16.1-07(2000) Specification for Industrial Steel Storage Racks

Reason: *RMI/ANSI MH 16.1-2007, Specification for the Design, Testing, and Utilization of Industrial Steel Storage Racks*, is designed to be a stand-alone Standard to be adopted by reference. For a number of years and several provision- and code-change cycles, the Rack Manufacturers Institute has worked to harmonize its Specification with the model codes and with the code-resource and seismic-provision documents. Working with the Non-Building Structures committees of the FEMA/BSSC TS-8 and ASCE 7, and the Task Group on *FEMA/BSSC 460(2005), Seismic Considerations for Steel Storage Racks Located in Areas Open to the Public*, the seismic provisions have been developed and stated to be self-sufficient, incorporating the results of the work of those efforts. For those who abide by *RMI/ANSI MH 16.1-2007*, there is no longer a need for the qualifying remarks and amendments as expressed in Section 15.4 and Section 15.5.1 of Section 15.5.3 of ASCE 7.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action: **Approved as Modified**

Modify proposal as follows:

2208.1 Storage racks. The design, testing and utilization of industrial steel storage racks, made of cold-formed or hot-rolled steel structural members, shall be in accordance with the *RMI/ANSI MH 16.1*. ~~Racks in the scope of this specification include industrial pallet racks, movable shelf racks and stacker racks made of cold-formed or hot-rolled steel structural members. Such rack types also include push-back rack, pallet-flow~~

rack, case flow rack pick modules, rack supported platforms, and the storage rack portion of any rack structure that acts as support for the exterior walls and roof, except as noted; and not other types of racks, such as drive-in and drive-through racks, cantilever racks, or portable racks. Where required by ASCE 7, the seismic design of storage racks shall be in accordance with the provisions of Section 15.5.3 of ASCE 7, except that items (1), (2), and (3) of Section 15.5.3 of ASCE 7 do not apply when the rack design satisfies RMI/ANSI MH 16.1.

Rack Manufacturing Institute

RMI/ANSI MH 16.1-07 08 Specification for the Design, Testing and Utilization of Industrial Steel Storage Racks

Committee Reason: The proposal to refer to the latest version of the standard provides clarifications that address many problems in the design of racks. The modification removes redundant language regarding the scope of the standard. In addition it corrects the date of the standard to 2008 and clarifies the applicability of ASCE 7 Section 15.5.3.

Assembly Action:

None

Final Hearing Results

S205-07/08

AM

Code Change No: **S206-07/08**

Original Proposal

Section: 2209.1

Proponent: Bonnie Manley, American Iron and Steel Institute, representing American Iron and Steel Institute

Revise as follows:

2209.1 General. The design of cold-formed carbon and low-alloy steel structural members shall be in accordance with ~~AISI-NAS AISI S100~~. The design of cold-formed stainless-steel structural members shall be in accordance with ASCE 8. Cold-formed steel light-framed construction shall also comply with Section 2210.

Reason: This code change proposal updates the reference to AISI's *North American Specification for the Design of Cold-Formed Steel Structural Members*, 2007 edition, which has been given the new number designation of AISI S100. This edition of AISI S100, as its name implies, is intended for use throughout Canada, Mexico, and the United States, and supersedes the 2001 edition with the 2004 supplement. AISI S100-07 was developed by a joint effort of the American Iron and Steel Institute's Committee on Specifications, the Canadian Standards Association's Technical Committee on Cold Formed Steel Structural Members (S136), and Camara Nacional de la Industria del Hierro y del Acero (CANACERO) in Mexico.

Since AISI S100-07 is intended for use in Canada, Mexico, and the United States, it uses a format that allows for requirements particular to each country. This results in a main document – Chapters A through G and Appendix 1 and 2 – that is intended for use in all three countries, and two country-specific appendices (A and B). Appendix A is required for use in both the United States and Mexico, and Appendix B is required for use in Canada.

Reflecting its North American scope, AISI S100-07 provides an integrated treatment of Allowable Strength Design (ASD), Load and Resistance Factor Design (LRFD), and Limit States Design (LSD). This is accomplished by including the appropriate resistance factors (ϕ) for use with LRFD and LSD and the appropriate factors of safety (Ω) for use with ASD. It should be noted that the use of LSD is limited to Canada and the use of LRFD and ASD is limited to the United States and Mexico.

AISI S100-07 provides well-defined procedures for the design of load-carrying cold-formed steel members in buildings, as well as other applications, provided that proper allowances are made for dynamic effects. The provisions reflect the results of continuing research to develop new and improved information on the structural behavior of cold-formed steel members. The major changes made in this edition of AISI S100, compared to the previous edition, are summarized as follows:

Reorganization

- The design provisions are reorganized according to their applicability to wall studs and wall stud assemblies (Section D4), floor, roof, or wall steel diaphragm construction (Section D5), and metal roof and wall systems (Section D6). Accordingly, provisions under Chapters C and D of previous editions are relocated.

Definitions

- Country specific terms are indicated in Section A1.3, "Definitions"
- This edition of AISI S100 utilizes terminology jointly defined by AISC and AISI.

Materials

- Provisions for applications of other steels (Section A2.2) have been rewritten.

Strength

- Strength reduction provisions (Section A2.3.2) are introduced for high-strength and low-ductility closed-box section members.

Elements

- The effective width equation (Eq. B2.2-2) for uniformly compressed stiffened elements with circular holes has been revised.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

- New provisions for unstiffened elements and edge stiffeners with stress gradient (Section B3.2) are introduced.
- The provisions for determining the effective width of uniformly compressed elements with one intermediate stiffener (previously in Section B4.1) have been replaced by the provisions of B5.1.

Members

- Provisions for distortional buckling for beams (Section C3.1.4) and columns (C4.2) are introduced.
- The design provisions for bearing stiffeners (previously termed “transverse stiffeners”) have been revised.
- Provisions for the web crippling strength for C- or Z-members with an overhang are added in Section C3.4.1.
- The equations for members subjected to combined bending and web crippling have been recalibrated.
- Provisions for considering combined bending and torsional loading (Section C3.6) are added.

Member Bracing

- Explicit equations for determining the required bracing force for members having neither flange connected to sheathing are provided.
- Provisions for determining the required bracing force and stiffness of a compression member are introduced.

Wall Stud and Wall Stud Assemblies

- The sheathing braced design provisions have been removed.
- New framing standards are referenced.

Floor, Roof, or Wall Steel Diaphragm Construction

- The safety factors and the resistance factors for diaphragms (Section D5) have been revised.

Metal Roof and Wall System

- New provisions for Z-section compression members having one flange fastened to a standing seam roof (Section D6.1.4) are added for the United States and Mexico.
- For standing seam roof panel systems, a load reduction is permitted in the United States and Mexico for load combinations that include wind uplift.
- The provisions for determining the anchorage forces and required stiffness for a purlin roof system under gravity load with the top flange connected to metal sheathing have been revised.

Connections

- Provisions for shear strength determination of welded sheet-to-sheet connections are added.
- An interaction check for screws subjected to combined shear and pull-over is added.
- The design provisions for block shear rupture (Section E5.3) have been revised.

Appendix B

- The section for delivered minimum thickness for Canada is deleted.
- The specified loads (Section A3.1) and the load factors and load combinations for LSD (Section A6.1.2) for Canada have been revised.

New Appendices

- Appendix 1, Direct Strength Design for Cold-Formed Steel Structural Members, is added. The Direct Strength Method provides alternative design provisions for several sections of Chapters C and D.
- Appendix 2, Second Order Analysis, is added. Appendix 2 provides alternative method for considering the second order effect in members subjected to compression and bending.

This code change also makes an editorial change from “light-framed” to “light-frame”, which is preferred by the industry. This editorial change should be made throughout the IBC. The addition of “also” is intended to clarify that AISI S100 is to be used in conjunction with the AISI standards adopted in IBC Section 2210.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This change is consistent with the standard update approved in S238-07/08. The change in referring to AISI S100 is editorial correction to reflect the new designation of the AISI standard.

Assembly Action:

None

Final Hearing Results

S206-07/08

AS

Code Change No: **S207-07/08**

Original Proposal

Section: 2209.2, Chapter 35 (New)

Proponent: Bonnie Manley, American Iron and Steel Institute, representing Steel Deck Institute

1. Revise as follows:

2209.2 Steel decks. The design and construction of cold-formed steel decks shall be in accordance with this section.

2209.2.1 Composite slabs on steel decks. Composite slabs of concrete and steel deck shall be permitted to be designed and constructed in accordance with ASCE 3 or ANSI/SDI-C1.0.

2209.2.2 Non-composite steel floor decks. Non-composite steel floor decks shall be permitted to be constructed in accordance with ANSI/SDI-NC1.0.

2209.2.3 Steel roof deck. Steel roof decks shall be permitted to be designed and constructed in accordance with ANSI/SDI-RD1.0.

2. Add standards to Chapter 35 as follows:

Steel Deck Institute

<u>C1.0-06</u>	<u>Standard for Composite Steel Floor Deck</u>
<u>NC1.0-06</u>	<u>Standard for Non-Composite Steel Floor Deck</u>
<u>RD1.0-06</u>	<u>Standard for Steel Roof Deck</u>

Reason: This code change proposal introduces three new SDI standards on cold-formed steel decks. It is intended that users be permitted to use these documents in lieu of the more formal approach of AISI S100, *North American Specification for the Design of Cold-Formed Steel Structural Members*. The scope of the documents is as follows:

ANSI/SDI C1.0: "This Specification for Composite Steel Deck shall govern the materials, design, and erection of cold formed steel deck which acts as a permanent form and as positive reinforcement for a structural concrete slab."

ANSI/SDI NC1.0: "This Specification for Non-Composite Steel Floor Deck shall govern the materials, design, and erection of cold formed non-composite steel deck used as a form for reinforced concrete slabs."

ANSI/SDI RD1.0: "This Specification for Steel Roof Deck shall govern the materials, design, and erection of cold formed steel deck used for the support of roofing materials, design live loads and SDI construction loads."

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Analysis: Review of proposed new standards SDI C1.0-06, NC1.0-06 and RD1.0-06 indicated that, in the opinion of ICC Staff, the standards did comply with ICC standards criteria.

Committee Action:

Disapproved

Committee Reason: There are some technical issues with the steel deck standards, regarding the use of fibers to substitute for steel reinforcement required by ACI 318 that should be resolved. This was evidenced by testimony on proposed modifications to both the composite steel floor deck and non-composite floor deck standards.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 17:

Thomas Sputo, PhD., PE, SE, Steel Deck Institute, requests Approval as Modified by this Public Comment.

Replace proposal as follows:

2209.2.2 Non-composite steel floor decks. Non-composite steel floor decks shall be permitted to be designed and constructed in accordance with ANSI/SDI-NC1.0, as modified in Section 2209.2.1.1.

2209.2.2.1 ANSI/SDI-NC1.0 Section 2.4B1. Replace Section 2.4B1 of ANSI/SDI-NC1.0 with the following:

1. General: The design of the concrete slabs shall be done in accordance with the ACI *Building Code Requirements for Reinforced Concrete*. The minimum concrete thickness above the top of the deck shall be 1 ½ inches (38 mm).

Steel Deck Institute

NC1.0-06 Standard for Non-Composite Steel Floor Deck

Commenter's Reason: This proposed modification to SDI NC1.0 is intended to remove any doubt that non-composite concrete slabs must be designed in accordance with the applicable reference standard -- ACI 318. By specifically requiring compliance with ACI 318 (which does not permit fibers or fibrous admixtures), and removing any mention of fibers or fibrous admixtures in SDI NC1.0, Section 2.4B1, the IBC Structural Committee's reason for Disapproval has been addressed.

Section 2.4B1 – Text as it appears in SD1-NC1.0:

1. **General:** The design of the concrete slabs shall be done in accordance with the ACI *Building Code Requirements for Reinforced Concrete*. The minimum concrete thickness above the top of the deck shall be 1-1/2 inches (38 mm). Randomly distributed fibers or fibrous admixtures shall not be substituted for welded wire fabric tensile reinforcement.

Public Comment 18:

Thomas Sputo, PhD., PE, SE, Steel Deck Institute, requests Approval as Modified by this Public Comment.

Replace proposal as follows:

2209.2.3 Steel roof deck. Steel roof decks shall be permitted to be designed and constructed in accordance with ANSI/SDI-RD1.0.

Steel Deck Institute

RD1.0-06 Standard for Steel Roof Deck

Commenter's Reason: Based on testimony from the floor, the IRC Building/Energy Committee disapproved the original proposal, citing confusion regarding the use of fibers as a substitute for steel reinforcement in both the composite steel floor deck and non-composite floor deck standards. However, the testimony from the floor regarding the substitution of fibers for steel reinforcement did not apply to the third SDI standard proposed for inclusion in Section 2209.2 – SDI-RD1.0, Standard for Steel Roof Deck. This comment simply recommends this document for adoption in the IBC.

Final Hearing Results

S207-07/08

AMPC17, 18

Code Change No: S208-07/08

Original Proposal

Sections: 2210, 2210.5 (New), 2210.6, Chapter 35 (New)

Proponent: Bonnie Manley, American Iron and Steel Institute

1. Revise as follows:

**SECTION 2210
COLD-FORMED STEEL
LIGHT-FRAMED CONSTRUCTION**

2210.1 General. ~~The design, installation and construction of cold-formed carbon or low-alloy steel, structural and nonstructural steel framing shall be in accordance with AISI-General and AISI-NAS.~~ The design and installation of

structural members and non-structural members utilized in cold-formed steel light frame construction where the specified minimum base steel thickness is between 0.0179 inches (0.455 mm) and 0.1180 inches (2.997 mm) shall be in accordance with AISI S200 and Sections 2210.2 through 2210.7, as applicable.

~~2210.2 Headers Header design. The design and installation of cold-formed steel box headers, back-to-back headers and single and double L headers used in single span conditions for load carrying purposes shall be in accordance with AISI Header, subject to the limitations therein. Headers, including box and back-to-back headers, and double and single L-headers shall be designed in accordance with AISI S212 or in accordance with AISI S100.~~

~~2210.3 Trusses Truss design. The design, quality assurance, installation and testing of cold-formed steel trusses shall be in accordance with AISI Truss, subject to the limitations therein. Trusses shall be designed in accordance with AISI S214.~~

~~2210.4 Wall stud design. The design and installation of cold-formed steel studs for structural and nonstructural walls shall be in accordance with AISI WSD. Wall studs shall be designed in accordance with AISI S211 or in accordance with AISI S100.~~

2. Add new text as follows:

2210.5 Floor and roof system design. Framing for floor and roof systems in buildings shall be designed in accordance with AISI S210 or in accordance with AISI S100.

3. Revise as follows:

~~2210.5 Lateral design. The design of light-framed cold-formed steel walls and diaphragms to resist wind and seismic loads shall be in accordance with AISI Lateral.~~ 2210.6 Lateral design. Light-framed shear walls, diagonal strap bracing that is part of a structural wall and diaphragms to resist wind, seismic and other in-plane lateral loads shall be designed in accordance with AISI S213.

~~2210.6 2210.7 Prescriptive framing. Detached one- and two-family dwellings and townhouses, up to two less than or equal to three stories in height, shall be permitted to be constructed in accordance with AISI-PM S230 subject to the limitations therein.~~

4. Add standard to Chapter 35 as follows:

AISI

S210-07 North American Standard for Cold-formed Steel Framing – Floor and Roof System Design

Reason: In this code change proposal, IBC Sections 2210.1 thru 2210.5 are recommended for deletion and the language from the 2007 edition of AISI S100, Section D4 is inserted with only minor editorial modifications. This new language adopts the 2007 editions of all the AISI Standards for Cold-Formed Steel Framing and provides the appropriate charging language. A brief summary of the changes to the AISI standards is provided below. A more extensive summary can be obtained on the AISI website: www.steel.org.

This code change also makes an editorial change from "light-framed" to "light-frame", which is preferred by the industry. This editorial change should be made throughout the IBC.

Summary of Changes to AISI Standards:

The 2007 editions of the AISI standards for cold-formed steel framing have just been completed. This work by the AISI Committee on Framing Standards includes the revision of six current standards and the issuing two new standards:

Revised Standards:

- AISI S200-07: North American Standard for Cold-Formed Steel Framing – General Provisions
- AISI S211-07: North American Standard for Cold-Formed Steel Framing – Wall Stud Design
- AISI S212-07: North American Standard for Cold-Formed Steel Framing – Header Design
- AISI S213-07: North American Standard for Cold-Formed Steel Framing – Lateral Design
- AISI S214-07: North American Standard for Cold-Formed Steel Framing – Truss Design
- AISI S230-07: Standard for Cold-Formed Steel Framing – Prescriptive Method for One and Two Family Dwellings

New Standards:

- AISI S201-07: North American Standard for Cold-Formed Steel Framing – Product Data
- AISI S210-07: North American Standard for Cold-Formed Steel Framing – Floor and Roof System Design

This summary presents a brief summary of major changes made in the revised standards, and an overview of the new standards.

It should be noted that a new numeric ANSI designation system was initiated with these 2007 edition AISI standards. It is hoped that this will simplify the referencing of the documents in this growing series of design and installation standards.

It should also be noted that the words "North American" are now in the titles of many of these standards. This was done to emphasize that these documents are intended for adoption and use not just in the United States, but also throughout North America. In all such documents, provisions applicable to Canada were added. AISI S200-07: North American Standard for Cold-Formed Steel Framing – General Provisions (Revision of AISI/COFS/GP-2004):

- A2 **Definitions:** Definitions for most of the terms in the various AISI standards for cold-formed steel framing were centralized in this standard to assure consistency and better facilitate maintenance of the series of standards. Definitions for the terms diaphragm, required strength, shear wall and yield strength were revised for consistency with the Standard Definitions for Use in the Design of Steel

Structures (AISI, 2004). The term base metal thickness was revised to base steel thickness. Definitions for the terms non-structural stud and structural stud were replaced with non-structural member and structural member. The definition for the term ridge was revised for consistency and use in all the cold-formed steel framing standards. Definitions for the truss related terms chord splice and pitch break were added.

- A4 **Corrosion Protection:** Language was added to clarify that a dissimilar metal may be used in direct contact with steel framing members if approved for that application, and commentary language was added to provide guidance on when such applications might not be a problem along with a reference regarding the use of stainless steel brick ties (CSA, 2004).
- A5 **Products:** The minimum base metal thickness table was removed and the thickness requirements now defer to an approved design or recognized product standard, such as AISI S201. A statement was added to clarify that the standard designator is intended to be the same when using either U.S. Customary or SI Metric units. A requirement was added that when specifying material for use in structural applications, the material used in design is identified on the contract documents and when ordering the material. Product identification requirements were modified to allow 96-inch spacing of identification in accordance with AISI S201 or ASTM A1003 (ASTM, 2005a) rather than the former 48-inch spacing.
- A6 **Referenced Documents:** The referenced document listing was updated to include AISI S100 (AISI, 2007) and AISI S201. ASTM references were updated. ASTM C954 (ASTM, 2004a) and C1002 (ASTM, 2004b) for screw fasteners for gypsum board attachment were added to the listing.
- C1 **In-Line Framing:** Commentary language was added to provide guidance on the use of load bearing top track assemblies, based on testing programs at the NAHB Research Center (NAHB, 2003) and the University of New Brunswick (Dawe, 2005).
- C3 **Installation Tolerances:** Commentary language was added to provide guidance on the wall stud gap tolerance, based on a testing program at the University of Missouri-Rolla (Findlay, 2005).
- D1 **Screw Connections:** In Section D1.6, requirements were added to reference the applicable ASTM standards for screw fasteners for gypsum board attachment.
- AISI S201-07: North American Standard for Cold-Formed Steel Framing – Product Data (New Standard, not intended for direct adoption in the IBC.):
- A **General:** This standard is intended to establish and encourage the production and use of standardized products in the United States, Canada and Mexico. It provides criteria, including material and product requirements for cold-formed steel C-shape studs, joists, track, U-channels, furring channels and angles intended to be utilized in structural and non-structural framing applications.
- B. **Materials:** This standard defines standard material grades and specifications, minimum base steel and design thickness, and coatings for corrosion protection.
- C. **Products:** This standard defines standard product designator, shapes, inside bend radius, lip length, punchouts, marking and manufacturing tolerances.
- D. **Quality Assurance:** This standard requires a properly documented quality control program and the proper application of quality assurance procedures.
- AISI S210-07: North American Standard for Cold-Formed Steel Framing – Floor and Roof System Design (New Standard):
- A. **General:** This standard is intended for the design and installation of cold-formed steel framing for floor and roof systems in buildings. The standard defers to AISI S100 (AISI, 2007), except when modified by the standard. Designing solely in accordance with AISI S100 is cited as an alternative to the standard.
- B. **Design:** This standard provides requirements for floor joists, ceiling joists and roof rafters are provided for both a discretely braced design; i.e., neglecting the structural bracing and/or composite-action contribution of attached sheathing or deck, or a continuously braced design. Provisions are provided for clip angle bearing stiffeners, based on a recent testing program at the University of Waterloo (Fox, 2006); and for bracing, based on available research, field experience and the requirements of AISI S100.
- C. **Installation:** This standard has no specific installation requirements beyond those of AISI S200.
- AISI S211-07: North American Standard for Cold-Formed Steel Framing – Wall Stud Design (Revision of AISI/COFS/WSD-2004):
- A1 **Scope:** A sentence was added to clarify that designing solely in accordance with AISI S100 (AISI, 2007) is an alternative to this standard.
- A2 **Definitions:** Definitions for terms used in this standard were removed from this section and centralized in AISI S200.
- A3 **Loads and Load Combinations:** For consistency with the other AISI standards for cold-formed steel framing, the requirements of former Section B on Loading were moved to this new section. Former Sections C and D were renamed Sections B and C, accordingly. Wind loading considerations were separated into Subsection A3.1 for clarity, since these provisions are not intended for use in Canada.
- A4 **Referenced Documents:** The referenced document listing was updated to include AISI S100 (AISI, 2007) and AISI S200. The ASCE 7 (ASCE, 2006) reference was updated.
- B **Design:** Former requirements for materials and corrosion protection, which merely referred the user to AISI S200, were deemed unnecessary and were deleted. A statement was added to emphasize that unless modified or supplemented in this standard, strength determinations are to be made in accordance with AISI S100.
- B2 **Connection Design:** Section B2.3 was revised to clarify that web crippling the stud must be evaluated in accordance with AISI S100 and requirements on bearing length were added. In Section B2.3, additional limitations on the methodology were added that are consistent with the original testing.
- AISI S212-07: North American Standard for Cold-Formed Steel Framing – Header Design (Revision of AISI/COFS/HEADER-2004):
- A1 **Scope:** For consistency with the other AISI standards for cold-formed steel framing, the requirements of former Section A1.1 were moved to the appropriate portions of Sections B and C. Commentary language was added to emphasize the limited scope of this standard and to provide guidance on the broader subject of opening design, including a reference to the Cold-Formed Steel Framing Design Guide (AISI, 2002).
- A2 **Definitions:** This new section was added to clarify that definitions for terms used in this standard are listed in AISI S200.
- A4 **Referenced Documents:** The referenced document listing was updated to include AISI S100 (AISI, 2007) and AISI S200. The ASCE 7 (ASCE, 2006) reference was updated.
- B1 **Back-to-Back Headers:** In Sections B1.2 and B1.4, requirements for evaluating shear in accordance with AISI S100 were added.
- B2 **Box Headers:** In Sections B2.2 and B2.4, requirements for evaluating shear in accordance with AISI S100 were added.
- B3 **Double L-Headers:** Limitations, from former Section A1.1, were added.
- B4 **Single L-Headers:** Limitations, from former Section A1.1, were added.
- B5 **Inverted L-Header Assemblies:** This new section was added to provide provisions for designing inverted L-header assemblies, based on rational engineering judgment, as a means to provide improved capacity for double and single L-headers.
- C1 **Back-to-Back and Box Headers:** Installation requirements for back-to-back and box headers, from former Section A1.1, were included in this new section.
- C2 **Double and Single L-Headers:** Installation requirements for double and single L-headers, from former Section A1.1, were included in this new section.
- C3 **Inverted L-Header Assemblies:** This new section was added to provide provisions for installing inverted L-header assemblies.
- AISI S213-07: North American Standard for Cold-Formed Steel Framing – Lateral Design (Revision of AISI/COFS/LATERAL-2004):
- A1 **Scope:** The scope was expanded to include shear walls and diaphragms resisting other in-plane lateral loads (i.e., other than wind or seismic) and provisions for such were added throughout the standard.

- A2 **Definitions:** Definitions for most of the terms used in this standard were removed from this section and centralized in AISI S200.
- A4 **Loads and Load Combinations:** This section, previously B2, was moved and expanded for consistency with the other AISI standards.
- A5 **Referenced Documents:** The referenced document listing was updated to include AISI S100 (AISI, 2007) and AISI S200. The ASCE 7 (ASCE, 2006) and various ASTM and other references were updated. References for the applicable standards for gypsum board (ASTM, 2006), fiberboard (AHA, 1995 and ASTM, 2001), screw fasteners (ASTM, 2004b; ASTM, 2004c) and cyclic testing (ASTM, 2005b) were added.
- C2 **Available Shear Strength:** The provisions regarding openings in and aspect ratios of Type I shear walls and wall piers in Type II shear walls were clarified. The equation for design deflection was revised to include the vertical deformation rather than the deflection of anchorage/attachment details. A correction was made to the tabulated maximum aspect ratio (h/w) for 0.027" steel sheet, one side in Table C2.1-1. Provisions for 15/32" Structural 1 sheathing (4-ply), one side with 68-mil framing were added. Provisions for fiberboard sheathed shear walls were added, based on tests at the NAHB Research Center (NAHB, 2005). Limitations to section C2.2 to specify the minimum size of framing screws were added. The requirement for the attachment of sheathing edges was clarified. The minimum requirements for flat strapping when used as blocking in a Type I shear wall were defined. A requirement was added that for other than steel sheathing, the screws be installed through the sheathing to the blocking. Commentary was added to clarify that the standard permits the use of studs with standard punchouts and anchor bolts with standard cut washers. Commentary was also added to warn against the overdriving of sheathing screws.
- C5 **Special Seismic Requirements:** The anchorage requirement was clarified as being applicable to uplift only. A special requirement for shear walls that perimeter members at openings be provided and detailed to distribute the shearing stresses was deemed redundant for Type I shear walls and incorrect for Type II walls and was deleted. Provisions for shear walls and diagonal strap bracing were separated into Sections C5.1 and C5.2. Additional special seismic requirements for diagonal strap bracing were introduced based largely on research at McGill University (Al-Kharat and Rogers, 2005, 2006, 2007), other available research and engineering judgment. Factors for the expected yield strength and tensile strength of diagonal strap bracing members were added, based in part on similar values published for hot-rolled structural steel materials (AISC, 2005). Provisions for seismic forces contributed by masonry and concrete walls, and other than concrete or masonry construction were added to new Sections C5.3 and C5.4. These requirements were patterned after provisions in the Special Design Provisions for Wind and Seismic (AFPA, 2005).
- D2 **Diaphragm Design:** A requirement was added that for other than steel sheathing, the screws be installed through the sheathing to the blocking. Commentary was added to justify diaphragm values in light of changes to the recognized screw connection strength calculation methodology.
- AISI S214-07: North American Standard for Cold-Formed Steel Framing – Truss Design (Revision of AISI/COFS/TRUSS-2004):
- A2 **Definitions:** Definitions for terms used in this standard were removed from this section and centralized in AISI S200.
- A4 **Referenced Documents:** The referenced document listing was updated to include AISI S100 (AISI, 2007) and AISI S200. The ASCE 7 (ASCE, 2006) reference was updated.
- D4 **Member Design:** Sections D4.2, D4.3, D4.4 and D4.5 were revised to clarify when members are to be evaluated for axial load alone, bending alone, and combined axial load and bending using the provisions of AISI S100. Section D4.4 was revised and Commentary language was added to clarify the requirements for trusses with C-shaped chord and web members.
- D5 **Gusset Plate Design:** This new section was added to provide provisions for designing gusset plates, based on based on a testing program at the University of Missouri-Rolla (Lutz, 2004).
- G3 **Full-Scale Structural Performance Load Test:** In Section G3.2, the required minimum number of test specimens was changed from two to three. In Section G3.7, the special Beta-factors for trusses were deleted and the user is deferred instead to Chapter F1 of AISI S100.
- AISI S230-07: Standard for Cold-Formed Steel Framing – Prescriptive Method for One and Two Family Dwellings (Revision of AISI/COFS/PM-2006):
- A1 **Scope:** The allowable number of stories was increased from two to three stories and provisions for such were added throughout the standard. The maximum story height was defined. Language was added to better describe how to handle an irregularity in a high seismic or high wind area that is isolated to a portion of a building.
- A2 **Definitions:** Definitions for most terms used in this standard were removed from this section and centralized in AISI S200. Definitions for seismic design category D0 and wind exposures B, C and D were added and the definition for seismic design category D1 was revised, in accordance with the building code.
- A3 **Referenced Documents:** The referenced document listing was updated to include AISI S100 (AISI, 2007), AISI S200, AISI S201 and AISI S214. The ASCE 7 (ASCE, 2006) and various ASTM and other references were updated. Reference for the applicable standard for anchor bolts (ASTM, 2004d) was added.
- A4 **Limitations of Framing Members:** Language was updated to reflect the new AISI S201 and ASTM A1003 (ASTM, 2005a) standards. Provisions for hole reinforcing were added and provisions for hole patching were revised, based on available research and engineering judgment.
- B2 **Bearing Stiffeners:** Requirements for C-shaped and track bearing stiffeners were revised, based on available research and engineering judgment. Provisions were added for clip angle bearing stiffeners, based on a recent testing program at the University of Waterloo (Fox, 2006).
- B4 **Anchor Bolts:** Provisions were added regarding anchor bolt washers in high wind areas and high seismic areas.
- D2 **Floor to Foundation or Structural Wall Connection:** Provisions were added to allow a single joist with bearing stiffeners in lieu of double joists on foundation walls parallel to the joist span.
- E2: **Wall to Foundation or Floor Connection:** Provisions were added for anchoring gable endwalls, based on a study at the University of Missouri-Rolla (Downey, Stephens and LaBoube, 2005).
- E3: **Wall Stud Sizes:** Tables were updated to the latest editions of AISI S100 (AISI, 2007), AISI S211 and ASCE 7 (ASCE, 2006). Provisions were added for sizing wall studs in gable endwalls, based on a study at the University of Missouri-Rolla.
- E7 **Headers:** Tables were updated to the latest editions of AISI S100, AISI 212 and ASCE 7. Tables were added for grade 50 members. Provisions were added for single L-headers and inverted L-header assemblies. Clarification was made that provisions for head tracks also apply to sill tracks. Provisions were added for sizing and installing headers in gable endwalls, based on a study at the University of Missouri-Rolla.
- E11 **Braced Walls In High Wind Areas and High Seismic Areas:** Provisions were revised to clarify that braced wall length adjustment factors based upon edge screw spacing less than 4 inches are not applicable to type II braced walls.
- F3 **Roof Rafters:** Tables were updated to the latest editions of AISI S100, AISI S210 and ASCE 7. Tables were added for grade 50 members. Limits were set on the rake overhang in gable endwalls, based on a study at the University of Missouri-Rolla.
- F4 **Hip Framing:** A new section was added to address hip framing, based on a study at the University of Missouri-Rolla (Waldo, Stephens and LaBoube, 2006).
- F6 **Ceiling and Roof Diaphragms:** Ceiling diaphragm design and installation requirements were added for gable endwalls, based on a study at the University of Missouri-Rolla.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Note: The following analysis was not in the Code Change Proposal book but was posted on the ICC website.

Analysis: Review of proposed new standard AISI S210-07 indicated that, in the opinion of ICC Staff, the standard did comply with ICC standards criteria.

Committee Action:

Approved as Modified

Modify proposal as follows:

2210.6 Lateral design. Light-framed shear walls, diagonal strap bracing that is part of a structural wall and diaphragms used to resist wind, seismic and other in-plane lateral loads shall be designed in accordance with AISI S213.

2210.7 Prescriptive framing. Detached one- and two-family dwellings and townhouses, less than or equal to three stories ~~in height~~ above grade plane, shall be permitted to be constructed in accordance with AISI S230 subject to the limitations therein.

(Portions of proposal not shown remain unchanged)

Committee Reason: This code change correlates the IBC section on cold-formed steel with the latest editions of AISI standards and adds the new standard for floor and roof framing. The modification makes editorial changes, providing terminology that is consistent with other code provision.

Assembly Action:

None

Final Hearing Results

S208-07/08

Code Change No: S209-07/08

Original Proposal

Section: 2210.3

Proponent: Edwin Huston, National Council of Structural Engineers Association (NCSEA), representing NCSEA Code Advisory Committee – General Engineering Subcommittee

1. Revise as follows:

2210.3 Trusses. ~~The design, quality assurance, installation and testing of cold-formed steel trusses shall be in accordance with AISI Truss, subject to the limitations therein. Cold-formed steel trusses shall be designed in accordance with the provisions of this code and accepted engineering practice. Members are permitted to be joined by screws, pins, rivets, bolts, clinching, welding, or other approved connecting devices.~~

2. Add new text as follows:

2210.3.1 Truss design drawings. The written, graphic and pictorial depiction of each individual truss shall be provided to the building official for approval prior to installation. The truss design drawings shall also be provided with the shipment of trusses delivered to the job site. Truss design drawings shall include, at a minimum, the information specified below:

1. Slope or depth, span and spacing;
2. Location of all joints and support locations;
3. Number of plies if greater than one;
4. Required bearing widths;
5. Design loads as applicable, including;

- 5.1. Top chord live load (including snow loads);
- 5.2. Top chord dead load;
- 5.3. Bottom chord live load;
- 5.4. Bottom chord dead load;
- 5.5. Additional loads and locations;
- 5.6. Environmental design criteria and loads (wind, snow, seismic, etc.); and
- 5.7. Other lateral loads, including drag strut loads.
6. Maximum reaction force and direction, including maximum uplift reaction forces where applicable;
7. All truss joint connections, information and details;
8. Member sizes, properties and details;
9. Truss- to- truss connections and truss field assembly requirements.
10. Calculated span to deflection ratio and maximum vertical and horizontal deflection for live and total load as applicable;
11. Maximum axial tension and compression in the truss members; and
12. Required permanent individual truss member restraint locations and the method and details of restraint/bracing to be used in accordance with Section 2210.3.2.

2210.3.2 Permanent individual truss member restraint/bracing. Where permanent restraint/bracing of truss members is specified on the truss design drawings, it shall be accomplished by one of the following methods:

1. Permanent individual truss member restraint/bracing shall be installed using standard industry lateral restraint/bracing details in accordance with generally accepted engineering practice. Locations for lateral restraint shall be identified on the truss design drawing.
2. The trusses shall be designed so that the buckling of any individual truss member is resisted internally by the individual truss through suitable means (i.e., buckling reinforcement by T-reinforcement or L-reinforcement, proprietary reinforcement, etc.). The buckling reinforcement of individual members of the trusses shall be installed as shown on the truss design drawing or on supplemental truss member buckling reinforcement details provided by the truss designer.
3. A project specific permanent individual truss member restraint/bracing design shall be permitted to be specified by any registered design professional.

2210.3.3 Trusses spanning 60 feet or greater. The owner shall contract with a registered design professional for the design of the temporary installation restraint/bracing and the permanent individual truss member restraint/bracing for trusses with clear spans 60 feet (18 288mm) or greater.

2210.3.4 Truss designer. The individual or organization responsible for the design of the trusses.

2210.3.5 Truss design drawings. Where required by the registered design professional, the building official, or the statutes of the jurisdiction in which the project is to be constructed, each individual truss design drawing shall bear the seal and signature of the truss designer.

Exceptions:

1. Where a cover sheet and truss index sheet are combined into a single sheet and attached to the set of truss design drawings, the single cover/truss index sheet is the only document required to be signed and sealed by the truss designer.
2. When a cover sheet and a truss index sheet are separately provided and attached to the set of truss design drawings, the cover sheet and the truss index sheet are the only documents required to be signed and sealed by the truss designer.

2210.3.6 Truss placement diagram. The truss manufacturer shall provide a truss placement diagram that identifies the proposed location for each individually designated truss and references the corresponding truss design drawing. The truss placement diagram shall be provided as part of the truss submittal package, and with the shipment of trusses delivered to the job site. Truss placement diagrams that serve only as a guide for installation and do not deviate from the permit submittal drawings shall not be required to bear the seal or signature of the truss designer.

2210.3.7 Truss submittal package. The truss submittal package shall consist of each individual truss design drawing; the truss placement diagram; the permanent individual truss member restraint/bracing method and details; any other structural details germane to the trusses as applicable; and the cover/truss index sheet.

2210.3.8 Anchorage. The design for the transfer of loads and anchorage of each truss to the supporting structure is the responsibility of the registered design professional.

2210.3.9 Alterations to trusses. Truss members and components shall not be cut, notched, drilled, spliced or otherwise altered in any way without written concurrence and approval of a registered design professional. Alterations resulting in the addition of loads to any member (i.e. HVAC equipment, piping, additional roofing or insulation, etc.) shall not be permitted without verification that the truss is capable of supporting such additional loading.

2210.3.10 AISI specification. In addition to Sections 2210.3 through 2210.3.9, the design, manufacture, installation, testing and quality assurance of cold formed steel trusses shall be in accordance with AISI S214. Job-site inspections shall be in compliance with Section 109 as applicable.

2210.3.11 Truss quality assurance. Trusses not part of a manufacturing process in accordance with Section 2210.3.10 or in accordance with a standard listed in Chapter 35, which provides requirements for quality control done under the supervision of a third party quality control agency, shall be manufactured in compliance with Sections 1704.2 and 1704.3 as applicable.

Reason: This language is proposed to be added in order for cold formed steel trusses to have compatible criteria as the requirements for wood trusses specified in Section 2303.4. The current Section does not provide the necessary criteria and delineation of responsibilities.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The addition of requirements for truss design drawings and submittals is an important clarification for cold-formed steel that is similar to the current requirements for wood trusses.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Edwin Huston, National Council of Structural Engineers Association (NCSEA), representing NCSEA Code Advisory Committee, General Engineering Subcommittee, requests Approval as Modified by this Public Comment.

Modify proposal as follows:

~~2210.3 Trusses. Cold-formed steel trusses shall be designed in accordance with the provisions of this code and accepted engineering practice. Members are permitted to be joined by screws, pins, rivets, bolts, clinching, welding, or other approved connecting devices.~~

2210.3.1 Design. Cold-Formed Steel Trusses shall be designed in accordance with AISI S214, Sections 2210.3.1 through 2210.3.5 and accepted engineering practice.

2210.3.1 Truss design drawings. The written, graphic and pictorial depiction of each individual truss shall be provided to the building official for approval prior to installation. The truss design drawings shall also be provided with the shipment of trusses delivered to the job site. Truss design drawings shall include, at a minimum, the information specified below:

1. ~~Slope or depth, span and spacing;~~
2. ~~Location of all joints and support locations;~~
3. ~~Number of plies if greater than one;~~
4. ~~Required bearing widths;~~
5. ~~Design loads as applicable, including:~~
 - 5.1. ~~Top chord live load (including snow loads);~~
 - 5.2. ~~Top chord dead load;~~
 - 5.3. ~~Bottom chord live load;~~
 - 5.4. ~~Bottom chord dead load;~~

- 5.5. — Additional loads and locations;
- 5.6. — Environmental design criteria and loads (wind, snow, seismic, etc.); and
- 5.7. — Other lateral loads, including drag strut loads;
6. — Maximum reaction force and direction, including maximum uplift reaction forces where applicable;
7. — All truss joint connections, information and details;
8. — Member sizes, properties and details;
9. — Truss to truss connections and truss field assembly requirements;
10. — Calculated span to deflection ratio and maximum vertical and horizontal deflection for live and total load as applicable;
11. — Maximum axial tension and compression in the truss members; and
12. — Required permanent individual truss member restraint locations and the method and details of restraint/bracing to be used in accordance with Section 2210.3.2.

2210.3.2 Truss Design Drawings. The Truss Design Drawings shall conform to the requirements of Section B2.3 of AISI S214 and shall be provided with the shipment of trusses delivered to the job site. The Truss Design Drawings shall include the details of permanent individual truss member restraint/bracing in accordance with section B6(a) or B6(c) of AISI S214 if these methods are utilized to provide restraint/bracing.

2210.3.2 Permanent individual truss member restraint/bracing. Where permanent restraint/bracing of truss members is specified on the truss design drawings, it shall be accomplished by one of the following methods:

1. — Permanent individual truss member restraint/bracing shall be installed using standard industry lateral restraint/bracing details in accordance with generally accepted engineering practice. Locations for lateral restraint shall be identified on the truss design drawing.
2. — The trusses shall be designed so that the buckling of any individual truss member is resisted internally by the individual truss through suitable means (i.e., buckling reinforcement by T reinforcement or L reinforcement, proprietary reinforcement, etc.). The buckling reinforcement of individual members of the trusses shall be installed as shown on the truss design drawing or on supplemental truss member buckling reinforcement details provided by the truss designer.
3. — A project specific permanent individual truss member restraint/bracing design shall be permitted to be specified by any registered design professional.

2210.3.3 Deferred Submittals. AISI Section B4.2 shall be deleted.

2210.3.3 2210.3.4 Trusses spanning 60 feet or greater. The owner shall contract with a registered design professional for the design of the temporary installation restraint/bracing and the permanent individual truss member restraint/bracing for trusses with clear spans 60 feet (18 288mm) or greater. Special inspection of trusses over 60 feet in length shall conform to Section 1704.

2210.3.4 Truss designer. The individual or organization responsible for the design of the trusses.

2210.3.5 Truss design drawings. Where required by the registered design professional, the building official, or the statutes of the jurisdiction in which the project is to be constructed, each individual truss design drawing shall bear the seal and signature of the truss designer.

Exceptions:

1. — Where a cover sheet and truss index sheet are combined into a single sheet and attached to the set of truss design drawings, the single cover/truss index sheet is the only document required to be signed and sealed by the truss designer.
2. — When a cover sheet and a truss index sheet are separately provided and attached to the set of truss design drawings, the cover sheet and the truss index sheet are the only documents required to be signed and sealed by the truss designer.

2210.3.6 Truss placement diagram. The truss manufacturer shall provide a truss placement diagram that identifies the proposed location for each individually designated truss and references the corresponding truss design drawing. The truss placement diagram shall be provided as part of the truss submittal package, and with the shipment of trusses delivered to the job site. Truss placement diagrams that serve only as a guide for installation and do not deviate from the permit submittal drawings shall not be required to bear the seal or signature of the truss designer.

2210.3.7 Truss submittal package. The truss submittal package shall consist of each individual truss design drawing; the truss placement diagram; the permanent individual truss member restraint/bracing method and details; any other structural details germane to the trusses as applicable; and the cover/truss index sheet.

2210.3.8 Anchorage. The design for the transfer of loads and anchorage of each truss to the supporting structure is the responsibility of the registered design professional.

2210.3.9 Alterations to trusses. Truss members and components shall not be cut, notched, drilled, spliced or otherwise altered in any way without written concurrence and approval of a registered design professional. Alterations resulting in the addition of loads to any member (i.e. HVAC equipment, piping, additional roofing or insulation, etc.) shall not be permitted without verification that the truss is capable of supporting such additional loading.

2210.3.10 AISI specification. In addition to Sections 2210.3 through 2210.3.9, the design, manufacture, installation, testing and quality assurance of cold formed steel trusses shall be in accordance with AISI S214. Job site inspections shall be in compliance with Section 109 as applicable.

2210.3.11 2210.3.5 Truss quality assurance. Trusses not part of a manufacturing process in accordance with Section 2210.3.10 or in accordance with a standard listed in Chapter 35, which that provides requirements for quality control done under the supervision of a third party quality control agency, shall be manufactured in compliance with Sections 1704.2 and 1704.3 as applicable.

Commenter's Reason: Over the past year, NCSEA has been working diligently with both AISI and WTCA to address their concerns surrounding the truss design requirements in S209 as compared to those found in AISI S214-07, North American Standard for Cold-Formed Steel Framing – Truss Design. Unfortunately, the language that the IBC Structural Code Development Committee accepted as submitted in Proposal S209-07/08 does not recognize the latest work by the three organizations. The modifications presented in this public comment correct IBC Section 2210.3 to reflect the established consensus on this topic, where such consensus could be reached within this short timeframe.

In response to Proposal S209-07/08, AISI agreed to process a supplement to AISI S214-07 addressing both NCSEA's and WTCA's concerns. Supplement 2 to AISI S214-07 was issued June 9, 2008 and is available for download from the AISI website: www.aisi.org. The following topics, which were originally presented in Proposal S209-07/08, were picked up with some minor modification in AISI S214, Supplement 2 and, consequently, are recommended for deletion from IBC Section 2210.3:

- Truss design drawings (2210.3.1) – Other than pointing the user to S214, stating that the details need to be shipped to the jobsite, and pointing out that restraint/bracing details need to be provided, this topic is addressed in AISI S214, Supplement 2, Section B2.
- Permanent individual truss member restraint/bracing (2210.3.2) – The topic is addressed in AISI S214, Supplement 2, Section B6.
- Truss designer (2210.3.4) – The topic is addressed in AISI S214, Supplement 2, Section B2.
- Truss design drawings (2210.3.5) – The topic is addressed in AISI S214, Supplement 2, Section B2
- Truss placement diagram (2210.3.6) – The topic is addressed in AISI S214, Supplement 2, Section B3.
- Truss submittal package (2210.3.7) – The topic is addressed in AISI S214, Supplement 2, Section B3.
- Anchorage (2210.3.8) – The topic is addressed in AISI S214, Supplement 2, Section B4.
- Alterations to trusses (2210.3.9) – The topic is addressed in AISI S214, Supplement 2, Section B5.
- AISI Specification (2210.3.10) – The reference to AISI S214 has been relocated to IBC Section 2210.3. It is considered that a pointer to IBC Section 109 is unnecessary

This Public Comment deletes Section B4.2, because when the Contract Drawings are submitted for permit, the Registered Design Professional may not know what items will be designated as deferred submittals. In addition, it is inappropriate for AISI Section B4.2 for cold-formed trusses to list requirements for deferred submittals on other items or materials.

During the development of Supplement 2, two topics were determined to be outside the jurisdiction of the AISI Committee on Framing Standards, the committee responsible for AISI S214. Consequently, they have been retained for inclusion in IBC Section 2210.3. They are:

- Design of Trusses spanning 60 feet or greater (2210.3.3) – AISI S214 covers the topic of permanent not temporary installation restraint/bracing. However, S209 put this under design. In this Public Comment it has been retained as 2210.3.3.
- Truss quality assurance (2210.3.11) – AISI S214, Chapter E provides requirements for Quality Criteria for Steel Trusses that are part of a manufacturing process. This section addresses trusses that fall outside of those processes. In this Public Comment it has been moved to 2210.3.4.

Please note, the modifications presented here coordinate with the changes accepted by the IBC Structural Code Development Committee in Proposal S208-07/08. Also, to fully integrate AISI S214-07, Supplement 2 into the IBC, a public comment has been submitted on Proposal S238-07/08 adopting the supplement in IBC Chapter 35.

Final Hearing Results

S209-07/08

AMPC1

Code Change No: S214-07/08

Original Proposal

Sections: 2303.2.1 (New), 2303.2.2 (New), 2303.2.3 (New); IRC R802.1.3.1 (New), R802.1.3.2 (New), R802.1.3.3 (New)

Proponent: Joseph T. Holland, III, Hoover Treated Wood Products, representing Hoover Treated Wood Products

THESE PROPOSALS ARE ON THE AGENDA OF THE IBC STRUCTURAL AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Add new text as follows:

2303.2 (Supp) Fire-retardant-treated wood. Fire-retardant-treated wood is any wood product which, when impregnated with chemicals by a pressure process or other means during manufacture, shall have, when tested in accordance with ASTM E 84 or UL 723, a listed flame spread index of 25 or less and show no evidence of significant progressive combustion when the test is continued for an additional 20-minute period. In addition, the flame front shall not progress more than 10.5 feet (3200 mm) beyond the centerline of the burners at any time during the test.

2303.2.1 Pressure process. For wood products impregnated with chemicals by a pressure process, the process shall be performed in closed vessels under pressures considerably above atmospheric.

2303.2.2 Other means during manufacture. For wood products produced by other means during manufacture the treatment shall be an integral part of the manufacturing process of the wood product. The treatment shall provide permanent protection to all surfaces of the wood product.

2303.2.3 Testing. For wood products produced by other means during manufacture, other than a pressure process, all sides of the wood product shall be tested in accordance with and produce the results required in Section 2303.2. Wood structural panels shall be permitted to test only the front and back faces.

(Renumber subsequent sections)

PART II – IRC BUILDING/ENERGY

Add new text as follows:

R802.1.3 Fire-retardant-treated wood. Fire-retardant treated wood (FRTW) is any wood product which, when impregnated with chemicals by a pressure process or other means during manufacture, shall have, when tested in accordance with ASTM E 84, a listed flame spread index of 25 or less and shows no evidence of significant progressive combustion when the test is continued for an additional 20-minute period. In addition, the flame front shall not progress more than 10.5 feet (3200 mm) beyond the center line of the burners at any time during the test.

R802.1.3.1 Pressure process. For wood products impregnated with chemicals by a pressure process, the process shall be performed in closed vessels under pressures considerably above atmospheric.

R802.1.3.2 Other means during manufacture. For wood products produced by other means during manufacture the treatment shall be an integral part of the manufacturing process of the wood product. The treatment shall provide permanent protection to all surfaces of the wood product.

R802.1.3.3 Testing. For wood products produced by other means during manufacture, other than a pressure process, all sides of the wood product shall be tested in accordance with and produce the results required in Section R802.1.3. Wood structural panels shall be permitted to test only the front and back faces.

(Renumber subsequent sections)

Reason: Purpose: Clarify the meaning of the phrase “pressure process or other means during manufacture” and provide testing requirements of treatments not impregnated by a pressure process in accordance with 2303.2 (R802.1.3 IRC).

Fire-retardant-treated wood is permitted for applications where noncombustible materials are required. It is a building and life safety issue. It is essential that any product used for such applications meet rigorous requirements insuring it will perform as expected. Equivalent performance from all sides insures installation is not a factor or which direction a fire is supposed to come from does not become an issue.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I – IBC STRUCTURAL

Committee Action:

Disapproved

Committee Reason: The intent to clarify the methods of fire retardant treatment may be good, but the proposed wording is not appropriate code language. Also enforcers would need some way to identify complying products in the field.

Assembly Action:

None

PART II – IRC B/E

Committee Action:

Disapproved

Committee Reason: The term "considerable" is ambiguous and unenforceable. There is no definition of the term "other means".

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Joseph Holland, Hoover Treated Wood Products, requests Approval as Modified by this Public Comment for Part I.

Modify proposal as follows:

2303.2 Fire-retardant-treated wood. Fire-retardant-treated wood is any wood product which, when impregnated with chemicals by a pressure process or other means during manufacture, shall have, when tested in accordance with ASTM E 84 or UL 723, a listed flame spread index of 25 or less and show no evidence of significant progressive combustion when the test is continued for an additional 20-minute period. In addition, the flame front shall not progress more than 10.5 feet (3200 mm) beyond the centerline of the burners at any time during the test.

2303.2.1 Pressure process. For wood products impregnated with chemicals by a pressure process, the process shall be performed in closed vessels under pressures not less than 50 pounds per square inch gage (psig) ~~considerably above atmospheric.~~

2303.2.2 Other means during manufacture. For wood products produced by other means during manufacture the treatment shall be an integral part of the manufacturing process of the wood product. The treatment shall provide permanent protection to all surfaces of the wood product.

2303.2.2 Testing. For wood products produced by other means during manufacture, other than a pressure process, all sides of the wood product shall be tested in accordance with and produce the results required in Section 2303.2. Wood structural panels shall be permitted to test only the front and back faces.

Commenter's Reason: The Structural Committee felt the language needed clarifying. This comment eliminates the nontechnical language. The committee also questioned how a code official would enforce the provisions. Section 2303.2.1 requires a label. The label must comply with the provision of Chapter 17. If a product doesn't have a label from an approved agency it does not meet the code.

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Joseph Holland, Hoover Treated Wood Products, requests Approval as Modified by this public comment for Part II.

Modify proposal as follows:

R802.1.3 Fire-retardant-treated wood. Fire-retardant-treated wood is any wood product which, when impregnated with chemicals by a pressure process or other means during manufacture, shall have, when tested in accordance with ASTM E 84 or UL 723, a listed flame spread index of 25 or less and show no evidence of significant progressive combustion when the test is continued for an additional 20-minute period. In addition, the flame front shall not progress more than 10.5 feet (3200 mm) beyond the centerline of the burners at any time during the test.

R802.1.3.1 Pressure process. For wood products impregnated with chemicals by a pressure process, the process shall be performed in closed vessels under pressures not less than 50 pounds per square inch gauge (psig) ~~considerably above atmospheric.~~

R802.1.3.2 Other means during manufacture. For wood products produced by other means during manufacture the treatment shall be an integral part of the manufacturing process of the wood product. The treatment shall provide permanent protection to all surfaces of the wood product.

R802.1.3.3 Testing. For wood products produced by other means during manufacture, other than a pressure process, all sides of the wood product shall be tested in accordance with and produce the results required in Section 2303.2. Wood structural panels shall be permitted to test only the front and back faces.

**DEFINITIONS
R202**

FIRE-RETARDANT-TREATED WOOD. Pressure-treated lumber and plywood that exhibit reduced surface burning characteristics and resist propagation of fire.

Pressure process. A process for treating wood using an initial vacuum followed by the introduction of pressure above atmospheric.

Other means during manufacture. A process where the wood raw material is treated with a fire-retardant formulation while undergoing creation as a finished product.

Commenter's Reason: Revisions are submitted to address the Residential Code Committee's comments. They stated the term "considerable" was ambiguous and felt definitions were needed.

Original Proposal

Sections: 2303.4.1.1, 2303.4.1.2, 2303.4.1.3, 2303.4.1.4, 2303.4.1.4.1, 2303.4.2, 2303.4.3, 2303.4.4, 2303.4.5, 2303.4.6, 2303.4.7

Proponent: Edwin T. Huston, Smith & Huston, Inc., representing the National Council of Structural Engineering Associations

Revise as follows:

2303.4.1.1 (Supp) Truss design drawings. The written, graphic and pictorial depiction of each individual truss shall be provided to the building official for approval prior to installation. Truss design drawings shall also be provided with the shipment of trusses delivered to the job site. Truss design drawings shall include, at a minimum, the information specified below:

1. Slope or depth, span and spacing;
2. Location of all joints and support locations;
- ~~3.~~ Number of plies if greater than one;
- ~~3-4.~~ Required bearing widths;
- 4-5. Design loads as applicable, including:
 - ~~4-1-5.1.~~ Top chord live load (for roof trusses, this shall be the controlling case of live load or including snow loads);
 - ~~4-2-5.2.~~ Top chord dead load;
 - ~~4-3-5.3.~~ Bottom chord live load;
 - ~~4-4-5.4.~~ Bottom chord dead load;
 - ~~4-5-5.5.~~ Additional loads and locations Concentrated loads and their points of application as applicable; and
 - ~~4-6-5.6.~~ Environmental design criteria and loads (wind, snow, seismic, etc.) Controlling wind and earthquake loads as applicable.
- ~~6.~~ Other lateral loads, including drag strut loads.
- ~~5-7.~~ Adjustments to wood member and metal connector plate design value for conditions of use;
- ~~6-8.~~ Each Maximum reaction force and direction, including maximum uplift reaction forces where applicable;
- ~~7-9.~~ Metal connector plate type, size, and thickness or gage, and the dimensioned location of each metal connector plate except where symmetrically located relative to the joint interface;
- ~~8-10.~~ Size, species and grade for each wood member;
- ~~9-11.~~ Truss-to-truss connections and truss field assembly requirements
 - ~~Specific connection capacities or connection capacities required for:~~
 - ~~9.1. — Truss to truss girder;~~
 - ~~9.2. — Truss ply to ply; and~~
 - ~~9.3. — Field assembly of a truss when the truss shown on the individual truss design drawing is supplied in separate pieces that will be field connected.~~
- ~~10-12.~~ Calculated span to deflection ratio and maximum vertical and horizontal deflection for live and total load as applicable;
- ~~11-13.~~ Maximum axial tension and compression forces in the truss members; and
- ~~12-14.~~ Required permanent individual truss member restraint location and the method and details of restraint/bracing to be used per Section 2303.4.1.2, unless a specific truss member permanent bracing plan for the roof or floor structural system is provided by a registered design professional.

2303.4.1.2 (Supp) Permanent individual truss member restraint. Where permanent restraint of truss members is required on the truss design drawings, it shall be accomplished by one of the following methods:

- ~~1.~~ The trusses shall be designed so that the buckling of any individual truss member is resisted internally by the individual truss through suitable means (i.e., buckling reinforcement by T-reinforcement or L-reinforcement). The buckling reinforcement of individual members of the trusses shall be installed as shown on the truss design drawing or on supplemental truss member buckling reinforcement details provided by the truss designer.

- ~~2. Permanent individual truss member restraint and diagonal bracing shall be installed using standard industry lateral restraint and diagonal bracing details in accordance with generally accepted engineering practice. Locations for lateral restraint shall be identified on the truss design drawing.~~
1. Permanent individual truss member restraint/bracing shall be installed using standard industry lateral restraint/bracing details in accordance with generally accepted engineering practice. Locations for lateral restraint shall be identified on the truss design drawing.
 2. The trusses shall be designed so that the buckling of any individual truss member is resisted internally by the individual truss through suitable means (i.e., buckling reinforcement by T-reinforcement or L-reinforcement), proprietary reinforcement, etc.) The buckling reinforcement of individual members of the trusses shall be installed as shown on the truss design drawing or on supplemental truss member buckling reinforcement details provided by the truss designer.
 3. A project specific permanent individual truss member restraint/bracing design shall be permitted to be specified by any registered design professional.

2303.4.1.3 Trusses spanning 60 feet or greater. The owner shall contract with any qualified registered design professional for the design of the temporary installation restraint/bracing and the permanent individual truss member restraint/bracing for all trusses with clear spans 60 feet (18 288 mm) or greater.

2303.4.1.3 2303.4.1.4 (Supp) Truss designer. The individual or organization responsible for the design of trusses.

2303.4.1.3.1 2303.4.1.4.1 (Supp) Truss design drawings. Where required by the registered design professional, the building official, or the statutes of the jurisdiction in which the project is to be constructed, each individual truss design drawing shall bear the seal and signature of the truss designer.

Exceptions:

1. Where a cover sheet and truss index sheet are combined into a single sheet and attached to the set of truss design drawings, the single cover/truss index sheet is the only document required to be signed and sealed by the truss designer.
2. When a cover sheet and a truss index sheet are separately provided and attached to the set of truss design drawings, the cover sheet and the truss index sheet are the only documents required to be signed and sealed by the truss designer.

2303.4.2 (Supp) Truss placement diagram. The truss manufacturer shall provide a truss placement diagram that identifies the proposed location for each individually designated truss and references the corresponding truss design drawing. The truss placement diagram shall be provided as part of the truss submittal package, and with the shipment of trusses delivered to the job site. Truss placement diagrams that serve only as a guide for installation and do not deviate from the permit submittal drawings shall not be required to bear the seal or signature of the truss designer.

Exception: ~~When the truss placement diagram is prepared under the direct supervision of a registered design professional, it is required to be signed and sealed.~~

2303.4.3 (Supp) Truss submittal package. The truss submittal package provided by the truss manufacturer shall consist of each individual truss design drawing, the truss placement diagram, the permanent individual truss member permanent restraint/bracing method and details and, any other structural details germane to the trusses; as applicable, the cover/truss index sheet.

2303.4.4 (Supp) Anchorage. The design for the transfer of loads and anchorage of each truss to the supporting structure is the responsibility of the registered design professional.

2303.4.5 (Supp) Alterations to trusses. Truss members and components shall not be cut, notched, drilled, spliced or otherwise altered in any way without written concurrence and approval of a registered design professional. Alterations resulting in the addition of loads to any member (e.g., HVAC equipment, pipng, additional roofing or insulation, etc. water heater) shall not be permitted without verification that the truss is capable of supporting such additional loading.

2303.4.6 (Supp) ~~Metal-plate-connected trusses~~ TPI 1 Specifications. In addition to Sections 2303.4.1 through 2303.4.5, the design, manufacture and quality assurance of metal-plate-connected wood trusses shall be in accordance with TPI 1. Job-site inspections shall be in compliance with Section 109.4 as applicable.

2303.4.7 Truss quality assurance. Trusses not part of a manufacturing process in accordance with Section 2303.4.6 or in accordance with a standard listed in Chapter 35, which provides requirements for quality control done under the supervision of a third party quality control agency, shall be manufactured in compliance with Section 1704.2 and 1704.6 as applicable.

Reason: This section has been modified to replicate the requirements of the Chapter 35 referenced standard ANSI/TPI 1–2007, National Design Standard for Metal Plate Connected Wood Trusses.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

2303.4.1.1 (Supp)Truss design drawings. The written, graphic and pictorial depiction of each individual truss shall be provided to the building official for approval prior to installation. Truss design drawings shall also be provided with the shipment of trusses delivered to the job site. Truss design drawings shall include, at a minimum, the information specified below:

1. Slope or depth, span and spacing;
2. Location of all joints and support locations;
3. Number of plies if greater than one;
4. Required bearing widths;
5. Design loads as applicable, including;
 - 5.1. Top chord live load ~~(for roof trusses, this shall be the controlling case of live load or snow load~~
 - 5.2. Top chord dead load;
 - 5.3. Bottom chord live load;
 - 5.4. Bottom chord dead load;
 - 5.5. Additional loads and locations
 - 5.6. Environmental design criteria and loads (wind, rain, snow, seismic, etc.)
6. Other lateral loads, including drag strut loads.
7. Adjustments to wood member and metal connector plate design value for conditions of use;
8. Maximum reaction force and direction, including maximum uplift reaction forces where applicable;
9. Metal connector plate type, size, and thickness or gage, and the dimensioned location of each metal connector plate except where symmetrically located relative to the joint interface;
10. Size, species and grade for each wood member;
11. Truss-to-truss connections and truss field assembly requirements
12. Calculated span to deflection ratio and maximum vertical and horizontal deflection for live and total load as applicable;
13. Maximum axial tension and compression forces in the truss members; and
14. Required permanent individual truss member restraint location and the method and details of restraint/bracing to be used per Section 2303.4.1.2.

(Portions of proposal not shown remain unchanged)

Committee Reason: This code change reformats and rewords the current wood truss design requirements and is largely editorial. This will benefit enforcement. The modifications clarify the required information regarding environmental loads.

Assembly Action:

None

Final Hearing Results

S216-07/08

AM

Code Change No: **S217-07/08**

Original Proposal

Section: 2303.4.2

Proponent: Edwin Huston, National Council of Structural Engineers Associations (NCSEA), representing NCSEA Code Advisory Committee – General Engineering Subcommittee

Revise as follows:

2303.4.2 (Supp) Truss placement diagram. The truss manufacturer shall provide a truss placement diagram that identifies the proposed location for each individually designated truss and references the corresponding truss design drawing. The truss placement diagram shall be provided as part of the truss submittal package, and with the shipment of trusses delivered to the job site. Truss placement diagrams shall not be required to bear the seal or signature of the truss designer.

~~**Exception:** When the truss placement diagram is prepared under the direct supervision of a registered design professional, it is required to be signed and sealed.~~

Reason: The truss placement diagram is an erection diagram that replicates the information on the approved construction documents per Section 106.3. As it requires no engineering input, direct supervision and the signature and seal of a registered design professional is not required.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal removes an unnecessary code provision and it is consistent with the prior action associated with wood truss design requirements.

Assembly Action:

None

AS

Code Change No: **S218-07/08**

Original Proposal

Section: 2304.9.5.1

Proponent: R. Scott Douglas, DCI Engineers, representing himself

Revise as follows:

2304.9.5.1 (Supp) Fasteners for preservative-treated wood. Fasteners for preservative-treated wood shall be of hot-dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper. Fasteners other than nails, and timber rivets, wood screws and lag screws shall be permitted to be of mechanically deposited zinc-coated steel with coating weights in accordance with ASTM B 695, Class 55 minimum.

Exception: Fasteners in SBX/DOT and zinc borate preservative-treated wood in an interior, dry environment need not be hot dipped galvanized.

Fastenings for wood foundations shall be as required in AF&PA Technical Report No. 7.

Reason: There is no documented evidence of any detrimental fastener corrosion when plain steel fasteners are used in SBX/DOT or zinc borate preservative treated wood in interior, dry environments; particularly when compared to other preservative wood treatments in identical environments. Tests by Simpson Strong-Tie have verified this field performance.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

2304.9.5.1 (Supp) Fasteners for preservative-treated wood. Fasteners for preservative-treated wood shall be of hot-dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper. Fasteners other than nails, and timber rivets, wood screws and lag screws shall be permitted to be of mechanically deposited zinc-coated steel with coating weights in accordance with ASTM B 695, Class 55 minimum.

Exception: Plain carbon steel fasteners in SBX/DOT and zinc borate preservative-treated wood in an interior, dry environment shall be permitted need not be hot dipped galvanized.

Committee Reason: This proposal allows an additional option for fasteners in limited locations. The modification rewords the exception to better state the proponent's intent.

Assembly Action:

None

Final Hearing Results

Code Change No: S219-07/08

Original Proposal

Sections: 2304.9.5, 2304.9.5.5 (New); IRC R319.3, R319.3.5 (New)

Proponent: Greg Greenlee, PE, USP Structural Connectors, representing himself

THESE PROPOSALS ARE ON THE AGENDA OF THE IBC STRUCTURAL AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Revise as follows:

2304.9.5 (Supp) Fasteners and connectors in contact with preservative-treated and fire-retardant-treated wood. Fasteners and connectors for in contact with preservative treated and fire-retardant-treated wood shall be in accordance with Sections 2304.9.5.1 through 2304.9.5.4. The coating weights for zinc-coated fasteners shall be in accordance with ASTM A 153. Connectors in contact with preservative-treated wood that are used in exterior applications shall be in accordance to the manufacturer's recommendations. In the absence of manufacturer's recommendation a minimum of ASTM A 653 type G185 zinc-coated galvanized steel, or equivalent, shall be used.

2304.9.5.1 (Supp) Fasteners for preservative-treated wood. Fasteners for preservative-treated wood shall be of hot-dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper. Fasteners other than nails, timber rivets, wood screws and lag screws shall be permitted to be of mechanically deposited zinc-coated steel with coating weights in accordance with ASTM B 695, Class 55 minimum.

2304.9.5.2 (Supp) Fastenings for wood foundations. Fastenings for wood foundations shall be as required in AF&PA Technical Report No. 7.

2304.9.5.3 (Supp) Fasteners for fire-retardant-treated wood used in exterior applications or wet or damp locations. Fasteners for fire-retardant-treated wood used in exterior applications or wet or damp locations shall be of hot-dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper. Fasteners other than nails, timber rivets, wood screws and lag screws shall be permitted to be of mechanically deposited zinc coated steel with coating weights in accordance with ASTM B 695, Class 55 minimum.

2304.9.5.4 (Supp) Fasteners for fire-retardant-treated wood used in interior applications. Fasteners for fire-retardant treated wood used in interior locations shall be in accordance with the manufacturer's recommendations. In the absence of manufacturer's recommendations, Section 2304.9.5.3 shall apply.

2304.9.5.5 Fasteners and connectors subject to exposure and located within 300 feet of the shoreline. Fasteners and connectors used in exterior applications that are located within 300 feet (91440 mm) of the shoreline shall be stainless steel grade 304 or 316 or an approved alternative.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R319.3 (Supp) Fasteners and connectors in contact with preservative-treated and fire-retardant-treated wood. Fasteners and connectors in contact with preservative-treated wood and fire-retardant-treated wood shall be in accordance with this section. The coating weights for zinc-coated fasteners shall be in accordance with ASTM A 153.

Connectors in contact with preservative-treated wood that are used in exterior applications shall be in accordance to the manufacturer's recommendations. In the absence of manufacturer's recommendation a minimum of ASTM A 653 type G185 zinc-coated galvanized steel, or equivalent, shall be used.

R319.3.1 (Supp) Fasteners for preservative treated wood. Fasteners for preservative-treated wood shall be of hot dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper.

Exceptions:

1. One-half-inch (12.7 mm) diameter or greater steel bolts.
2. Fasteners other than nails, timber rivets, wood screws and lag screws shall be permitted to be of mechanically deposited zinc coated steel with coating weights in accordance with ASTM B 695, Class 55 minimum.

R319.3.2 (Supp) Fastenings for wood foundations. Fastenings for wood foundations shall be as required in AF&PA Technical Report No. 7.

R319.3.3 (Supp) Fasteners for fire-retardant-treated wood used in exterior applications or wet or damp locations. Fasteners for fire-retardant-treated wood used in exterior applications or wet or damp locations shall be of hot dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper.

R319.3.4 (Supp) Fasteners for fire-retardant-treated wood used in interior applications. Fasteners for fire-retardant treated wood used in interior locations shall be in accordance with the manufacturer's recommendations. In the absence of the manufacturer's recommendations, Section R319.3.3 shall apply.

R319.3.5 Fasteners and connectors subject to exposure and located within 300 feet of the shoreline. Fasteners and connectors used in exterior application that are located within 300 feet (91440mm) of the shoreline shall be stainless steel grade 304 or 316 or an approved alternative.

Reason: The added language in this proposal will accomplish two things. First, it will clarify the minimum coating requirements for connectors used in exterior applications and in contact with preservative treated wood. Currently connector manufacturers are recommending at a minimum a G185 coating for connectors in contact with preservative treated wood in exterior applications. This recommendation is based on accelerated corrosion testing conducted by USP Structural Connectors and others in the industry. Second, it will add specific requirements for connectors and fasteners in coastal areas. Both of these items were proposed during the last code cycle, but needed to be coordinated further with the proponents. As stated in the last code cycle, the extra hazard to fasteners and connectors installed in an environment of regular exposure to salt spray has been seen to promote their premature failure leading to the collapse of the decks constructed with currently code compliant fasteners and connectors. By requiring grade 304 or 316 stainless steel or an equivalent approved by the building official the usable expectant life of these fasteners and connectors will be extended to equal those installed in less hazardous environments.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing Results

**PART I – IBC STRUCTURAL
Committee Action:**

Disapproved

Committee Reason: The committee does not feel that this proposal is ready for the code. There was a particular concern over the appropriate relationship between a manufacturer's recommendations and the referenced ASTM standard.

Assembly Action:

None

**PART II – IRC B/E
Committee Action:**

Approved as Modified

Modify the proposal as follows:

R319.3 (Supp) Fasteners and connectors in contact with preservative-treated and fire-retardant-treated wood. Fasteners and connectors in contact with preservative-treated wood and fire-retardant-treated wood shall be in accordance with this section. The coating weights for zinc-coated fasteners shall be in accordance with ASTM A 153.

R319.3.1 (Supp) Fasteners for preservative treated wood. Fasteners for preservative-treated wood shall be of hot dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper. Coating types and weights for connectors in contact with preservative-treated wood ~~that are used in exterior applications~~ shall be in accordance with the connector manufacturer's recommendations. In the absence of manufacturer's recommendations a minimum of ASTM A 653 type G185 zinc-coated galvanized steel, or equivalent, shall be used.

Exceptions:

1. One-half-inch (12.7 mm) diameter or greater steel bolts.
2. Fasteners other than nails, timber rivets, wood screws and lag screws shall be permitted to be of mechanically deposited zinc coated steel with coating weights in accordance with ASTM B 695, Class 55 minimum.

R319.3.2 (Supp) Fastenings for wood foundations. Fastenings for wood foundations shall be as required in AF&PA Technical Report No. 7.

R319.3.3 (Supp) Fasteners for fire-retardant-treated wood used in exterior applications or wet or damp locations. Fasteners for fire-retardant-treated wood used in exterior applications or wet or damp locations shall be of hot dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper.

R319.3.4 (Supp) Fasteners for fire-retardant-treated wood used in interior applications. Fasteners for fire-retardant treated wood used in interior locations shall be in accordance with the manufacturer's recommendations. In the absence of the manufacturer's recommendations, Section R319.3.3 shall apply.

~~**R319.3.5 Fasteners and connectors subject to exposure and located within 300 feet of the shoreline.** Fasteners and connectors used in exterior application that are located within 300 feet (91440mm) of the shoreline shall be stainless steel grade 304 or 316 or an approved alternative.~~

Committee Reason: The proposal as modified serves to clarify the minimum coating requirements for fasteners and connectors in contact with preservative treated wood. By requiring the proper coating for fasteners and connectors the usable expectant life will be extended. The committee felt the modification was necessary to eliminate the restrictive language that specifically addressed fasteners and connectors used in exterior locations and subject to exposure within 300 feet of a shoreline as it was too restrictive.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Greg Greenlee, PE, USP Structural Connectors, requests Approval as Modified by this Public Comment for Part I.

Modify proposal as follows:

2304.9.5 (Supp) Fasteners and connectors in contact with preservative-treated and fire-retardant-treated wood. Fasteners and connectors in contact with preservative treated and fire-retardant-treated wood shall be in accordance with Sections 2304.9.5.1 through 2304.9.5.4. The coating weights for zinc-coated fasteners shall be in accordance with ASTM A 153. ~~Connectors in contact with preservative-treated wood that are used in exterior applications shall be in accordance to the manufacturer's recommendations. In the absence of manufacturer's recommendation a minimum of ASTM A 653 type G185 zinc-coated galvanized steel, or equivalent, shall be used.~~

2304.9.5.1 (Supp) Fasteners and connectors for preservative-treated wood. Fasteners ~~for~~ in contact with preservative-treated wood shall be of hot-dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper. Fasteners other than nails, timber rivets, wood screws and lag screws shall be permitted to be of mechanically deposited zinc-coated steel with coating weights in accordance with ASTM B 695, Class 55 minimum. Connectors that are used in exterior applications and in contact with preservative treated wood shall have coating types and weights in accordance with the treated wood or connector manufacturer's recommendations. In the absence of manufacturer's recommendation a minimum of ASTM A 653 type G185 zinc-coated galvanized steel, or equivalent, shall be used.

2304.9.5.2 (Supp) Fastenings for wood foundations. Fastenings for wood foundations shall be as required in AF&PA Technical Report No. 7.

2304.9.5.3 (Supp) Fasteners for fire-retardant-treated wood used in exterior applications or wet or damp locations. Fasteners for fire-retardant-treated wood used in exterior applications or wet or damp locations shall be of hot-dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper. Fasteners other than nails, timber rivets, wood screws and lag screws shall be permitted to be of mechanically deposited zinc coated steel with coating weights in accordance with ASTM B 695, Class 55 minimum.

2304.9.5.4 (Supp) Fasteners for fire-retardant-treated wood used in interior applications. Fasteners for fire-retardant treated wood used in interior locations shall be in accordance with the manufacturer's recommendations. In the absence of manufacturer's recommendations, Section 2304.9.5.3 shall apply.

~~**2304.9.5.5 Fasteners and connectors subject to exposure and located within 300 feet of the shoreline.** Fasteners and connectors used in exterior applications that are located within 300 feet (91440 mm) of the shoreline shall be stainless steel grade 304 or 316 or an approved alternative.~~

Commenter's Reason: At the hearings in Palm Springs this modification was disapproved because of the numerous floor modifications proposed. This public comment addresses the concerns of interested parties and includes their suggested modifications into a single public comment. The changes themselves add needed language to the code to clarify the minimum coating requirements for connectors used in exterior applications. Currently connector manufacturers are recommending at a minimum a G185 coating for connectors in contact with preservative treated wood in exterior applications. This public comment also includes some minor editorial changes to clarify the intent of the original submittal. Finally, this proposal is necessary to make the IBC language coordinate with the IRC language approved at the hearings in Palm Springs.

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Greg Greenlee, PE, USP Structural Connectors, requests Approval as Modified by this Public Comment for Part II.

Further modify proposal as follows:

R319.3 (Supp) Fasteners and connectors in contact with preservative-treated and fire-retardant-treated wood. Fasteners and connectors in contact with preservative-treated wood and fire-retardant-treated wood shall be in accordance with this section. The coating weights for zinc-coated fasteners shall be in accordance with ASTM A 153.

R319.3.1 (Supp) Fasteners and connectors for preservative treated wood. Fasteners ~~in contact with~~ for preservative-treated wood shall be of hot dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper. ~~Coating types and weights for connectors~~ Connectors that are used in exterior applications and in contact with preservative-treated wood shall have coating types and weights ~~be~~ in accordance with the treated wood or connector manufacturer's recommendations. In the absence of manufacturer's recommendations a minimum of ASTM A 653 type G185 zinc-coated galvanized steel, or equivalent, shall be used.

Exceptions:

1. One-half-inch (12.7 mm) diameter or greater steel bolts.
2. Fasteners other than nails, timber rivets, wood screws and lag screws shall be permitted to be of mechanically deposited zinc coated steel with coating weights in accordance with ASTM B 695, Class 55 minimum.

R319.3.2 (Supp) Fastenings for wood foundations. Fastenings for wood foundations shall be as required in AF&PA Technical Report No. 7.

R319.3.3 (Supp) Fasteners for fire-retardant-treated wood used in exterior applications or wet or damp locations. Fasteners for fire-retardant-treated wood used in exterior applications or wet or damp locations shall be of hot dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper.

R319.3.4 (Supp) Fasteners for fire-retardant-treated wood used in interior applications. Fasteners for fire-retardant treated wood used in interior locations shall be in accordance with the manufacturer's recommendations. In the absence of the manufacturer's recommendations, Section R319.3.3 shall apply.

Commenter's Reason: The public comments include minor clarification and editorial changes to the floor modification approved at the hearings in Palm Springs.

Final Hearing Results

**S219-07/08, Part I
S219-07/08, Part II**

**AMPC
AMPC**

Code Change No: S221-07/08

Original Proposal

Sections: 2304.11.2.1, 2308.10.1

Proponent: Philip Brazil, PE, SE, Reid Middleton, Inc., representing himself

Revise as follows:

2304.11.2.1 Joists, girders and subfloor. Where wood joists or the bottom of a wood structural floor without joists are closer than 18 inches (457 mm), or wood girders are closer than 12 inches (305 mm) to the exposed ground in crawl spaces or unexcavated areas located within the perimeter of the building foundation, the floor ~~assembly construction~~ (including posts, girders, joists and subfloor) shall be of naturally durable or preservative-treated wood.

2308.10.1 Wind uplift. ~~The roof assemblies construction~~ shall have rafter and truss ties to the wall below. Resultant uplift loads shall be transferred to the foundation using a continuous load path. The rafter or truss to wall connection shall comply with Tables 2304.9.1 and 2308.10.1.

Reason: The changes are proposed to avoid potential conflicts with the use of "floor assembly" and "roof assembly" elsewhere in the 2006 IBC. These terms are used extensively in the fire safety provisions in conjunction with the fire resistance of assemblies incorporating floors and roofs (i.e., horizontal assemblies). "Roof assembly" is also defined in Chapter 15 and is used extensively with those provisions. The sections above contain the only instances of "floor assembly(ies)" and "roof assembly(ies)" in the structural chapters of the 2006 IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The reference to floor or roof construction is a more succinct statement that is preferable to using the term "assembly".

Assembly Action:

None

Final Hearing Results

AS

Code Change No: S222-07/08

Original Proposal

Table 2306.3.2

Proponent: Edward L. Keith, APA – the Engineered Wood Association

Add figure to table as follows:

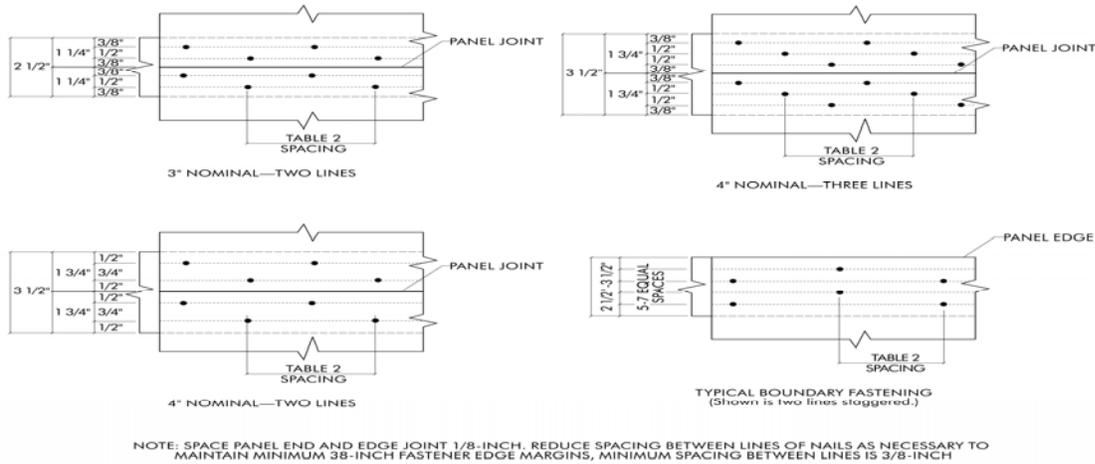

TABLE 2306.3.2
ALLOWABLE SHEAR (POUNDS PER FOOT) FOR WOOD STRUCTURAL PANEL BLOCKED DIAPHRAGMS
UTILIZING MULTIPLE ROWS OF FASTENERS (HIGH LOAD DIAPHRAGMS) WITH FRAMING OF
DOUGLAS FIR-LARCH OR SOUTHERN PINE ^a FOR WIND OR SEISMIC LOADING ^{b, g, h}

(Portions of table not shown remain unchanged)

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

Reason: The purpose is to clarify the code.

When the table was added to the IBC, the figures at the bottom of the table were inadvertently left out. The figures give diagrams of the various multi-row nail applications showing required spacing and staggering. These construction details provide clarity to the table and are essential to develop the values listed in the table. These figures have been part of this table for over two decades.

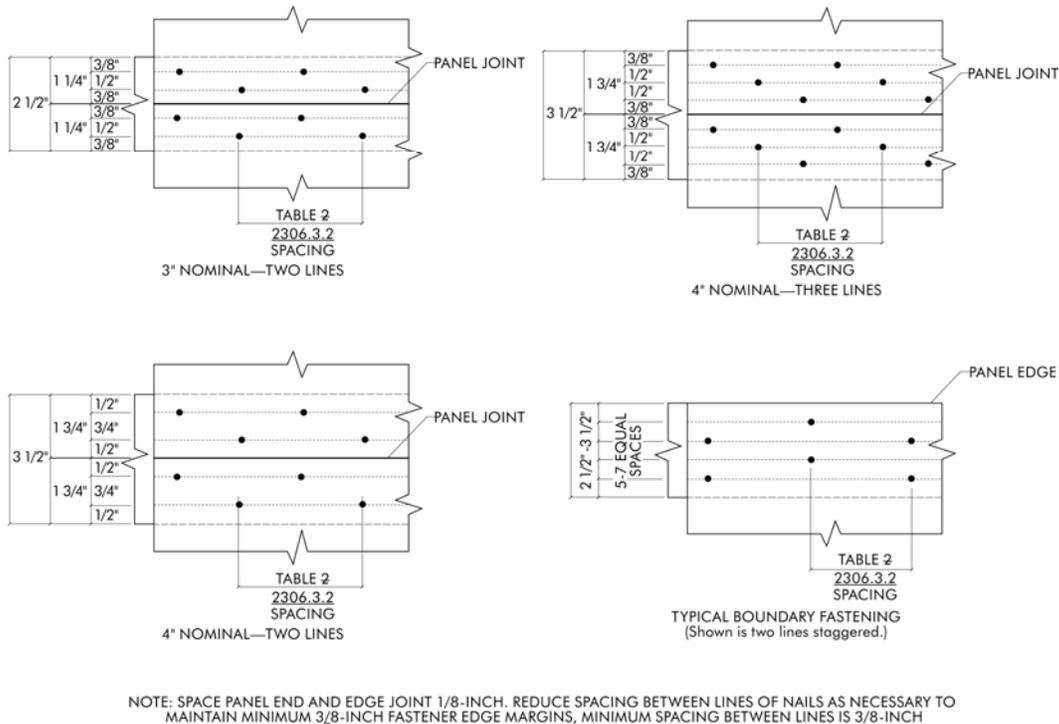

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

Committee Reason: This proposal clarifies the code by adding an illustration of nail spacing and staggering to the diaphragm load table. The modification corrects typos in the figure submitted with the code change.

Assembly Action:

None

Final Hearing Results

S222-07/08

AM

Code Change No: S224-07/08

Original Proposal

Section: 2308.3.2

Proponent: James E. Russell, Building Codes Consultant, representing himself.

Revise as follows:

2308.3.2 Braced wall line panel connections. Wind and seismic lateral forces shall be transferred from the roofs and floors to braced wall lines panels and from the braced wall lines panels in upper stories to the braced wall lines panels in the story below by the following:

1. ~~Braced wall line panel top and bottom plates shall be fastened to joists, rafters or full-depth blocking above in accordance with Table 2304.9.1 items 11, 12, 15 or 19 as applicable based on the orientation of the joists or rafters to the braced wall line. Braced wall line bottom plates shall be connected to joists or blocking below in accordance with Table 2304.9.1 item number 6, or to foundations in accordance with Section 2308.3.3. At exterior gable end walls b~~Braced wall panels sheathing in the top story shall be extended and fastened to roof framing ~~at intervals not to exceed where the spacing between parallel exterior braced wall lines is greater than 50 feet (15240 mm) between parallel braced wall lines.~~

Exception: Where roof trusses are used and are installed perpendicular to an exterior braced wall line, lateral forces shall be transferred from the roof diaphragm to the braced wall by blocking of the ends of the trusses or by other approved methods providing equivalent lateral force transfer. Blocking shall be minimum 2 inch (51 mm) nominal thickness and equal to the depth of the truss at the wall line and shall be fastened to the braced wall line top plate as specified in Table 2304.9.1 item number 11.

2. ~~Bottom plate fastening to joist or blocking below shall be with not less than 3-16d nails at 16 inches (406 mm) o.c.~~
3. ~~Blocking shall be nailed to the top plate below with not less than 3-8d toenails per block~~
4. ~~Joists parallel to the top plate shall be nailed to the top plate with not less than 8d toenails at 6 inches (152 mm) o.c.~~

~~In addition, top plate laps shall be nailed with not less than 8-16d face nails on each side of each break in the top plate.~~

Reason: The purpose of this code change is to improve the understanding of current code section 2308.3.2 regarding connections required along braced wall lines, and to eliminate redundant information specified elsewhere in the code, by:

1. Editorially clarifying in the first paragraph that the "forces" to be transferred are "wind and seismic lateral" forces.
2. Clarifying in the first paragraph and in current item number 1, that Section 2308.3.2 applies to braced wall *lines*, instead of only to the braced wall *panel* portion of a braced wall line. For example, the connection between blocking or floor framing and a braced wall line top plate does not occur ONLY at the braced wall panel location, nor does the connection of the wall bottom plate to the foundation occur ONLY at the braced wall panel location. The connections between top plate and other framing above that are currently specified in items number 3 and 4 of Section 2308.3.2 are applicable to the entire length of a braced wall line, not just at braced wall panels, because those connections are identically specified in Table 2304.9.1. The term braced wall *panel* would only be correct IF the section was specifying special or additional connections at the braced wall panel portion of a wall, however, the current section does not specify any connections that are different or in addition to those already in the code.

3. Adding new wording in current item number 1 to identify where each of the required connections is already specified in the code. This better informs the code user regarding where to locate the specifics for each connection being considered in this section.
4. Modifying the wording in the final sentence of current item number 1 to apply only to exterior gable end walls, because that is the only location where braced wall panels can be practically extended and attached to the roof framing. Also the phrase “*braced wall panel shall be extended*” is clarified to state “braced wall panel *sheathing in the top story* shall be extended” to provide a clearer description of what is to be done. When rafters (or trusses) are perpendicular to a exterior braced wall line there is no practical method of “extending and attaching” the wall panel (or panel sheathing) to roof framing oriented at 90 degrees to the wall direction. When rafters and ceiling joists are perpendicular to a braced wall line, conventional construction has traditionally relied on the connections specified in items number 11, 15 and 19 of Table 2304.9.1 to provide a load path to transfer wind and seismic lateral forces. ALSO, at interior braced wall lines, there has never been a conventional construction provision in the legacy codes or the IRC that specifies extending *interior* braced wall line panels above the top plate to attach to roof framing (rafter/ceiling joist system, or a truss). Further, the maximum spacing of parallel braced wall lines is 35 feet (Sec. 2308.3), therefore a distance of 50 feet between parallel braced wall lines can only occur when the interior braced wall line spacing is ignored.
5. Clarifying the exception by adding the words “*and are installed perpendicular to an exterior braced wall line*” to identify the orientation of trusses to the braced wall where the blocking at the ends of the trusses would occur. Roof trusses installed parallel to a braced wall is not a configuration that was envisioned by the current section’s wording “*blocking of the ends of trusses*”. For example, where trusses are oriented parallel to, but NOT directly above a braced wall line, blocking providing a lateral load path from the roof to the braced wall would not be provided at truss ends. Instead multiple blocks would occur perpendicular to the truss bottom chord at some specific interval measured along the braced wall line.
6. Modifying the end of the first sentence of the exception to include the words “*providing equivalent lateral force transfer*” provides the building official with a basis for judging the acceptability of a method other than blocking between ends of trusses. This also informs truss manufactures regarding what will be considered when approving methods other than blocking.
7. Adding a sentence at the end of the exception to specify the required minimum blocking size and the connection of the blocking to the braced wall top plate, because that information is currently not specified in the exception.
8. Deletion of the redundant connection information in existing items 2, 3, and 4, and in the existing final paragraph, because all of that information is currently identically specified in Table 2304.9.1 or Section 2308.9.2.1.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This is a needed clarification of the connection requirements along braced wall lines.

Assembly Action:

None

Final Hearing Results

S224-07/08

AS

Code Change No: S227-07/08

Original Proposal

Section: 2308.9.1; IRC R602.3

Proponent: Robert Rice, Josephine County, OR, representing Josephine County Building Safety and Southern Oregon Chapter International Code Council.

THESE PROPOSALS ARE ON THE AGENDA OF THE IBC STRUCTURAL AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Revise as follows:

2308.9.1 Size, height and spacing. The size, height and spacing of studs shall be in accordance with Table 2308.9.1 except that utility-grade studs shall not be spaced more than 16 inches (406 mm) o.c., or support more than a roof and ceiling, or exceed 8 feet (2438 mm) in height for exterior walls and load-bearing walls or 10 feet (3048 mm) for interior nonload-bearing walls. Studs shall be continuous from a support at the bottom to a support at the top to resist loads perpendicular to wall. The support shall be a foundation or floor, ceiling or roof diaphragm or shall be designed in accordance with accepted engineering practice.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R602.3 Design and construction. Exterior walls of wood-frame construction shall be designed and constructed in accordance with the provisions of this chapter and Figures R602.3(1) and R602.3(2) or in accordance with AF&PA's NDS. Components of exterior walls shall be fastened in accordance with Tables R602.3(1) through R602.3(4). Exterior walls covered with foam plastic sheathing shall be braced in accordance with Section R602.10. Structural sheathing shall be fastened directly to structural framing members.

Studs shall be continuous from a support at the bottom to a support at the top to resist loads perpendicular to wall. The support shall be a foundation or floor, ceiling or roof diaphragm or shall be designed in accordance with accepted engineering practice.

Reason: *The prescriptive provisions of the IBC intentionally parallel the prescriptive provisions of the IRC.* The prescriptive provisions of the IRC are based on platform or balloon framing as stated in section, "**R301.1.2 Construction Systems**. The requirements of this code are based on platform and balloon-frame construction....."

With platform or balloon framing, the walls are supported at top and bottom to resist wind or seismic loads that are applied to the face of the wall ("out of plane loads"). The bottom is fastened to the floor system (diaphragm) or directly to the foundation. The top of the wall is supported by ceiling or roof diaphragms. The diaphragm is the ceiling or roof sheathing and defined in the code as

IBC: "A horizontal or sloped system acting to transmit lateral forces to the vertical resisting elements. When the term "diaphragm" is used, it includes horizontal bracing systems."

IRC: "A horizontal or nearly horizontal system acting to transmit lateral forces to the vertical resisting elements. When the term "diaphragm" is used, it includes horizontal bracing systems."

In the common condition where vaulted trusses are used, the gable end truss should be vaulted as well and the wall should be framed up to the bottom of the vaulted truss. Another option would be to not install a truss at the end-wall and frame the exterior wall up to the roof sheathing (i.e. "Balloon Framed"). In either case, the studs are supported at top and bottom.

This is consistent with BCSI 1-03, "**Guide to good practice for handling, installing & bracing of metal plate connected wood trusses**", by the Wood Truss Council of America and the Truss Plate Institute, October 1, 2003 which states,

"Important Note: Scissor truss applications must not be framed with flat bottom chord gable end frames as this creates a hinge in the wall/gable interface that is below the bottom chord plane diaphragm. Adequate bracing of this condition is difficult and sometimes impossible."

An article in the December 2004 Building Safety Journal, by Gregg Shea, P.E., Ted Osterberger, P.E. and Frank E Woeste, PhD, P.E. titled "Evaluating Tall Residential Walls for Code Conformance" addresses the issue of tall gable end walls. The article speaks in detail about the condition that my proposal addresses. In the article they state,

"DON'T create a hinge with stacked framing. The use of platform framing without a diaphragm for support results in a hinge at the center"
"Hinges in tall walls caused by inappropriate platform framing, lack of continuous vertical members or a gable end truss profile different from the adjacent roof trusses create structural instabilities."

In summary, if the wall is not supported at the top by a ceiling or roof diaphragm it is not prescriptive and an engineered design should be provided describing adequate support through multiple top plates, horizontal beam at top of wall, perpendicular interior walls, or other approved methods to resist out-of-plane lateral loads.

Bibliography:

BCSI 1-03, "**Guide to good practice for handling, installing & bracing of metal plate connected wood trusses**", by the Wood Truss Council of America and the Truss Plate Institute, October 1, 2003

Evaluating Tall Residential Walls for Code Conformance, December 2004 *Building Safety Journal*, by Gregg Shea, P.E., Ted Osterberger, P.E. and Frank E Woeste, PhD, P.E.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I – IBC STRUCTURAL

Committee Action:**Approved as Modified****Modify proposal as follows:**

2308.9.1 Size, height and spacing. The size, height and spacing of studs shall be in accordance with Table 2308.9.1 except that utility-grade studs shall not be spaced more than 16 inches (406 mm) o.c., or support more than a roof and ceiling, or exceed 8 feet (2438 mm) in height for exterior walls and load-bearing walls or 10 feet (3048 mm) for interior nonload-bearing walls. Studs shall be continuous from a support at the bottom to a support at the top to resist loads perpendicular to wall. The support shall be a foundation or floor, ceiling or roof diaphragm or shall be designed in accordance with accepted engineering practice.

Exception: Jack studs, trimmer studs and cripple studs at openings in walls that comply with Table 2308.9.5.

Committee Reason: This code change clarifies the intent of the code by requiring studs to be continuous which eliminates possible hinges in walls. The modification adds an appropriate exception which addresses conditions at wall openings.

Assembly Action:**None**

PART II – IRC B/E
Committee Action:

Disapproved

Committee Reason: This proposal would permit an unlimited height stud at maximum stud spacing from a floor to a three story ceiling. This would also permit stacking of panelized construction.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Larry Wainwright, WTCA, representing the Structural Building Components Industry, requests Approval as Modified by this Public Comment for Part I.

Further modify proposal as follows:

2308.9.1 Size, height and spacing. The size, height and spacing of studs shall be in accordance with Table 2308.9.1 except that utility-grade studs shall not be spaced more than 16 inches (406 mm) o.c., or support more than a roof and ceiling, or exceed 8 feet (2438 mm) in height for exterior walls and load-bearing walls or 10 feet (3048 mm) for interior nonload-bearing walls. Studs shall be continuous from a support at the ~~bottom~~ sole plate to a support at the top plate to resist loads perpendicular to wall. The support shall be a foundation or floor, ceiling or roof diaphragm or shall be designed in accordance with accepted engineering practice.

Exception: Jack studs, trimmer studs and cripple studs at openings in walls that comply with Table 2308.9.5.

Commenter's Reason: This is an editorial change to more clearly communicate the intent of the proponent. The terms "top" and "bottom" are replaced with "sole plate" and "top plate", which are used in the referenced table 602.3(1).

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Robert Rice, Josephine County Building Safety, representing Josephine County and Southern Oregon Chapter of ICC, requests Approval as Modified by this Public Comment for Part II.

Modify proposal as follows:

R602.3 Design and construction. Exterior walls of wood-frame construction shall be designed and constructed in accordance with the provisions of this chapter and Figures R602.3(1) and R602.3(2) or in accordance with AF&PA's NDS. Components of exterior walls shall be fastened in accordance with Tables R602.3(1) through R602.3(4). Exterior walls covered with foam plastic sheathing shall be braced in accordance with Section R602.10. Structural sheathing shall be fastened directly to structural framing members.

Studs shall be continuous from a support at the bottom to a support at the top to resist loads perpendicular to wall. The support shall be a foundation or floor, ceiling or roof diaphragm or shall be designed in accordance with accepted engineering practice.

Exception: Jack studs, trimmer studs and cripple studs at openings in wall that comply with Tables R502.5(1) and R502.5(2).

Commenter's Reason: For reference, the IBC version of this proposal, S227-07/08 Part I, was approved by committee As Modified by the exception as shown for wall openings. The committee reason states, "This code change clarifies the intent of the code by requiring studs to be continuous which eliminates possible hinges in wall. The modification adds an appropriate exception which addresses conditions at wall openings."

At the IRC hearings a member of the committee asked two questions that were not able to be addressed at the microphone during Code Development Hearings due to timing. The committees reason states,

"This proposal would permit an unlimited height stud at maximum stud spacing from a floor to a three story ceiling. This would also permit stacking of panelized construction."

The two concerns raised by the committee member can be answered as follows;

1. Stud height and spacing is already defined and regulated in the IRC in Section R602.3.1 and Tables R602.3(5) and Table R602.3.1. I have included it in the proposal above for reference. This proposal does not change the limitations on height & spacing that are currently in the code.
2. Panelized construction, such as Structural Insulated Panels (SIPS), would be a designed system. This would certainly be true if the panels were stacked. This concern is already addressed in the proposal by the statement, "or shall be designed in accordance with accepted engineering practice."

I urge your support of this proposal.

Purpose

The prescriptive provisions of the IRC are based on platform or balloon framing as stated in section, "R301.1.2 Construction Systems. The requirements of this code are based on platform and balloon-frame construction....."

With platform or balloon framing, the walls are supported at top and bottom to resist wind or seismic loads that are applied to the face of the wall ("out of plane loads"). The bottom is fastened to the floor system (diaphragm) or directly to the foundation. The top of the wall is supported by ceiling or roof diaphragms. The diaphragm is the ceiling or roof sheathing and defined in the code as

"A horizontal or nearly horizontal system acting to transmit lateral forces to the vertical resisting elements. When the term "diaphragm" is used, it includes horizontal bracing systems."

In the common condition where vaulted trusses are used, the gable end truss should be vaulted as well and the wall should be framed up to the bottom of the vaulted truss. Another option would be to not install a truss at the endwall and frame the exterior wall up to the roof sheathing (i.e. "Balloon Framed"). In either case, the studs are supported at top and bottom.

This is consistent with BCSI 1-03, "Guide to good practice for handling, installing & bracing of metal plate connected wood trusses", by the Wood Truss Council of America and the Truss Plate Institute, October 1, 2003 which states,

"Important Note: Scissor truss applications must not be framed with flat bottom chord gable end frames as this creates a hinge in the wall/gable interface that is below the bottom chord plane diaphragm. Adequate bracing of this condition is difficult and sometimes impossible."

An article in the December 2004 Building Safety Journal, by Gregg Shea, P.E., Ted Osterberger, P.E. and Frank E Woeste, PhD, P.E. titled "Evaluating Tall Residential Walls for Code Conformance" addresses the issue of tall gable end walls. The article speaks in detail about the condition that my proposal addresses. In the article they state,

"DON'T create a hinge with stacked framing. The use of platform framing without a diaphragm for support results in a hinge at the center"

"Hinges in tall walls caused by inappropriate platform framing, lack of continuous vertical members or a gable end truss profile different from the adjacent roof trusses create structural instabilities.

In summary, if the wall is not supported at the top by a ceiling or roof diaphragm it is not prescriptive and an engineered design should be provided describing adequate support through multiple top plates, horizontal beam at top of wall, perpendicular interior walls, or other approved methods.

Public Comment 2:

Larry Wainwright, WTCA, representing the Structural Building Components Industry, requests Approval as Modified by this Public Comment.

Modify proposal as follows:

R602.3 Design and construction. Exterior walls of wood-frame construction shall be designed and constructed in accordance with the provisions of this chapter and Figures R602.3(1) and R602.3(2) or in accordance with AF&PA's NDS. Components of exterior walls shall be fastened in accordance with Tables R602.3(1) through R602.3(4). Exterior walls covered with foam plastic sheathing shall be braced in accordance with Section R602.10. Structural sheathing shall be fastened directly to structural framing members.

Studs shall be continuous from a support at the ~~bottom~~ sole plate to a support at the top plate to resist loads perpendicular to wall. The support shall be a foundation or floor, ceiling or roof diaphragm or shall be designed in accordance with accepted engineering practice.

Commenter's Reason: To maintain consistency, the terms "top" and "bottom" are replaced with "sole plate" and "top plate", which are used in the referenced table 602.3(1).

Final Hearing Results

S227-07/08, Part I	AMPC
S227-07/08, Part II	AMPC1, 2

Code Change No: **S229-07/08**

Original Proposal

Section: 2308.11.2

Proponent: Jim W. Sealy, FAIA, and Kelly Cobeen, Building Seismic Safety Council of the National Institute of Building Sciences, representing FEMA/BSSC Code Resource Support Committee

Revise as follows:

2308.11.2 (Supp) Concrete or masonry. Concrete or masonry walls and stone or masonry veneer shall not extend above the basement.

Exceptions:

1. Stone and masonry veneer is permitted to be used in the first two stories above grade plane or the first three stories above grade plane where the lowest story has concrete or masonry walls in Seismic Design Category B, provided that structural use panel wall bracing is used and the length of bracing provided is one- and one half times the required length as determined in Table 2308.9.3(1).
2. Stone and masonry veneer is permitted to be used in the first story above grade plane or the first two stories above grade plane where the lowest story has concrete or masonry walls in Seismic Design Category B or C.
3. Stone and masonry veneer is permitted to be used in both stories of buildings with the first two stories above grade plane in Seismic Design Categories B and C, provided the following criteria are met:
 - 3.1. Type of brace per Section 2308.9.3 shall be Method 3 and the allowable shear capacity in accordance with Table 2306.4.1 shall be a minimum of 350 plf (5108 N/m).
 - 3.2. The bracing of the top story shall be located at each end and at least every 25 feet (7620 mm) o.c. but not less than 40 percent of the braced wall line. The bracing of the first story shall be located at each end and at least every 25 feet (7620 mm) o.c. but not less than 35 percent of the braced wall line. Braced wall panels in the second story shall be located in accordance with Section 2308.9.3 and not more than 25 feet (7620 mm) on center, and the total length of braced wall panels shall be not less than 25% of the braced wall line length. Braced wall panels in the first story shall be located in accordance with Section 2308.9.3 and not more than 25 feet (7620 mm) on center, and the total length of braced wall panels shall be not less than 45% of the braced wall line length.
 - 3.3. Hold-down connectors shall be provided at the ends of each braced walls panel for the second story floor-to first story connection floor-wall assembly with an allowable design of 2,000 pounds (8896 N). Hold-down connectors shall be provided at the ends of each wall segment of the braced walls panel for the first story floor-to foundation connection with an allowable design of 3,900 pounds (17 347 N). In all cases, the hold-down connector force shall be transferred to the foundation.
 - 3.4. Cripple walls shall not be permitted.

Reason: As printed in the 2006 IBC, the required bracing percentages in Exception 3.2 appear to be in error as more bracing is required in the second story than the first story while the first story will have higher seismic loads. This code change proposes to correct this error in Exception 3.2 by including bracing percentages similar to those required by IRC Table R703.7(1). Additional editorial changes are made to clarify the intent of Exception 3.3. Further, in the first paragraph, the word "plane" is struck out of the term "two stories above grade plane" to avoid hillside walk-out basement configurations. Using the current grade plane wording essentially allows the basement story level walk-out facing exterior wall line and portions of the two perpendicular exterior walls to include veneer while only being braced for a two-story condition. The existing Exception 3 provisions are predicated on only two story levels of veneer. Exceptions 1 and 2 do not require the deletion of the grade plane wording because those provisions will allow a basement walk-out condition.

The code change corrects an error but will increase costs, although not substantially.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal corrects an obvious flaw in the wording of the exception for stone and masonry veneer.

Assembly Action:

None

Final Hearing Results

S229-07/08

AS

Code Change No: **S230-07/08**

Original Proposal

Sections: 2407.1.4 (New), 2407.1.4.1 (New), 2407.1.4.2 (New)

Proponent: William E. Koffel, PE, Koffel Associates, Inc., representing Glazing Industry Code Committee

Add new text as follows:

2407.1.4 Glazing in wind-borne debris regions. Glazing installed in in-fill panels or balusters in wind-borne debris regions shall comply with the following:

2407.1.4.1 Ballusters and infill panels. Glass installed in exterior railing in-fill panels or balusters shall be laminated glass complying with Category II of CPSC 16 CFR 1201 or Class A of ANSI Z97.1

2407.1.4.2 Glass supporting top rail. When the top rail is supported by glass, the assembly shall be tested according to the impact requirements of Section 1609.1.2. The top rail shall remain in place after impact.

Reason: The proposal enhances the code by helping to minimize the glass debris in a windstorm. Laminated glass installed in in-fill panels or balusters of exterior railings will remain integral after breakage occurs. In the case of all-glass type railings, structural integrity can be maintained by incorporating impact resistant glass. According to the Miami-Dade County Building Department, a dangerous situation resulted after the 2005 hurricanes in South Florida where top handrails fell off the buildings. It was noted that rails located in the small missile areas of the building that disengaged from the building become large missile debris in those areas. This proposal serves to qualify the glass railing system that can provide retention and structural integrity to support the rail after the glass has been impacted.

It is the intent of proposed 2407.1.4.2 to only require the missile impact test and not the cycling test requirements contained in the ASTM test standard.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This code change furthers the elimination of wind-borne debris in hurricane regions, by adding requirements for glass in-fill panels used on the exterior in wind-borne debris regions.

Assembly Action:

None

Final Hearing Results

AS

Code Change No: **S231-07/08**

Original Proposal

Section: 2409

Proponent: William E. Koffel, PE, Koffel Associates, Inc., representing Glazing Industry Code Committee

1. Revise as follows:

SECTION 2409
GLASS IN ELEVATOR HOISTWAYS AND ELEVATOR CARS

2409.1 Glass in elevator hoistway enclosures. Glass in elevator hoistway enclosures and hoistway doors shall be laminated glass conforming to ANSI Z97.1 or 16 CFR Part 1201. ~~Markings as specified in the applicable standard shall be on each separate piece of glass and shall remain visible after installation.~~

2. Add new text as follows:

2409.1.1 Fire-rated hoistways. Glass installed in hoistways and hoistway doors where the hoistway is required to have a fire resistance rating shall also comply with Section 715.

2409.1.2 Glass hoistway doors. The glass in glass hoistway doors shall be not less than 60 percent of the total visible door panel surface area as seen from the landing side.

2409.2 Glass vision panels. Glass in vision panels in elevator hoistway doors shall be permitted to be any transparent glazing material not less than 0.25 inches (0.64 mm) in thickness conforming to ANSI Z97.1 or 16CFR Part 1201. The area of any single vision panel shall not be less than 24 square inches (15484 mm²) and the total area of one or more vision panels in any hoistway door shall be not more than 85 square inches (54839 mm²).

2409.3 Glass in elevator cars. Glass in elevator car enclosures, glass elevator car doors, and glass used for lining walls and ceilings of elevator cars shall be laminated glass conforming to ANSI Z97.1 or 16CFR Part 1201.

Exception: Tempered glass shall be permitted to be used for lining walls and ceilings of elevator cars provided:

1. The glass is bonded to a nonpolymeric coating, sheeting, or film backing having a physical integrity to hold the fragments when the glass breaks.
2. The glass is not subjected to further treatment such as sandblasting; etching; heat treatment; or painting that could alter the original properties of the glass.
3. The glass is tested to the acceptance criteria for laminated glass as specified in ANSI Z97.1 or 16CFR Part 1201.

The glass in glass elevator car doors shall be not less than 60 percent of the total visible door panel surface area as seen from the car side of the doors.

Reason: The intent of Section 2409 was to include the requirements of ASME A17.1 in the Building Code. However, only a portion of the glass requirements contained in ASME A17.1 are currently included in the IBC. As such, there is considerable confusion regarding the glass requirements for elevator cars and elevator hoistways. The purpose of this proposal is to more fully incorporate the provisions of ASME A17.1 in the IBC. The proposed revisions are consistent with ASME A17.1 except as follows:

1. ASME A17.1 permits wired glass to be installed in vision panels in hoistway doors. The proposal does not permit the use of wired glass consistent with the requirements for glazing in hazardous locations.
2. ASME A171 permits the use of Type 3C film reinforced silvered mirror glass that conforms to a Canadian standard to be used in jurisdictions enforcing the National Building Code of Canada.

The language regarding marking of the glass has been deleted since Section 2406 already contains requirements for marking safety glazing. If the text proposed to be deleted is retained, the text will also need to be added in about five locations of the proposed text.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Approved as Submitted**

Committee Reason: Agreement with the proponent's reason which indicates that some confusion over glass requirements can be eliminated by including a more complete set of requirements for elevator cars and hoistways in Section 2409.

Assembly Action:**None**

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

William E. Koffel, P.E. Koffel Associates, Inc, representing Glazing Industry Code Committee, requests Approval as Modified by this Public Comment.

Modify proposal as follows:

**SECTION 2409
GLASS IN ELEVATOR HOISTWAYS AND ELEVATOR CARS**

2409.1 Glass in elevator hoistway enclosures. Glass in elevator hoistway enclosures and hoistway doors shall be laminated glass conforming to ANSI Z97.1 or 16 CFR Part 1201.

2409.1.1 Fire-rated hoistways. Glass installed in hoistways and hoistway doors where the hoistway is required to have a fire resistance rating shall also comply with Section 715.

2409.1.2 Glass hoistway doors. The glass in glass hoistway doors shall be not less than 60 percent of the total visible door panel surface area as seen from the landing side.

2409.2 Glass vision panels. Glass in vision panels in elevator hoistway doors shall be permitted to be any transparent glazing material not less than 0.25 inches (0.64 mm) in thickness conforming to Class A in accordance with ANSI Z97.1 or Category II in accordance with 16CFR Part 1201. The area of any single vision panel shall not be less than 24 square inches (15484 mm²) and the total area of one or more vision panels in any hoistway door shall be not more than 85 square inches (54839 mm²).

2409.3 Glass in elevator cars.

2409.3.1 Glass types. Glass in elevator car enclosures, glass elevator car doors, and glass used for lining walls and ceilings of elevator cars shall be laminated glass conforming to Class A in accordance with ANSI Z97.1 or Category II in accordance with CPSC 16CFR Part 1201.

Exception: Tempered glass shall be permitted to be used for lining walls and ceilings of elevator cars provided:

1. The glass is bonded to a nonpolymeric coating, sheeting, or film backing having a physical integrity to hold the fragments when the glass breaks.
2. The glass is not subjected to further treatment such as sandblasting; etching; heat treatment; or painting that could alter the original properties of the glass.
3. The glass is tested to the acceptance criteria for laminated glass as specified ~~in~~ for Class A in accordance with ANSI Z97.1 or Category II in accordance with CPSC 16CFR Part 1201.

2409.3.2 Surface area. The glass in glass elevator car doors shall be not less than 60 percent of the total visible door panel surface area as seen from the car side of the doors.

Commenter's Reason: The original proposal did not specify the category or classification of safety glazing required.

Final Hearing Results

Code Change No: **S232-07/08**

Original Proposal

Table 2506.2, Chapter 35 (New); IRC R702.3.1, Chapter 43 (New)

Proponent: George Shortreed, Georgia-Pacific Gypsum LLC, representing Georgia-Pacific Gypsum LLC

THESE PROPOSALS ARE ON THE AGENDA OF THE IBC STRUCTURAL AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

1. Revise table as follows:

**TABLE 2506.2 (Supp)
GYPSUM BOARD MATERIALS AND ACCESSORIES**

MATERIAL		STANDARD
-----------------	--	-----------------

Accessories for gypsum board	ASTM C 1047	
Adhesives for fastening gypsum wallboard	ASTM C 557	
Elastomeric joint sealants	ASTM C 920	
Exterior soffit board	ASTM C 931	
Fiber-reinforced gypsum panels	ASTM C 1278	
Glass mat gypsum backing panel	ASTM C 1178	
<u>Glass mat gypsum panel</u>	<u>ASTM C 1658</u>	
Glass mat gypsum substrate	ASTM C 1177	
Gypsum backing board and gypsum shaftliner board	ASTM C 442	
Gypsum ceiling board	ASTM C 1395	
Gypsum sheathing	ASTM C 79	
Gypsum wallboard	ASTM C 36	
Joint reinforcing tape and compound	ASTM C 474; C 475	
Nails for gypsum boards	ASTM C 514, F 547, F 1667	
Predecorated gypsum board	ASTM C 960	
Steel screws	ASTM C 954, C 1002	
Steel studs, load bearing	ASTM C 955	
Steel studs, nonload bearing	ASTM C 645	
Standard specification for gypsum board	ASTM C 1396	
Testing gypsum and gypsum products	ASTM C 22, C 472, C 473	
Water-resistant gypsum backing board	ASTM C 630	

2. Add standard to Chapter 35 as follows:

ASTM

ASTM C 1658/C 1658M-06 Standard Specification for Glass Mat Gypsum Panels.

PART II – IRC BUILDING/ENERGY

1. Revise as follows:

R702.3.1 Materials. All gypsum board materials and accessories shall conform to ASTM C 36, C 79, C 475, C 514, C 630, C 931, C 960, C 1002, C 1047, C 1177, C 1178, C 1278, C 1395, ~~or~~ C 1396 or C 1658 and shall be installed in accordance with the provisions of this section. Adhesives for the installation of gypsum board shall conform to ASTM C 557.

2. Add standard to Chapter 43 as follows:

ASTM

ASTM C 1658/C 1658M-06 Standard Specification for Glass Mat Gypsum Panels.

Reason: The purpose of this proposal is to add ASTM specifications for glass mat gypsum materials to the list of gypsum board materials presently in the code. These specifications have been developed by the ASTM consensus process and are comparable to other specifications listed. This includes a glass mat gypsum panel suitable for interior use.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Note: The following analysis was not in the Code Change Proposal book but was posted on the ICC website.

Analysis: Review of proposed new standard ASTM C 1658/C 1658M-06 indicated that, in the opinion of ICC Staff, the standard did comply with ICC standards criteria.

PART I – IBC STRUCTURAL

Committee Action:

Approved as Submitted

Committee Reason: This code change adds material requirements in the form of a referenced standard that is appropriate with the wider use of glass mat gypsum panel products.

Assembly Action:

None

PART II – IRC B/E

Committee Action:

Approved as Submitted

Committee Reason: This change adds the appropriate ASTM Standard for glass mat gypsum panel for interior use.

Assembly Action:

None

Code Change No: S235-07/08

Original Proposal

Chapter 35

Proponent: James A. Rossberg, PE, Structural Engineering Institute of ASCE, representing Structural Engineering Institute of ASCE

Revise as follows:

CHAPTER 35 REFERENCED STANDARDS

ASCE/SEI

7—05 Minimum Design Loads for Buildings and Other Structures including Supplement No.1 and Supplement No. 2 and excluding Chapter 14 and Appendix 11A.

Reason: The purpose of this change is to adopt Supplement No. 2 to the 2005 edition of ASCE/SEI 7 which is shown below in its entirety. Supplement No. 2 revises the minimum base shear equations for both buildings and non-building structures. The need for this change was indicated by the results from the 75% Draft of *ATC-63, Quantification of Building System Performance and Response Parameters*, which indicate that tall buildings may fail at an unacceptably low seismic level and therefore the minimum base shear equation for buildings is being restored to that which appeared in the 2002 edition of ASCE 7.

Because nonbuilding structures not similar to buildings have low R-values compared to the special reinforced concrete moment frames studied in ATC-63, the ASCE 7 standards committee chose not to restore the high minimum base shears for nonbuilding structures not similar to buildings found in ASCE 7-02. In many cases, these previous minimum base shears gave many nonbuilding structures not similar to buildings

effective R-values less than 1.0. Therefore, the Seismic Subcommittee believes that the minimum base shear equation of $0.044S_{DS}I$ used for buildings should also be applied to nonbuilding structures not similar to buildings.

Supplement No. 2 was approved by the ASCE 7 standards committee in the summer of 2007 and will be opened for public review and comment in the fall of 2007. It is expected that Supplement No. 2 will have fully completed the ASCE consensus process prior to the 2008 spring ICC hearings.

Supplement No. 2 will be distributed via the SEI website, newsletters and assorted other media. Upon the next printing of ASCE 7-05 it will be included directly in the text of the document. The complete text of Supplement No. 2 is as follows:

Supplement No. 2 to ASCE 7-05:

Revise Equation 12.8-5 of Section 12.8.1.1 of ASCE 7-05 as shown below:

12.8.1.1 Calculation of Seismic Response Coefficient. The seismic response coefficient, C_s , shall be determined in accordance with Eq. 12.8-2.

$$C_s = \frac{S_{DS}}{\left(\frac{R}{I}\right)} \quad (\text{Eq. 12.8-2})$$

where:

- S_{DS} = the design spectral response acceleration parameter in the short period range as determined from Section 11.4.4
- R = the response modification factor in Table 12.2-1, and
- I = the occupancy importance factor determined in accordance with Section 11.5.1

The value of C_s computed in accordance with Eq. 12.8-2 need not exceed the following:

$$C_s = \frac{S_{D1}}{T\left(\frac{R}{I}\right)} \quad \text{for } T \leq T_L \quad (\text{Eq. 12.8-3})$$

$$C_s = \frac{S_{D1}T_L}{T^2\left(\frac{R}{I}\right)} \quad \text{for } T > T_L \quad (\text{Eq. 12.8-4})$$

C_s shall not be less than
 $C_s = 0.04 \underline{0.044S_{DS}} \geq 0.01 \quad (\text{Eq. 12.8-5})$

In addition, for structures located where S_1 is equal to or greater than 0.6g, C_s shall not be less than

$$C_s = \frac{0.5S_1}{\left(\frac{R}{I}\right)} \quad (\text{Eq. 12.8-6})$$

where I and R are as defined in Section 12.8.1.1 and

- S_{D1} = the design spectral response acceleration parameter at a period of 1.0 sec, as determined from Section 11.4.4
- T = the fundamental period of the structure (sec) determined in Section 12.8.2
- T_L = long-period transition period (sec) determined in Section 11.4.5
- S_1 = the mapped maximum considered earthquake spectral response acceleration parameter determined in accordance with Section 11.4.1

Revise Equations 15.4-1 and 15.4-2 of Section 15.4.1, item 2, as shown below:

2. For nonbuilding systems that have an R value provided in Table 15.4-2, the seismic response coefficient (C_s) shall not be taken less than

$$C_s = 0.03 \underline{0.044S_{DS}} \geq 0.03 \quad (15.4-1)$$

and for nonbuilding structures located where $S_1 \geq 0.6g$, C_s shall not be taken less than

$$C_s = \frac{0.8S_1}{\left(\frac{R}{I}\right)} \quad (15.4-2)$$

EXCEPTION: Tanks and vessels that are designed to AWWA D100, AWWA D103, API 650 Appendix E, and API 620 Appendix L as modified by this standard, shall be subject to the larger of the minimum base shear values defined by the reference document or the following equations:

$$C_s = 0.04 \underline{0.044S_{DS}} \geq 0.01 \quad (15.4-3)$$

and for nonbuilding structures located where $S_1 \geq 0.6g$, C_s shall not be taken less than

$$C_s = \frac{0.5 S_1}{\left(\frac{R}{I}\right)} \quad (15.4-4)$$

Minimum base shear requirements need not apply to the convective (sloshing) component of liquid in tanks.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal adds a supplement to the currently referenced edition of ASCE 7, which restores prior minimum base shear requirements for earthquake design.

Assembly Action:

None

Final Hearing Results

S235-07/08

AS

Code Change No: S236-07/08

Original Proposal

Chapter 35

Proponent: David P. Tyree, P.E., C.B.O., American Forest & Paper Association, representing American Forest & Paper Association

Revise as follows:

**CHAPTER 35
REFERENCED STANDARDS**

American Forest and Paper Association

ANSI/AF&PA SDPWS-05-08 AF&PA Supplement Special Design Provisions for Wind and Seismic

Reason: This is an update to an existing AF&PA/ANSI Standard. The new supplement is scheduled to be approved as an AF&PA standard by June 2008. The supplement will further be approved as an ANSI consensus standard by August 2008. *ANSI / AF&PA SDPWS-2008 - Special Design Provisions for Wind and Seismic standard with Commentary* covers materials, design and construction of wood members, fasteners, and assemblies to resist wind and seismic forces. Engineered design of wood structures to resist wind or seismic forces is either by allowable stress design (ASD); or load and resistance factor design (LRFD). Criteria for proportioning, design, and detailing of engineered wood systems, members, and connections in lateral force resisting systems is provided. Nominal shear capacities of diaphragms and shear walls are provided for reference assemblies.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Disapproved at the proponent's request, because the updated standard is not complete. The standard is needed and the committee is hopeful that a public comment will be submitted.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

David P. Tyree, PE, CBO, American Forest & Paper Association, requests Approval as Submitted.

Commenter's Reason: This proposal updated an existing AF&PA/ANSI Standard referenced in the IBC - ANSI / AF&PA SDPWS-2008 - Special Design Provisions for Wind and Seismic standard with Commentary is scheduled to be available on 7/31/08. The ICC Structural Committee felt there was a need for this updated standard to be referenced in the 2009 IBC, but could not recommend approval without the standard being completed. The reason statement in their findings also stated that they hoped for a public comment. This standard (when completed) will be posted on our website for free download for all users. www.awc.org.

Reason: The *CP 28 Code Development Policy*, Section 4.5* requires the updating of referenced standards to be accomplished administratively, and be processed as a Code Change Proposal. In May 2007, a letter was sent to each developer of standards that are referenced in the International Codes, asking them to provide ICC with a list of their standards in order to update to the current edition. Above is the received list of the referenced standards that are under the maintenance responsibility of the IBC Structural Committee.

***4.5 Updating Standards:** The updating of standards referenced by the Codes shall be accomplished administratively by the appropriate code development committee in accordance with these full procedures except that multiple standards to be updated may be included in a single proposal.

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Bonnie Manley, American Iron and Steel Institute, requests Approval as Modified by this Public Comment.

Modify proposal as follows:

AISI S230-07 Standard for Cold-formed Steel Framing—Prescriptive Method for One- and Two-family Dwellings, with Supplement 2, dated 2008

(Portions of proposal not shown remain unchanged)

Commenter's Reason: AISI S230-07 w/ S2-08 -: This modification adopts the recently completed Supplement 2 to AISI S230-07 (Standard for Cold-Formed Steel Framing – Prescriptive Method for One- and Two-family Dwellings, 2007 Edition). This supplement was issued in June 2008 and is available for download from the AISI website: www.steel.org. (Click on "Construction" link and then click on "Codes and Standards" link.) It completely replaces Supplement 1 to AISI S230-07, and is intended to revise and clarify provisions related to low wind and low seismic wall bracing.

Please note, to fully integrate AISI S230-07, Supplement 2 into the ICC Codes, public comments have also been submitted on Proposals RB11-07/08 and RB168-07/08.

Public Comment 2:

Bonnie Manley, American Iron and Steel Institute, requests Approval as Modified by this Public Comment.

Modify proposal as follows:

AISI S214-07 North American Standard for Cold-formed Steel Framing – Truss Design, with Supplement 2, dated 2008

(Portions of proposal not shown remain unchanged)

Commenter's Reason: AISI S214-07 w/ S2-08. This modification adopts the recently completed Supplement 2 to AISI S214-07 (North American Standard for Cold-Formed Steel Framing – Truss Design, 2007 Edition). This supplement was issued in June 2008 and is available for download from the AISI website: www.steel.org. (Click on "Construction" link and then click on "Codes and Standards" link.) It completely replaces Supplement 1 to AISI S214-07, and revises and clarifies provisions related to design responsibilities, loading, quality criteria and bracing for greater consistency with building codes and industry practice. Specifically, the purpose of this supplement is to better harmonize with the provisions desired by involved industry groups, including NCSEA and WTCA, which were initially documented in IBC Proposal S209-07/08. Please note, to fully integrate AISI S214-07, Supplement 2 into the IBC, a public comment has also been submitted on Proposal S209-07/08.

Final Hearing Results

S238-07/08**AMPC1, 2**

2006 INTERNATIONAL FIRE CODE

Code Change No: **F84-07/08**

Original Proposal

Sections: 509.1 (IBC [F] 911.1)

Proponent: Ken Kraus, Fire Department, Los Angeles, CA

Revise as follows:

509.1 (IBC [F] 911.1) (Supp) Features. Where required by other sections of this code and in all buildings classified as high-rise buildings by the *International Building Code*, a fire command center for fire department operations shall be provided. The location and accessibility of the fire command center shall be approved by the fire department. The fire command center shall be separated from the remainder of the building by not less than a 1-hour fire barrier constructed in accordance with Section 706 of the *International Building Code* or horizontal assembly constructed in accordance with Section 711 of the *International Building Code*, or both. The room shall be a minimum of ~~96~~ 250 square feet (~~9~~ 23 m²) with a minimum dimension of ~~8~~ 10 feet (~~2438~~ 3048 mm). A layout of the fire command center and all features required by this section to be contained therein shall be submitted for approval prior to installation. The fire command center shall comply with NFPA 72 and shall contain the following features:

1. The emergency voice/alarm communication system unit.
2. The fire department communications system.
3. Fire-detection and alarm system annunciator system.
4. Annunciator unit visually indicating the location of the elevators and whether they are operational.
5. Status indicators and controls for air-handling systems.
6. The fire-fighters control panel required by Section 909.16 for smoke control systems installed in the building.
7. Controls for unlocking stairway doors simultaneously.
8. Sprinkler valve and water-flow detector display panels.
9. Emergency and standby power status indicators.
10. A telephone for fire department use with controlled access to the public telephone system.
11. Fire pump status indicators.
12. Schematic building plans indicating the typical floor plan and detailing the building core, means of egress, fire protection systems, fire-fighting equipment and fire department access.
13. Work table.
14. Generator supervision devices, manual start and transfer features.
15. Public address system, where specifically required by other sections of this code.
16. Elevator fire recall switch in accordance with ASME A17.1.
17. Elevator emergency or standby power selector switch(es), where emergency or standby power is provided.

Reason: This proposal is intended to increase the minimum size of the Fire Command Center to a size and configuration that is conducive to effective use of the facility by emergency responders.

The current minimum requirement for the size of a Fire Command Center is impractical. Fire Command Centers (FCC) not only need to be designed to accommodate a significant number of emergency responders wearing full personal protective equipment. FCC's are also used to review building emergency plans during incidents, co-locate decision makers within the Incident Command System (ICS) and interpret fire protection system information. Given the multiple uses of the FCC, it is extremely likely that the limitations of a 10' by 10' room would serve to compromise the effectiveness of Incident management.

The current minimum size has proven in both exercise and emergency incident scenarios to be too small and confining.

A minimum size of 250 square feet allows for the necessary personnel to effectively perform the required tasks associated with a Fire Command Center.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

509.1 (IBC [F] 911.1) (Supp) Features. Where required by other sections of this code and in all buildings classified as high-rise buildings by the *International Building Code*, a fire command center for fire department operations shall be provided. The location and accessibility of the fire command center shall be approved by the fire department. The fire command center shall be separated from the remainder of the building by not less than a 1-hour fire barrier constructed in accordance with Section 706 of the *International Building Code* or horizontal assembly constructed in accordance with Section 711 of the *International Building Code*, or both. The room shall be a minimum of ~~250~~ 200 square feet (23 19 m²) with a minimum dimension of 10 feet (3048 mm). A layout of the fire command center and all features required by this section to be contained therein shall be submitted for approval prior to installation. The fire command center shall comply with NFPA 72 and shall contain the following features:

(Features 1 through 17 are unchanged)

Committee Reason: The proposal was approved because the committee felt that it will provide additional working room for the fire command staff who will occupy the fire command center. The modification provides a more reasonable working size for the fire command center.

Assembly Action:

None

Final Hearing Results

F84-07/08

AM

Code Change No: F85-07/08

Original Proposal

Sections: 509.1 (IBC [F] 911.1)

Proponent: Lawrence G. Perry, AIA, representing Building Owners and Managers Association International (BOMA)

Revise as follows:

509.1 (IBC [F] 911.1) (Supp) Features. Where required by other sections of this code and in all buildings classified as high-rise buildings by the *International Building Code*, a fire command center for fire department operations shall be provided. The location and accessibility of the fire command center shall be approved by the fire department. The fire command center shall be separated from the remainder of the building by not less than a 1-hour fire barrier constructed in accordance with Section 706 of the *International Building Code* or horizontal assembly constructed in accordance with Section 711 of the *International Building Code*, or both. The room shall be a minimum of 96 square feet (9 m²) with a minimum dimension of 8 feet (2438 mm). A layout of the fire command center and all features required by this section to be contained therein shall be submitted for approval prior to installation. The fire command center shall comply with NFPA72 and shall contain the following features:

1. The emergency voice/alarm communication system unit.
2. The fire department communications system.
3. Fire-detection and alarm system annunciator system.
4. Annunciator visually indicating the location of the elevators and whether they are operational.
5. Status indicators and controls for air-handling systems.
6. The fire-fighter=s control panel required by Section 909.16 for smoke control systems installed in the building.
7. Controls for unlocking stairway doors simultaneously.
8. Sprinkler valve and water-flow detector display panels.
9. Emergency and standby power status indicators.
10. A telephone for fire department use with controlled access to the public telephone system.
11. Fire pump status indicators.
12. Schematic building plans indicating the typical floor plan and detailing the building core, means of egress, fire protection systems, fire-fighting equipment and fire department access, and the location of fire walls, fire barriers, fire partitions, smoke barriers and smoke partitions.
13. Work table.
14. Generator supervision devices, manual start and transfer features.

15. Public address system, where specifically required by other sections of this code.
16. Elevator fire recall switch in accordance with ASME A17.1.
17. Elevator emergency or standby power selector switch(es), where emergency or standby power is provided.

Reason: This proposal will add additional information to first responders in buildings having fire command centers. It will require that the schematic building plans, which are already required, include the location of fire walls, fire barriers, fire partitions, smoke barriers, and smoke partitions. BOMA believes this is a far better method of providing this information to fire inspectors and responding fire fighters than providing stencils or stickers on walls throughout the building. BOMA has submitted a separate proposal to delete the requirement for marking of rated walls (newly added to Section 703.6 of the IBC).

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal was approved because the committee felt that it will provide the emergency operations commander with needed information in a convenient location at little or no cost.

Assembly Action:

None

Final Hearing Results

F85-07/08

AS

Code Change No: F87-07/08

Original Proposal

Sections: 511 (New), 907.2.12.2 (IBC [F] 907.2.12.2), Appendix I (New)

Proponent: Tom Lariviere, Fire Department, Madison, MS, representing Joint Fire Service Review Committee

1. Add new text as follows:

SECTION 511
EMERGENCY RESPONDER RADIO COVERAGE

511.1 Emergency responder radio coverage in new buildings. All new buildings shall have approved radio coverage for emergency responders within the building.

511.2 Emergency responder radio coverage in existing buildings. Existing buildings that do not have approved radio coverage for emergency responders within the building shall be equipped with such coverage within 18 months of receiving notice of such deficiency from the fire code official.

2. Revise as follows:

907.2.12.2 (IBC [F] 907.2.12.2) (Supp) Fire department communication system. An approved ~~two-way, fire department communication~~ emergency responder radio coverage system designed and installed in accordance with NFPA 72 shall be provided for fire department use. It shall operate between a fire command center complying with Section 509 and elevators, elevator lobbies, emergency and standby power rooms, fire pump rooms, areas of refuge and inside enclosed exit stairways. ~~The fire department communication device shall be provided at each floor level within the enclosed exit stairway.~~

Exception: ~~Fire department radio systems where approved by the fire department.~~

3. Add new appendix as follows:

APPENDIX I
EMERGENCY RESPONDER RADIO COVERAGE

SECTION I101
GENERAL

I101 Scope. Systems, components, and equipment required to provide emergency responder radio coverage shall be in accordance with this appendix.

I101.1 Permit. A construction permit is required for installation of or modification to emergency responder radio coverage systems and related equipment. Maintenance performed in accordance with this code is not considered a modification and does not require a permit.

SECTION I102
DEFINITIONS

I102.1 Definitions. For the purpose of this appendix, certain terms are defined as follows:

AGENCY. Any emergency responder department within the jurisdiction that utilizes radio frequencies for communication. This could include, but not be limited to, various public safety agencies such as fire department, emergency medical services and law enforcement.

SECTION I103
TECHNICAL REQUIREMENTS

I103.1 Radio signal strength. The building shall be considered to have acceptable emergency responder radio coverage when signal strength measurements in 90 percent of all areas on each floor of the building meet the signal strength requirements in Sections I103.1.1 and I103.1.2.

I103.1.1 Minimum signal strength into the building. A minimum signal strength of -95 dBm shall be receivable within the building.

I103.1.2 Minimum signal strength out of the building. A minimum signal strength of -100 dBm shall be received by the agency's radio system when transmitted from within the building.

I103.2 System design. The emergency responder radio coverage system shall be designed in accordance with Sections I103.2.1 through I103.2.5.

I103.2.1 Amplification Systems Allowed. Buildings and structures which cannot support the required level of radio coverage shall be equipped with a radiating cable system, a distributed antenna system with FCC certified signal boosters, or other system approved by the fire code official in order to achieve the required adequate radio coverage.

I103.2.2 Technical criteria. The fire code official shall maintain a document providing the specific technical information and requirements for the emergency responder radio coverage system. This document shall contain, but not be limited to, the various frequencies required, the location of radio sites, effective radiated power of radio sites, and other supporting technical information.

I103.2.3 Secondary power. The emergency responder radio coverage system shall be equipped with a secondary source of power. The secondary source of power shall be either a battery system or an emergency generator. The secondary power supply shall supply power automatically when the primary power source is lost. The secondary source of power shall be capable of operating the emergency responder radio coverage system for a period of at least twelve hours.

I103.2.3.1 Battery Systems. The active components of the installed system or systems shall be capable of operating on an independent battery system for a period of at least twelve hours without external power input. The battery system shall automatically charge in the presence of external power input.

I103.2.4 Signal Booster requirements. If used, signal boosters shall meet the following requirements:

1. All signal booster components shall be contained in a NEMA4 type water proof cabinet.
2. The battery system shall be contained in a NEMA4 type water proof cabinet.
3. The system shall include automatic alarming of malfunctions of the signal booster and battery system. Any resulting trouble alarm shall be automatically transmitted to an approved central station or proprietary supervising station as defined in NFPA 72 or, when approved by the fire code official, shall sound an audible signal at a constantly attended location.
4. Equipment shall have FCC Certification prior to installation.

I103.2.5 Additional frequencies and change of frequencies. The emergency responder radio coverage system shall be capable of modification or expansion in the event frequency changes are required by the FCC or additional frequencies are made available by the FCC.

I103.3 Installation requirements. The installation of the public safety radio coverage system shall be in accordance with Sections I103.3.1 through I103.3.5.

I103.3.1 Approval prior to installation. No amplification system capable of operating on frequencies licensed to any public safety agency by the FCC shall be installed without prior coordination and approval of the fire code official.

I103.3.2 Permit required. A construction permit as required by Section 105.7.11 shall be obtained prior to the installation of the emergency responder radio coverage system.

I103.3.3 Minimum qualifications of personnel. The minimum qualifications of the system designer and lead installation personnel shall include:

1. A Valid FCC issued General Radio Operators License, and
2. Certification of in-building system training issued by a nationally recognized organization, school or a certificate issued by the manufacturer of the equipment being installed.

The agency may waive these requirements upon successful demonstration of adequate skills and experience satisfactory to the fire code official.

I103.3.4 Acceptance test procedure. When an emergency responder radio coverage system is required, and upon completion of installation, the building owner shall have the radio system tested to ensure that two-way coverage on each floor of the building is a minimum of 90 percent. The test procedure shall be conducted as follows:

1. Each floor of the building shall be divided into a grid of 20 approximately equal areas.
2. The test shall be conducted using a calibrated portable radio of the latest brand and model used by the agency talking through the agency's radio communications system.
3. A maximum of two nonadjacent areas will be allowed to fail the test.
4. In the event that three of the areas fail the test, in order to be more statistically accurate, the floor may be divided into 40 equal areas. A maximum of four nonadjacent areas will be allowed to fail the test. If the system fails the 40-area test, the system shall be altered to meet the 90 percent coverage requirement.
5. A test location approximately in the center of each grid area will be selected for the test, then the radio will be enabled to verify two-way communications to and from the outside of the building through the public agency's radio communications system. Once the test location has been selected, that location shall represent the entire area. If the test fails in the selected test location, that grid area shall fail, and prospecting for a better spot within the grid area will not be allowed.
6. The gain values of all amplifiers shall be measured and the test measurement results shall be kept on file with the building owner so that the measurements can be verified during annual tests. In the event that the measurement results become lost, the building owner will be required to rerun the acceptance test to reestablish the gain values.
7. As part of the installation a spectrum analyzer or other suitable test equipment shall be utilized to insure spurious oscillations are not being generated by the subject signal booster. This test will be conducted at time of installation and subsequent annual inspections.

I103.3.5 FCC compliance. The emergency responder radio coverage system installation and components shall also comply with all applicable Federal regulations, including but not limited to, Federal Communications Rules (47 CFR 90.219).

I103.4 Maintenance. The emergency responder radio coverage system shall be maintained in accordance with Sections I103.4.1 through I103.4.5.

I103.4.1 Maintenance. The public radio coverage system shall be maintained operational at all times.

I103.4.2 Permit required. A permit as required by Section 105.7.4 shall be obtained prior to the modification or alteration of the emergency responder radio coverage system.

I103.4.3 Testing and proof of compliance. The emergency responder radio coverage system shall be inspected and tested annually or whenever structural changes occur including additions or remodels that could materially change the original field performance tests. Testing shall consist of the following:

1. In-building coverage test as described in Section I103.3.4.
2. Signal boosters shall be tested to ensure that the gain is the same as it was upon initial installation and acceptance.
3. Backup batteries and power supplies shall be tested under load of a period of one hour to verify that they will properly operate during an actual power outage. If within the one hour test period the battery exhibits symptoms of failure, the test shall be extended for additional one hour periods until the integrity of the battery can be determined.
4. All other active components shall be checked to verify operation within the manufacturer's specifications.
5. At the conclusion of the testing a report shall be submitted to the fire code official which shall verify compliance with Section I103.3.4.

I103.4.4 Additional frequencies. The building owner shall modify or expand the emergency responder radio coverage system at their expense in the event frequency changes are required by the FCC or additional frequencies are made available by the FCC. Prior approval of a public safety radio coverage system on previous frequencies does not exempt this section.

I103.4.5 Field testing. Agency personnel shall have the right to enter onto the property at any reasonable time to conduct field-testing to verify the required level of radio coverage.

Reason: Large buildings have historically provided barriers to radio communications within them. This is the reason high rise buildings are required to install hard wired, two-way communications systems. The typical system has phone jacks strategically located throughout the building (in stairways, elevator lobbies, and inside elevators), with hand sets available to emergency responders in the lobby or the fire control room. However, problems with this solution include:

- Handset availability – even if they don't get stolen or misplaced, the typical building will only have five handsets, far too few for the dozens to hundreds of firefighters required to successfully bring a high rise fire under control
- Lack of training for responders – while some fire departments routinely train on these systems, each one is different, presenting problems remembering the special considerations necessary to operate successfully in each high rise building; other responders (law enforcement, EMS) don't train on these systems at all, and many times don't even know they exist
- Buildings other than high-rise interfere with routine radio communications, but aren't required to provide an alternative.

When this requirement was implemented, it was the best alternative available. Now, technology has progressed to a point where there are multiple solutions with multiple technologies to address virtually any situation. These solutions support emergency responders' radio systems so that no additional training is required by the responders; the same communication system that they use every day can be used in any building in a jurisdiction.

Emergency response agencies use radio communications routinely and lives depend on the adequacy of the radio communication system. Communications must be able to go both into and out of the buildings in times of emergency. Whether it be someone inside the building requesting assistance, or even worse calling May Day, or the Incident Commander outside the building trying to obtain a status report to make a determination on deployment of additional resources, communications is critical.

Some will complain of the cost of these systems, which range from the relatively inexpensive to very expensive, depending upon the solution chosen by the building owner or developer (one estimate is from \$.40/ft to \$1.25/ft). The fact is that tax payers have invested billions of dollars in their public safety communications systems. It isn't unusual for a mid-size jurisdiction to spend millions of dollars to equip emergency responders with communications systems, only to have a developer construct a building that defeats the entire system inside their facility. Good public policy dictates that these owners/developers bear the cost of upgrading their facilities to allow emergency responders to utilize the tools that tax payers have provided. This is in keeping with the philosophy inherent in the I-Codes that, when a facility grows too large or complex for effective fire response, that fire protection features be provided within the building at the owner's expense.

This proposal provides that an adequate level of communication is available within the building. Once a deficiency is noted in a building, the installation and technical criteria in Appendix I can be utilized to design and install a system to enhance the radio communications. There are several types of systems that can be utilized to enhance radio traffic and under this proposal any of these systems can be used.

This proposal also includes existing buildings in Section 511.2. While modeling and other techniques may provide a good prediction as to whether a building will interfere with radio communications, the reality is that it is unknown if a building will need to install any type of radio system enhancements until after the building is constructed. These issues are dependent on the construction type, shadows of other buildings, size of structure, etc. This proposal includes existing structures so that once the building is built, the system can be installed at any time, when and if it becomes necessary; it also provides a reasonable amount of time for existing buildings to come into conformance (18 months after notification).

The proposed Appendix I includes design, construction, maintenance and testing criteria. This provides guidance to the code official and ensures that the emergency responder radio coverage system will be operational throughout the life of the building.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing Results

Committee Action:**Approved as Submitted**

Committee Reason: The proposal was approved because the committee felt that it has merit and would resolve a serious and long-standing issue in fire department operational efficiency and safety. The committee indicated, however, that there are substantial issues which need to be resolved, including, but not limited to: applicability to "all" buildings would be unreasonable; the application to existing buildings would be onerous; there is no exception for single family residences; deleting the fire department communications system would eliminate a useful backup system; the title phrase "emergency responder" could lead to demands for other municipal departments that use radios to be provided with such a system; and technical requirements should not be relegated to an appendix. The committee expressed its hope that the continuing work on this topic by the ICC Code Technology Committee and the JFSRC would resolve the concerns.

Assembly Action:**None**

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Paul K. Heilstedt, PE, FAIA, Chair, ICC Code Technology Committee, (CTC), requests Approval as Modified by this public comment.

Tom Lariviere, Chair, ICC Joint Fire Service Review Committee (JFSRC), requests Approval as Modified by this public comment.

John Dean, representing the National Association of State Fire Marshals (NASFM), requests Approval as Modified by this public comment.

Sean DeCrane, representing the International Association of Fire Fighters (IAFM), requests Approval as Modified by this public comment.

Jack Murphy, representing the Fire Safety Directors of Greater New York, requests Approval as Modified by this public comment.

Modify proposal as follows:

511.1 Emergency responder radio coverage in new buildings. All new buildings shall have approved radio coverage for emergency responders within the building based upon the existing coverage levels of the public safety communication systems of the jurisdiction at the exterior of the building. This section shall not require improvement of the existing public safety communication systems.

Exceptions:

1. Where approved by the building code official and the fire code official, a wired communication system shall be permitted to be installed or maintained in lieu of an approved radio coverage system.
2. Where it is determined by the fire code official that the radio coverage system is not needed.

511.2 Radio signal strength. The building shall be considered to have acceptable emergency responder radio coverage when signal strength measurements in 95 percent of all areas on each floor of the building meet the signal strength requirements in items 511.2.1 and 511.2.2.

511.2.1 Minimum signal strength into the building. A minimum signal strength of -95 dBm shall be receivable within the building.

511.2.2 Minimum signal strength out of the building. A minimum signal strength of -100 dBm shall be received by the agency's radio system when transmitted from within the building.

511.2- 511.3 Emergency responder radio coverage in existing buildings. Existing buildings that do not have approved radio coverage for emergency responders within the building shall be equipped with such coverage according to one of the following: ~~within 18 months of receiving notice of such deficiency from the fire code official.~~

1. Wherever existing wired communication system cannot be repaired or is being replaced, or where not approved in accordance with Section 511.1 Exception 1.
2. Within a time frame established by the adopting authority.

907.2.12.2 (IBC [F] 907.2.12.2) (Supp) Fire department communication system. ~~An approved emergency responder radio coverage system shall be provided for fire department use. It shall operate between a fire command center complying with Section 509 and elevators, elevator lobbies, emergency and standby power rooms, fire pump rooms, areas of refuge and inside enclosed exit stairways. Where a wired communications system is approved in lieu of a radio coverage system in accordance with section 511, the wired fire department communications systems shall be designed and installed in accordance with NFPA 72 and shall operate between a fire command center complying with Section 509, elevators, elevator lobbies, emergency and standby power rooms, fire pump rooms, areas of refuge and inside enclosed exit stairways. The fire department communication device shall be provided at each floor level within the enclosed exit stairway.~~

APPENDIX I
EMERGENCY RESPONDER RADIO COVERAGE

SECTION I103
TECHNICAL REQUIREMENTS

~~I103.1 Radio signal strength.~~ The building shall be considered to have acceptable emergency responder radio coverage when signal strength measurements in 90 percent of all areas on each floor of the building meet the signal strength requirements in Sections I103.1.1 and I103.1.2.

~~I103.1.1 Minimum signal strength into the building.~~ A minimum signal strength of -95 dBm shall be receivable within the building.

~~I103.1.2 Minimum signal strength out of the building.~~ A minimum signal strength of -100 dBm shall be received by the agency's radio system when transmitted from within the building.

(Renumber subsequent sections.)

(Portions of Appendix I of the proposal not shown remain unchanged.)

~~Commenter's Reason:~~ The CTC also proposed a code change to address repeaters in F171 – 07/08. The CTC prefers F87 and has worked with the proponent in developing a public comment to clarify the provisions for new and existing buildings.

~~511.1:~~ This section has been clarified to note that the existing coverage levels at the building (not in the building) need not be upgraded as a result of the need for coverage in the building. The purpose of the radio coverage in the building is to take the existing signal outside the building and amplify it. The exceptions provide an option for wired systems as an alternative and also if it is determined by the fire code official that emergency coverage is not needed, then it need not be provided. Obviously, both of these exceptions will require that the code official be consulted by the design professional.

There are two reasons for leaving an exception for the wired systems. One is because some fire service representatives have asked for the option to be there so they can make the decision whether or not to deal with the radio repeater system. Note that it is not automatically available, only if approved, so in your jurisdiction you won't have to approve it. The other reason for the wired option is because there are situations where you cannot solve the problem with radio repeater technology because the space is designed to prevent any radio waves from getting in or out, (lead shielding for example), in those cases the ability will exist for the local code officials to approve, (actually to require as well), a wired system if they agree it is the proper method for that space.

~~511.2:~~ The provisions for signal strength are viewed as critical and need to be uniformly applied. As such, they have been relocated from the proposed appendix and incorporated into the body of the code.

~~511.3:~~ There is clearly a need for existing buildings to be provided with coverage. However, requiring an existing wired system to be updated within 18 months when the system is operational or can be repaired is viewed as excessive. Further, an 18 month threshold is rather arbitrary and really should be left up to the adopting authority to decide the time frame for compliance for existing buildings.

~~907.2.12.2:~~ This comment is intended to clarify where wired systems are provided and approved, it can be used in lieu of a radio system and provides the technical language concerning how the system is to be installed.

Code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: <http://www.iccsafe.org/cs/cc/ctc/index.html>. Since its inception in April/2005, the CTC has held fifteen meetings - all open to the public. This public comment is a result of the CTC's investigation of the area of study entitled "NIST World Trade Center Recommendations". The CTC web page for this area of study is: <http://www.iccsafe.org/cs/cc/ctc/WTC.html>

Final Hearing Results

F87-07/08

AMPC1

Code Change No: **F89-07/08**

Original Proposal

Sections: 604.2.15.1.3, 604.2.15.3, IBC [F] 403.10.2, IBC [F] 403.11.1

Proponent: James C. Gerren, Clark County, NV Department of Development Services

1. Revise as follows:

604.2.15.1.3 Connected facilities. Power and lighting facilities for the fire command center and elevators specified in Sections 403.8 and 403.9 of the *International Building Code*, as applicable, ~~and electrically powered fire pumps required to maintain pressure,~~ shall be transferable to the standby source. Standby power shall be provided for at least one elevator to serve all floors and be transferable to any elevator.

604.2.15.3 Emergency systems. Exit signs, exit illumination as required by Chapter 10, electrically powered fire pumps required to maintain pressure, and elevator car lighting are classified as emergency systems and shall operate within 10 seconds of failure of the normal power supply and shall be capable of being transferred to the standby source.

Exception: Exit sign, exit and means of egress illumination are permitted to be powered by a standby source in buildings of Group F and S occupancies.

2. Revise IBC as follows:

[F] 403.10.2 Standby power loads. The following are classified as standby power loads:

1. Power and lighting for the fire command center required by Section 403.8; and
- ~~2. Electrically powered fire pumps; and~~
- ~~3. 2. Ventilation and automatic fire detection equipment for smokeproof enclosures.~~

Standby power shall be provided for elevators in accordance with Sections 1007.4 and 3003.

[F] 403.11.1 Emergency power loads. The following are classified as emergency power loads:

1. Exit signs and means of egress illumination required by Chapter 10;
2. Elevator car lighting;
3. Emergency voice/alarm communications systems;
4. Automatic fire detection systems; and
5. Fire alarm systems.
6. Electrically powered fire pumps.

Reason: The purpose of the proposed change is to clarify the code.

Section 9.6.2.1 of NFPA 20 (2003 edition), Standard for the Installation of Stationary Pumps for Fire Protection, requires on-site generators that are used to supply alternate power to electric motor-driven fire pumps to meet the requirements of Level 1, Type 10, Class X emergency power supply systems (EPSSs) of NFPA 110, Standard for Emergency and Standby Power Systems. NFPA 110 (2005 edition), Table 4.1(b) requires Type 10 EPSSs to restore power within 10 seconds. Since standby power is required to be available within 60 seconds, it is not appropriate to include electrically powered fire pumps in the list of standby power loads. Accordingly, the proposed code change would move electrically powered fire pumps from the list of standby power loads in Section 604.2.15.1.3 and IBC [F] 403.10.2 to the list of emergency power loads in Section 604.2.15.3 and IBC [F] 403.11.1.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal was approved because the committee felt that it will provide correlation with the referenced standard, NFPA 20.

Assembly Action:

None

Final Hearing Results

AS

Code Change No: **F116-07/08**

Original Proposal

Table 803.3; IBC Table 803.9

Proponent: Tom Lariviere, Fire Department, Madison, MS, representing Joint Fire Service Review Committee

THESE PROPOSALS ARE ON THE AGENDA OF THE IFC AND THE IBC FIRE SAFETY CODE DEVELOPMENT COMMITTEES AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IFC

Revise table as follows:

**TABLE 803.3
INTERIOR WALL AND CEILING FINISH REQUIREMENTS BY OCCUPANCY^k**

Group	Sprinklered ^l			Nonsprinklered		
	Exit enclosures and exit passageways ^{a,b}	Corridors	Rooms and enclosed spaces ^c	Exit enclosures and exit passageways ^{a,b}	Corridors	Rooms and enclosed spaces ^c
B, E, M, R-1, R-4	B	C	C	A	B	C
<u>R-4</u>	<u>B</u>	<u>C</u>	<u>C</u>	<u>A</u>	<u>B</u>	<u>B</u>

(Portions of table and footnotes not shown remain unchanged)

PART II – IBC FIRE SAFETY

Revise table as follows:

**TABLE 803.9 (Supp)
INTERIOR WALL AND CEILING FINISH REQUIREMENTS BY OCCUPANCY^k**

Group	Sprinklered ^l			Nonsprinklered		
	Exit enclosures and exit passageways ^{a,b}	Corridors	Rooms and enclosed spaces ^c	Exit enclosures and exit passageways ^{a,b}	Corridors	Rooms and enclosed spaces ^c
B, E, M, R-1, R-4	B	C	C	A	B	C
<u>R-4</u>	<u>B</u>	<u>C</u>	<u>C</u>	<u>A</u>	<u>B</u>	<u>B</u>

(Portions of table and footnotes not shown remain unchanged)

Reason: Table 803.3 in the IFC governs wall and ceiling finish in existing buildings. Table 803.3 in the IBC governs wall and ceiling finish in new buildings.

The change that occurs in this proposal is to increase the flame spread rating from Class C to Class B in rooms and areas within Group R-4 occupancies. These occupancies house clients that in many cases need assistance to evacuate. The increased level of safety afforded by requiring a Class B rating will provide additional time for evacuation before the room is totally involved in fire.

This proposal is consistent with Federal regulations for board and care facilities.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing Results

PART I – IFC

Committee Action:

Disapproved

Committee Reason: The proposal was disapproved because the committee had several concerns with the proposal, including that federal licensing requirements should remain a choice, not an IFC mandate because the code cannot accommodate widely varying licensure requirements. Also, changing the class of interior finish for non-sprinklered Group R-4 in the proposal would be in conflict with the IBC interior finish requirements for new buildings. Applying the provisions to existing buildings would create an undue burden in requiring changes to existing interior finishes.

Assembly Action:

None

**PART II – IBC FIRE SAFETY
Committee Action:**

Approved as Submitted

Committee Reason: The committee agreed that it was appropriate for the allowable flame spread index in Group R-4, interior wall and ceiling finishes, to be reduced in some instances. Occupants with Group R-4 in many cases need assistance to evacuate. The increased level of safety afforded by requiring a lower maximum flame spread index (Class B rating) provides additional time for evacuation of the structure.

Assembly Action:

None

Final Hearing Results

F116-07/08, Part I	D
F116-07/08, Part II	AS

Code Change No: F120-07/08

Original Proposal

Sections: 804.1; IBC [F] 806.5**Proponent:** Douglas H. Evans, PE, Department of Development Services, Clark County, NV**1. Revise IFC as follows:**

804.1 (Supp) Interior trim. Material, other than foam plastic, used as interior trim shall have a minimum Class C flame spread index and smoke-developed index, when tested in accordance with ASTM E 84, as described in Section 803.1.1. Combustible trim, excluding handrails and guardrails, shall not exceed 10 percent of the specific wall or ceiling areas ~~in to~~ which it is ~~located~~ attached.

2. Revise IBC as follows:

[F] 806.5 (Supp) Interior trim. Material, other than foam plastic used as interior trim shall have a minimum Class C flame spread and smoke-developed index when tested in accordance with ASTM E 84 or UL 723, as described in Section 803.1. Combustible trim, excluding handrails and guardrails, shall not exceed 10 percent of the aggregate specific wall or ceiling area ~~in to~~ which it is ~~located~~ attached.

Reason: If one reads the code literally, 10 percent all the allowable decorative wall materials may be placed on a single wall, which may actually allow the quantity of decorative materials to exceed the size of a specific wall. The proposed revision limits the percentage of decorative material to the respective wall.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

804.1 (Supp) Interior trim. Material, other than foam plastic, used as interior trim shall have a minimum Class C flame spread index and smoke-developed index, when tested in accordance with ASTM E 84 or UL 723, as described in Section 803.1.1. Combustible trim, excluding handrails and guardrails, shall not exceed 10 percent of the specific wall or ceiling areas to which it is attached.

(Portions of proposal not shown remain unchanged)

Committee Reason: The proposal was approved because the committee felt that it will provide better control of the fire load of interior finishes. The committee did express a concern that the retroactive provisions of the IFC should recognize that there may be previously approved applications based on the IBC's "aggregate" wall or ceiling area. The modification provides correlation with IBC Section [F] 806.5 and other sections that reference both ASTM E 84 and UL 723 as a result of the approval of code change FS11-06/07 in the last cycle.

Assembly Action:

None

Final Hearing Results

F120-07/08

AM

Code Change No: **F121-07/08**

Original Proposal

Sections: 804.2.3 (IBC [F] 2604.2.3)

Proponent: Douglas H. Evans, PE, Department of Development Services, Clark County, NV

Revise as follows:

804.2.3 (IBC [F] 2604.2.3) (Supp) Area limitation. The interior trim shall not constitute more than 10 percent of the specific wall or ceiling areas of a room or space to which it is attached.

Reason: First of all, the code is inconsistent. Sometimes it specifies walls and ceilings and sometimes walls or ceilings. This revision can be looked at partially as clarification.

Most importantly, imagine a 100,000 sq ft casino, convention center or ballroom with 30 foot high walls (this is not uncommon). Within the other limitations specified in this section, a substantial quantity of decorative foam plastic materials may be installed on a single wall or ceiling. For the 100,000 sq ft example specified, that could allow in excess of 13,000 sq ft of decorative combustible foam plastic "trim".

Cost Impact: The code change proposal will increase the cost of construction and should not affect most applications

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal was approved as Submitted for consistency with the action taken on code change F120-07/08.

Assembly Action:

None

Final Hearing Results

AS

Code Change No: **F128-07/08**

Original Proposal

Sections: 807.1.2 (IBC [F] 806.1.2)

Proponent: Douglas H. Evans, PE, Department of Development Services, Clark County, NV

Revise as follows:

807.1.2 (IBC [F] 806.1.2) Combustible decorative materials. The permissible amount of decorative materials meeting the flame propagation performance criteria of NFPA 701 shall not exceed 10 percent of the aggregate area of specific walls and ceilings wall or ceiling area to which it is attached.

Exceptions:

1. In auditoriums in Group A, the permissible amount of decorative material meeting the flame propagation performance criteria of NFPA 701 shall not exceed ~~50~~ 75 percent of the aggregate wall ~~area of walls and ceiling~~ where the building is equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1, and where the material is installed in accordance with Section 803.4 of the *International Building Code*.
2. The amount of fabric partitions suspended from the ceiling and not supported by the floor in Group B and M occupancies shall not be limited.

Reason: First of all, the code is inconsistent. Sometimes it specifies walls and ceilings and sometimes walls or ceilings. This revision can be looked at partially as clarification.

Most importantly, imagine a 100,000 sq ft casino, convention center or ballroom with 30 foot high walls (this is not uncommon). If one reads the code literally, this section allows all the decorative materials to be placed in a single location. This could allow draperies or other combustible features to be well in excess of the entire wall area. For the 100,000 sq ft example specified, that could allow in excess of 13,000 sq ft of decorative combustible applications in a single location.

The change to Exception 1 clarifies that the surface being considered is the walls and not the ceiling. In most cases, 50 percent of the walls and ceiling area will exceed 75 percent of the wall area. As such, the proposed amendment will be more conservative (and more specific), while still allowing draperies in theaters to cover a substantial portion of the walls.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Approved as Submitted**

Committee Reason: The proposal was approved as Submitted for consistency with the actions taken on code changes F120- and F121-07/08.

Assembly Action:**None**

Final Hearing Results

F128-07/08

AS

Code Change No: **F132-07/08**

Original Proposal

Sections: 903.2.1.3, 903.2.1.4 (IBC [F] 903.2.1.3, [F] 903.2.1.4)

Proponent: Tom Lariviere, Fire Department, Madison, MS, representing Joint Fire Service Review Committee

Revise as follows:

903.2.1.3 (IBC [F] 903.2.1.3) Group A-3. An automatic sprinkler system shall be provided for Group A-3 occupancies where one of the following conditions exists:

1. The fire area exceeds 12,000 square feet (1115 m²);
2. The fire area has an occupant load of 300 or more; or
3. The fire area is located on a floor other than the level of exit discharge.

Exception: ~~Areas used exclusively as participant sports areas where the main floor area is located at the same level as the level of exit discharge of the main entrance and exit.~~

903.2.1.4 (IBC [F] 903.2.1.4) Group A-4. An automatic sprinkler system shall be provided for Group A-4 occupancies where one of the following conditions exists:

1. The fire area exceeds 12,000 square feet (1115 m²);
2. The fire area has an occupant load of 300 or more; or
3. The fire area is located on a floor other than the level of exit discharge.

Exception: ~~Areas used exclusively as participant sports areas where the main floor area is located at the same level as the level of exit discharge of the main entrance and exit.~~

Reason: The intention of the exception was for gymnasiums and similar areas where the probable occupant load was significantly less than what would be determined based on a square footage per occupant factor. These facilities have become multi-use and the occupant load is frequently higher than what was anticipated or expected when the exception was developed, and the fire load can vary based on the used to far exceed what would be expected for a sporting area.

For example, a community recreation center is constructed with no sprinklers over the gymnasium floor. The same area is also utilized for receptions and various community activities such as work fairs, rummage sale, art exhibits, emergency shelters for persons displaced by natural disasters, etc. Such uses could even include eating, sleeping, and fire loads far in excess of a few uniforms and leather volleyballs.

Cost Impact: Since the rest of the building will be sprinklered, the additional cost is only for additional sprinkler lines.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposal was disapproved because the committee felt that the current exception that is aimed at limited-use facilities is needed and that the "exclusive" use of the area for participant sports is the key to successful application and must be strictly enforced by the fire code official at the outset of a project. Changes to the use of the area after occupancy should be reviewed as an illegal change in use that must be regulated.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Tom Lariviere, Fire Department, Madison, MS, representing Joint Fire Service Review Committee, requests Approval as Submitted.

Commenter-s Reason: This public comment allows for the facility to be construction without any restrictions on use or the need for the local fire code official to track each and every event in each and every location where this exception was utilized within the jurisdiction.

The intention of the exception was for gymnasiums and similar areas where the probable occupant load was significantly less than what would be determined based on a square footage per occupant factor. These facilities have become multi-use and the occupant load is frequently higher than what was anticipated or expected when the exception was developed, and the fire load can vary based on the used to far exceed what would be expected for a sporting area.

For example, a community recreation center is constructed with no sprinklers over the gymnasium floor. The same area is also utilized for receptions and various community activities such as work fairs, rummage sale, art exhibits, emergency shelters for persons displaced by natural disasters, etc. Such uses could even include eating, sleeping, and fire loads far in excess of a few uniforms and leather volleyballs.

Code Change No: F133-07/08

Original Proposal

Sections: 903.2.2 (IBC [F] 903.2.2)

Proponent: Jeff Hugo, National Fire Sprinkler Association

Revise as follows:

903.2.2 (IBC [F] 903.2.2) (Supp) Group E. An automatic sprinkler system shall be provided for Group E occupancies as follows:

1. Throughout all Group E fire areas greater than ~~20,000~~ 12,000 square feet (~~1858~~ 1115 m²) in area.
2. Throughout every portion of educational buildings below the lowest level of exit discharge that serves that portion of the building.

Exception: An automatic sprinkler system is not required in any fire area or area below the level of exit discharge where every classroom throughout the building has at least one exterior exit door at ground level.

Reason: The continuity of mission is important for educational occupancies. If a community loses a school that community cannot quickly recover to resume normal school activities. There are several similarities between educational and several other occupancies, therefore sprinkler requirements should also be similar. Reducing the fire area from 20,000 s.f. to 12,000 s.f. will aid in fire fighter rescue, smaller area of damage, and a quicker recovery to school programs if a sprinkler system is not chosen. Although through consistent fire drills, deaths are rare, but the possibility exists for a large loss of life in educational occupancies. A threshold of 20,000 square feet is one of the highest minimum sprinkler thresholds in the code and exists without good reason. Some states have already mandated complete sprinkler protection in educational occupancies.

In most cases it is not economically feasible to build a school without sprinkler protection. The cost savings for a community to build a school is introduced when the decision to install sprinklers is done at the early stages of the project where they can take advantage of the sprinkler trade ups for building construction. Another factor to consider is federal, state, and local tax monies available to build and repair schools. A fire sprinkled school will cost less to insure, less to rebuild, less liability to the school system, less injuries, less taxes, and less downtime. According to statistics only 24% of the nation's schools have fire sprinklers. However the average fire loss when sprinklers are present are \$2,800 versus \$12,900 having no sprinklers, resulting in a 78% reduction in damage.

Fires during lockdowns, hostage, or terrorist events are now a concern than during the legacy codes where the 20,000 s.f. threshold evolved from. A fire during a lockdown is a lose-lose event for the administrators' and children. Fire sprinklers can control the fire during the lockdown in lieu of endangering the children exiting during the lockdown or prohibiting egress caused by the fire.

Statistics from a four year period of 1999-2002, there were an estimated average of 7,070 structure fires in educational occupancies along with 113 injuries and \$112 million in property damage. K-12 schools make up 5,230 fires, 88 injuries, and \$74 million in fire damage. This is money from the taxes we pay, and these are our children getting burned and injured. Fire sprinklers can reduce the cost while increasing fire protection. Including fire sprinklers during the design process can significantly reduce the construction cost.

Bibliography:

EDUCATIONAL PROPERTIES, National Fire Protection Association, September 2006

Practical Information on Crisis Planning: A Guide for Schools and Communities, US Dept of Education, Jan. 2007

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal was approved because the committee agreed that the proponent's reason statement accurately and adequately substantiates the need for the change, which will provide increased life safety and property protection in buildings that are an essential part of a community. Whereas several previous proposals sought to sprinker all schools without exception, this proposal includes a reduced but reasonable threshold that is similar to other sprinkler thresholds in Section 903.

Assembly Action:

None

Final Hearing Results

F133-07/08

AS

Code Change No: F135-07/08

Original Proposal

Sections: 903.2.6 (IBC [F] 903.2.6)

Proponent: Jesse J. Beitel, Hughes Associates, Inc., representing American Home Furnishings Alliance and National Home Furnishings Association

Revise as follows:

903.2.6 (IBC [F] 903.2.6) Group M. An automatic sprinkler system shall be provided throughout buildings containing a Group M occupancy where one of the following conditions exists:

1. Where a Group M fire area exceeds 12,000 square feet (1115 m²);
2. Where a Group M fire area is located more than three stories above grade plane; ~~or~~
3. Where the combined area of all Group M fire areas on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m²); ~~or~~
4. Where a Group M occupancy is used primarily for the display and sale of upholstered furniture.

Reason: This proposal is submitted jointly by the American Home Furnishings Alliance (AHFA) and the National Home Furnishings Association (NHFA) in the interest of making furniture retail and warehouse facilities safer for employees, customers and first responders. AHFA represents manufacturers and importers of residential furniture, some of whom also operate branded retail stores. NHFA's membership comprises 2,800 corporate entities representing 10,000 retail furniture stores in all 50 states and several foreign countries.

The proposal to require sprinklers for Group M occupancies containing significant amounts of upholstered furniture recognizes that, under certain circumstances, all upholstered furniture will ignite and contribute to the fuel load of a fire. There is no such thing as totally fire safe upholstered furniture.

The AFHA and the NHFA have examined proposals for exempting vendors of certain constructions of furniture and concluded that such exemptions would be impractical for local code officials to enforce. This is the case because the internal construction of furniture cannot be established reliably without deconstructing it.

Further, materials and constructions touted as more fire resistant have not proven so to the satisfaction of fire authorities. The U.S. Consumer Product Safety Commission (CPSC) has tested furniture with combustion modified polyurethane foam such as that required in California and the United Kingdom and found that such foam does not meaningfully improve fire performance when furniture is exposed to an open flame. Other researchers have found that constructions employing the fire-blocking barriers now prevalent in mattresses do not reliably slow the progression of furniture fires. This is likely due to the variety of upholstery fabrics and seating geometries typical of furniture as compared to mattresses.

The most protective code measure would establish uniform, easily enforceable sprinkler requirements and not base safety considerations on differences in furniture construction that may or may not exhibit better fire performance in a retail setting.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

903.2.6 (IBC [F] 903.2.6) Group M. An automatic sprinkler system shall be provided throughout buildings containing a Group M occupancy where one of the following conditions exists:

1. Where a Group M fire area exceeds 12,000 square feet (1115 m²);
2. Where a Group M fire area is located more than three stories above grade plane;
3. Where the combined area of all Group M fire areas on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m²); ~~or~~
4. Where a Group M occupancy is used ~~primarily~~ for the display and sale of upholstered furniture.

Committee Reason: The proposal was approved because the committee felt that it is a good first step supported by the furniture industry in attempting to deal with the hazards presented by upholstered furniture. The committee indicated its sense that future efforts on the topic need to address Group F and S upholstered furniture occupancies as well and that a reasonable sprinkler threshold needs to be added to provide some relief to the small businesses that will now be affected. The modification removes a subjective term that the committee felt could create serious enforcement inconsistencies.

Assembly Action:

None

Final Hearing Results

F135-07/08

AM

Code Change No: F136-07/08

Original Proposal

Sections: 903.2.8, 903.2.8.1, 903.2.9 (IBC [F] 903.2.8, [F] 903.2.8.1, [F] 903.2.9)

Proponent: Tom Lariviere, Fire Department, Madison, MS, representing Joint Fire Service Review Committee

Revise as follows:

903.2.8 (IBC [F] 903.2.8) Group S-1. An automatic sprinkler system shall be provided throughout all buildings containing a Group S-1 occupancy where one of the following conditions exists:

1. A Group S-1 fire area exceeds 12,000 square feet (1115 m²);
2. A Group S-1 fire area is located more than three stories above grade plane; or
3. The combined area of all Group S-1 fire areas on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m²).
4. A group S-1 fire area used for the storage of commercial trucks or buses where the fire area exceeds 5,000 square feet (464 m²).

903.2.8.1 (IBC [F] 903.2.8.1) (Supp) Repair garages. An automatic sprinkler system shall be provided throughout all buildings used as repair garages in accordance with Section 406 of the *International Building Code*, as shown:

1. Buildings having two or more stories above grade plane, including basements, with a fire area containing a repair garage exceeding 10,000 square feet (929 m²).
2. Buildings no more than one story above grade plane, with a fire area containing a repair garage exceeding 12,000 square feet (1115 m²).
3. Buildings with a repair garage servicing vehicles parked in the basement.
4. A group S-1 fire area used for the repair of commercial trucks or buses where the fire area exceeds 5,000 square feet (464 m²).

903.2.9 (IBC [F] 903.2.9) (Supp) Group S-2. An automatic sprinkler system shall be provided throughout buildings classified as enclosed parking garages in accordance with Section 406.4 of the *International Building Code* as follows.

1. Where the fire area of the enclosed parking garage exceeds 12,000 square feet (1115 m²); or
2. Where the enclosed parking garage is located beneath other groups.

~~**Exception:** Enclosed parking garages located beneath Group R-3 occupancies.~~

Reason: This proposal adds an additional trigger for sprinkler protection in repair garages. This is a logical alignment with Section 903.2.9.1. Currently, a building that stores trucks is required to be protected by a fire sprinkler system at 5,000 square feet but if trucks are repaired within the same building, the building can go up to 12,000 square feet. The addition of the term 'stored' within 903.2.8 has been added since a multi-purpose are used to store more than trucks, such as a fire station bay, is an S-1 rather than an S-2.

The removal of the exception to 903.2.9 is to add clarity. Group R-3 occupancies are required to be protected by a fire sprinkler system and the exception adds confusion.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

903.2.9 (IBC [F] 903.2.9) (Supp) Group S-2. An automatic sprinkler system shall be provided throughout buildings classified as enclosed parking garages in accordance with Section 406.4 of the *International Building Code* as follows.

1. Where the fire area of the enclosed parking garage exceeds 12,000 square feet (1115 m²); or
2. Where the enclosed parking garage is located beneath other groups.

Exception: Enclosed parking garages located beneath Group R-3 occupancies.

(Portions of proposal not shown remain unchanged)

Committee Reason: The proposal was disapproved because the committee felt that it will provide fire protection for the more hazardous area of garages. The modification retains the exception because Group R-3 occupancies can be sprinklered with an NFPA 13D system which would not include the garages.

Assembly Action:

None

Final Hearing Results

F136-07/08

AM

Code Change No: **F138-07/08**

Original Proposal

Sections: 903.2.10, 903.2.12.1, 903.2.12.2, 903.2.13, Table 903.2.13 (IBC [F] 903.2.10, [F] 903.2.12.1, [F] 903.2.12.2, [F] 903.2.13, [F] Table 903.2.13)

Proponent: Daniel E. Nichols, PE, NY State Division of Code Enforcement and Administration

1. Revise as follows:

903.2.10 (IBC [F] 903.2.10) ~~Windowless stories in all occupancies~~ Specific buildings areas and hazards. In all occupancies an automatic sprinkler system shall be installed for building design or hazards in the locations set forth in Sections 903.2.10.1 through ~~903.2.10.1.3~~ 903.2.10.6.

Exception: Group R-3 and Group U.

2. Relocate sections and table as follows:

~~903.2.12.1~~ **903.2.10.4 (IBC [F] ~~903.2.12.1~~ [F] 903.2.10.4) Ducts conveying hazardous exhausts.** Where required by the *International Mechanical Code*, automatic sprinklers shall be provided in ducts conveying hazardous exhaust, flammable or combustible materials.

Exception: Ducts where the largest cross-sectional diameter of the duct is less than 10 inches (254 mm).

~~903.2.12.2~~ **903.2.10.5 (IBC [F] ~~903.2.12.2~~ [F] 903.2.10.5) Commercial cooking operations.** An automatic sprinkler system shall be installed in a commercial kitchen exhaust hood and duct system where an automatic sprinkler system is used to comply with Section 904.

~~903.2.13~~ **903.2.10.6 (IBC [F] ~~903.2.13~~ [F] 903.2.10.6) Other required suppression system.** In addition to requirements of 903.2, the provisions indicated in Table ~~903.2.13~~ 903.2.10 also require the installation of a suppression system for certain buildings and areas.

**TABLE 903.2.13 903.2.10 (IBC TABLE [F] ~~903.2.13~~ [F] 903.2.10)
ADDITIONAL REQUIRED FIRE-EXTINGUISHING SYSTEMS**

(No change to table contents)

Reason: At present both Section 903.2.10 and 903.2.12 identify “other” places where sprinkler protection is required. These 5 things are either based on an identifiable hazard of the activity or design. As compared to section 903.2.11 which is essentially a list of references to other provisions, these 5 are detailed in Section 903. The distinction between the items in 903.2.10 and .12 is artificial and unneeded. Further, the existing title of 903.2.10 – Windowless stories in all occupancies is misleading. Only subsection 903.2.10.1 addresses the windowless situation. The intent of this proposal is editorial. It results in the sprinkler requirement provisions of 903 to be in 4 rough categories: 1 – Based on occupancy; 2 – based on building design or feature; 3-reference to other section; 4 – during construction;

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Approved as Submitted****Committee Reason:** The proposal was approved because the committee felt that it provides a logical reorganization of the sections.**Assembly Action:****None**

Final Hearing Results

F138-07/08**AS**

Code Change No: F140-07/08

Original Proposal

Sections: 903.3.1.2 (IBC [F] 903.3.1.2)**Proponent:** Jeffrey M. Shapiro, PE, International Code Consultants, representing National Multi Housing Council**Revise as follows:**

903.3.1.2 (IBC [F] 903.3.1.2) NFPA 13R sprinkler systems. ~~Where allowed in buildings of In~~ Group R occupancies, up to and including four stories in height, automatic sprinkler systems shall be installed throughout in accordance with NFPA 13R.

Reason: The proposed change is intended to clarify application of the code with respect to NFPA 13R systems. The title of NFPA 13R is "Standard for the Installation of Sprinkler Systems in Residential Occupancies up to and Including Four Stories in Height," with the key word being "occupancies." Currently, Section 903.3.1.2, by referring to "buildings of Group R," implies that NFPA 13R systems would not be permitted in any portion of a mixed use occupancy, which is inappropriate. In a mixed use containing Group R, it is entirely appropriate to permit NFPA 13R as a basis for sprinkler protection in the residential portion of the building, as well as accessory uses within residential areas. Other areas are, however, be required to be protected in accordance with NFPA 13. The proposal makes this clear.

Note that Section 903.2.7 still requires fire sprinklers throughout all buildings with a Group R fire area, so by changing Section 903.3.1.2 to refer to "occupancies," there is no impact on the requirement that the entire building containing a Group R fire area must be sprinklered.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Disapproved**

Committee Reason: The proposal was disapproved because the committee disagreed that the proposal is a simple clarification and clean-up of the section and felt that there is also sufficient ambiguity in Section 903.3.1 and all of its subsections to create a need for a complete re-work of that section and all of its subsections. It was felt that this section could be viewed as a specific requirement that would override Section 903.3.1 which could be viewed as only the general requirement and that mixed uses could claim on that basis that non-residential parts of the building do not need to comply with NFPA 13. Based on the proposed wording, it was also felt that this revised section could mandate the use of NFPA 13R for all Group R occupancies

Assembly Action:**None**

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jeffrey Shapiro, PE, International Code Consultants, representing National Multi Housing Council, requests Approval as Modified by this public comment.

Replace proposal with the following:

903.3.1 Standards. Sprinkler systems shall be designed and installed in accordance with Sections 903.3.1.1, unless otherwise permitted by Sections 903.3.1.2 or 903.3.1.3.

903.3.1.1 NFPA 13 sprinkler systems. Where the provisions of this code require that a building or portion thereof be equipped throughout with an automatic sprinkler system in accordance with this section, sprinklers shall be installed throughout in accordance with NFPA 13 except as provided in Section 903.3.1.1.1.

903.3.1.1.1 Exempt locations. Automatic sprinklers shall not be required in the following rooms or areas where such rooms or areas are protected with an approved automatic fire detection system in accordance with Section 907.2 that will respond to visible or invisible particles of combustion. Sprinklers shall not be omitted from any room merely because it is damp, of fire-resistance rated construction or contains electrical equipment.

1. Any room where the application of water, or flame and water, constitutes a serious life or fire hazard.
2. Any room or space where sprinklers are considered undesirable because of the nature of the contents, when approved by the fire code official.
3. Generator and transformer rooms separated from the remainder of the building by walls and floor/ceiling or roof/ceiling assemblies having a fire-resistance rating of not less than 2 hours.
4. Rooms or areas that are of noncombustible construction with wholly noncombustible contents.
5. Fire service access elevator machine rooms and machinery spaces.

903.3.1.2 NFPA 13R sprinkler systems. ~~Where allowed in buildings of Group R, up to and including four stories in height, a~~ Automatic sprinkler systems ~~shall be in Group R occupancies up to and including four stories in height shall be permitted to be~~ installed throughout in accordance with NFPA 13R.

903.3.1.2.1 Balconies and decks. Sprinkler protection shall be provided for exterior balconies, decks and ground floor patios of dwelling units where the building is of Type V construction, provided there is a roof or deck above. Sidewall sprinklers that are used to protect such areas shall be permitted to be located such that their deflectors are within 1 inch (25 mm) to 6 inches (152 mm) below the structural members and a maximum distance of 14 inches (356 mm) below the deck of the exterior balconies and decks that are constructed of open wood joist construction.

903.3.1.3 NFPA 13D sprinkler systems. ~~Where allowed,~~ Automatic sprinkler systems ~~installed~~ in one- and two-family dwellings shall be permitted to be installed throughout in accordance with NFPA 13D.

Commenter's Reason: The proposed revision addresses the request of the code development committee for a comprehensive cleanup of this section. Although our original intent was simply to clarify application of the code with respect to NFPA 13R systems, the committee made it clear that they wanted the whole section fixed. That has now been done.

Final Hearing Results

AMPC

Code Change No: F144-07/08

Original Proposal

Sections: 903.3.1.3 (IBC [F] 903.3.1.3)

Proponent: Anthony C. Apfelbeck, City of Altamonte Springs, FL

Revise as follows:

903.3.1.3 (IBC [F] 903.3.1.3) NFPA 13D sprinkler systems. Where allowed, automatic sprinkler systems installed in one and two-family dwellings and townhouses shall be installed throughout in accordance with NFPA 13D.

Reason: This proposal clarifies that NFPA 13D systems are an appropriate application in the townhouse environment. A townhouse is defined as a "single-family dwelling" by the IBC and the IRC. IRC Section R317.2 further indicates, "Each townhouse shall be considered a separate building. . ." NFPA 13D's scope states, "This standard shall cover the design and installation of automatic sprinkler systems for protection against the fire hazards in one- and two-family dwellings and manufactured homes." NFPA 13D's definition of dwelling states, "Any building that contains not more than one or two dwelling units. . ." Therefore, since each townhouse is classified as a separate building designed under the IBC, IRC and 13D definitions, the 13D system is an appropriate level of protection for each townhouse.

There are also a number of practical applications that preclude the utilization of a 13R system in a townhouse environment without significant difficulty:

1. Since "townhomes" typically involve separate ownership of property and the units extent from "foundation to roof", a common 13R system piping supplying all units would necessitate a complex common ownership element shared between the differing property owners. A community association would need to be established in order to "own" the common element. This common element may also require recorded easement to access the system in each persons house.
2. This community association would need to maintain the 13R system since 13R systems require maintenance and inspections in accordance with NFPA 25. This would involve coordinated access to each property and a shared maintenance cost.
3. If an external bell or monitoring of the 13R system is required, this would necessitate a separate house electrical panel, again owned by a community association. This would create an ongoing expense of electrical service and maintenance/testing of a fire alarm monitoring panel, if present.
4. If monitoring of the 13R system is required, this would then mandate a method of transmission which may involve the added expense of phone lines to the community association. An easement may be needed to access the phone lines.

None of these issues are present when an NFPA 13D system is installed in a townhouse. Therefore, the 13D system is appropriate for the townhouse application.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal was approved because the committee felt that it is consistent with the scope of NFPA 13D. It was pointed out, however, that the definition of "townhouse" in the IBC includes 3 or more attached dwelling units which differs from the term defined in the IRC. Some separation requirement could be added to this section to resolve that issue.

Assembly Action:

None

F144-07/08

AS

Code Change No: F147-07/08

Original Proposal

Sections: 903.4.1 (IBC [F] 903.4.1)

Proponent: Steven L. Schoon, Golder Ranch Fire District, AZ, representing Arizona Fire Marshals Association

Revise as follows:

903.4.1 (IBC [F] 903.4.1) (Supp) Monitoring. Alarm, supervisory and trouble signals shall be distinctly different and shall be automatically transmitted to an approved ~~central station, remote supervising station or proprietary~~ supervising station or, when approved by the fire code official, shall sound an audible signal at a constantly attended location.

Exceptions:

1. Underground key or hub valves in roadway boxes provided by the municipality or public utility are not required to be monitored.
2. Backflow prevention device test valves located in limited area sprinkler system supply piping shall be locked in the open position. In occupancies required to be equipped with a fire alarm system, the backflow preventer valves shall be electrically supervised by a tamper switch installed in accordance with NFPA 72 and separately annunciated.

Reason: The proposed revision is for consistency with the code language found in the fire alarm system monitoring Section 907.7.5 (2007 Supplement to the IFC) Supervising Station is defined by the IFC and the wording of central station, remote supervising station or proprietary supervising station is not needed.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal was approved because the committee felt that it removes unnecessary text.

Code Change No: F157-07/08

Original Proposal

Sections: 905.3.3 (IBC [F] 905.3.3)

Proponent: Tom Lariviere, Fire Department, Madison, MS, representing Joint Fire Service Review Committee

Revise as follows:

905.3.3 (IBC [F] 905.3.3) (Supp) Covered mall buildings. A covered mall building shall be equipped throughout with a standpipe system where required by Section 905.3.1. Covered mall buildings not required to be equipped with a standpipe system by Section 905.3.1 shall be equipped with Class I hose connections connected to the automatic sprinkler system sized to deliver water at 250 gallons per minute (946.4 L/min) at the most hydraulically remote outlet hose connection while concurrently supplying the automatic sprinkler system demand. The standpipe system shall be designed to not exceed a friction loss of 50 pounds per square inch (345 kPa) with a flow of 250 gallons per minute (946.4 L/min) from the fire department connection to the hydraulically most remote hose connection. Hose connections shall be provided at each of the following locations:

1. Within the mall at the entrance to each exit passageway or corridor.
2. At each floor-level landing within enclosed stairways opening directly on the mall.
3. At exterior public entrances to the mall.
4. At other locations as necessary so that the distance to reach all portions of a tenant space or anchor store does not exceed 200 (60 960 mm) feet from a hose connection.

Reason: Design of standpipe systems need to have two parameters, flow and pressure. Currently, there is no residual design pressure as part of the requirement which, in turn, provides a discrepancy on what output pressure to a fire department standpipe pack will be. Additionally, this section provides for hose connections connected to a sprinkler system rather than a bona-fide standpipe system. A vast majority of these systems act as a manual wet system, requiring the fire department to pump the FDC. Since this section deals with is a sprinkler system with hose connections, it makes sense that the maximum pump pressure is 175 psi so there is not unneeded damage to the sprinkler heads.

Location of the standpipe connections is revised to take into account some of the vast and varying designs found in mall layouts. The design of a covered mall has its roots to the covering of a city street. Section 402 of the IBC is still based on this premise, noticeable by the 20 foot wide mall walkway, tenant separations, etc. The fire department hose connections required by the section are to allow the fire department to extinguish a fire within the building, independent of the height of the mall. The problem is that the current hose connections are predicated on the exiting requirements found in IBC Section 402. Section 402.4.4 requires the travel distance within the mall space of a maximum of 200 feet. The theory is that the measurement starts at all mall entrances and exits, and meets the distances found in IFC Section 905 for sprinklered buildings. However, the current system does nothing for fires in tenant spaces and anchor buildings.

The current code text does not provide adequate coverage for the covered mall building design. The revision in Item 4 will allow for additional hose connections throughout the mall to reach those portions of the mall that are not within 200' of hose from a connection required in Items #1-3.

The term "outlet" is revised to "connection" so that it is consistent throughout the requirements.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

905.3.3 (IBC [F] 905.3.3) (Supp) Covered mall buildings. A covered mall building shall be equipped throughout with a standpipe system where required by Section 905.3.1. Covered mall buildings not required to be equipped with a standpipe system by Section 905.3.1 shall be equipped with Class I hose connections connected to the automatic sprinkler system sized to deliver water at 250 gallons per minute (946.4 L/min) at the most hydraulically remote hose connection while concurrently supplying the automatic sprinkler system demand. The standpipe system shall be designed to not exceed a ~~friction loss of 50 pounds per square inch (345 kPa)~~ residual pressure loss with a flow of 250 gallons per minute (946.4 L/min) from the fire department connection to the hydraulically most remote hose connection. Hose connections shall be provided at each of the following locations:

1. Within the mall at the entrance to each exit passageway or corridor.
2. At each floor-level landing within enclosed stairways opening directly on the mall.
3. At exterior public entrances to the mall.
4. At other locations as necessary so that the distance to reach all portions of a tenant space ~~anchor store~~ does not exceed 200 (60 960 mm) feet from a hose connection.

Committee Reason: The proposal was approved because the committee felt that it provides good guidance to the code official regarding design of standpipe systems in covered malls. The modifications reflect what the committee felt the correct pressure loss terminology should be and also the fact that a covered mall, by definition, does not include anchor stores.

Assembly Action:**None**

Code Change No: F158-07/08

Original Proposal

Sections: 905.3.7 (IBC [F] 905.3.7)

Proponent: Tom Lariviere, Fire Department, Madison, MS, representing Joint Fire Service Review Committee

Delete without substitution:

~~**905.3.7 (IBC [F] 905.3.7) Marinas and boatyards.** Marinas and boatyards shall be equipped throughout with standpipe systems in accordance with NFPA 303.~~

Reason: This section is no longer needed after the recent adoption of the Chapter 45 Marinas (Supp). Section 905.3.7 now needs to be deleted since the issue of standpipes is now addressed in Chapter 45 (Supp). The deletion needs to occur in the IFC and IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Approved as Modified****Modify the proposal as follows:**

905.3.7 (IBC [F] 905.3.7) Marinas and boatyards. Standpipes in marinas and boatyards shall comply with Chapter 45.

Committee Reason: The proposal was approved because the committee felt that that the proponent's reason statement substantiates the need for the change, however the committee also felt that leaving a "pointer" section in Section 905, as indicated in the modification, would be useful to the fire code official.

Assembly Action:**None**

Final Hearing Results

F158-07/08

AM

Code Change No: **F159-07/08**

Original Proposal

Sections: 905.4 (IBC [F] 905.4)

Proponent: Gene Boecker, Code Consultants, Inc.

Revise as follows:

905.4 (IBC [F] 905.4) Location of Class I standpipe hose connections. Class I standpipe hose connections shall be provided in all of the following locations:

1. In every required stairway, a hose connection shall be provided for each floor level above or below grade. Hose connections shall be located at an intermediate floor level landing between floors, unless otherwise approved by the fire code official.
2. On each side of the wall adjacent to the exit opening of a horizontal exit.

Exception: Where floor areas adjacent to a horizontal exit are reachable from exit stairway hose connections by a 30-foot (9144 mm) hose stream from a nozzle attached to 100 feet (30480 mm) of hose, a hose connection shall not be required at the horizontal exit.

3. In every exit passageway, at the entrance from the exit passageway to other areas of a building.

Exception: Where floor areas adjacent to an exit passageway are reachable from exit stairway hose connections by a 30-foot (9144 mm) hose stream from a nozzle attached to 100 feet (30480 mm) of hose, a hose connection shall not be required at the entrance from the exit passageway to other areas of the building.

4. In covered mall buildings, adjacent to each exterior public entrance to the mall and adjacent to each entrance from an exit passageway or exit corridor to the mall.
5. Where the roof has a slope less than four units vertical in 12 units horizontal (33.3-percent slope), each standpipe shall be provided with a hose connection located either on the roof or at the highest landing of a stairway with stair access to the roof. An additional hose connection shall be provided at the top of the most hydraulically remote standpipe for testing purposes.
6. Where the most remote portion of a nonsprinklered floor or story is more than 150 feet (45 720 mm) from a hose connection or the most remote portion of a sprinklered floor or story is more than 200 feet (60 960 mm) from a hose connection, the fire code official is authorized to require that additional hose connections be provided in approved locations.

Reason: The exception to item #2 was included in the code as a recognition of the fact that multiple outlets in the same vicinity do not add to safety but merely increase costs. The same should be true for the situation described in item #3. If there is an outlet that is located in the vicinity of the exit passageway entrance, then it makes sense to use that and not require an outlet at each entrance.

To illustrate, imagine two scenarios: 1) In a multi-level covered mall building, an exit stairway exists in which a vertical standpipe is provided. The stairway is located approximately 30 feet from the mall entrance. Because the code requires an outlet at the entrance to the exit passageway, a second outlet would need to be installed although the area could be reached from the outlet in the stairway. 2) An exit passageway is provided in a health care setting as a way to meet travel distances and smoke compartment criteria. It is not a horizontal exit because the area of refuge does not exist in the passageway. Multiple doors access the corridor from rooms and spaces adjacent to it. According to the current language of the code, a hose outlet would be required adjacent to each of these doors which would result in an outlet every 20 – 30 feet (or even closer) inside the passageway.

In both these scenarios the literal application of the code does not contribute to additional safety but merely adds cost to the construction. It is only reasonable that the exception apply to this condition in the same manner as that item immediately prior.

This proposal will afford the same level of logic and reason as that in the prior item and eliminate a sometimes costly duplication.

Cost Impact: The code change proposal will not increase the cost of construction. A reduction in construction costs will occur in situations where the proposed exception reduces the redundant outlet(s).

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal was approved because the committee felt that it provides a useful clarification and refinement of required standpipe hose connection locations.

Assembly Action:

None

Final Hearing Results

F159-07/08

AS

Code Change No: **F160-07/08**

Original Proposal

Sections: 906.2 (IBC [F] 906.2)

Proponent: A. Brooks Ballard, Virginia Department of Corrections

Revise as follows:

906.2 (IBC [F] 906.2) (Supp) General requirements. Portable fire extinguishers shall be selected, installed and maintained in accordance with this section and NFPA 10.

Exceptions:

1. The travel distance to reach an extinguisher shall not apply to the spectator seating portions of Group A-5 occupancies.
2. Thirty-day inspections shall not be required and maintenance shall be allowed to be once every three years for dry-chemical or halogenated agent portable fire extinguishers that are supervised by a listed and approved electronic monitoring device, provided that all of the following conditions are met:
 - 2.1. Electronic monitoring shall confirm that extinguishers are properly positioned, properly charged and unobstructed.
 - 2.2. Loss of power or circuit continuity to the electronic monitoring device shall initiate a trouble signal.
 - 2.3. The extinguishers shall be installed inside of a building or cabinet in a noncorrosive environment.
 - 2.4. Electronic monitoring devices and supervisory circuits shall be tested every three years when extinguisher maintenance is performed.
 - 2.5. A written log of required hydrostatic test dates for extinguishers shall be maintained by the owner to ensure that hydrostatic tests are conducted at the frequency required by NFPA10.
3. In Group I-3, portable fire extinguishers shall be permitted to be located at staff locations.

Reason: Extinguishers located throughout the facility are at times tampered with, removed and/or used for weapons by occupants in a detention or correctional setting. This change would protect the extinguishers from damage or removal by inmates while still making them available to staff and employees for use in an emergency situation. At least one of the Legacy Codes allowed extinguishers to be located at staff locations and/or locked.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal was approved because the committee felt that it provides a reasonable exception to the fire extinguisher location requirements for Group I-3 occupancies, where tampering is a concern.

Assembly Action:

None

Final Hearing Results

F160-07/08

AS

Code Change No: **F161-07/08**

Original Proposal

Sections: 907.1.1, 907.1.2 (New) [IBC [F] 907.1.1, [F] 907.1.2 (New)]

Proponent: Gene Boecker, Code Consultants, Inc.

Revise as follows:

907.1.1 (IBC [F] 907.1.1) (Supp) Construction documents. ~~Construction documents for fire alarm systems shall be submitted for review and approval prior to system installation.~~ of sufficient clarity to indicate the location, nature and extent of the work proposed and show in detail that it will conform to the provisions of this code, the *International Building Code*, and relevant laws, ordinances, rules and regulations, as determined by the fire code official.

907.1.2 (IBC [F] 907.1.2) (Supp) Fire alarm shop drawings. ~~Construction documents~~ Shop drawings for fire alarm systems shall be submitted for review and approval prior to system installation. ~~Construction documents~~ and shall include, but not be limited to, all of the following:

1. A floor plan which indicates the use of all rooms.
2. Locations of alarm-initiating ~~and notification appliances~~ devices.
3. Locations of alarm notification appliances, including candela ratings for visible alarm notification appliances.
3. 4 Location of fire alarm control unit, transponders, and notification power supplies.
4. 5 Annunciators.
5. 6 Power connection.
6. 7 Battery calculations.
7. 8 Conductor type and sizes.
8. 9 Voltage drop calculations.
9. 10 Manufacturers, data sheets indicating model numbers and listing information for equipment, devices and materials.
10. 11 Details of ceiling height and construction.
11. 12 The interface of fire safety control functions.
12. 13 Classification of the supervising station.

907.1.2 (Supp) 907.1.3 (IBC [F] 907.1.3) Equipment. (No change to current text)

Reason: Section 907 evolved as an amalgamation of the three legacy codes. Although Section 907 was revised during the last cycle some additional items have been identified that need further clarification. The charging statement for Occupancy Groups is inconsistent. The text that indicates what is required is inconsistent. And, the general arrangement of text, although in a logical format, is not consistent with the way many people approach the code. Nor is it consistent with the way that Section 903 is organized. The proposal is an effort made by a group of people from various segments of the industry and code application to correlate, reformat and generally improve usability of the code. Before addressing the technical and formatting changes involved in the proposal, it is worth noting appreciation to the people who helped work on this effort. In alphabetical order:

Bill Aaron (Code Consultants, Inc.),
 Diane Arend (Office of the State Fire Marshal; California),
 Gene Boecker (Code Consultants, Inc),
 Shane Clary (Bay Alarm)
 John Guhl (Office of the State Fire Marshal; California),
 Tom Hammerberg (Automatic Fire Alarm Association, Inc),
 Bill Hoppie (SimplexGrinnell),
 Dan Nichols (Building Codes Division; State of New York),
 Jim Schifiliti (Fire Safety Consultants, Inc)

These changes are important because construction documents and shop drawings are not for the same purpose. The wording added to 907.1.1 was extracted from the IBC, Section 106.1.1. Shop drawings referred to in Section 907 are specific to fire alarm equipment and installation. This information may not be available at the time the contractor applies for the building permit, but is essential for review prior to the installation of the fire alarm system.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal was approved because the committee felt that the change provides a needed refinement of the construction document requirements which were part of the reorganization of Section 907 in the last cycle.

Assembly Action:

None

Final Hearing Results

F161-07/08

AS

Code Change No: F162-07/08

Original Proposal

Sections: 907.2 (IBC [F] 907.2)

Proponent: Jeffrey M. Shapiro, PE, International Code Consultants, representing National Multi Housing Council

Revise as follows:

907.2 (IBC [F] 907.2) (Supp) Where required - new buildings and structures. An approved manual, automatic or manual and automatic fire alarm system installed in accordance with the provisions of this code and NFPA 72 shall be provided in new buildings and structures in accordance with Sections 907.2.1 through 907.2.22 and provide occupant notification in accordance with Section 907.6, unless other requirements are provided by another section of this code.

A minimum of one manual fire alarm box shall be provided in an approved location to initiate a fire alarm signal for fire alarm systems employing automatic fire detectors or waterflow detection devices. Where other sections of this code allow elimination of fire alarm boxes due to sprinklers, a single fire alarm box shall be installed.

Exceptions:

1. The manual fire alarm box is not required for fire alarm systems dedicated to elevator recall control and supervisory service.
2. The manual fire alarm box is not required for Group R-2 occupancies.

Reason: Manual fire alarm boxes in apartment occupancies invite tampering and false alarms, and there is no apparent fire safety benefit to be gained by placing a single fire alarm box in such occupancies.

Justification offered last year to substantiate the need for the single manual alarm box was that it might be needed by a sprinkler technician to initiate an alarm if sprinklers/waterflow switches are out of service, but this makes no sense. Assuming that the alarm box is located in the valve room to avoid making it available to vandals, a technician working on any part of the sprinkler system, other than the valve, would be far away, and may or may not even know where the alarm box is. If the box were to be located where it will be accessible for occupant use, it is difficult to believe that occupants would know the location of a single pull box in a building or that they would seek out the box to initiate an alarm if the waterflow switch failed.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

907.2 (IBC [F] 907.2) (Supp) Where required - new buildings and structures. An approved manual, automatic or manual and automatic fire alarm system installed in accordance with the provisions of this code and NFPA 72 shall be provided in new buildings and structures in accordance with Sections 907.2.1 through 907.2.22 and provide occupant notification in accordance with Section 907.6, unless other requirements are provided by another section of this code.

A minimum of one manual fire alarm box shall be provided in an approved location to initiate a fire alarm signal for fire alarm systems employing automatic fire detectors or waterflow detection devices. Where other sections of this code allow elimination of fire alarm boxes due to sprinklers, a single fire alarm box shall be installed.

Exceptions:

1. The manual fire alarm box is not required for fire alarm systems dedicated to elevator recall control and supervisory service.
2. The manual fire alarm box is not required for Group R-2 occupancies unless required by the fire code official to provide a means for fire watch personnel to initiate an alarm during a sprinkler system impairment event. Where provided, the manual fire alarm box shall not be located in an area that is accessible to the public.

Committee Reason: The proposal was approved because the committee agreed that the manual fire alarm box should not be provided in Group R-2 where false alarms are a problem. The modification avoids putting the manual fire alarm box in all Group R-2 occupancies where there could be a false alarm problem while leaving open the option for the fire code official to require one in a restricted location for use by fire watch personnel, if needed.

Assembly Action:

None

Proponent: Gene Boecker, Code Consultants, Inc.

1. Revise as follows:

907.2 (IBC [F] 907.2) (Supp) Where required new buildings and structures. An approved ~~manual, automatic or manual and automatic~~ fire alarm system installed in accordance with the provisions of this code and NFPA 72 shall be provided in new buildings and structures in accordance with Sections 907.2.1 through 907.2.22 and provide occupant notification in accordance with Section 907.6, unless other requirements are provided by another section of this code.

A minimum of one manual fire alarm box shall be provided in an approved location to initiate a fire alarm signal for fire alarm systems employing automatic fire detectors or waterflow detection devices. Where other sections of this code allow elimination of fire alarm boxes due to sprinklers, a single fire alarm box shall be installed.

Exception: The manual fire alarm box is not required for fire alarm systems dedicated to elevator recall control and supervisory service.

907.2.6.3 (IBC [F] 907.2.6.3) (Supp) Group I-3 occupancies. Group I-3 occupancies shall be equipped with a manual ~~fire alarm system~~ and automatic ~~fire alarm~~ smoke detection system installed for alerting staff.

907.2.8.2 (IBC [F] 907.2.8.2) (Supp) Automatic smoke detection fire alarm system. An automatic ~~smoke detection fire alarm~~ system that activates the occupant notification system in accordance with Section 907.6 shall be installed throughout all interior corridors serving sleeping units.

Exception: An automatic ~~smoke fire~~ detection system is not required in buildings that do not have interior corridors serving sleeping units and where each sleeping unit has a means of egress door opening directly to an exit or to an exterior exit access that leads directly to an exit.

907.2.11 (IBC [F] 907.2.11) (Supp) Special amusement buildings. An automatic smoke detection system shall be provided in special amusement buildings in accordance with Sections 907.2.11.1 through 907.2.11.3.

Exception: ~~In areas where ambient conditions will cause a smoke detection system to alarm, an approved alternative type of automatic fire detector shall be installed.~~

907.2.12 (IBC [F] 907.2.12) (Supp) High-rise buildings. Buildings with a floor used for human occupancy located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access shall be provided with an automatic ~~fire alarm~~ smoke detection system in accordance with Section 907.2.12.1 and an emergency voice/alarm communication system in accordance with Section 907.6.2.2.

Exceptions:

1. Airport traffic control towers in accordance with Section 907.2.21 and Section 412 of the *International Building Code*.
2. Open parking garages in accordance with Section 406.3 of the *International Building Code*.
3. Buildings with an occupancy in Group A-5 in accordance with Section 303.1 of the *International Building Code*.
4. Low-hazard special occupancies in accordance with Section 503.1.1 of the *International Building Code*.
5. Buildings with an occupancy in Group H-1, H-2 or H-3 in accordance with Section 415 of the *International Building Code*.
6. In Group I-1 and I-2 occupancies, the alarm shall sound at a constantly attended location and general occupant notification shall be broadcast by the paging system.

907.2.12.1 (IBC [F] 907.2.12.1) (Supp) Automatic fire ~~smoke~~ detection. ~~Smoke detectors~~ An automatic smoke detection system shall be provided in accordance with this section. ~~Smoke detectors shall be connected to an automatic fire alarm system.~~ The activation of any detector required by this section shall operate the emergency voice/alarm communication system. Smoke detectors shall be located as follows:

1. In each mechanical equipment, electrical, transformer, telephone equipment or similar room which is not provided with sprinkler protection, elevator machine rooms, and in elevator lobbies.
2. In the main return air and exhaust air plenum of each air-conditioning system having a capacity greater than 2,000 cubic feet per minute (cfm) (0.94 m³/s). Such detectors shall be located in a serviceable area downstream of the last duct inlet.
3. At each connection to a vertical duct or riser serving two or more stories from a return air duct or plenum of an air-conditioning system. In Group R-1 and R-2 occupancies, a smoke detector is allowed to be used in each return-air riser carrying not more than 5,000 cfm (2.4m³/s) and serving not more than 10 air-inlet openings.

907.2.13 (IBC [F] 907.2.13) (Supp) Atriums connecting more than two stories. A ~~fire alarm~~ smoke detection system shall be installed in occupancies with an atrium that connects more than two stories. The system shall be activated in accordance with Section 907.6. Such occupancies in Group A, E or M shall be provided with an emergency voice/alarm communication system complying with the requirements of Section 907.6.2.2.

907.2.14 (IBC [F] 907.2.14) (Supp) High-piled combustible storage areas. An automatic ~~fire~~ smoke detection system shall be installed throughout high-piled combustible storage areas where required by Section 2306.5.

907.2.17 (IBC [F] 907.2.14) (Supp) Underground buildings with smoke control systems. Where a smoke control system is installed in an underground building in accordance with the *International Building Code*, automatic ~~fire~~ smoke detectors shall be provided in accordance with Sections ~~907.2.17.1 and 907.2.17.2~~.

2. Add new definition as follows:

902.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

AUTOMATIC SMOKE DETECTION SYSTEM. A fire alarm system that has initiation devices that utilize smoke detectors for protection of an area such as a room or space with detectors to provide early warning of fire.

Reason: Section 907 evolved as an amalgamation of the three legacy codes. Although Section 907 was revised during the last cycle some additional items have been identified that need clarification. The charging statement for Occupancy Groups is inconsistent. The text that indicates what is required is inconsistent. And, the general arrangement of text, although in a logical format, is not consistent with the way many people approach the code. Nor is it consistent with the way that Section 903 is organized. The proposal is an effort made by a group of people from various segments of the industry and code application to correlate, reformat and generally improve usability of the code. Before addressing the technical and formatting changes involved in the proposal, it is worth noting appreciation to the people who helped work on this effort. In alphabetical order:

Bill Aaron (Code Consultants, Inc.),
 Diane Arend (Office of the State Fire Marshal; California),
 Gene Boecker (Code Consultants, Inc),
 Shane Clary (Bay Alarm)
 John Guhl (Office of the State Fire Marshal; California),

Tom Hammerberg (Automatic Fire Alarm Association, Inc),
Bill Hopple (SimplexGrinnell),
Dan Nichols (Building Codes Division; State of New York),
Jim Schifiliti (Fire Safety Consultants, Inc)

The main purpose of this code proposal is to align terms within this Section to two main terms, “automatic smoke detection system” and “manual fire alarm system.” Currently, the language can be confusing with some sections requiring automatic fire detection systems and others requiring automatic smoke detection systems. Both of these terms are technically requiring the same thing. However, an automatic fire detection can be interpreted as a sprinkler system, which is not the intent of this section. If it was, the requirements would be found in Section 903.

A definition has been added for automatic smoke detection system, to assist the code user in determining what the code is specifically requiring.

Of special note, Section 907.2.11 appears to be a technical change. However, this is editorial since this allowance is globally accepted throughout Section 907, being specifically regulated in Section 907.5.3.

Furthermore, Section 907.2.12.1 removes redundant language with the addition of the ‘system’ requirement and is not a technical change.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

907.2.13 (IBC [F] 907.2.13) (Supp) Atriums connecting more than two stories. A ~~fire alarm smoke detection~~ system shall be installed in occupancies with an atrium that connects more than two stories, with smoke detection installed throughout the atrium. The system shall be activated in accordance with Section 907.6. Such occupancies in Group A, E or M shall be provided with an emergency voice/alarm communication system complying with the requirements of Section 907.6.2.2.

(Portions of proposal not shown remain unchanged)

Committee Reason: The proposal was approved because the committee felt that it will provide correlated usage of the newly defined term “automatic smoke detection system” and the term “manual fire alarm system”, thus eliminating the current confusion caused by some sections requiring “automatic fire detection systems” (which could be interpreted as being a sprinkler system) and others requiring “automatic smoke detection systems”. The modification provides clarification that only the atrium portion of the building is required to be provided with smoke detection, not the entire building.

Assembly Action:

None

Code Change No: F164-07/08

Original Proposal

Sections: 907.2.5, 907.2.6, 907.2.6.3.3, 907.2.7.1, 907.2.12.2, 907.6, 907.6.2.1.1, 9097.6.2.1.2, 907.6.2.2, 907.6.2.3.3 (New), 907.6.2.2.4, 907.7.3.2, 907.7.4 (IBC [F] 907.2.5, [F] 907.2.6, [F] 907.2.6.3.3, [F] 907.2.7.1, [F] 907.2.12.2, [F] 907.6, [F] 907.6.2.1.1, [F] 907.6.2.1.2, [F] 907.6.2.2, [F] 907.6.2.3.3 (New), [F] 907.6.2.2.4, [F] 907.7.3.2, [F] 907.7.4

Proponent: Gene Boecker, Code Consultants, Inc.

Revise as follows:

907.2.5 (IBC [F] 907.2.5) (Supp) Group H. A manual fire alarm system that activates the occupant notification system shall be installed in Group H-5 occupancies and in occupancies used for the manufacture of organic coatings. An automatic smoke detection system that activates the occupant notification system shall be installed for highly toxic gases, organic peroxides and oxidizers in accordance with Chapters 37, 39 and 40, respectively.

907.2.6 (IBC [F] 907.2.6) (Supp) Group I. A manual fire alarm system that activates the occupant notification system shall be installed in Group I occupancies. An automatic smoke detection system that activates the occupant notification system shall be provided in accordance with Sections 907.2.6.1 and 907.2.6.2.

907.2.6.3.3 (IBC [F] 907.2.6.3.3) Smoke detectors. An automatic smoke detection system shall be installed throughout resident housing areas, including sleeping units and contiguous day rooms, group activity spaces and other common spaces normally accessible to residents.

Exceptions:

1. Other approved smoke-detection arrangements providing equivalent protection, including, but not limited to, placing detectors in exhaust ducts from cells or behind protective guards listed for the purpose, are allowed when necessary to prevent damage or tampering.
2. Sleeping units in Use Conditions 2 and 3 as described in Section 308 of the *International Building Code*.
3. Smoke detectors are not required in sleeping units with four or fewer occupants in smoke compartments that are equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.

907.2.7.1 (IBC [F] 907.2.7.1) (Supp) Occupant notification. During times that the building is occupied, the initiation of a signal from a manual fire alarm box or from a water flow switch shall not be required to activate the alarm notification appliances when an alarm signal is activated at a constantly attended location from which evacuation instructions shall be initiated over an emergency voice/alarm communication system installed in accordance with Section 907.6.2.2.

~~The emergency voice/alarm communication system shall be allowed to be used for other announcements, provided the manual fire alarm use takes precedence over any other use.~~

907.2.12.2 (IBC [F] 907.2.12.2) (Supp) Fire department communication system. An approved two-way, fire department communication system designed and installed in accordance with NFPA 72 shall be provided for fire department use. It shall operate between a fire command center complying with Section 509 and elevators, elevator lobbies, emergency and standby power rooms, fire pump rooms, areas of refuge and inside enclosed exit stairways. The fire department communication device shall be provided at each floor level within the enclosed exit stairway.

Exception: Fire department radio systems are allowed to replace two-way fire department communication systems where approved by the fire department.

907.6 (IBC [F] 907.6) (Supp) Alarm Occupant notification systems. A fire alarm system shall annunciate at the panel and shall initiate occupant notification upon activation, in accordance with Sections 907.6.1 through 907.6.2.3.4. Where a fire alarm system is required by another section of this code, it shall be activated by:

1. Automatic fire detectors.
2. Sprinkler water-flow devices.
3. Manual fire alarm boxes.
4. Automatic fire-extinguishing systems.

Exceptions:

- ~~1. Occupant notification is not required for fire detectors used to control fire safety functions in accordance with Section 907.4.~~
2. Where notification systems are allowed elsewhere in Section 907 to annunciate at a constantly attended location.

907.6.2.1.1 (IBC [F] 907.6.2.1.1) (Supp) Average sound pressure. The audible alarm notification appliances shall provide a sound pressure level of 15 decibels (dBA) above the average ambient sound level or 5 dBA above the maximum sound level having a duration of at least 60 seconds, whichever is greater, in every ~~occupied~~ occupiable space within the building. The minimum sound pressure levels shall be: 75 dBA in occupancies in Groups R and I-1; 90 dBA in mechanical equipment rooms; and 60 dBA in other occupancies.

907.6.2.1.2 (IBC [F] 907.6.2.1.2) (Supp) Maximum sound pressure. The maximum sound pressure level for audible alarm notification appliances shall be 110 dBA at the minimum hearing distance from the audible appliance. Where the average ambient noise is greater than ~~405~~ 95 dBA, visible alarm notification appliances shall be provided in accordance with NFPA 72 and audible alarm notification appliances shall not be required.

907.6.2.2 (IBC [F] 907.6.2.2) (Supp) Emergency voice/alarm communication system. The emergency voice/alarm communication system shall be designed and installed in accordance with NFPA 72. The operation of any automatic fire detector, sprinkler waterflow device or manual fire alarm box shall automatically sound an alert tone followed by voice instructions giving approved information and directions for a general or staged evacuation on a minimum of the alarming floor, the floor above and the floor below in accordance with the buildings fire safety and evacuation plans required by Section 404. In high-rise buildings, the system shall operate on a minimum of the alarming floor, the floor above and the floor below. Speakers shall be provided throughout the building by paging zones. As a minimum, paging zones shall be provided as follows:

1. Elevator groups.
2. Exit stairways.
3. Each floor.
4. Areas of refuge as defined in Section 1002.1.

Exception: In Group I-1 and I-2 occupancies, the alarm shall sound in a constantly attended area and a general occupant notification shall be broadcast over the overhead page.

907.6.2.2.3 (IBC [F] 907.6.2.2.3) Alternate uses. The emergency voice/alarm communication system shall be allowed to be used for other announcements, provided the manual fire alarm use takes precedence over any other use.

(Renumber subsequent section)

907.7.3.2 (IBC [F] 907.7.3.2) (Supp) High-rise buildings. In buildings with a floor used for human occupancy that is located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access, a separate zone by floor shall be provided for all each of the following types of alarm-initiating devices where provided:

1. Smoke detectors.
2. Sprinkler water-flow devices.
3. Manual fire alarm boxes.
4. Other approved types of automatic fire detection devices or suppression systems.

907.7.4 (IBC [F] 907.7.4) (Supp) Access. Access shall be provided to each ~~detector~~ fire alarm device and notification appliance for periodic inspection, maintenance and testing.

Reason: Section 907 evolved as an amalgamation of the three legacy codes. Although Section 907 was revised during the last cycle some additional items have been identified that need clarification. The charging statement for Occupancy Groups is inconsistent. The text that indicates what is required is inconsistent. And, the general arrangement of text, although in a logical format, is not consistent with the way many people approach the code. Nor is it consistent with the way that Section 903 is organized. The proposal is an effort made by a group of people from various segments of the industry and code application to correlate, reformat and generally improve usability of the code. Before addressing the technical and formatting changes involved in the proposal, it is worth noting appreciation to the people who helped work on this effort. In alphabetical order:

Bill Aaron (Code Consultants, Inc.),
 Diane Arend (Office of the State Fire Marshal; California),
 Gene Boecker (Code Consultants, Inc),
 Shane Clary (Bay Alarm)
 John Guhl (Office of the State Fire Marshal; California),
 Tom Hammerberg (Automatic Fire Alarm Association, Inc),
 Bill Hopple (SimplexGrinnell),
 Dan Nichols (Building Codes Division; State of New York),
 Jim Schifiliti (Fire Safety Consultants, Inc)

907.2.5 Justification – The added language is for consistency with the language for other Occupancy Groups.

907.2.6 Justification – The added language is for consistency with the language for other Occupancy Groups.

907.6.3.3 Exceptions Justification – The added language is to identify where to find more information regarding Use Conditions 2 and 3. This improves usability of the Code.

907.2.7.1 Justification – The language is relocated to section 907.6.2.2 for clarity so that emergency voice alarm system requirements are grouped in one area.

907.2.12.2 Justification – The added language is for clarity indicating that fire department radio systems are allowed as a substitute for two-way fire department communications systems.

907.6 Justification – This exception is in direct conflict with the requirements of Section 907.4 which requires occupant notification.

907.6.2.1.1 Justification - The added language is for consistency with the language throughout this code.

907.6.2.1.2 Justification – The decibel level is revised to be in alignment with NFPA 72 and A.D.A.

907.6.2.2.3 Justification – The language is relocated from section 907.2.7.1 for clarity so that emergency voice alarm system requirements are grouped in one area.

907.6.2.2.34 Justification – Renumbering to incorporate the relocated emergency voice/alarm communication requirement.

907.7.4 Justification – The added language is for clarity indicating that access is to be provide for all fire alarm devices for servicing

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Approved as Submitted**

Committee Reason: The proposal was approved because the committee agreed that the change provides a logical, needed refinement and correlation of the language used in all occupancy group fire alarm requirements which were part of the reorganization of Section 907 in the last cycle.

Assembly Action:**None**

Final Hearing Results

F164-07/08

AS

Code Change No: F165-07/08

Original Proposal

Sections: 907.2.6 (IBC [F] 907.2.6)**Proponent:** Gene Boecker, Code Consultants, Inc.**Revise as follows:**

907.2.6 (IBC [F] 907.2.6) (Supp) Group I. A manual fire alarm system shall be installed in Group I occupancies. An automatic smoke detection system shall be provided in accordance with Sections 907.2.6.1 and 907.2.6.2.

Exceptions:

1. Manual fire alarm boxes in resident or patient sleeping areas of Group I-1 and I-2 occupancies shall not be required at exits if located at all nurses= control stations or other constantly attended staff locations, provided such stations are visible and continuously accessible and that travel distances required in Section 907.5.2 are not exceeded.
2. Occupant notification systems are not required to be activated where private mode signaling installed in accordance with NFPA 72 is approved by the fire code official.

Reason: Section 907 evolved as an amalgamation of the three legacy codes. Although Section 907 was revised during the last cycle some additional items have been identified that need further clarification. The charging statement for Occupancy Groups is inconsistent. The text that indicates what is required is inconsistent. And, the general arrangement of text, although in a logical format, is not consistent with the way many people approach the code. Nor is it consistent with the way that Section 903 is organized. The proposal is an effort made by a group of people from various segments of the industry and code application to correlate, reformat and generally improve usability of the code. Before addressing the technical and formatting changes involved in the proposal, it is worth noting appreciation to the people who helped work on this effort. In alphabetical order:

Bill Aaron (Code Consultants, Inc.),
 Diane Arend (Office of the State Fire Marshal; California),
 Gene Boecker (Code Consultants, Inc),
 Shane Clary (Bay Alarm)
 John Guhl (Office of the State Fire Marshal; California),
 Tom Hammerberg (Automatic Fire Alarm Association, Inc),
 Bill Hopple (SimplexGrinnell),
 Dan Nichols (Building Codes Division; State of New York),
 Jim Schifiliti (Fire Safety Consultants, Inc)

The new exception is to clearly allow only notifying the staff instead of all building occupants in the event of a fire. This is a common practice in Group I occupancies, and the current language would not allow that.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Approved as Submitted**

Committee Reason: The committee agreed that there is no need to notify of a fire alarm the occupants who are incapable of taking meaningful evacuation action in response to it and that the fire code official should have specific approval authority in that decision.

Assembly Action:

None

Final Hearing Results

F165-07/08

Code Change No: **F166-07/08**

Original Proposal

Sections: 907.2.9.1 (IBC [F] 907.2.9.1)

Proponent: Jeffrey M. Shapiro, PE, International Code Consultants, representing himself

Revise as follows:

907.2.9.1 (IBC [F] 907.2.9.1) (Supp) Manual fire alarm system. A manual fire alarm system that activates the occupant notification system in accordance with Section 907.6 shall be installed in Group R-2 occupancies where:

1. Any dwelling unit or sleeping unit is located three or more stories above the lowest level of exit discharge;
2. Any dwelling unit or sleeping unit is located more than one story below the highest level of exit discharge of exits serving the dwelling unit or sleeping unit; or
3. The building contains more than 16 dwelling units or sleeping units.

Exceptions:

1. A fire alarm system is not required in buildings not more than two stories in height where all dwelling units or sleeping units and contiguous attic and crawl spaces are separated from each other and public or common areas by at least 1-hour fire partitions and each dwelling unit or sleeping unit has an exit directly to a public way, exit court or yard.
4. 2. Manual fire alarm boxes are not required where the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2 and the occupant notification appliances will automatically activate throughout the notification zones upon a sprinkler water flow.
2. ~~A manual fire alarm system is not required in buildings not more than two stories in height that do not have interior corridors serving dwelling units provided that dwelling units either have a means of egress door opening directly to an exterior exit access that leads directly to the exits or are served by open-ended corridors designed in accordance with Section 1023.6, Exception 4.~~
3. A fire alarm system is not required in buildings that do not have interior corridors serving dwelling units and are protected by an approved automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2, provided that dwelling units either have a means of egress door opening directly to an exterior exit access that leads directly to the exits or are served by open-ended corridors designed in accordance with Section 1023.6, Exception 4.

Reason: This proposal returns the exceptions in Section 907.2.9.1 to the 2006 IFC text. These exceptions were changed as part of Proposal F122-06/07, which according to the proponent was not intended to make technical changes to the 2006 requirements. However, closer scrutiny revealed that the change significantly reduced the scope of the old Exception 3 (which was revised and renumbered as Exception 2 in the 2007 Supplement) by limiting application to only allow elimination of manual alarms, as opposed to the entire alarm system, and only in buildings not exceeding two stories in height.

Likewise, the change to the old Exception 1 (which was revised and incorporated into Exception 2 in the 2007 Supplement) significantly reduced the scope of Exception 1 by only allowing elimination of manual fire alarm boxes, as opposed to the entire alarm system. Because Proposal F122 provided no justification for making these technical changes, this proposal simply reverses unsubstantiated revisions to the code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Approved as Submitted**

Committee Reason: The proposal was approved because the committee felt that the change returning the exceptions to the 2006 edition Section 907.2.9.1 is appropriate because the reorganization of Section 907 in the last cycle did not intend to make any technical changes but did in this case, without any justification.

Assembly Action:**None**

Final Hearing Results

F166-07/08

AS

Code Change No: F167-07/08

Original Proposal

Sections: 907.2.10 through 907.2.10.3 (New) [IBC [F] 907.2.10 through [F] 907.2.10.3 (New)], 907.3.3.4

Proponent: Gene Boecker, Code Consultants, Inc.

1. Add new text as follows:

907.2.10 (IBC [F] 907.2.10) Group R-4. Fire alarm systems and smoke alarms shall be installed in Group R-4 occupancies as required in Sections 907.2.10.1 through 907.2.10.3.

907.2.10.1 (IBC [F] 907.2.10.1) Manual fire alarm system. A manual fire alarm system that activates the occupant notification system in accordance with Section 907.6 shall be installed in Group R-4 occupancies.

Exceptions:

1. A manual fire alarm system is not required in buildings not more than two stories in height where all individual sleeping units and contiguous attic and crawl spaces to those units are separated from each other and public or common areas by at least 1-hour fire partitions and each individual sleeping unit has an exit directly to a public way, exit court or yard.
2. Manual fire alarm boxes are not required throughout the building when the following conditions are met:
 - 2.1. The building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
 - 2.2. The notification appliances will activate upon sprinkler water flow; and
 - 2.3. At least one manual fire alarm box is installed at an approved location.
3. Manual fire alarm boxes in resident or patient sleeping areas shall not be required at exits where located at all nurses' control stations or other constantly attended staff locations, provided such stations are visible and continuously accessible and that travel distances required in Section 907.5.2.1 are not exceeded.

907.2.10.2 (IBC [F] 907.2.10.2) Automatic smoke detection system. An automatic smoke detection system that activates the occupant notification system in accordance with Section 907.6 shall be installed in corridors, waiting areas open to corridors and habitable spaces other than sleeping units and kitchens.

Exceptions:

1. Smoke detection in habitable spaces is not required where the facility is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
2. An automatic smoke detection system is not required in buildings that do not have interior corridors serving sleeping units and where each sleeping unit has a means of egress door opening directly to an exit or to an exterior exit access that leads directly to an exit.

907.2.10.3 (IBC [F] 907.2.10.3) Smoke alarms. Single- and multiple-station smoke alarms shall be installed in accordance with Section 907.2.11.

(Renumber subsequent sections)

2. Revise as follows:

907.3.3.4 (Supp) Group R-4. An automatic or manual fire alarm system that activates the occupant notification system in accordance with Section 907.6 shall be installed in existing Group R-4 residential care/assisted living facilities in accordance with Section 907.2.10.

Exceptions:

1. Where there are interconnected smoke alarms meeting the requirements of Section ~~907.2.10~~ 907.2.11 and there is at least one manual fire alarm box per floor arranged to sound continuously the smoke alarms.
2. Other manually activated, continuously sounding alarms approved by the fire code official.

Reason: Section 907 evolved as an amalgamation of the three legacy codes. Although Section 907 was revised during the last cycle some additional items have been identified that need further clarification. The charging statement for Occupancy Groups is inconsistent. The text that indicates what is required is inconsistent. And, the general arrangement of text, although in a logical format, is not consistent with the way many people approach the code. Nor is it consistent with the way that Section 903 is organized. The proposal is an effort made by a group of people from various segments of the industry and code application to correlate, reformat and generally improve usability of the code. Before addressing the technical and formatting changes involved in the proposal, it is worth noting appreciation to the people who helped work on this effort. In alphabetical order:

Bill Aaron (Code Consultants, Inc.),
Diane Arend (Office of the State Fire Marshal; California),
Gene Boecker (Code Consultants, Inc),
Shane Clary (Bay Alarm)
John Guhl (Office of the State Fire Marshal; California),
Tom Hammerberg (Automatic Fire Alarm Association, Inc),
Bill Hopple (SimplexGrinnell),
Dan Nichols (Building Codes Division; State of New York),
Jim Schifiliti (Fire Safety Consultants, Inc)

This is to add a requirement for new Group R-4 occupancies. Reviewing the occupancy categories in Chapter 3, a Group R-4 can be considered either a small Group I-1 or a Group R-2 with occupants that have special needs or limitations. A further review finds that both Group I-1 and Group R-2 occupancies both have fire alarm requirements for new buildings, but Group R-4 does not. The lack of needed requirements in the current IBC/IFC is very evident. The code change proposal will not increase the cost of construction since IFC Section 907.3 requires a fire alarm retroactively in Group R-4 occupancies. As the IFC currently reads, a one day old R-4 would technically be required to retrofit an automatic or manual alarm system into the building, which doesn't make sense.

The proposed language is based on the Group R-2 requirements for manual fire alarm systems and Group I-1 requirements for automatic smoke detection systems. The proposed language adds exceptions that would apply to Group I-1 occupancies, such as additional manual pull box exceptions for sprinklered sleeping areas and nurses stations, and removes the 16 dwelling unit requirement for manual fire alarms since an Group R-4 cannot have more than 16 occupants.

The proposed language also modifies the retroactive Group R-4 requirements to reference back to the new requirements. Currently, there is not clear direction on what is required for a fire alarm system retroactively. The reference to the new section provides needed requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The committee felt that the change provides a needed refinement and correlation of the fire protection requirements for new Group R-4 occupancies, which are currently in conflict with the alarm requirements for existing Group R-4 occupancies. Currently, existing Group R-4 occupancies are required to be provided with an automatic or manual fire alarm whereas new Group R-4 occupancies are not required to be so equipped.

Assembly Action:

None

Code Change No: **F168-07/08**

Original Proposal

Sections: 907.2.12 (IBC [F] 907.2.12)

Proponent: Gene Boecker, Code Consultants, Inc.

Revise as follows:

907.2.12 (IBC [F] 907.2.12) (Supp) High-rise buildings. Buildings with a floor used for human occupancy located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access shall be provided with an automatic fire alarm system and an emergency voice/alarm communication system in accordance with Section 907.6.2.2.

Exceptions:

1. Airport traffic control towers in accordance with Section 907.2.21 and Section 412 of the *International Building Code*.
2. Open parking garages in accordance with Section 406.3 of the *International Building Code*.
3. Buildings with an occupancy in Group A-5 in accordance with Section 303.1 of the *International Building Code*.
4. Low-hazard special occupancies in accordance with Section 503.1.1 of the *International Building Code*.
5. Buildings with an occupancy in Group H-1, H-2 or H-3 in accordance with Section 415 of the *International Building Code*.
6. In Group I-1 and I-2 occupancies, the alarm shall sound at a constantly attended location and general occupant notification shall be broadcast by the ~~paging system~~ emergency voice/alarm communication system.

Reason: Section 907 evolved as an amalgamation of the three legacy codes. Although Section 907 was revised during the last cycle some additional items have been identified that need further clarification. The charging statement for Occupancy Groups is inconsistent. The text that indicates what is required is inconsistent. And, the general arrangement of text, although in a logical format, is not consistent with the way many people approach the code. Nor is it consistent with the way that Section 903 is organized. The proposal is an effort made by a group of people from various segments of the industry and code application to correlate, reformat and generally improve usability of the code. Before addressing the technical and formatting changes involved in the proposal, it is worth noting appreciation to the people who helped work on this effort. In alphabetical order:

Bill Aaron (Code Consultants, Inc.),
 Diane Arend (Office of the State Fire Marshal; California),
 Gene Boecker (Code Consultants, Inc),
 Shane Clary (Bay Alarm)
 John Guhl (Office of the State Fire Marshal; California),
 Tom Hammerberg (Automatic Fire Alarm Association, Inc),
 Bill Hopple (SimplexGrinnell),
 Dan Nichols (Building Codes Division; State of New York),
 Jim Schifiliti (Fire Safety Consultants, Inc)

All other fire alarm systems in high-rises require the use of an emergency voice/alarm communication system. Paging systems do not have supervised wiring or specific secondary power requirements. There is no assurance this system will work when it is needed to work. NFPA 72 and this Code allow emergency voice/alarm systems to be used for other purposes, such as paging. In addition, NFPA 72 does not require emergency voice/alarm systems to operate automatically, so the operation will be the same with the added benefit of having the circuits supervised and the ability to operate on secondary power in the event of a building power failure. Currently there is no requirement for paging systems to be on an emergency power source.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal was approved because the committee felt that it corrects the type of voice system suitable for high-rise buildings to a more reliable, supervised voice alarm communications system.

Assembly Action:

None

Final Hearing Results

F168-07/08

Code Change No: **F169-07/08**

Original Proposal

Sections: 907.2.12.1, 907.2.12.1.1 (New), 907.2.12.1.2 (New) [IBC [F] 907.2.12.1, [F] 907.2.12.1.1 (New), [F] 907.2.12.1.2 (New)]

Proponent: Gene Boecker, Code Consultants, Inc.

Revise as follows:

907.2.12.1 (IBC [F] 907.2.12.1) (Supp) Automatic fire detection. Automatic smoke detection in high rise buildings shall be in accordance with Sections 907.2.12.1.1 and 907.2.12.1.2.

907.2.12.1.1 (IBC [F] 907.2.12.1.1) Area smoke detection. Area smoke detectors shall be provided in accordance with this section. Smoke detectors shall be connected to an automatic fire alarm system. The activation of any detector required by this section shall operate the emergency voice/alarm communication system in accordance with Section 907.6.2.2. Smoke detectors shall be located as follows:

1. In each mechanical equipment, electrical, transformer, telephone equipment or similar room which is not provided with sprinkler protection, ~~elevator machine rooms, and in elevator lobbies.~~
2. In each elevator machine room and in elevator lobbies.

907.2.12.1.2 (IBC [F] 907.2.12.1.2) Duct smoke detection. Duct smoke detectors complying with Section 907.4.1 shall be located as follows:

- ~~2.~~ 1. In the main return air and exhaust air plenum of each air-conditioning system having a capacity greater than 2,000 cubic feet per minute (cfm) (0.94 m³/s). Such detectors shall be located in a serviceable area downstream of the last duct inlet.
- ~~3.~~ 2. At each connection to a vertical duct or riser serving two or more stories from a return air duct or plenum of an air-conditioning system. In Group R-1 and R-2 occupancies, a smoke detector is allowed to be used in each return-air riser carrying not more than 5,000 cfm (2.4m³/s) and serving not more than 10 air-inlet openings.

Reason: Section 907 evolved as an amalgamation of the three legacy codes. Although Section 907 was revised during the last cycle some additional items have been identified that need clarification. The charging statement for Occupancy Groups is inconsistent. The text that indicates what is required is inconsistent. And, the general arrangement of text, although in a logical format, is not consistent with the way many people approach the code. Nor is it consistent with the way that Section 903 is organized. The proposal is an effort made by a group of people from various segments of the industry and code application to correlate, reformat and generally improve usability of the code. Before addressing the technical and formatting changes involved in the proposal, it is worth noting appreciation to the people who helped work on this effort. In alphabetical order:

Bill Aaron (Code Consultants, Inc.),
 Diane Arend (Office of the State Fire Marshal; California),
 Gene Boecker (Code Consultants, Inc),
 Shane Clary (Bay Alarm)
 John Guhl (Office of the State Fire Marshal; California),
 Tom Hammerberg (Automatic Fire Alarm Association, Inc),
 Bill Hopple (SimplexGrinnell),
 Dan Nichols (Building Codes Division; State of New York),
 Jim Schifiliti (Fire Safety Consultants, Inc)

Justification for proposal for Section 907.2.12.1: Item 2 is added to avoid confusion with the requirements of item 1. Elevator machine rooms and elevator lobbies are required to have smoke detectors for elevator recall even if these locations are sprinklers. By moving them to a separate line, it should reduce confusion in interpretations in this code.

Justification for proposal for Section 907.2.12.1.2: A separate duct smoke detection section is being added to avoid confusion and to clarify that the type of smoke detector used shall be approved for duct applications (higher air velocities, temperatures and humidity) and to allow the use of a supervisory signal in lieu of a fire alarm signal (emergency voice alarm/communication notification).

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal was approved because the committee felt that it provides needed clarification of the automatic fire detection and duct smoke detection systems for high-rise buildings.

Assembly Action:

None

Final Hearing Results

F169-07/08

AS

Code Change No: F172-07/08

Original Proposal

Sections: 907.2.18.1 (IBC [F] 907.2.18.1)

Proponent: Gene Boecker, Code Consultants, Inc.

Delete without substitution:

~~**907.2.18.1 (IBC [F] 907.2.18.1) (Supp) Public address system.** Where a fire alarm system is not required by Section 907.2, a public address system shall be provided which shall be capable of transmitting voice communications to the highest level of exit discharge serving the underground portions of the structure and all levels below.~~

Reason: Section 907 evolved as an amalgamation of the three legacy codes. Although Section 907 was revised during the last cycle some additional items have been identified that need further clarification. The charging statement for Occupancy Groups is inconsistent. The text that indicates what is required is inconsistent. And, the general arrangement of text, although in a logical format, is not consistent with the way many people approach the code. Nor is it consistent with the way that Section 903 is organized. The proposal is an effort made by a group of people from various segments of the industry and code application to correlate, reformat and generally improve usability of the code. Before addressing the technical and formatting changes involved in the proposal, it is worth noting appreciation to the people who helped work on this effort. In alphabetical order:

Bill Aaron (Code Consultants, Inc.),
Diane Arend (Office of the State Fire Marshal; California),
Gene Boecker (Code Consultants, Inc),
Shane Clary (Bay Alarm)
John Guhl (Office of the State Fire Marshal; California),
Tom Hammerberg (Automatic Fire Alarm Association, Inc),
Bill Hopple (SimplexGrinnell),
Dan Nichols (Building Codes Division; State of New York),
Jim Schifiliti (Fire Safety Consultants, Inc)

This is a 'do-loop' and old language. The 'do-loop' is that an automatic smoke detection system is required by 907.2 (namely 907.2.17), so 907.2.18.1 is not needed. Also, if a reason was found where an automatic detection system isn't needed, the PA system is in direct conflict with the EVACS system found in 907.2.18 for deep underground buildings.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The committee agreed that the proponent's reason statement accurately and adequately substantiates the need for the change, which deletes an unneeded and unenforceable section.

Assembly Action:

F172-07/08

AS

Code Change No: **F173-07/08**

Original Proposal

Sections: 907.2.21 (IBC [F] 907.2.21)

Proponent: Gene Boecker, Code Consultants, Inc.

Revise as follows:

907.2.21 (IBC [F] 907.2.21) (Supp) Airport traffic control towers. An automatic fire detection system that activates the occupant notification system in accordance with Section 907.6 shall be provided in airport control towers in all occupiable and equipment spaces.

Exception: Audible appliances shall not be installed within the control tower cab.

Reason: Section 907 evolved as an amalgamation of the three legacy codes. Although Section 907 was revised during the last cycle some additional items have been identified that need clarification. The charging statement for Occupancy Groups is inconsistent. The text that indicates what is required is inconsistent. And, the general arrangement of text, although in a logical format, is not consistent with the way many people approach the code. Nor is it consistent with the way that Section 903 is organized. The proposal is an effort made by a group of people from various segments of the industry and code application to correlate, reformat and generally improve usability of the code. Before addressing the technical and formatting changes involved in the proposal, it is worth noting appreciation to the people who helped work on this effort. In alphabetical order:

Bill Aaron (Code Consultants, Inc.),
 Diane Arend (Office of the State Fire Marshal; California),
 Gene Boecker (Code Consultants, Inc),
 Shane Clary (Bay Alarm)
 John Guhl (Office of the State Fire Marshal; California),
 Tom Hammerberg (Automatic Fire Alarm Association, Inc),
 Bill Hopple (SimplexGrinnell),
 Dan Nichols (Building Codes Division; State of New York),
 Jim Schifiliti (Fire Safety Consultants, Inc)

The proposed changes to 907.2.21 are to provide clarification as to where fire alarm devices and appliances are required within airport traffic control towers. Equipment spaces have been added as these may be areas within an airport traffic control tower where a fire may begin, but may not be occupied. Early warning of a fire in these areas is required so as to alert the occupants of occupancy and emergency forces.

Due to the nature of the operation of airport traffic control towers, the notification of occupants within the cab is to be by visual notification appliances only.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

907.2.21 (IBC [F] 907.2.21) (Supp) Airport traffic control towers. An automatic ~~fire~~ smoke detection system that activates the occupant notification system in accordance with Section 907.6 shall be provided in airport control towers in all occupiable and equipment spaces.

Exception: Audible appliances shall not be installed within the control tower cab.

Committee Reason: The proposal was approved because the committee felt that it recognizes the critical need for quiet in air traffic control tower cabs. The modification provides correlation of the terminology in this section with the terminology established by code change F163-07/08.

Assembly Action:

None

Final Hearing Results

F173-07/08

AM

Code Change No: F174-07/08

Original Proposal

Sections: 907.2.22 (IBC [F] 907.2.22)

Proponent: Gene Boecker, Code Consultants, Inc.

Revise as follows:

907.2.22 (IBC [F] 907.2.22) (Supp) Battery rooms. An automatic smoke detection system shall be installed in areas containing stationary storage battery systems with a liquid capacity of more than 50 gallons (189 L). ~~The detection system shall activate a local alarm signal at a constantly attended location or shall be supervised by an approved central, proprietary, or remote station service.~~

Reason: Section 907 evolved as an amalgamation of the three legacy codes. Although Section 907 was revised during the last cycle some additional items have been identified that need clarification. The charging statement for Occupancy Groups is inconsistent. The text that indicates what is required is inconsistent. And, the general arrangement of text, although in a logical format, is not consistent with the way many people approach the code. Nor is it consistent with the way that Section 903 is organized. The proposal is an effort made by a group of people from various segments of the industry and code application to correlate, reformat and generally improve usability of the code. Before addressing the technical and formatting changes involved in the proposal, it is worth noting appreciation to the people who helped work on this effort. In alphabetical order:

Bill Aaron (Code Consultants, Inc.),
Diane Arend (Office of the State Fire Marshal; California),
Gene Boecker (Code Consultants, Inc),
Shane Clary (Bay Alarm)
John Guhl (Office of the State Fire Marshal; California),
Tom Hammerberg (Automatic Fire Alarm Association, Inc),
Bill Hopple (SimplexGrinnell),
Dan Nichols (Building Codes Division; State of New York),
Jim Schifiliti (Fire Safety Consultants, Inc)

This is in conflict with IFC Section 907.7.5 (Supp) regarding monitoring. A battery room does not have any special conditions that should give the local alarm option since IFC 907.7.5 (Supp) does not permit any other automatic smoke detection system from utilizing a local alarm only.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal was approved because the committee felt that it deletes text that is in conflict with the alarm monitoring requirements of Section 907.

Assembly Action:

None

Final Hearing Results

F174-07/08

AS

Code Change No: **F179-07/08**

Original Proposal

Sections: 907.4.1 (IBC [F] 907.4.1)

Proponent: Gene Boecker, Code Consultants, Inc.

Revise as follows:

907.4.1 (IBC [F] 907.4.1) (Supp) Duct smoke detectors. Smoke detectors installed in ducts shall be listed for the air velocity, temperature and humidity present in the duct. Duct smoke detectors shall be connected to the building's fire alarm control unit when a fire alarm system is required by 907.2. Activation of a duct smoke detector shall initiate a visible and audible supervisory signal at a constantly attended location and shall perform the intended fire safety function in accordance with this code and the *International Mechanical Code*. Duct smoke detectors shall not be used as a substitute for required open area detection.

Exceptions:

1. The supervisory signal at a constantly attended location is not required where duct smoke detectors activate the buildings alarm notification appliances.
2. In occupancies not required to be equipped with a fire alarm system, actuation of a smoke detector shall activate a visible and an audible signal in an approved location. Smoke detector trouble conditions shall activate a visible or audible signal in an approved location and shall be identified as air duct detector trouble.

Reason: Section 907 evolved as an amalgamation of the three legacy codes. Although Section 907 was revised during the last cycle some additional items have been identified that need clarification. The charging statement for Occupancy Groups is inconsistent. The text that indicates what is required is inconsistent. And, the general arrangement of text, although in a logical format, is not consistent with the way many people approach the code. Nor is it consistent with the way that Section 903 is organized. The proposal is an effort made by a group of people from various segments of the industry and code application to correlate, reformat and generally improve usability of the code. Before addressing the technical and formatting changes involved in the proposal, it is worth noting appreciation to the people who helped work on this effort. In alphabetical order:

Bill Aaron (Code Consultants, Inc.),
Diane Arend (Office of the State Fire Marshal; California),
Gene Boecker (Code Consultants, Inc),
Shane Clary (Bay Alarm)
John Guhl (Office of the State Fire Marshal; California),
Tom Hammerberg (Automatic Fire Alarm Association, Inc),
Bill Hopple (SimplexGrinnell),
Dan Nichols (Building Codes Division; State of New York),
Jim Schifiliti (Fire Safety Consultants, Inc)

This section is being modified to clarify that duct smoke detectors shall be listed for the air velocity, temperature and humidity present in the duct system (due to the higher air velocities, temperatures and humidity's inside HVAC ducts) and to correlate with the fire safety function requirements of the International Mechanical Code (HVAC shut-down and fire-smoke damper activation). The language in this proposal is also consistent with the requirements of NFPA 72.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal was approved because the committee felt that it provides a clear statement that duct smoke detectors must be suitable and listed for the environment within the duct system.

Assembly Action:

None

Final Hearing Results

F179-07/08

AS

Code Change No: **F180-07/08**

Original Proposal

Sections: 907.5.3, 907.5.3.1 (New) [IBC [F] 907.5.3, [F] 907.5.3.1 (New)]

Proponent: Gene Boecker, Code Consultants, Inc.

Revise as follows:

907.5.3 (IBC [F] 907.5.3) (Supp) Automatic smoke detection. An automatic smoke detection system shall utilize ~~The automatic fire detectors shall be smoke detectors. Where unless ambient conditions prohibit such an~~ installation. of smoke detectors; In spaces where smoke detectors are not utilized, other approved automatic fire ~~detection shall be permitted required. Where an automatic sprinkler protection system installed in such areas in~~ accordance with Section 903.3.1.1 or 903.3.1.2 is provided and connected to the building fire alarm system, ~~automatic heat detection required by this section shall not be required.~~

907.5.3.1 (IBC [F] 907.5.3.1)Automatic sprinkler system. In areas where ambient conditions prohibit the ~~installation of smoke detectors, an automatic sprinkler system installed in such areas in accordance with Section~~ 903.3.1.1 or 903.3.1.2 and connected to the fire alarm system shall be approved as automatic fire detection.

Exception: Heat detectors for elevator functions.

Reason: Section 907 evolved as an amalgamation of the three legacy codes. Although Section 907 was revised during the last cycle some additional items have been identified that need clarification. The charging statement for Occupancy Groups is inconsistent. The text that indicates what is required is inconsistent. And, the general arrangement of text, although in a logical format, is not consistent with the way many people approach the code. Nor is it consistent with the way that Section 903 is organized. The proposal is an effort made by a group of people from various segments of the industry and code application to correlate, reformat and generally improve usability of the code. Before addressing the technical and formatting changes involved in the proposal, it is worth noting appreciation to the people who helped work on this effort. In alphabetical order:

Bill Aaron (Code Consultants, Inc.),
Diane Arend (Office of the State Fire Marshal; California),
Gene Boecker (Code Consultants, Inc),
Shane Clary (Bay Alarm)
John Guhl (Office of the State Fire Marshal; California),
Tom Hammerberg (Automatic Fire Alarm Association, Inc),
Bill Hopple (SimplexGrinnell),
Dan Nichols (Building Codes Division; State of New York),
Jim Schifiliti (Fire Safety Consultants, Inc)

This is an attempt to clean up the language regarding automatic smoke detection. The purpose is to drive home that automatic smoke detection systems use smoke detectors unless they are not able to be installed because of the space being served. Also, it spins off the automatic sprinkler system tradeoff to make it an approved use in place of smoke detectors when the area cannot be served with smoke detectors and the system is connected to the fire alarm system. The exception listed as part of the proposed sprinkler system tradeoff section is so the code user does not utilize this section for the prescriptive elevator requirements in ASME A17.1 for the specialized fire safety functions regulated therein.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposal was disapproved because the committee felt that it does not provide the clarity desired by the proponent and would cause confusion in the application of the section.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Gene Boecker, Code Consultants, Inc., representing himself, requests Approval as Modified by this public comment.

Modify proposal as follows:

907.5.3 (IBC [F] 907.5.3) (Supp) Automatic smoke detection. ~~Where an~~ An automatic smoke detection system is required it shall utilize smoke detectors unless ambient conditions prohibit such an installation. In spaces where smoke detectors are cannot be utilized due to ambient conditions, ~~other approved automatic fire heat detectors detection~~ shall be ~~required~~ permitted.

907.5.3.1 (IBC [F] 907.5.3.1) Automatic sprinkler system. For conditions other than specific fire safety functions noted in Section 907.4, in ~~in~~ areas where ambient conditions prohibit the installation of smoke detectors, an automatic sprinkler system installed in such areas in accordance with Section 903.3.1.1 or 903.3.1.2 ~~and that is~~ connected to the fire alarm system shall be approved as automatic ~~fire~~ heat detection.

~~Exception: Heat detectors for elevator functions.~~

Commenter's Reason: The language intent in the original proposal is incorporated into the single section. Consistent with the other code changes this year, the distinction is made between smoke detection and "fire alarm." The application whereby heat detection is permitted is included but clarified so that sprinklers cannot be used as a substitution for specific heat detectors required in Section 907.4. This is consistent with current intent.

While there may yet be a need to clean up some of the interpretation applications it is important to get the "fire alarm" language out of the code since it is being deleted elsewhere and will no longer have relevance. This maintains the status quo in application while cleaning up the language for the 2009 edition.

Final Hearing Results

F180-07/08

AMPC

Code Change No: **F189-07/08**

Original Proposal

Sections: 909.11 (IBC [F] 909.11)

Proponent: Robert J. Davidson, Davidson Code Concepts, LLC, representing himself

Revise as follows:

909.11 (IBC [F] 909.11) (Supp) Power systems. The smoke control system shall be supplied with two sources of power. Primary power shall be the normal building power systems. Secondary power shall be from an approved standby source complying with the International Code Council *Electrical Code Administrative Provisions*. The standby power source and its transfer switches shall be in a room separate from the normal power transformers and switch gear and ventilated directly to and from the exterior. The room shall be enclosed with not less than 1-hour fire barriers constructed in accordance with Section 706 of the *International Building Code* or horizontal assemblies constructed in accordance with Section 711 of the *International Building Code*, or both. ~~Power distribution from the two sources shall be by independent routes.~~ Transfer to full standby power shall be automatic and within 60 seconds of failure of the primary power. The systems shall comply with this code or the International Code Council *Electrical Code Administrative Provisions*.

Reason: This deletion is being recommended from a practical standpoint. The section requires that the stand-by power source and the transfer switches be in a room separate from the normal power transformers and switch gear.

Both the normal power supply and the stand-by power supply are controlled by the transfer switches. The power to the various devices and equipment that make up the smoke control system are distributed from the transfer switches.

That being the case, how can you distribute power from the two sources independently? To do so would require the power supply to go to a transfer switch located at each device or piece of equipment.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal was approved because the committee felt that it deletes problematic, unenforceable code text.

Assembly Action:

None

Final Hearing Results

F189-07/08

AS

Code Change No: F193-07/08

Original Proposal

Sections: 910.2 (IBC [F] 910.2)

Proponent: Rick Thornberry, PE, The Code Consortium, representing AAMA Smoke Vent Task Group

Revise as follows:

910.2 (IBC [F] 910.2) Where required. Smoke and heat vents shall be installed in the roofs and draft curtains shall be installed on the underside of roofs of one-story buildings or portions thereof occupied for the uses set forth in Sections 910.2.1 through 910.2.3.

Reason: This is an editorial clarification to provide for a charging requirement that draft curtains are required to be installed under the provisions of this section as are smoke and heat vents.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee felt that the proposal could create confusion in that it appears to require draft curtain in all cases whereas Chapter 23 allows certain exceptions. It was also felt that that the subject matter should be located in Section 910.3.5.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Rick Thornberry, The Code Consortium, Inc., representing AAMA Smoke Vent Task Group, requests Approval as Modified by this public comment.

Replace proposal as follows:

910.3.5 (IBC [F] 910.3.5) Draft curtains. Where required by Table 910.3, draft curtains shall be ~~provided~~ installed on the underside of the roof in accordance with this section.

Exception: Where areas of buildings are equipped with ESFR sprinklers, draft curtains shall not be provided within these areas. Draft curtains shall only be provided at the separation between the ESFR sprinklers and the conventional sprinklers.

Commenter's Reason: Based on the Committee's suggestion made in its Reason for disapproval of the original code change proposal, we are submitting this Public Comment. Instead of revising Section 910.2, we are proposing to revise Section 910.3.5 Draft Curtains as indicated in the Committee's Reason statement. This is an editorial clarification which indicates that the draft curtains are to be installed on the underside of the

roof. Although this may be obvious, there is no definition for draft curtain, nor any other indication that draft curtains are to be installed on the underside of roofs. However, it is a basic assumption made by designers and installers who provides draft curtains in conjunction with smoke and heat vents.

AMPC

Code Change No: F194-07/08

Original Proposal

Table 910.3 (IBC [F] Table 910.3)

Proponent: Rick Thornberry, PE, The Code Consortium, representing AAMA Smoke Vent Task Group

Revise table footnote as follows:

**TABLE 910.3 (IBC TABLE [F] 910.3)
REQUIREMENTS FOR DRAFT CURTAINS AND SMOKE AND HEAT VENTS^a**

(Portions of table not shown remain unchanged)

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929m².

- a. ~~Requirements for rack storage heights in excess of those indicated shall be in accordance with Chapter 23. For solid-piled storage heights in excess of those indicated, an approved engineered design shall be used.~~
- b. The distance specified is the maximum distance from any vent in a particular draft curtained area to walls or draft curtains which form the perimeter of the draft curtained area.
- c. Where draft curtains are not required, the vent area to floor area ratio shall be calculated based on a minimum draft curtain depth of 6 feet (Option 1).
- d. "H" is the height of the vent, in feet, above the floor.

Reason: Chapter 23 does not contain specific requirements for smoke and heat vents. It refers to Section 910.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee felt that Note a serves valuable function in directing the code user to Chapter 23, notable Section 2308.5, and should be retained

Assembly Action:

None

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Rick Thornberry, The Code Consortium, Inc., representing AAMA Smoke Vent Task Group, requests Approval as Modified by this public comment.

Replace proposal as follows:

**TABLE 910.3 (IBC TABLE [F] 910.3)
REQUIREMENTS FOR DRAFT CURTAINS AND SMOKE AND HEAT VENTS^a**

(Portions of table not shown remain unchanged)

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929 m²

- Additional requirements for rack storage heights in excess of those indicated shall be in accordance with Chapter 23. For solid-piled storage heights in excess of those indicated, an approved engineered design shall be used.
- The distance specified is the maximum distance from any vent in a particular draft curtained area to walls or draft curtains which form the perimeter of the draft curtained area.
- Where draft curtains are not required, the vent area to floor area ratio shall be calculated based on a minimum draft curtain depth of 6 feet (Option 1).
- "H" is the height of the vent, in feet, above the floor.

Commenter's Reason: We agree with the Committee's concerns expressed in their Reason for disapproving this code change that the reference to Chapter 23 for rack storage heights in excess of those indicated in the table as noted in Footnote a serves a valuable function. However, the purpose for us deleting the reference was that there were no specific requirements that addressed smoke and heat vents and/or draft curtains. Therefore, we felt that it was an unnecessary reference within the context of the Table and Section 910. To remedy this and to clarify the code reference, we have proposed this Public Comment which slightly revises Footnote a to indicate that Chapter 23 should be referred to for "additional" requirements for those rack storage heights in excess of those indicated in the table. This will alert the user of the code to the fact that there are other requirements that should be considered in addition to those for the smoke and heat vents specified in Table 910.3 for these very rack storage facilities. Yet they will not need to refer to Chapter 23 for any additional criteria for smoke and heat vents or draft curtains.

Final Hearing Results

F194-07/08

AMPC

Code Change No: F195-07/08

Original Proposal

Table 910.3 (IBC [F] Table 910.3)

Proponent: Rick Thornberry, PE, The Code Consortium, representing AAMA Smoke Vent Task Group

Revise table column heading and footnote as follows:

**TABLE 910.3 (IBC TABLE [F] 910.3)
REQUIREMENTS FOR DRAFT CURTAINS AND SMOKE AND HEAT VENTS^a**

OCCUPANCY GROUP AND COMMODITY CLASSIFICATION	DESIGNATED STORAGE HEIGHT (feet)	MINIMUM DRAFT CURTAIN DEPTH (feet)	MAXIMUM AREA FORMED BY DRAFT CURTAINS (square feet)	VENT-AREA-TO FLOOR-AREA RATIO ^c	MAXIMUM SPACING OF VENT CENTERS (feet)	MAXIMUM DISTANCE TO <u>FROM</u> VENTS FROM TO WALL OR DRAFT CURTAIN ^b (feet)
--	----------------------------------	------------------------------------	---	--	--	---

(Portions of table not shown remain unchanged)

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929m².

- Requirements for rack storage heights in excess of those indicated shall be in accordance with Chapter 23. For solid-piled storage heights in excess of those indicated, an approved engineered design shall be used.
- ~~The distance specified is the maximum distance from any vent in a particular draft curtained area to walls or draft curtains which form the perimeter of the draft curtained area.~~ Vents adjacent to walls or draft curtains shall be located within a horizontal distance not greater than the maximum distance specified in this column as measured perpendicular to the wall or draft curtain that forms the perimeter of the draft curtained area.
- Where draft curtains are not required, the vent area to floor area ratio shall be calculated based on a minimum draft curtain depth of 6 feet (Option 1).
- "H" is the height of the vent, in feet, above the floor.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

Reason: This proposal is for editorial clarity. Not every vent is required to be within the specified maximum distance from a wall or draft curtain. That limitation is only applicable to those vents adjacent to the walls or draft curtains and not to other vents located in the middle of the draft curtained area.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The committee agreed that the proponent's reason statement accurately and adequately substantiates the need for the change, which clarifies the intent of the code with regard to vent spacing.

Assembly Action:

None

Final Hearing Results

F195-07/08

AS

Code Change No: F198-07/08

Original Proposal

Sections: 910.3.4 (IBC [F] 910.3.4)

Proponent: Rick Thornberry, PE, The Code Consortium, representing AAMA Smoke Vent Task Group

Revise as follows:

910.3.4 (IBC [F] 910.3.4) (Supp) Vent locations. Smoke and heat vents shall be located 20 feet (6096 mm) or more from adjacent lot lines and fire walls and 10 feet (3048 mm) or more from fire barriers. Vents shall be uniformly located within the roof area ~~above high-piled storage areas,~~ with consideration given to roof pitch, draft curtain location, sprinkler location and structural members.

Reason: Editorial clarification. This requirement should apply in all cases, not just for high piled storage areas.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee felt that the proposal could lead to vents being required throughout all roof areas, even where they would serve no useful purpose.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Rick Thornberry, The Code Consortium, Inc., representing AAMA Smoke Vent Task Group, requests Approval as Modified by this public comment.

Modify proposal as follows:

910.3.4 (IBC [F] 910.3.4) (Supp) Vent locations. Smoke and heat vents shall be located 20 feet (6096 mm) or more from adjacent lot lines and fire walls and 10 feet (3048 mm) or more from fire barriers. Vents shall be uniformly located within the roof in the areas of the building where the vents are required to be installed by Section 910.2 with consideration given to roof pitch, draft curtain location, sprinkler location and structural members.

Commenter's Reason: This Public Comment responds to the Committee's Reason for disapproving the original code change proposal. The Committee was concerned that the original revisions to this section would have caused vents to be required throughout all roof areas in the building, even in areas where they would serve no useful purpose or were not otherwise required. So we have revised the code change proposal so that it clearly indicates that the vents are only to be installed in those areas of the building where the vents are required by Section 910.2. The important point of this revision is that the vents must be uniformly located within the roof in those areas where vents are to be provided and not just where they are located above high-piled storage areas.

Final Hearing Results

F198-07/08

AMPC

Code Change No: F199-07/08

Original Proposal

Sections: 910.3.5 (IBC [F] 910.3.5)

Proponent: Edwin M. Berkel, CFI, Mehlville Fire Protection District, representing himself

Revise as follows:

910.3.5 (IBC [F] 910.3.5) Draft curtains. Where required, draft curtains shall be provided in accordance with this section.

Exception: Where areas of buildings are equipped with ESFR sprinklers, draft curtains shall not be provided within these areas. Draft curtains shall only be provided at the separation between the ESFR sprinklers and the ~~conventional~~ standard response sprinklers

Reason: The existing code text makes use of an undefined term, "conventional sprinklers". This code change corrects that by using "standard response sprinklers" which is the correct term utilized in the reference standards.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Approved as Submitted**

Committee Reason: The committee agreed that the proponent's reason statement accurately and adequately substantiates the need for the change, which provides clarification by using correct sprinkler terminology in the correct manner.

Assembly Action:**None**

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Bob Eugene, Underwriters Laboratories, Inc., requests Approval as Modified by this public comment.

Modify proposal as follows:

910.3.5 (IBC [F] 910.3.5) Draft curtains. Where required, draft curtains shall be provided in accordance with this section.

Exception: Where areas of buildings are equipped with ESFR sprinklers, draft curtains shall not be provided within these areas. Draft curtains shall only be provided at the separation between the ESFR sprinklers and the ~~standard response~~ non-ESFR sprinklers.

Commenter's Reason: The approved code text uses "standard response sprinklers" which is the correct term utilized in the reference standards, but might limit some of the sprinkler response technology. The intent is to limit the early response of sprinklers using different response technology and this change will provide an unlimited array of sprinklers that maybe found in High-piled storage arrangement.

Final Hearing Results

F199-07/08

AMPC

Code Change No: F201-07/08

Original Proposal

Sections: 912.2.1 (IBC [F] 912.2.1)

Proponent: Tom Lariviere, Fire Department, Madison, MS, representing Joint Fire Service Review Committee

Revise as follows:

912.2.1 (IBC [F] 912.2.1) Visible location. Fire department connections shall be located on the street side of buildings, fully visible and recognizable from the street or nearest point of fire department vehicle access or as otherwise approved by the fire ~~code official~~ chief.

Reason: Item F132-06/07, Section 912.2 received a lengthy debate and committee modification which subsequently received membership approval at the final action hearings in NY. The final revision to IFC 912.2 requires that the FDC is located as required by the fire chief and reads as follows:

912.2 Location. With respect to hydrants, driveways, buildings and landscaping, fire department connections shall be so located that fire apparatus and hose connected to supply the system will not obstruct access to the buildings for other fire apparatus. The location of fire department connections shall be approved by the fire chief.

The proposed revision to IFC 912.2.1 merely correlates with the revision to IFC 912.2 and eliminates conflict between the two sections.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The committee agreed that the proponent's reason statement accurately and adequately substantiates the need for the change, which properly changes the approval authority from the fire code official to the fire chief since fire department connection location is a fire department operational issue.

Assembly Action:

None

Final Hearing Results

F201-07/08

AS

Code Change No: F202-07/08

Original Proposal

Sections: 912.4 (IBC [F] 912.4)

Proponent: Tom Lariviere, Fire Department, Madison, MS, representing Joint Fire Service Review Committee

Revise as follows:

912.4 (IBC [F] 912.4) Signs. An metal approved permanent sign with raised letters at least 1 inch (25 mm) in size shall be mounted on all new and existing fire department connections serving automatic sprinklers, standpipes or fire pump connections. Such signs shall read: AUTOMATIC SPRINKLERS or STANDPIPES or TEST CONNECTION or a combination thereof as applicable. Where the fire department connection does not serve the entire building, a sign shall be provided indicating the portions of the building served.

Reason: Many sprinkler and standpipe systems were installed prior to current standards. Furthermore, standpipe systems are currently allowed to be manual or automatic in non high-rise buildings as well as many buildings have partial sprinkler or standpipe systems.

The purpose of the sign is to provide the responding firefighters with the correct information on which portions of a building are served by the fire department connection. Many buildings include multiple sets of fire department connections which are not interconnected. Some examples include:

1. Separate connections for the building sprinkler system and the dry standpipe system in open parking structures
2. Rehabilitated buildings where a sprinkler system is only installed on certain floors
3. A high-rise building constructed prior to the adoption of a building code that has a manual wet system

Signs are also required in NFPA 14, and this proposal will allow the raised letter sign to be provided as indicated in NFPA 14 or provide another sign. Many departments are requiring other signs which are more descriptive and provide more information than the minimal sign required in NFPA 14.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

912.4 (IBC [F] 912.4) Signs. An metal approved permanent sign with raised letters at least 1 inch (25 mm) in size shall be mounted on all new and existing fire department connections serving automatic sprinklers, standpipes or fire pump connections. Such signs shall read: AUTOMATIC SPRINKLERS or STANDPIPES or TEST CONNECTION or a combination thereof as applicable. Where the fire department connection does not serve the entire building, a sign shall be provided indicating the portions of the building served.

Committee Reason: The committee agreed that the proponent's reason statement accurately and adequately substantiates the need for the change, which will provide important information to the fire department as to which of multiple fire department connections should be used. The modification retains the current text of the first sentence of the section for correlation with the requirements of NFPA 13.

Assembly Action:

None

Final Hearing Results

F202-07/08

AM

Code Change No: **F203-07/08**

Original Proposal

Sections: 913.2.1 (New) [IBC 913.2.1 (New)]

Proponent: Phillip Brazil, PE, Reid Middleton, Inc., representing himself

1. (IFC) Add new text as follows:

913.2 Protection against interruption of service. The fire pump, driver, and controller shall be protected in accordance with NFPA 20 against possible interruption of service through damage caused by explosion, fire, flood, earthquake, rodents, insects, windstorm, freezing, vandalism and other adverse conditions.

913.2.1 Protection of fire pump rooms. Rooms where fire pumps are located shall be separated from all other areas of the building in accordance with the *International Building Code*.

2. (IBC) Add new text as follows:

[F] 913.2 [Supp] Protection against interruption of service. The fire pump, driver, and controller shall be protected in accordance with NFPA 20 against possible interruption of service through damage caused by explosion, fire, flood, earthquake, rodents, insects, windstorm, freezing, vandalism and other adverse conditions.

[F] 913.2.1 Protection of fire pump rooms. Fire pumps shall be located in rooms that are separated from all other areas of the building by 2-hour fire barriers constructed in accordance with Section 706 or 2-hour horizontal assemblies constructed in accordance with Section 711, or both.

Exceptions:

1. In other than high-rise buildings, separation by 1-hour fire barriers constructed in accordance with Section 706 or 1-hour horizontal assemblies constructed in accordance with Section 711, or both, shall be permitted in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.
2. Separation is not required for fire pumps physically separated in accordance with NFPA 20.

Reason: The Standard for the Installation of Stationary Pumps for Fire Protection, NFPA 20, specifies protection for indoor fire pumps by means of physical or fire separation. I assume the 2007 edition of NFPA 20 will be the edition that is referenced in the 2009 IBC and IFC. Section 5.12.1.1 of NFPA 20 specifies physical separation or protection by fire-rated construction. I interpret “fire-rated construction” to be a reference to separation by a fire barrier, horizontal assembly, or both. Section 5.12.1.1.1 specifies a 2-hour fire-resistance rating for the separation in high-rise buildings but is silent on the physical separation distance. Table 5.12.1.1.2 specifies the physical separation distances and fire-resistance ratings for nonhigh-rise buildings. A 2-hour fire-resistance rating for the separation is specified except for fully sprinklered buildings and pump rooms/houses (i.e., equipped throughout with an automatic sprinkler system complying with NFPA 13 or NFPA 13R). A minimum physical separation distance of 50 feet is specified in all cases and, presumably, would apply when physical separation is utilized in a high-rise building.

By referencing NFPA 20 in the IBC, the physical or fire separation specified in Section 5.12.1.1 of NFPA 20 becomes a construction requirement. The purpose of this proposal is to specify the fire separation as a requirement in the IBC so that designers and building officials are made aware of it. The proposed language will also clarify what is required. The reference to separation by “fire-rated construction” in NFPA 20 does not make it clear what is required for protection of the separating walls and horizontal assemblies at openings, penetrations, joints, ducts and air transfer openings. It is also silent on requirements for continuity, where one or more of the separating walls is an exterior wall, and where one of the horizontal assemblies is a roof assembly. Specifying fire barriers and horizontal assemblies makes it clear what is required by virtue of their provisions in Sections 706 and 711, respectively.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The committee agreed that the proponent's reason statement accurately and adequately substantiates the need for the change, which will provide an increased level of fire pump reliability by enclosing them in a fire-resistance rated pump room using requirements correlated with NFPA 20.

Assembly Action:

None

Final Hearing Results

F203-07/08

AS

Code Change No: F219-07/08

Original Proposal

Sections: 1802.1 (IBC [F] 415.2), 2703.2.2.1

Proponent: Doug Hall, Fire Department, City of Westminster, CO, representing Fire Marshal's Association of Colorado

Revise as follows:

**SECTION 1802
DEFINITIONS**

1802.1 (IBC [F] 415.2) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

HAZARDOUS PRODUCTION MATERIAL (HPM). A solid, liquid or gas associated with semiconductor manufacturing that has a degree-of-hazard rating in health, flammability or ~~reactivity~~ instability of Class 3 or 4 as ranked by NFPA 704 and which is used directly in research, laboratory or production processes which have as their end product materials that are not hazardous.

2703.2.2.1 Design and construction. Piping, tubing, valves, fittings and related components used for hazardous materials shall be in accordance with the following:

1. Piping, tubing, valves, fittings and related components shall be designed and fabricated from materials that are compatible with the material to be contained and shall be of adequate strength and durability to withstand the pressure, structural and seismic stress and exposure to which they are subject.
2. Piping and tubing shall be identified in accordance with ASME A13.1 to indicate the material conveyed.
3. Readily accessible manual valves or automatic remotely activated fail-safe emergency shutoff valves shall be installed on supply piping and tubing at the following locations:
 - 3.1. The point of use.
 - 3.2. The tank, cylinder or bulk source.
4. Manual emergency shutoff valves and controls for remotely activated emergency shutoff valves shall be identified and the location shall be clearly visible, accessible and indicated by means of a sign.
5. Backflow prevention or check valves shall be provided when the backflow of hazardous materials could create a hazardous condition or cause the unauthorized discharge of hazardous materials.
6. Where gases or liquids having a hazard ranking of:

Health hazard Class 3 or 4
Flammability Class 4
~~Reactivity~~ Instability Class 3 or 4

in accordance with NFPA 704 are carried in pressurized piping above 15 pounds per square inch gauge (psig) (103 kPa), an approved means of leak detection and emergency shutoff or excess flow control shall be provided. Where the piping originates from within a hazardous material storage room or area, the excess flow control shall be located within the storage room or area. Where the piping originates from a bulk source, the excess flow control shall be located as close to the bulk source as practical.

Exceptions:

1. Piping for inlet connections designed to prevent backflow.
2. Piping for pressure relief devices.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

Reason: NFPA 704 no longer recognizes the “Reactivity” label for the applicable classification of hazardous materials. Revising the classification to the current 2007 edition of NFPA 704 terminology reflects exactly what the IFC standards reference states. The use of the term “reactivity” misinforms the intent of this specific classification. Appropriate use of the term “instability” reflects the intent of the current NFPA 704 classification system for fire personnel and industrial emergency responders.

“Reactivity” has been erroneously taught to thousands of emergency responders and private industry users that the numeric rating system quantified the degree of reactivity a chemical might have with other chemicals, i.e. how reactive a chemical is to something else.

Instability directly correlates to the degree of intrinsic susceptibility of materials to release energy when exposed to thermal or mechanical shock and/or elevated temperatures or pressure. There is no direct correlation with a chemical's compatibility to another chemical substance.

There are approximately 16 references in the 2007 IFC to the NFPA 704 standard. The IFC should accurately reflect the information from a standard.

Cost Impact: No direct cost impact to facility users as the NFPA 704 numeric rating system has not changed for instability.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The committee agreed that the proponent's reason statement accurately and adequately substantiates the need for the change, which would provide a useful clarification of the terminology and correlation with NFPA 704.

Assembly Action:

None

Final Hearing Results

F219-07/08

AS

Code Change No: F225-07/08

Original Proposal

Sections: 2201.1, 2202.1 (New), 1103.5, 1106.1; IBC 412.1 (New)

Proponent: Tom Lariviere, Fire Department, Madison, MS, representing Joint Fire Service Review Committee

1. Revise as follows:

2201.1 Scope. Automotive motor fuel-dispensing facilities, marine motor fuel-dispensing facilities, fleet vehicle motor fuel-dispensing facilities aircraft motor-vehicle fuel-dispensing facilities and repair garages shall be in accordance with this chapter and the *International Building Code*, *International Fuel Gas Code* and the *International Mechanical Code*. Such operations shall include both operations that are accessible to the public and private operations.

1103.5 Dispensing of flammable and combustible liquids. The dispensing, transferring and storage of flammable and combustible liquids shall be in accordance with this chapter and Chapter 34. Aircraft motor vehicle fuel-dispensing ~~stations~~ facilities shall be in accordance with Chapter 22.

1106.1 Aircraft motor vehicle fuel-dispensing ~~stations~~ facilities. Aircraft motor vehicle fuel-dispensing ~~stations~~ facilities shall be in accordance with Chapter 22.

2. Add new definition as follows:

2202.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

AIRCRAFT MOTOR-VEHICLE FUEL-DISPENSING FACILITY. That portion of property where flammable or combustible liquids or gases used as motor fuels are stored and dispensed from fixed equipment into the fuel tanks of aircraft.

3. Add new text as follows:

IBC 412.1 General. Aircraft related occupancies shall comply with this section and the *International Fire Code*.

(Renumber subsequent sections)

Reason: The IFC has construction requirements for aircraft related facilities in Chapter 11 Aviation Facilities, however, Section 412 Aircraft-related Occupancies in the IBC does not direct the user to the fire code other than for aircraft paint hangers. The new language proposed for Section 412.1 will provide that reference.

Additionally, IFC Chapter 11 Aviation Facilities requires "Aircraft Motor-Vehicle Fuel-Dispensing Stations" to be installed in accordance with Chapter 22 of that code, however, of all the different types of motor vehicle facilities defined by Chapter 22 and listed in Section 2201.1 Scope, aircraft motor-vehicle fuel-dispensing stations are not included. The proposed language clarifies that these facilities are within the scope of Chapter 22 and provides a definition.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Approved as Modified****Modify the proposal as follows:**

2202.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

AIRCRAFT MOTOR-VEHICLE FUEL-DISPENSING FACILITY. That portion of property where flammable or combustible liquids or gases used as motor fuels are stored and dispensed from fixed automotive-type equipment into the fuel tanks of aircraft.

(Portions of proposal not shown remain unchanged)

Committee Reason: The committee agreed that the proponent's reason statement accurately and adequately substantiates the need for the change, which fills the need for defining this type of motor fuel dispensing facility. The modification further clarifies that these facilities, found mainly at small, local airports, use the same type of dispensing equipment as automotive facilities rather than the more sophisticated fuelers and systems found at larger airports.

Assembly Action:**None**

Final Hearing Results

F225-07/08

AM

Code Change No: F233-07/08

Original Proposal

Sections: 2209.5.1.1, Chapter 45 (New); IBC 406.5.2, Chapter 35 (New)

THESE PROPOSALS ARE ON THE AGENDA OF THE IFC AND THE IBC GENERAL CODE DEVELOPMENT COMMITTEES AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Thomas Joseph, Chair, Hydrogen Industry Panel on Codes (HIPOC)

1. PART I – IFC**Revise as follows:**

2209.5.1.1 (Supp) Vehicle fueling pad. The vehicle fueling pad shall be fueled on non-coated or concrete or a other approved paving material having a resistivity resistance not exceeding one megohm as determined by an approved method the methodology specified in DIN EN 1081.

2. Add standard to Chapter 45 as follows:

European Committee for Standardization (EN)
Central Secretariat
Rue de Stassart 36
B-10 50 Brussels

European Standard EN 1081: 1998 Resilient Floor Coverings – Determination of the Electrical Resistance

PART I – IBC GENERAL

406.5.2 (Supp) Vehicle fueling pad. The vehicle ~~fueling pad~~ shall be fueled on non-coated ~~of~~ concrete or a other approved paving material having a resistivity resistance not exceeding 1 megohm as determined by an approved method ~~the methodology specified in DIN EN 1081.~~

2. Add standard to Chapter 35 as follows:

European Committee for Standardization (EN)
Central Secretariat
Rue de Stassart 36
B-10 50 Brussels

European Standard EN 1081: 1998 Resilient Floor Coverings – Determination of the Electrical Resistance

Reason: The proposed changes retain the original intent of this section while correcting some incorrect language and providing additional guidance for the code official. These changes address concerns voiced by ICC members during the last code cycle regarding the specified units and the request for additional guidance for the code official by using a referenced standard.

Units: Megohms are the appropriate measurement of resistance, not resistivity.

Referenced Standard: The referenced EN standard 1081:1998, which now has DIN status, is the best available standard that is applicable to measuring resistance of vehicle fueling pads. With this change the official still has the option to use another approved method, but DIN EN 1081:1998 is the referred method for measurement if non-coated concrete is not used. It may be worth noting that DIN EN 1081:1998 was created using an open, transparent and consensus-based process similar to the procedures used by ANSI-approved standard development organizations. Considering Standard 1081 also bares the EN designation, the U.S. building regulatory community should be comfortable that it has been, and will continue to be, carefully scrutinized and representative of the work of a true consensus body that we Americans are familiar with.

These proposed changes will retain the original intent of this section to dissipate static electricity built up on the vehicle from driving before the driver's door is opened--with corrected language and better guidance. The overall goal is to increase the safety of vehicle fueling. Concrete is allowed for the fueling pad with no resistance measurements needed; if an alternate material is desired, it can be used as long as it has a resistance less than or equal to 1 megohm. Both the concrete and 1 megohm criteria are cited from the American Petroleum Institute (API) 2003 Recommended Practices (RP), section 4.6.9.2. NFPA 77: *Recommended Practice on Static Electricity*, section 7.4.1.3 also points out that a resistance of 1 megohm or less is considered adequate to dissipate any charges. Additionally, the proposed language has been proposed by the State of Michigan, Department of Environmental Quality – Waste and Hazardous Materials Division for Michigan's *Hydrogen Storage and Dispensing Rules*, and is consistent with changes proposed under the current cycle to NFPA 55-2005, *Standard for the Storage, Use, and Handling of Compressed Gasses and Cryogenic Fluids in Portable and Stationary Containers, Cylinders, and Tanks*.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing Results

Note: The following analysis was not in the Code Change Proposal book but was posted on the ICC website.

Analysis: Review of proposed new standard EN 1981:1998 indicated that, in the opinion of ICC Staff, the standard did comply with ICC standards criteria.

PART I – IFC

Committee Action:

Approved as Submitted

Committee Reason: The proposal was approved because the committee felt that the proponent had responded to the committees concerns regarding the way the standard is referenced. That concern was expressed in the committee action on code change F156-07/07 in the last cycle.

Assembly Action:

None

PART II – IBC GENERAL

Committee Action:

Disapproved

Committee Reason: The committee did not receive enough data to determine the applicability of the requirements.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted for Part II.

Public Comment:

Thomas Joseph, Chair, Hydrogen Industry Panel on Codes, requests Approval as Submitted.

Commenter's Reason: The Hydrogen Industry asks the Membership to uphold IFC Committee Action on Part I for "As Submitted" and reverse IBC General Committee Action on Part II from "Disapprove" to "As Submitted" for consistency and uniformity in enforcement.

Fifteen (15) copies of the European Standard DIN EN 1081:1998-04, proposing electrostatic discharge (ESD) material and testing requirements for vehicle fueling surfaces were purchased and provided to the IFC Secretariat and Code Development Committee. The Secretariat's analysis indicated DIN EN 1081 was reviewed for compliance with ICC policy and accepted as compliant. Part I was subsequently reviewed and approved by the IFC Development Committee.

Part II was disapproved by IBC General Development Committee, not on technical grounds, but based on (1) Not having received additional copies of the standard and (2) that the IFC Secretariat's review and acceptance of DIN EN 1081 had not been coordinated with the IBC-General Secretariat or the IBC General Committee.

Final Hearing Results

F233-07/08, Part I	AS
F233-07/08, Part II	AS

Code Change No: F241-07/08

Original Proposal

Sections: 2403.8.4 (New); IBC 3102.1

Proponent: Daniel E. Nichols, PE, NY State Division of Code Enforcement and Administration

THESE PROPOSALS ARE ON THE AGENDA OF THE IFC AND THE IBC GENERAL CODE DEVELOPMENT COMMITTEES AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IFC

Add new text as follows:

2403.8.4 Membrane structures on buildings. Membrane structures that are erected on buildings, balconies, decks, or other structures shall be regulated as permanent membrane structures in accordance with Section 3102 of the *International Building Code*.

(Renumber subsequent sections)

PART II – IBC GENERAL

3102.1 General. The provisions of this section shall apply to air-supported, air-inflated, membrane-covered cable and membrane-covered frame structures, collectively known as membrane structures, erected for a period of 180 days or longer. Those erected for a shorter period of time shall comply with the *International Fire Code*. Membrane structures covering water storage facilities, water clarifiers, water treatment plants, sewage treatment plants, greenhouses and similar facilities not used for human occupancy, are required to meet only the requirements of Sections 3102.3.1 and 3102.7. Membrane structures erected on a building, balcony, deck or other structure for any period of time shall comply with this section.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

Reason: The purpose of this code proposal is to limit the location where temporary membrane structures can be erected, based on regulations already found in the temporary membrane structure requirements.

Temporary membrane structures that are placed in a field or parking lot are afforded several safety features including fire separation distance from other hazards (buildings, vehicles), separation from other tents, and provide an unobstructed means of egress path for the uniformly located exits. When a membrane structure is placed upon a building or deck, the temporary membrane structure requirements do not currently regulate exiting from the temporary membrane structure to a set of stairs or door nor do they regulate the hazards that could be below the temporary membrane structure. Furthermore, the temporary membrane structure section does not contain requirements on the regulation of the loads temporary membrane structures would have on a structure below.

With the means of egress, fire separation, and structural issues, it is best for temporary membrane structures to be regulated as permanent membrane structures and subject to the International Building Code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I – IFC

Committee Action:

Approved as Submitted

Committee Reason: The proposal was approved because it provides needed guidance to the fire code official on how membrane structures erected on buildings are to be viewed and regulated. Without this change, they are essentially a building addition without regulation. The action is also consistent with the action taken by the IBC-General Committee on Part II.

Assembly Action:

None

PART II – IBC GENERAL

Committee Action:

Approved as Submitted

Committee Reason: If a membrane is constructed on a building it needs to be regulated. This proposal would clarify between the temporary requirements in the IFC and the permanent membrane requirements in the IBC.

Assembly Action:

None

Final Hearing Results

F241-07/08, Part I	AS
F241-07/08, Part II	AS

Code Change No: **F243-07/08**

Original Proposal

Chapter 24, Section: 105.6.43, 105.7.13, 202 (IBC 202); Table 906.1 (IBC Table [F] 906.1)

Proponent: Tom Lariviere, Fire Department, Madison, MS, representing Joint Fire Service Review Committee

THESE PROPOSALS ARE ON THE AGENDA OF THE IFC AND THE IBC GENERAL CODE DEVELOPMENT COMMITTEES AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IFC

1. Revise Chapter 24 as follows:

CHAPTER 24 TENTS, CANOPIES AND OTHER MEMBRANE STRUCTURES

SECTION 2401 GENERAL

2401.1 (Supp) Scope. Tents, ~~canopies~~ and membrane structures shall comply with this chapter. The provisions of Section 2403 are applicable only to temporary tents, ~~canopies~~ and membrane structures. The provisions of Section 2404 are applicable to temporary and permanent tents, ~~canopies~~ and membrane structures.

SECTION 2402 DEFINITIONS

CANOPY. A structure, enclosure or shelter constructed of fabric or pliable materials supported by any manner, except by air or the contents it protects, and is open without sidewalls or drops on 75 percent or more of the perimeter

TENT. A structure, enclosure or shelter, with or without sidewalls or drops, constructed of fabric or pliable material supported by any manner except by air or the contents that it protects.

SECTION 2403 TEMPORARY TENTS, CANOPIES AND MEMBRANE STRUCTURES

2403.1 General. All temporary tents, ~~canopies~~ and membrane structures shall comply with this section.

2403.2 Approval required. Tents and membrane structures having an area in excess of ~~200~~ 400 square feet (~~19~~ 37 m²) and ~~canopies in excess of 400 square feet (37 m²)~~ shall not be erected, operated or maintained for any purpose without first obtaining a permit and approval from the fire code official.

Exceptions:

1. Tents used exclusively for recreational camping purposes.
2. ~~Fabric canopies~~ Tents open on all sides which comply with all of the following:
 - 2.1. Individual ~~canopies tents~~ having a maximum size of 700 square feet (65 m²).
 - 2.2. The aggregate area of multiple ~~canopies tents~~ placed side by side without a fire break clearance of 2 feet (3658 mm), not exceeding 700 square feet (65 m²) total.
 - 2.3. A minimum clearance of 12 feet (3658 mm) to all structures and other tents.

2403.3 Place of assembly. (No change to current text)

2403.4 Permits. (No change to current text)

2403.5 Use period. Temporary tents, air-supported, air-inflated or tensioned membrane structures ~~and canopies~~ shall not be erected for a period of more than 180 days within a 12-month period on a single premises.

2403.6 Construction documents. A detailed site and floor plan for tents, ~~canopies~~ or membrane structures with an occupant load of 50 or more shall be provided with each application for approval. The ~~tent, canopy~~ or membrane structure floor plan shall indicate details of the means of egress facilities, seating capacity, arrangement of the seating and location and type of heating and electrical equipment.

2403.7 Inspections. (No change to current text)

2403.7.1 Inspection report. (No change to current text)

2403.8 Access, location and parking. Access location and parking for temporary tents, ~~canopies~~ and membrane structures shall be in accordance with this section.

2403.8.1 Access. (No change to current text)

2403.8.2 Location. Tents, ~~canopies~~ or membrane structures shall not be located within 20 feet (6096 mm) of lot lines, buildings, other tents, ~~canopies~~ or membrane structures, parked vehicles or internal combustion engines. For the purpose of determining required distances, support ropes and guy wires shall be considered as part of the temporary membrane structure, or tent ~~or canopy~~.

Exceptions:

1. Separation distance between membrane structures, and tents ~~and canopies~~ not used for cooking, is not required when the aggregate floor area does not exceed 15,000 square feet (1394 m²).
2. Membrane structures, or tents ~~or canopies~~ need not be separated from buildings when all of the following conditions are met:
 - 2.1. The aggregate floor area of the membrane structure, or tent ~~or canopy~~ shall not exceed 10,000 square feet (929 m²).

- 2.2. The aggregate floor area of the building and membrane structure, ~~or tent or canopy~~ shall not exceed the allowable floor area including increases as indicated in the *International Building Code*.
- 2.3. Required means of egress provisions are provided for both the building and the membrane structure, ~~or tent or canopy~~, including travel distances.
- 2.4. Fire apparatus access roads are provided in accordance with Section 503.

2403.8.3 Location of structures in excess of 15,000 square feet in area. (No change to current text)

2403.8.4 Connecting corridors. (No change to current text)

2403.8.5 Fire break. An unobstructed fire break passageway or fire road not less than 12 feet (3658 mm) wide and free from guy ropes or other obstructions shall be maintained on all sides of all tents, ~~canopies~~ and membrane structures unless otherwise approved by the fire code official.

2403.9 Anchorage required. Tents, ~~canopies~~ or membrane structures and their appurtenances shall be adequately roped, braced and anchored to withstand the elements of weather and prevent against collapsing. Documentation of structural stability shall be furnished to the fire code official on request.

2403.10 Temporary air-supported and air-inflated membrane structures. (No change to current text)

2403.10.1 Door operation. (No change to current text)

2403.10.2 Fabric envelope design and construction. (No change to current text)

2403.10.3 Blowers. (No change to current text)

2403.10.4 Auxiliary power. (No change to current text)

2403.11 Seating arrangements. Seating in tents, ~~canopies~~ or membrane structures shall be in accordance with Chapter 10.

2403.12 Means of egress. Means of egress for temporary tents, ~~canopies~~ and membrane structures shall be in accordance with Sections 2403.12.1 through 2403.12.8.

2403.12.1 Distribution. (No change to current text)

2403.12.2 Number. (No change to current text)

**TABLE 2403.12.2
MINIMUM NUMBER OF MEANS OF EGRESS AND MEANS OF
EGRESS WIDTHS FROM TEMPORARY MEMBRANE
STRUCTURES, AND TENTS AND CANOPIES**

OCCUPANT LOAD	MINIMUM NUMBER OF MEANS OF EGRESS	MINIMUM WIDTH OF EACH MEANS OF EGRESS (inches)	MINIMUM WIDTH OF EACH MEANS OF EGRESS (inches)
		Tent or Canopy	Membrane Structure
10 to 199	2	72	36
200 to 499	3	72	72
500 to 999	4	96	72
1,000 to 1,999	5	120	96
2,000 to 2,999	6	120	96
Over 3,000 ^a	7	120	96

For SI: 1 inch = 25.4 mm.

- a. When the occupant load exceeds 3,000, the total width of means of egress (in inches) shall not be less than the total occupant load multiplied by 0.2 inches per person.

2403.12.3 Exit openings from tents. (No change to current text)

2403.12.4 Doors. (No change to current text)

2403.12.5 Aisle. (No change to current text)

2403.12.5.1 Arrangement and maintenance. (No change to current text)

2403.12.6 Exit signs. (No change to current text)

2403.12.6.1 (Supp) Exit sign illumination. (No change to current text)

2403.12.7 Means of egress illumination. (No change to current text)

2403.12.8 Maintenance of means of egress. (No change to current text)

SECTION 2404
TEMPORARY AND PERMANENT TENTS, CANOPIES
AND MEMBRANE STRUCTURES

2404.1 General. All tents, ~~canopies~~ and membrane structures, both temporary and permanent, shall be in accordance with this section. Permanent tents, ~~canopies~~ and membrane structures shall also comply with the *International Building Code*.

2404.2 Flame propagation performance treatment. Before a permit is granted, the owner or agent shall file with the fire code official a certificate executed by an approved testing laboratory certifying that the tents; ~~canopies~~ and membrane structures and their appurtenances; sidewalls, drops and tarpaulins; floor coverings, bunting and combustible decorative materials and effects, including sawdust when used on floors or passageways, shall be composed of material meeting the flame propagation performance criteria of NFPA 701 or shall be treated with a flame retardant in an approved manner and meet the flame propagation performance criteria of NFPA 701, and that such flame propagation performance criteria are effective for the period specified by the permit.

2404.3 Label. Membrane structures, or tents or canopies shall have a permanently affixed label bearing the identification of size and fabric or material type.

2404.4 Certification. An affidavit or affirmation shall be submitted to the fire code official and a copy retained on the premises on which the tent or air-supported structure is located. The affidavit shall attest to the following information relative to the flame propagation performance criteria of the fabric:

1. Names and address of the owners of the tent, ~~canopy~~ or air-supported structure.
2. Date the fabric was last treated with flame-retardant solution.
3. Trade name or kind of chemical used in treatment.
4. Name of person or firm treating the material.
5. Name of testing agency and test standard by which the fabric was tested.

2404.5 (Supp) Combustible materials. Hay, straw, shavings or similar combustible materials shall not be located within any tent, ~~canopy~~ or membrane structure containing an assembly occupancy, except the materials necessary for the daily feeding and caring of animals. Sawdust and shavings utilized for a public performance or exhibit shall not be prohibited provided the sawdust and shavings are kept damp. Combustible materials shall not be permitted under stands or seats at any time.

2404.6 Smoking. Smoking shall not be permitted in tents, ~~canopies~~ or membrane structures. Approved "No Smoking" signs shall be conspicuously posted in accordance with Section 310.

2404.7 Open or exposed flame. Open flame or other devices emitting flame, fire or heat or any flammable or combustible liquids, gas, charcoal or other cooking device or any other unapproved devices shall not be permitted inside or located within 20 feet (6096 mm) of the tent, ~~canopy~~ or membrane structures while open to the public unless approved by the fire code official.

2404.8 Fireworks. Fireworks shall not be used within 100 feet (30 480 mm) of tents, ~~canopies~~ or membrane structures.

2404.9 Spot lighting. (No change to current text)

2404.10 Safety film. Motion pictures shall not be displayed in tents, ~~canopies~~ or membrane structures unless the motion picture film is safety film.

2404.11 (Supp) Clearance. (No change to current text)

2404.12 Portable fire extinguishers. (No change to current text)

2404.13 Fire protection equipment. (No change to current text)

2404.14 Occupant load factors. (No change to current text)

2404.15 Heating and cooking equipment. (No change to current text)

2404.15.1 Installation. (No change to current text)

2404.15.2 Venting. Gas, liquid and solid fuel-burning equipment designed to be vented shall be vented to the outside air as specified in the *International Fuel Gas Code* and the *International Mechanical Code*. Such vents shall be equipped with approved spark arresters when required. Where vents or flues are used, all portions of the tent, ~~canopy~~ or membrane structure shall be not less than 12 inches (305 mm) from the flue or vent.

2404.15.3 Location. (No change to current text)

2404.15.4 Operations. (No change to current text)

2404.15.5 Cooking tents. Tents where cooking is performed shall be separated from other tents, ~~canopies~~ or membrane structures by a minimum of 20 feet (6096 mm).

2404.15.6 Outdoor cooking. Outdoor cooking that produces sparks or grease-laden vapors shall not be performed within 20 feet (6096 mm) of a tent, ~~canopy~~ or membrane structure.

2404.15.7 Electrical heating and cooking equipment. (No change to current text)

2404.16 LP-gas. (No change to current text)

2404.16.1 General. (No change to current text)

2404.16.2 Location of containers. LP-gas containers shall be located outside. Safety release valves shall be pointed away from the tent, ~~canopy~~ or membrane structure.

2404.16.2.1 Containers 500 gallons or less. (No change to current text)

2404.16.2.2 Containers more than 500 gallons. (No change to current text)

2404.16.3 Protection and security. Portable LP-gas containers, piping, valves and fittings which are located outside and are being used to fuel equipment inside a tent, ~~canopy~~ or membrane structure shall be adequately protected to prevent tampering, damage by vehicles or other hazards and shall be located in an approved location. Portable LP-gas containers shall be securely fastened in place to prevent unauthorized movement.

2404.17 Flammable and combustible liquids. (No change to current text)

2404.17.1 Use. (No change to current text)

2404.17.2 Flammable and combustible liquid storage. Flammable and combustible liquids shall be stored outside in an approved manner not less than 50 feet (15 240 mm) from tents, ~~canopies~~ or membrane structures. Storage shall be in accordance with Chapter 34.

2404.17.3 Refueling. Refueling shall be performed in an approved location not less than 20 feet (6096 mm) from tents, ~~canopies~~ or membrane structures.

2404.18 Display of motor vehicles. Liquid- and gas-fueled vehicles and equipment used for display within tents, ~~canopies~~ or membrane structures shall be in accordance with Sections 2404.18.1 through 2404.18.5.3.

2404.18.1 Batteries. (No change to current text)

2404.18.2 Fuel systems. Vehicles or equipment shall not be fueled or defueled within the tent, ~~canopy~~ or membrane structure.

2404.18.2.1 Quantity limit. (No change to current text)

2404.18.2.2 Inspection. (No change to current text)

2404.18.2.3 Closure. (No change to current text)

2404.18.3 Location. (No change to current text)

2404.18.4 Places of assembly. (No change to current text)

2404.18.5 Competitions and demonstrations. Liquid and gas-fueled vehicles and equipment used for competition or demonstration within a tent, ~~canopy~~ or membrane structure shall comply with Sections 2404.18.5.1 through 2404.18.5.3.

2404.18.5.1 Fuel storage. (No change to current text)

2404.18.5.2 Fueling. (No change to current text)

2404.18.5.3 Spills. (No change to current text)

2404.19 Separation of generators. Generators and other internal combustion power sources shall be separated from tents, ~~canopies~~ or membrane structures by a minimum of 20 feet (6096 mm) and shall be isolated from contact with the public by fencing, enclosure or other approved means.

2404.20 Standby personnel. When, in the opinion of the fire code official, it is essential for public safety in a tent, ~~canopy~~ or membrane structure used as a place of assembly or any other use where people congregate, because of the number of persons, or the nature of the performance, exhibition, display, contest or activity, the owner, agent or lessee shall employ one or more qualified persons, as required and approved, to remain on duty during the times such places are open to the public, or when such activity is being conducted.

Before each performance or the start of such activity, standby personnel shall keep diligent watch for fires during the time such place is open to the public or such activity is being conducted and take prompt measures for extinguishment of fires that occur and assist in the evacuation of the public from the structure.

There shall be trained crowd managers or crowd manager supervisors at a ratio of one crowd manager/supervisor for every 250 occupants, as approved.

2404.21 (Supp) Combustible vegetation. Combustible vegetation that could create a fire hazard shall be removed from the area occupied by a tent, ~~canopy~~ or membrane structure, and from areas within 30 feet (9144 mm) of such structures.

2404.22 (Supp) Combustible waste material. The floor surface inside tents, ~~canopies~~ or membrane structures and the grounds outside and within a 30 foot (9144 mm) perimeter shall be kept clear of combustible waste and other combustible materials that could create a fire hazard. Such waste shall be stored in approved containers and shall be removed from the premises at least once a day during the period the structure is occupied by the public.

2. Revise as follows:

105.6.43 Temporary membrane structures, and tents ~~and canopies~~. An operational permit is required to operate an air-supported temporary membrane structure or a tent having an area in excess of ~~200~~ 400 square feet (~~49~~ 37 m²), ~~or a canopy in excess of 400 square feet (37 m²).~~

Exceptions:

1. Tents used exclusively for recreational camping purposes.
2. ~~Fabric canopies~~ Tents open on all sides which comply with all of the following:
 - 2.1. Individual ~~canopies~~ tents having a maximum size of 700 square feet (65 m²).
 - 2.2. The aggregate area of multiple ~~canopies~~ tents placed side by side without a fire break clearance of not less than 12 feet (3658 mm) shall not exceed 700 square feet (65 m²) total.
 - 2.3. A minimum clearance of 12 feet (3658 mm) to structures and other tents shall be provided.

105.7.13 Temporary membrane structures, and tents ~~and canopies~~. A construction permit is required to erect an air-supported temporary membrane structure or a tent having an area in excess of ~~200~~ 400 square feet (~~49~~ 37 m²), ~~or a canopy in excess of 400 square feet (37 m²).~~

Exceptions:

1. Tents used exclusively for recreational camping purposes.
2. Funeral tents and curtains or extensions attached thereto, when used for funeral services.
3. ~~Fabric canopies~~ Tents and awnings open on all sides which comply with all of the following:
 - 3.1. Individual ~~canopies~~ tents shall have a maximum size of 700 square feet (65 m²).
 - 3.2. The aggregate area of multiple ~~canopies~~ tents placed side by side without a fire break clearance of not less than 12 feet (3658 mm) shall not exceed 700 square feet (65 m²) total.
 - 3.3. A minimum clearance of 12 feet (3658 mm) to structures and other tents shall be maintained.

SECTION 202 GENERAL DEFINITIONS

CANOPY. ~~See Section 2402.1. A structure or architectural projection of rigid construction over which a covering is attached that provides weather protection, identity or decoration, and may be structurally independent or supported by attachment to a building on one end and by not less than one stanchion on the outer end.~~

**TABLE 906.1 [IBC [F] TABLE 906.1 (Supp)]
ADDITIONAL REQUIRED PORTABLE FIRE EXTINGUISHERS**

SECTION	SUBJECT
2404.12	Tents, canopies and membrane structures

(Portions of table not shown remain unchanged)

PART II – IBC GENERAL

Revise definitions as follows:

SECTION 202
DEFINITIONS

CANOPY. ~~An~~ A permanent structure or architectural projection of rigid construction over which a covering is attached that provides weather protection, identity or decoration, and shall be structurally independent or ~~and is~~ supported by the attachment to a building to which it is attached and at the outer on one end and by not less than one stanchion on the outer end. A canopy is comprised of a rigid structure over which a covering is attached.

TENT (Supp). A structure, enclosure or shelter, with or without sidewalls or drops, constructed of fabric or pliable material supported in any manner except by air or the contents it protects.

Reason: General:

The pivot point of this proposed code change affecting tents and canopies is the major difference in the way “tents” and “canopies” are defined between the building and fire codes. If it’s agreed the difference is significant and that the two codes need to be correlated, then the majority of changes needed are to be made to the fire code.

With some minor differences in the respective wording, a tent is a tent in either code. But that’s not the case with canopies.

To date, the building code definition of a canopy has been broad and general enough to encompass most everything thought of in the vernacular, be it a covered walkway or the structure that stands over fuel dispensing islands.

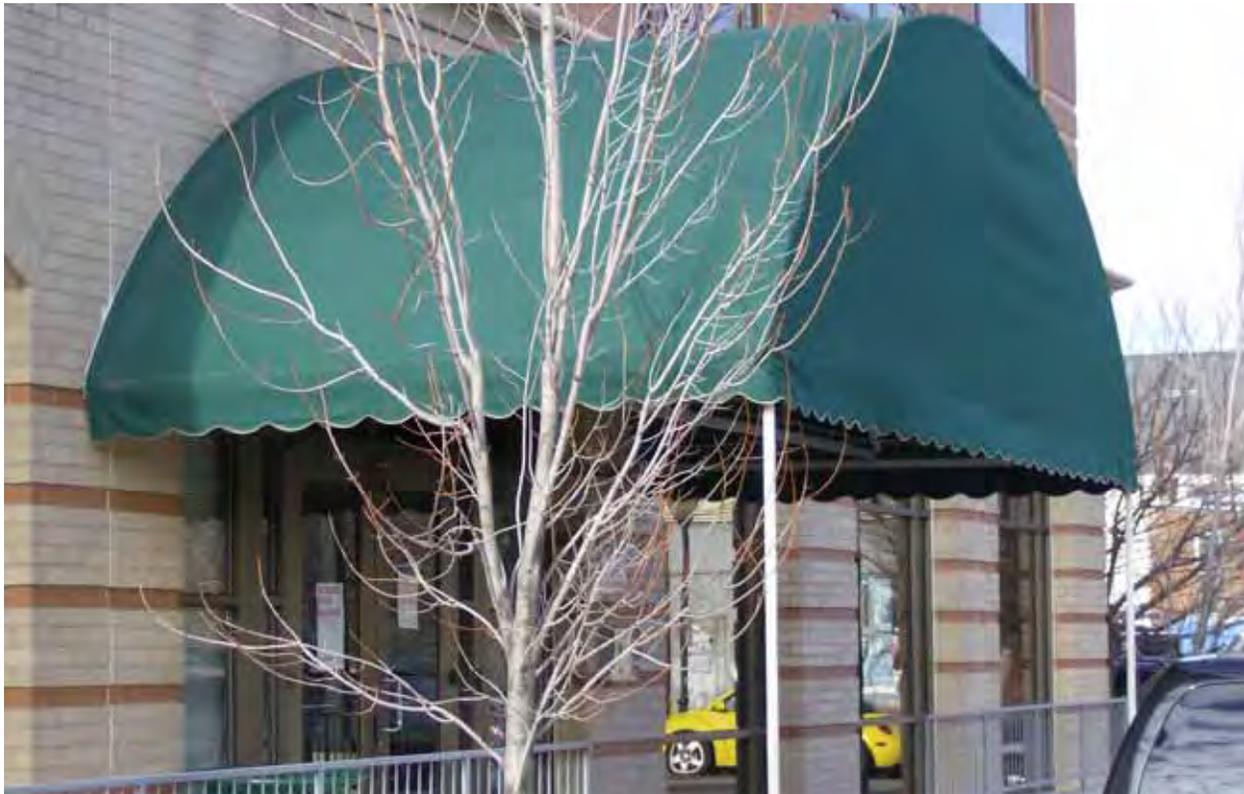

Using the current fire code verbiage of a tent or canopy, the following fits the definition of a tent:

This photo fits the definition of a canopy, and at the same time, fits the building code definition of a tent:

In the vernacular, the following are examples of canopies in the building code:

The above photo is also addressed in the fire code as a canopy but it doesn't fit the fire code definition.

Definitions:

The proposed change to the definition of canopy in both codes is to ensure what's being described still includes everything previously thought of in the vernacular but to the exclusion of the fire code's current definition of a canopy which is essentially a tent without sidewalls. Therefore, the definition of canopy is proposed for deletion and relocation in the fire code so as to cover the multiple applications currently found in the code.

By example, while the current definition of canopy in the fire code is found in Chapter 24 Tents, Canopies and Other Membrane Structures, the context and application of a canopy is totally out sync with how canopies are addressed in Chapter 22, Motor Fuel-Dispensing Facilities and Repair Garages. Unlike the temporary nature of tents and canopies in an unchanged Chapter 24, through Chapter 22, canopies are basically independent structures with some permanence expected. In addition, the building code uses the fire code as a reference for the design and construction of canopies at fueling stations. (See IBC Sections 406.5.2, 406.5.2.1 and 2606.10.) By redefining canopies as proposed and locating the revised definition in IFC Chapter 2, it will apply to all sections of the code where canopies are addressed.

Through this proposal, there is no attempt to change the current numerical values found in the code as they relate to exit discharge capacity, the number of exits, occupancy load, etc. What is desired is to change the definitions in both codes to ensure both codes comport with each other.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

Code side-by-side comparison:

Attached is a comparison of the building and fire code to help illustrate the need to revise and correlate the definitions of tents and canopies, and how the technical applications of the codes get applied.

IBC Definition	IFC Definition	Permit Thresholds		Proposed change to IBC and IFC	Webster's 3 rd New International Dictionary (as referenced in IFC Section 201.4)
		IBC	IFC		
AWNING. An architectural projection that provides weather protection, identity or decoration and is wholly supported by the building to which it is attached. An awning is comprised of a lightweight, rigid skeleton structure over which a covering is attached.	Silent. Not defined.				
CANOPY. An architectural projection that provides weather protection, identity or decoration and is supported by the building to which it is attached and at the outer end by not less than one stanchion. A canopy is comprised of a rigid structure over which a covering is attached.	CANOPY. A structure, enclosure or shelter constructed of fabric or pliable materials supported by any manner, except by air or the contents it protects, and is open without sidewalls or drops on 75 percent or more of the perimeter.	>0 sq. ft.	>400 sq. ft.	Canopy. A structure or architectural projection of rigid construction over which a covering is attached that provides weather protection, identity or decoration, and may be structurally independent or supported by attachment to a building on one end by not less than one stanchion on the outer end.	Canopy. 1: a covering usu. For shelter or protection a: a covering usu. of cloth suspended from the four high posts of a bed d: a temporary or permanent cover providing shelter and decoration (as over a door or window) f: an awning or marquee often stretching from doorway to curb or covering a section of grandstand.
TENT. Any structure, enclosure or shelter which is constructed of canvas or pliable material supported in any manner except by air or the contents it protects.	TENT. A structure, enclosure or shelter constructed of fabric or pliable material supported by any manner except by air or the contents that it protects.	>120 sq. ft. (Sec. 3103.1.1)	>200 sq. ft. Exception: Aggregate (w/ less than 12 ft. fire break) or individual fabric canopies = or <700 sq. ft.	TENT. A structure, enclosure or shelter, with or without sidewalls or drops, constructed of fabric or pliable material supported by any manner except by air or the contents that it protects.	Tent. 1: a collapsible shelter of canvas or other material stretched and sustained by poles, usu. made fast by ropes attached to pegs hammered into the ground, and used for camping outdoors (as by soldiers or vacationers) or as a temporary building (as for theatrical performance) 3: something that resembles a tent or that serves as a shelter

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I – IFC

Committee Action:

Approved as Submitted

Committee Reason: The proposal was approved because the committee felt that it provides a needed clarification and improved correlation between the tent and canopy provisions of the IBC and those of the IFC. It was observed, however, that the lack of a definition for canopy in the IFC may become problematic later on. The action is also consistent with the action of the IBC-General Committee on Part II.

Assembly Action:

None

PART II – IBC GENERAL

Committee Action:

Approved as Submitted

Committee Reason: Clarifies within the IBC the difference between a tent-like structure and permanent canopy structure such as those used in locations such as fuel service stations.

Assembly Action:

None

Final Hearing Results

**F243-07/08, Part I
F243-07/08, Part II**

**AMPC
AS**

Code Change No: F245-07/08

Original Proposal

Sections: 2701.2.2.1, 2702.1 (IBC [F] 307.2)

Proponent: Larry Fluer, Fluer, Inc., representing Compressed Gas Association

1. Revise as follows:

2701.2.2.1 Physical hazards. The material categories listed in this section are classified as physical hazards. A material with a primary classification as a physical hazard can also pose a health hazard.

1. Explosives and blasting agents.
2. Flammable and combustible liquids.
3. Flammable solids ~~and gases~~.
4. Organic peroxide materials.
5. Oxidizer materials.
6. Pyrophoric materials.
7. Unstable (reactive) materials.
8. Water-reactive solids and liquids.
9. Cryogenic fluids.
10. Compressed gases.

2. Revise definition as follows:

2702.1 (IBC [F] 307.2) Definitions. The following words and terms shall, for the purposes of this chapter, Chapters 28 through 44 and as used elsewhere in this code, have the meanings shown herein.

PHYSICAL HAZARD. A chemical for which there is evidence that it is a combustible liquid, compressed gas, cryogenic, explosive, ~~flammable gas~~, flammable liquid, flammable solid, organic peroxide, oxidizer, pyrophoric or unstable (reactive) or water-reactive material.

Reason: All compressed gases are physical hazards by definition. Those gases that are regulated as either physical or health hazards within the context of Chapter 27 are identified in Tables 2703.1.1(1) through 2703.1.1(4). Compressed gases with no listed MAQ are not regulated within Chapter 27; however, they are regulated by Chapter 30.

Deleting the term “and gases” from item 3 of Section 2701.2.2.1 and adding a general category of “compressed gases” and deleting the term “flammable gas” from the definition will correlate this section with the definition of physical hazard.

Revision of the term physical hazard has been made to delete “flammable gas” as it is redundant to the category of “compressed gas.”

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Disapproved at the request of the proponent who wishes to revise the proposal to reflect a consensus that has been reached on how to better deal with physical and health hazards since the proposal was first submitted.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Larry Fluer, Fluer, Inc., representing Compressed Gas Association, requests Approval as Modified by this public comment.

Modify proposal as follows:

2701.2.2.1 Physical hazards. The material categories listed in this section are classified as physical hazards. A material with a primary classification as a physical hazard can also pose a health hazard.

1. Explosives and blasting agents.
2. ~~Flammable and~~ Combustible liquids.
3. Flammable solids, liquids and gases.
4. Organic peroxide ~~materials~~ solids or liquids.
5. Oxidizer ~~materials~~ solids or liquids.
6. Oxidizing gases.
- 6- ~~7.~~ Pyrophoric ~~materials~~ solids, liquids or gases.
- 7- ~~8.~~ Unstable (reactive) materials solids, liquids or gases.
- 8- ~~9.~~ Water-reactive ~~materials~~ solids and or liquids.
- 9- ~~10.~~ Cryogenic fluids.
- 10- ~~Compressed gases~~.

2702.1 (IBC [F] 307.2) Definitions. The following words and terms shall, for the purposes of this chapter, Chapters 28 through 44 and as used elsewhere in this code, have the meanings shown herein.

PHYSICAL HAZARD. A chemical for which there is evidence that it is a combustible liquid, ~~compressed gas~~, cryogenic fluid, explosive, flammable solid, liquid or gas, ~~flammable liquid, flammable solid~~, organic peroxide solid or liquid, oxidizer solid or liquid, oxidizing gas, pyrophoric solids, liquid or gas or unstable (reactive) materials solid, liquid or gas or water-reactive materials, solid or liquid.

Commenter's Reason: The original submittal was initially triggered by the introduction of a definition for oxidizing gases and changes in terminology to clarify the differences between "oxidizer, solids and liquids" vs. oxidizing gases. During discussion with participants at the committee hearings a concern was raised with the inclusion of a general category of "compressed gas" to the list of physical hazards even though the term was used within the definition itself.

The proposed modification adds oxidizing gases to the list of items in Section 2701.2.2.1 and correlates the terminology used in the definition with that used in the list of materials. The apparent inconsistency in terminology for unstable and water reactive materials is driven by the definitions as they appear in material specific chapters 43 and 44 respectively using the term "unstable (reactive) material" to include solids, liquids and gases and the term "water-reactive material" to describe the material regulated which is limited to the solid and liquid form of materials in this category.

Approval of this modification will bring consistency between the definition of physical hazard and the list of materials regulated as physical hazards within the context of the IFC.

Code Change No: F247-07/08

Original Proposal

Table 2703.1.1(1) [IBC [F] Table 307.1(1)], Table 2703.1.1(3)

Proponent: Larry Fluor, Fluor, Inc., representing Compressed Gas Association

Revise tables as follows:

**TABLE 2703.1.1(1) [IBC [F] 307.1(1)](Supp)
MAXIMUM ALLOWABLE QUANTITY PER CONTROL AREA OF
HAZARDOUS MATERIAL POSING A PHYSICAL HAZARD^{a,j,m,n,p}**

MATERIAL	CLASS	GROUP WHEN THE MAXIMUM ALLOWABLE QUANTITY IS EXCEEDED	STORAGE ^b			USE-CLOSED SYSTEMS ^b			USE-OPEN SYSTEMS ^b	
			Solid pounds (cubic feet)	Liquid gallons (pounds)	Gas cubic feet at NTP	Solid pounds (cubic feet)	Liquid gallons (pounds)	Gas cubic feet at NTP	Solid pounds (cubic feet)	Liquid gallons (pounds)
Inert gas	Gaseous	<u>Not Applicable</u>	<u>Not Applicable</u>	<u>Not Applicable</u>	<u>Not Limited</u>	<u>Not Applicable</u>	<u>Not Applicable</u>	<u>Not Limited</u>	<u>Not Applicable</u>	<u>Not Applicable</u>
	Liquefied	<u>Not Applicable</u>	<u>Not Applicable</u>	<u>Not Applicable</u>	<u>Not Limited</u>	<u>Not Applicable</u>	<u>Not Applicable</u>	<u>Not Limited</u>	<u>Not Applicable</u>	<u>Not Applicable</u>
Cryogenic	Not Applicable	<u>Not Applicable</u>	<u>Not Applicable</u>	<u>Not Applicable</u>	<u>Not Limited</u>	<u>Not Applicable</u>	<u>Not Applicable</u>	<u>Not Limited</u>	<u>Not Applicable</u>	<u>Not Applicable</u>
Inert		<u>Not Applicable</u>	<u>Not Applicable</u>	<u>Not Applicable</u>	<u>Not Limited</u>	<u>Not Applicable</u>	<u>Not Applicable</u>	<u>Not Limited</u>	<u>Not Applicable</u>	<u>Not Applicable</u>

(Portions of table and footnotes not shown remain unchanged)

TABLE 2703.1.1(3) (Supp)
MAXIMUM ALLOWABLE QUANTITY PER CONTROL AREA OF HAZARDOUS MATERIAL
POSING A PHYSICAL HAZARD IN AN OUTDOOR CONTROL AREA^{a,b,c}

MATERIAL	CLASS	GROUP WHEN THE MAXIMUM ALLOWABLE QUANTITY IS EXCEEDED	STORAGE ^b			USE-CLOSED SYSTEMS ^b			USE-OPEN SYSTEMS ^b	
			Solid pounds (cubic feet)	Liquid gallons (pounds)	Gas cubic feet at NTP	Solid pounds (cubic feet)	Liquid gallons (pounds)	Gas cubic feet at NTP	Solid pounds (cubic feet)	Liquid gallons (pounds)
Inert gas	Gaseous	Not Applicable	Not Applicable	Not Applicable	Not Limited	Not Applicable	Not Applicable	Not Limited	Not Applicable	Not Applicable
	Liquefied	Not Applicable	Not Applicable	Not Applicable	Not Limited	Not Applicable	Not Applicable	Not Limited	Not Applicable	Not Applicable
Cryogenic Inert	Not Applicable	Not Applicable	Not Applicable	Not Applicable	Not Limited	Not Applicable	Not Applicable	Not Limited	Not Applicable	Not Applicable

(Portions of table and footnotes not shown remain unchanged)

Reason: Permits are required for inert gases when exceeding the amounts indicated in Tables 105.6.8 and 105.6.10; however, occupancy is not determined based on a quantity of inert gas. With respect to the table inert gases should be treated in a manner similar to Unstable Reactive or Water Reactive Class 1 materials where the quantity is indicated as “unlimited.” This change will coordinate the MAQ tables with Section 2701.2.2.1 which lists cryogenics and the definition of physical hazard in Section 2702.1 which lists definitions and includes all “compressed gases.”

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal was approved because the committee felt that the additional table entries will provide needed guidance to the fire code official in determining occupancy Group H.

Assembly Action:

None

AS

Code Change No: F254-07/08

Original Proposal

Sections: 2704.7; IBC [F] 414.5.4

Proponent: Lance H. Edwards, The National Paint & Coatings Association

Revise as follows:

2704.7 (Supp) Standby or emergency power. Where mechanical ventilation, treatment systems, temperature control, alarm, detection or other electrically operated systems are required, such systems shall be provided with an emergency or standby power system in accordance with NFPA 70 and Section 604.

Exceptions:

1. Standby or emergency power for mechanical ventilation for storage of flammable and combustible liquids in single story occupancies.
- ~~2.~~ ~~3.~~ Storage areas for Class 1 and 2 oxidizers.
- ~~3.~~ ~~4.~~ Storage areas for Class II, III, IV and V organic peroxides.
- ~~4.~~ ~~5.~~ Storage areas for asphyxiant, irritant and radioactive gases.
- ~~5.~~ ~~6.~~ For storage areas for highly toxic or toxic materials, see Sections 3704.2.2.8 and 3704.3.2.6.
- ~~6.~~ Standby power for mechanical ventilation, treatment systems and temperature control systems shall not be required where an approved fail-safe engineered system is installed.

[F] 414.5.4 (Supp) Standby or emergency power. Where mechanical ventilation, treatment systems, temperature control, alarm, detection or other electrically operated systems are required, such systems shall be provided with an emergency or standby power system in accordance with Section 2702.

Exceptions:

1. Standby or emergency power for mechanical ventilation for storage of flammable and combustible liquids in single story occupancies.
- ~~4-~~ 2. Storage areas for Class 1 and 2 oxidizers.
- ~~2-~~ 3. Storage areas for Class II, III, IV and V organic peroxides.
- ~~3-~~ 4. Storage areas for asphyxiant, irritant and radioactive gases.
- 4- 5. For storage, use and handling areas for highly toxic or toxic materials, see Sections 3704.2.2.8 and 3704.3.2.6 of the *International Fire Code*.
- ~~5-~~ 6. Standby power for mechanical ventilation, treatment systems and temperature control systems shall not be required where an approved fail-safe engineered system is installed.

Reason: This proposal will remove the requirement for standby power for flammable and combustible liquid storage ventilation. The requirement for standby power was originally not applicable to flammable and combustible liquids. NFPA 30 never required it for storage and still does not. When the Chapter 27 ventilation requirements were applied to flammable and combustible liquids storage the standby power requirement was inadvertently picked up. When enforced, it is a costly provision with very limited benefit. This proposal will coordinate the IFC and NFPA 30 requirements for standby power for flammable and combustible liquids storage ventilation. These materials are in sealed containers in storage so we do not see the need for the redundant requirement for standby power for ventilation for this condition.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

2704.7 (Supp) Standby or emergency power. Where mechanical ventilation, treatment systems, temperature control, alarm, detection or other electrically operated systems are required, such systems shall be provided with an emergency or standby power system in accordance with NFPA 70 and Section 604.

Exceptions:

1. ~~Standby or emergency power for m-~~ Mechanical ventilation for storage of Class IB and Class IC flammable and combustible liquids in closed containers not exceeding 6.5 gallons (25 L) capacity single story occupancies.
2. Storage areas for Class 1 and 2 oxidizers.
3. Storage areas for Class II, III, IV and V organic peroxides.
4. Storage areas for asphyxiant, irritant and radioactive gases.
5. For storage areas for highly toxic or toxic materials, see Sections 3704.2.2.8 and 3704.3.2.6.
6. Standby power for mechanical ventilation, treatment systems and temperature control systems shall not be required where an approved fail-safe engineered system is installed.

[F] 414.5.4 (Supp) Standby or emergency power. Where mechanical ventilation, treatment systems, temperature control, alarm, detection or other electrically operated systems are required, such systems shall be provided with an emergency or standby power system in accordance with Section 2702.

Exceptions:

1. ~~Standby or emergency power for m-~~ Mechanical ventilation for storage of Class IB and Class IC flammable and combustible liquids in closed containers not exceeding 6.5 gallons (25 L) capacity single story occupancies.
2. Storage areas for Class 1 and 2 oxidizers.
3. Storage areas for Class II, III, IV and V organic peroxides.
4. Storage areas for asphyxiant, irritant and radioactive gases.
5. For storage, use and handling areas for highly toxic or toxic materials, see Sections 3704.2.2.8 and 3704.3.2.6 of the *International Fire Code*.
6. Standby power for mechanical ventilation, treatment systems and temperature control systems shall not be required where an approved fail-safe engineered system is installed.

Committee Reason: The committee agreed that the proponent's reason statement accurately and adequately substantiates the need for the change. The modification correlates with industry treatment of portable container storage. Notably, FM Global recognizes that storage of small, closed containers does not pose a risk that warrants ventilation for these materials. FM Data Sheet 7-29, *Flammable and Combustible Liquid Storage in Portable Containers*, does not require mechanical ventilation for flammable liquids in closed containers of not greater than 6.5 gallons individual capacity, with a flash point of not greater than 100 °F and a boiling point equal to or greater than 100°F. NFPA 30, *Flammable and*

Combustible Liquids Code, also recognizes that closed container storage does not pose a risk that warrants ventilation (ventilation is required if there is open dispensing). These materials are in sealed containers in storage. Any loss of power would require an immediate cessation of operations, which would eliminate spill risk. By limiting the container size, the potential for accidental spills is significantly reduced.

Original Proposal

Sections: 4002.1 (IBC 307.2)

Proponent: Patrick A. McLaughlin, McLaughlin & Associates, representing Arch Chemicals, Inc., and PPG Industries, Inc.

Revise definition as follows:

4002.1 (IBC 307.2) Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

OXIDIZER. A material that readily yields oxygen or other oxidizing gas, or that readily reacts to promote or initiate combustion of combustible materials and, if heated or contaminated, can result in vigorous self-sustained decomposition ~~Examples of other oxidizing gases include bromine, chlorine and fluorine.~~

Class 4. An oxidizer that can undergo an explosive reaction due to contamination or exposure to thermal or physical shock and that causes a severe increase in the burning rate of combustible materials with which it comes into contact. In addition, the oxidizer ~~will enhance~~ causes a severe increase in the burning rate and can cause spontaneous ignition of combustibles.

Class 3. An oxidizer that ~~will~~ causes a severe increase in the burning rate of combustible materials with which it comes in contact ~~or that will undergo vigorous self-sustained decomposition caused by contamination or exposure to heat~~.

Class 2. An oxidizer that will cause a moderate increase in the burning rate ~~or that causes spontaneous ignition~~ of combustible materials with which it comes in contact.

Class 1. An oxidizer ~~that does not moderately increase the burning rate of whose primary hazard is that it slightly increases the burning rate but which does not cause spontaneous ignition when it comes in contact with~~ combustible materials.

Reason: This proposal updates the IFC (IBC) definition of oxidizer to be consistent with the current definition of an oxidizer. The definition of an oxidizer in the IFC (IBC) is based on the definition in the Uniform Fire Code which came from NFPA 430.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal was approved because the committee felt that it provides an appropriate update to the definition oxidizer consistent with OSHA regulations and NFPA 40.

Assembly Action:

None

THESE PROPOSALS ARE ON THE AGENDA OF THE IMC, THE IRC MECHANICAL, THE IFGC AND THE IBC FIRE SAFETY CODE DEVELOPMENT COMMITTEES AS 4 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IMC

Revise as follows:

305.5 Protection against physical damage. In concealed locations where piping, other than cast-iron or steel, is installed through holes or notches in studs, joists, rafters or similar members less than 1.5 inches (38 mm) from the nearest edge of the member, the pipe shall be protected by shield plates. Protective steel shield plates ~~shall be a minimum of 0.062-inch-thick (1.6 mm)-steel~~ having a minimum thickness of 0.0575-inches (1.463 mm) (No. 16 Gage), shall cover the area of the pipe where the member is notched or bored, and shall extend a minimum of 2 inches (51 mm) above sole plates and below top plates.

307.2.3 Auxiliary and secondary drain systems. In addition to the requirements of Section 307.2.1, a secondary drain or auxiliary drain pan shall be required for each cooling or evaporator coil or fuel-fired appliance that produces condensate, where damage to any building components will occur as a result of overflow from the equipment drain pan or stoppage in the condensate drain piping. One of the following methods shall be used:

1. An auxiliary drain pan with a separate drain shall be provided under the coils on which condensation will occur. The auxiliary pan drain shall discharge to a conspicuous point of disposal to alert occupants in the event of a stoppage of the primary drain. The pan shall have a minimum depth of 1.5 inches (38 mm), shall not be less than 3 inches (76 mm) larger than the unit or the coil dimensions in width and length and shall be constructed of corrosion-resistant material. ~~Metallic Galvanized sheet steel~~ galvanized sheet metal pans shall have a minimum thickness of not less than ~~0.0276 0.0236 -inch (0.7 mm)~~ 0.0236 -inch (0.6010 mm) (No. 24 gauge) galvanized sheet metal. Nonmetallic pans shall have a minimum thickness of not less than 0.0625 inch (1.6 mm).
2. A separate overflow drain line shall be connected to the drain pan provided with the equipment. Such overflow drain shall discharge to a conspicuous point of disposal to alert occupants in the event of a stoppage of the primary drain. The overflow drain line shall connect to the drain pan at a higher level than the primary drain connection.
3. An auxiliary drain pan without a separate drain line shall be provided under the coils on which condensate will occur. Such pan shall be equipped with a water-level detection device conforming to UL 508 that will shut off the equipment served prior to overflow of the pan. The auxiliary drain pan shall be constructed in accordance with Item 1 of this section.
4. A water level detection device conforming to UL 508 shall be provided that will shut off the equipment served in the event that the primary drain is blocked. The device shall be installed in the primary drain line, the overflow drain line, or in the equipment-supplied drain pan, located at a point higher than the primary drain line connection and below the overflow rim of such pan.

Exception: Fuel-fired appliances that automatically shut down operation in the event of a stoppage in the condensate drainage system.

(Footnotes not shown remain unchanged)

506.3.1.1 (Supp) Grease duct materials. Grease ducts serving Type I hoods shall be constructed of steel ~~not less than 0.055-inch (1.4 mm) (No. 16 Gage) in thickness~~ having a minimum thickness of 0.575-inch (1.463 mm) (No. 16 gage) or stainless steel not less than ~~0.044~~ 0.0450-inch (1.14 mm) (No. 18 Gage) in thickness.

Exception: Factory-built commercial kitchen grease ducts listed and labeled in accordance with UL 1978 and installed in accordance with Section 304.1.

507.4 Type I materials. Type I hoods shall be constructed of steel ~~not less than 0.043-inch (1.09 mm) (No. 18 MSG) in thickness,~~ having a minimum thickness of 0.0466-inches (1.181 mm) (No. 18 Gage) or stainless steel not less than ~~0.037~~ 0.0335-inch (~~0.94 mm~~) (.8525 mm) (No. 20 MSG) in thickness.

507.5 Type II hood materials. Type II hoods shall be constructed of steel ~~not less than 0.030-inch (0.76 mm) (No. 22 Gage) in thickness,~~ having a minimum thickness of 0.0296-inches (.7534 mm) (No. 22 Gage) or stainless steel not less than ~~0.024~~ 0.0220-inch (~~0.61 mm~~) (5550 mm) (No. 24 Gage) in thickness, copper sheets weighing not less than 24 ounces per square foot (7.3 kg/m²), or of other approved material and gage.

[F] 513.13.1 (IFC 902.13.1; IBC [F] 902.13.1) Materials. Control-air tubing shall be hard-drawn copper, Type L, ACR in accordance with ASTM B 42, ASTM B 43, ASTM B 68, ASTM B 88, ASTM B 251 and ASTM B 280. Fittings shall be wrought copper or brass, solder type in accordance with ASME B 16.18 or ASME B 16.22. Changes in direction shall be made with appropriate tool bends. Brass compression-type fittings shall be used at final connection to devices; other joints shall be brazed using a BCuP5 brazing alloy with solidus above 1,100°F (593°C) and liquids below 1,500°F (816°C). Brazing flux shall be used on copper-to-brass joints only.

Exception: Nonmetallic tubing used within control panels and at the final connection to devices provided all of the following conditions are met:

1. Tubing shall be listed by an approved agency for flame and smoke characteristics.
2. Tubing and connected device shall be completely enclosed within a galvanized or paint-grade steel enclosure ~~of not less than 0.030 inch (0.76 mm) (No. 22 galvanized sheet gage) thickness~~ having a minimum thickness of 0.0296-inches (.7534 mm) (No. 22 Gage) Entry to the enclosure shall be by copper tubing with a protective grommet of neoprene or teflon or by suitable brass compression to male barbed adapter.
3. Tubing shall be identified by appropriately documented coding.
4. Tubing shall be neatly tied and supported within the enclosure. Tubing bridging cabinets and doors or moveable devices shall be of sufficient length to avoid tension and excessive stress. Tubing shall be protected against abrasion. Tubing serving devices on doors shall be fastened along hinges.

For SI: 1 inch = 25.4 mm, 1 square inch = 645.16 mm².

**TABLE 803.10.4
CHIMNEY CONNECTOR SYSTEMS AND CLEARANCES
TO COMBUSTIBLE WALL MATERIALS FOR DOMESTIC HEATING APPLIANCES^{a,b,c,d}**

System A (12-inch clearance)	A 3.5-inch-thick brick wall shall be framed into the combustible wall. A 0.625-inch-thick fire-clay liner (ASTM C 315 or equivalent) shall be firmly cemented in the center of the brick wall maintaining a 12-inch clearance to combustibles. The clay liner shall run from the outer surface of the bricks to the inner surface of the chimney liner.
System B (9-inch clearance)	A labeled solid-insulated factory-built chimney section (1-inch insulation) the same inside diameter as the connector shall be utilized. Sheet metal <u>steel</u> supports cut to maintain a 9-inch clearance to combustibles shall be fastened to the wall surface and to the chimney section. Fasteners shall not penetrate the chimney flue liner. The chimney length shall be flush with the masonry chimney liner and sealed to the masonry with water-insoluble refractory cement. Chimney manufacturers' parts shall be utilized to securely fasten the chimney connector to the chimney section.
System C (6-inch clearance)	A sheet metal steel (minimum number 24 Gage) ventilated thimble <u>having a minimum thickness of 0.0236-inches (.6010 mm) (No.24 Gage)</u> having two 1-inch air channels shall be installed with a sheet steel chimney connector. (minimum number 24 Gage). <u>Sheet Steel</u> supports (minimum number 24 Gage) shall be cut to maintain a 6-inch clearance between the thimble and combustibles. <u>The chimney connector and steel supports shall have a minimum thickness of 0.0236-inches (.6010 mm) (No 24 Gage)</u> . One side of the support shall be fastened to the wall on all sides. Glass-fiber insulation shall fill the 6-inch space between the thimble and the supports.
System D (2- inch clearance)	A labeled solid-insulated factory-built chimney section (1-inch insulation) with a diameter 2 inches larger than the chimney connector shall be installed with a sheet steel chimney connector (minimum number 24 Gage) <u>having a minimum thickness of 0.0236-inches (.6010 mm) (No.24 Gage)</u> . Sheet metal <u>steel</u> supports shall be positioned to maintain a 2-inch clearance to combustibles and to hold the chimney connector to ensure that a 1-inch airspace surrounds the chimney connector through the chimney section. The steel support shall be fastened to the wall on all sides and the chimney section shall be fastened to the supports. Fasteners shall not penetrate the liner of the chimney section.

(Footnotes not shown remain unchanged)

M1308.2 Protection against physical damage. In concealed locations where piping, other than cast-iron or galvanized steel, is installed through holes or notches in studs, joists, rafters or similar members less than 1.5 inches (38 mm) from the nearest edge of the member, the pipe shall be protected by shield plates. Protective steel shield plates shall be a minimum of 0.062-inch-thick (1.6 mm) steel having a minimum thickness of 0.0575-inches (1.463 mm) (No. 16 Gage), shall cover the area of the pipe where the member is notched or bored, and shall extend a minimum of 2 inches (51 mm) above sole plates and below top plates.

M1411.3.1 (Supp) Auxiliary and secondary drain systems. In addition to the requirements of Section M1411.3, a secondary drain or auxiliary drain pan shall be required for each cooling or evaporator coil where damage to any building components will occur as a result of overflow from the equipment drain pan or stoppage in the condensate drain piping. Such piping shall maintain a minimum horizontal slope in the direction of discharge of not less than 1/8 unit vertical in 12 units horizontal (1-percent slope). Drain piping shall be a minimum of 3/4-inch (19 mm) nominal pipe size. One of the following methods shall be used:

1. An auxiliary drain pan with a separate drain shall be installed under the coils on which condensation will occur. The auxiliary pan drain shall discharge to a conspicuous point of disposal to alert occupants in the event of a stoppage of the primary drain. The pan shall have a minimum depth of 1.5 inches (38 mm), shall not be less than 3 inches (76 mm) larger than the unit or the coil dimensions in width and length and shall be constructed of corrosion-resistant material. Metallic Galvanized sheet steel pans shall have a minimum thickness of not less than ~~0.0276-inch~~ 0.0236-inches (0.7 mm) (.6010 mm) (No. 24 Gage) galvanized sheet metal. Nonmetallic pans shall have a minimum thickness of not less than 0.0625 inch (1.6 mm).
2. A separate overflow drain line shall be connected to the drain pan provided with the equipment. This overflow drain shall discharge to a conspicuous point of disposal to alert occupants in the event of a stoppage of the primary drain. The overflow drain line shall connect to the drain pan at a higher level than the primary drain connection.
3. An auxiliary drain pan without a separate drain line shall be installed under the coils on which condensate will occur. This pan shall be equipped with a water level detection device conforming to UL 508 that will shut off the equipment served prior to overflow of the pan. The pan shall be equipped with a fitting to allow for drainage. The auxiliary drain pan shall be constructed in accordance with Item 1 of this section.

4. A water level detection device conforming to UL 508 shall be provided that will shut off the equipment served in the event that the primary drain is blocked. The device shall be installed in the primary drain line, the overflow drain line or the equipment-supplied drain pan, located at a point higher than the primary drain line connection and below the overflow rim of such pan.

M1502.5 Duct construction. Exhaust ducts shall be constructed of rigid metal, having a minimum thickness of 0.016-inch thick (0.4 mm) rigid metal ducts, 0.0157-inches (.3950 mm) (No. 28 Gage) having and shall have smooth interior surfaces with joints running in the direction of air flow. Exhaust ducts shall not be connected with sheet-metal screws or fastening means which extend into the duct.

M1505.1 General. Domestic open-top broiler units shall be provided with a metal exhaust hood, ~~not less than 28 gage,~~ having a minimum thickness of 0.0157-inches (.3950 mm (No. 28 Gage) with 1/4 inch (6 mm) clearance between the hood and the underside of combustible material or cabinets. A clearance of at least 24 inches (610 mm) shall be maintained between the cooking surface and the combustible material or cabinet. The hood shall be at least as wide as the broiler unit and shall extend over the entire unit. Such exhaust hood shall discharge to the outdoors and shall be equipped with a backdraft damper or other means to control infiltration/exfiltration when not in operation. Broiler units incorporating an integral exhaust system, and listed and labeled for use without an exhaust hood, need not be provided with an exhaust hood.

2. Delete and substitute as follows:

**TABLE M1601.1.1(2)
GAGES OF METAL DUCTS AND PLENUMS USED FOR HEATING OR COOLING**

TYPE OF DUCT	SIZE (inches)	MINIMUM THICKNESS (inch)	EQUIVALENT GALVANIZED SHEET GAGE	APPROXIMATE ALUMINUM B & S GAGE

- a. For duct gages and reinforcement requirements at static pressures of 1/2", 1" and 2" w.g., SMACNA Duct Construction Standard, Tables 2-1; 2-2 and 2-3 shall apply.

3. Revise table as follows:

**TABLE M1803.2
THICKNESS FOR SINGLE-WALL METAL PIPE CONNECTORS^a**

DIAMETER OF CONNECTOR (inches)	GALVANIZED SHEET METAL GAGE NUMBER	MINIMUM THICKNESS (inch) (mm)
Less than 6	26	0.019
6 to 10 14 inches and less	24 28	0.024 0.0157 (.3950 mm)
Over 10 through 16 16 and 18 inch ^a	22 26	0.029 0.0187 (.4712 mm)

For SI: 1 inch = 25.4 mm.

a. For sizes larger than 18 inches SMACNA Duct Construction Standard, Table 3-5 shall apply.

PART III – IFGC

Revise as follows:

404.5 Protection against physical damage. In concealed locations, where piping other than black or galvanized steel is installed through holes or notches in wood studs, joists, rafters or similar members less than 1.5 inches (38 mm) from the nearest edge of the member, the pipe shall be protected by shield plates. ~~Protective steel shield plates shall be a minimum of 1/16-inch-thick (1.6 mm) steel, having a minimum thickness of 0.0575-inches (1.463 mm) (No. 16 Gage)~~ shall cover the area of the pipe where the member is notched or bored and shall extend a minimum of 4 inches (102 mm) above sole plates, below top plates and to each side of a stud, joist or rafter.

502.4 Insulation shield. Where vents pass through insulated assemblies, an insulation shield constructed of steel not less than 26-gage sheet (0.016-inch) (0.4 mm) metal having a minimum thickness of 0.0187-inches (.4712 mm) (No. 26 Gage) shall be installed to provide clearance between the vent and the insulation material. The clearance shall not be less than the clearance to combustibles specified by the vent manufacturer's installation instructions. Where vents pass through attic space, the shield shall terminate not less than 2 inches (51 mm) above the insulation materials and shall be secured in place to prevent displacement. Insulation shields provided as part of a listed vent system shall be installed in accordance with the manufacturer's installation instructions.

502.7 Protection against physical damage. In concealed locations, where a vent is installed through holes or notches in studs, joists, rafters or similar members less than 1.5 inches (38 mm) from the nearest edge of the member, the vent shall be protected by shield plates. Protective steel shield plates shall be a minimum of 1/16-inch-thick (1.6 mm) steel, having a minimum thickness of 0.0575-inches (1.463 mm) (No. 16 Gage) shall cover the area of the vent where the member is notched or bored and shall extend a minimum of 4 inches (102 mm) above sole plates, below top plates and to each side of a stud, joist or rafter.

PART IV – IBC FIRE SAFETY

716.5.3 (Supp) Shaft enclosures. Shaft enclosures that are permitted to be penetrated by ducts and air transfer openings shall be protected with approved fire and smoke dampers installed in accordance with their listing.

Exceptions:

1. Fire dampers are not required at penetrations of shafts where:
 - 1.1. Steel exhaust subducts are extended at least 22 inches (559 mm) vertically in exhaust shafts, provided there is a continuous airflow upward to the outside; or
 - 1.2. Penetrations are tested in accordance with ASTM E119 or UL263 as part of the fire-resistance rated assembly; or
 - 1.3. Ducts are used as part of an approved smoke control system designed and installed in accordance with Section 909 and where the fire damper will interfere with the operation of the smoke control system; or
 - 1.4. The penetrations are in parking garage exhaust or supply shafts that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
2. In Group B and R occupancies, equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, smoke dampers are not required at penetrations of shafts where:

- 2.1. Kitchen, clothes dryer, bathroom and toilet room exhaust openings are installed with steel exhaust subducts, having a ~~wall thickness of at least 0.019 inch (0.48 mm); and~~ minimum thickness of - .0187-inches (0.4712 mm) (No. 26 Gage)
- 2.2. That extend at least 22 inches (559 mm) vertically; and
- 2.3. An exhaust fan is installed at the upper terminus of the shaft that is, powered continuously in accordance with the provisions of Section 909.11, so as to maintain a continuous upward airflow to the outside.
3. Smoke dampers are not required at penetration of exhaust or supply shafts in parking garages that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
4. Smoke dampers are not required at penetrations of shafts where ducts are used as part of an approved mechanical smoke control system designed in accordance with Section 909 and where the smoke damper will interfere with the operation of the smoke control system.
5. Fire dampers and combination fire/smoke dampers are not required in kitchen and clothes dryer exhaust system when installed in accordance with the *International Mechanical Code*.

716.5.4 (Supp) Fire partitions. Ducts and air transfer openings that penetrate fire partitions shall be protected with listed fire dampers installed in accordance with their listing.

Exceptions: In occupancies other than Group H, fire dampers are not required where any of the following apply:

1. The partitions are tenant separation or corridor walls in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and the duct is protected as a through penetration in accordance with Section 712.
2. Tenant partitions in covered mall buildings where the walls are not required by provisions elsewhere in the code to extend to the underside of the floor or roof sheathing, slab or deck above.
3. The duct system is constructed of approved materials in accordance with the *International Mechanical Code* and the duct penetrating the wall complies with all of the following requirements:
 - 3.1. The duct shall not exceed 100 square inches (0.06 m²).
 - 3.2. The duct shall be constructed of steel ~~a minimum of 0.0217 inch (0.55 mm) in thickness~~ having a minimum thickness of 0.0157-inches (0.3950 mm) (No. 28 Gage).
 - 3.3. The duct shall not have openings that communicate the corridor with adjacent spaces or rooms.
 - 3.4. The duct shall be installed above a ceiling.
 - 3.5. The duct shall not terminate at a wall register in the fire-resistance-rated wall.
 - 3.6. A minimum 12-inch-long (305 mm) ~~by 0.060-inch thick (1.52 mm)~~ steel sleeve having a minimum thickness of 0.0575-inches (1.465 mm) (No. 16 Gage) shall be centered in each duct opening. The sleeve shall be secured to both sides of the wall and all four sides of the sleeve with minimum 11/2-inch by 11/2-inch by 0.060-inch (38 mm by 38 mm by 1.52 mm) steel retaining angles. The retaining angles shall be secured to the sleeve and the wall with No. 10 (M5) screws. The annular space between the steel sleeve and the wall opening shall be filled with mineral wool batting on all sides.

716.6.1(Supp) Through penetrations. In occupancies other than Groups I-2 and I-3, a duct constructed of approved materials in accordance with the *International Mechanical Code* that penetrates a fire-resistance-rated floor/ceiling assembly that connects not more than two stories is permitted without shaft enclosure protection, provided a listed fire damper is installed at the floor line or the duct is protected in accordance with Section 712.4. For air transfer openings, see Exception 7 to Section 707.2.

Exception: A duct is permitted to penetrate three floors or less without a fire damper at each floor, provided it meets all of the following requirements:

1. The duct shall be contained and located within the cavity of a wall and shall be constructed of steel ~~not less than 0.019 inch (0.48 mm) (26 gage) in thickness~~ having a minimum thickness of 0.0187-inches ((0.4712 mm) (No. 26 Gage).
2. The duct shall open into only one dwelling or sleeping unit and the duct system shall be continuous from the unit to the exterior of the building.
3. The duct shall not exceed 4-inch (102 mm) nominal diameter and the total area of such ducts shall not exceed 100 square inches (0.065 m²) in any 100 square feet (9.3 m²) of floor area.
4. The annular space around the duct is protected with materials that prevent the passage of flame and hot gases sufficient to ignite cotton waste where subjected to ASTM E 119 or UL 263 time-temperature conditions under a minimum positive pressure differential of 0.01 inch (2.49 Pa) of water at the location of the penetration for the time period equivalent to the fire-resistance rating of the construction penetrated.
5. Grille openings located in a ceiling of a fire-resistance- rated floor/ceiling or roof/ceiling assembly shall be protected with a listed ceiling radiation damper installed in accordance with Section 716.6.2.1.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

Reason: The code has been inconsistent in its approach to decimals and the related gages. This is a much needed clean up in an attempt to bring consistency in language as it relates to stated decimals and gages. The gage should always accompany a decimal as most end users relate to a gage as opposed to a decimal. Some decimals were not accurate to the stated gage. Also, some of the gages stated in the tables were not consistent with the standard and were changed to reflect that. Now anyone can reference the SMACNA standard and go to Table A-2; A-4 and 3-5 and see where the numbers come from. A new footnote has been added to Tables 603.4, 803.9 (1) and 503.10.2.4 to direct the user to more information that doesn't necessarily need to be in the code. There are many combinations of gages and reinforcement methods available for use which means no one particular gage fits all situations. This itemized account will make things clearer as to the intent of this change.

Bibliography

SMACNA Duct Construction Standards, 2005, Table A-1 and A-3; Sheet Metal and Air Conditioning Contractors National Association, Inc.; Chantilly, VA.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I – IMC

Committee Action:

Approved as Modified

Modify proposal as follows:

307.2.3 Auxiliary and secondary drain systems. In addition to the requirements of Section 307.2.1, a secondary drain or auxiliary drain pan shall be required for each cooling or evaporator coil or fuel-fired appliance that produces condensate, where damage to any building components will occur as a result of overflow from the equipment drain pan or stoppage in the condensate drain piping. One of the following methods shall be used:

1. An auxiliary drain pan with a separate drain shall be provided under the coils on which condensation will occur. The auxiliary pan drain shall discharge to a conspicuous point of disposal to alert occupants in the event of a stoppage of the primary drain. The pan shall have a minimum depth of 1.5 inches (38 mm), shall not be less than 3 inches (76 mm) larger than the unit or the coil dimensions in width and length and shall be constructed of corrosion-resistant material. Galvanized sheet steel pans shall have a minimum thickness of not less than 0.0236-inch (0.6010 mm) (No. 24 gage) ~~galvanized sheet metal~~. Nonmetallic pans shall have a minimum thickness of not less than 0.0625-inch (1.6 mm).
2. A separate overflow drain line shall be connected to the drain pan provided with the equipment. Such overflow drain shall discharge to a conspicuous point of disposal to alert occupants in the event of a stoppage of the primary drain. The overflow drain line shall connect to the drain pan at a higher level than the primary drain connection.
3. An auxiliary drain pan without a separate drain line shall be provided under the coils on which condensate will occur. Such pan shall be equipped with a water-level detection device conforming to UL 508 that will shut off the equipment served prior to overflow of the pan. The auxiliary drain pan shall be constructed in accordance with Item 1 of this section.
4. A water level detection device conforming to UL 508 shall be provided that will shut off the equipment served in the event that the primary drain is blocked. The device shall be installed in the primary drain line, the overflow drain line, or in the equipment-supplied drain pan, located at a point higher than the primary drain line connection and below the overflow rim of such pan.

Exception: Fuel-fired appliances that automatically shut down operation in the event of a stoppage in the condensate drainage system.

**TABLE 803.9(1)
MINIMUM CHIMNEY CONNECTOR THICKNESS FOR LOW-HEAT APPLIANCES^a**

DIAMETER OF CONNECTOR (inches)	MINIMUM NOMINAL THICKNESS (galvanized) (inches) (mm)
<u>5 and smaller</u>	<u>0.022 (No. 26 Gage)</u>
<u>Larger than 5 and up to 10</u>	<u>0.028 (No. 24 Gage)</u>
<u>Larger than 10 and up to 16</u>	<u>0.034 (No. 22 Gage)</u>
<u>14 inches and less</u>	<u>0.0157 (.3950 mm) (No. 28 Gage)</u>
<u>Larger than 16 16 and 18 inch^a</u>	<u>0.064 (No. 16 Gage) 0.0187 (.4712 mm) (No. 26 Gage)</u>

For SI: 1 inch = 25.4 mm.

a. ~~For sizes larger than 18 inches SMACNA Duct Construction Standard, Table 3-5 shall apply.~~

(Portions of proposal not shown remain unchanged)

Committee Reason: This code change provides consistency between the I-codes and SMACNA's Duct Construction Standards related to sheet metal thicknesses. Both the decimal and gage designations of thickness have been revised. The modification deleted duplicated language in Section 307.2.3 and reverted Table 803.9(1) back to the current code language because that table is for oil-burning appliance connectors and there was concern that reducing the wall thicknesses was not justified for such high heat applications.

Assembly Action:

None

PART II – IRC-M

Committee Action:

Approved as Modified

Modify proposal as follows:

**TABLE M1803.2
THICKNESS FOR SINGLE-WALL METAL PIPE CONNECTORS^a**

DIAMETER OF CONNECTOR (inches)	GALVANIZED SHEET METAL GAGE NUMBER	MINIMUM THICKNESS (inch) (<u>mm</u>)
<u>Less than 6</u>	<u>26</u>	<u>0.019</u>
<u>6 to 10</u> <u>14 inches and less</u>	<u>24</u> <u>28</u>	<u>0.024</u> <u>0.0157 (.3950 mm)</u>
<u>Over 10 through 16</u> <u>16 and 18 inch^a</u>	<u>22</u> <u>26</u>	<u>0.029</u> <u>0.0187 (.4712 mm)</u>

For SI: 1 inch = 25.4 mm.

a. ~~For sizes larger than 18 inches SMACNA Duct Construction Standard, Table 3-5 shall apply.~~

(Portions of proposal not shown remain unchanged)

Committee Reason: This code change provides consistency between the I-codes and SMACNA's Duct Construction Standards related to decimal and gage designations of sheet metal thicknesses. The modification reverted Table M1803.2 back to the current code language because that table is for oil-burning appliance connectors and there was concern that reducing the wall thicknesses was not justified for such high heat applications.

Assembly Action:

None

PART III – IFGC

Committee Action:

Approved as Submitted

Committee Reason: The proposed revisions make the code more user-friendly by providing a gage number in addition to a minimum thickness number. For consistency, the gage number designations and thicknesses have been aligned with those in the SMACNA duct construction standard.

Assembly Action:

None

PART IV – IBC FIRE SAFETY

Committee Action:

Approved as Modified

Modify proposal as follows:

716.5.3 (Supp) Shaft enclosures. Shaft enclosures that are permitted to be penetrated by ducts and air transfer openings shall be protected with approved fire and smoke dampers installed in accordance with their listing.

Exceptions:

1. Fire dampers are not required at penetrations of shafts where:
 - 1.1. Steel exhaust subducts are extended at least 22 inches (559 mm) vertically in exhaust shafts, provided there is a continuous airflow upward to the outside; or
 - 1.2. Penetrations are tested in accordance with ASTM E119 or UL263 as part of the fire-resistance rated assembly; or
 - 1.3. Ducts are used as part of an approved smoke control system designed and installed in accordance with Section 909 and where the fire damper will interfere with the operation of the smoke control system; or
 - 1.4. The penetrations are in parking garage exhaust or supply shafts that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
2. In Group B and R occupancies, equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, smoke dampers are not required at penetrations of shafts where:
 - 2.1. Kitchen, clothes dryer, bathroom and toilet room exhaust openings are installed with steel exhaust subducts, having a minimum wall thickness of 0.187-inches (0.4712 mm) (No. 26 Gage)
 - 2.2. That extend at least 22 inches (559 mm) vertically; and
 - 2.3. An exhaust fan is installed at the upper terminus of the shaft that is, powered continuously in accordance with the provisions of Section 909.11, so as to maintain a continuous upward airflow to the outside.
3. Smoke dampers are not required at penetration of exhaust or supply shafts in parking garages that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
4. Smoke dampers are not required at penetrations of shafts where ducts are used as part of an approved mechanical smoke control system designed in accordance with Section 909 and where the smoke damper will interfere with the operation of the smoke control system.
5. Fire dampers and combination fire/smoke dampers are not required in kitchen and clothes dryer exhaust system when installed in accordance with the *International Mechanical Code*.

716.5.4 (Supp) Fire partitions. Ducts and air transfer openings that penetrate fire partitions shall be protected with listed fire dampers installed in accordance with their listing.

Exceptions: In occupancies other than Group H, fire dampers are not required where any of the following apply:

1. The partitions are tenant separation or corridor walls in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and the duct is protected as a through penetration in accordance with Section 712.
2. Tenant partitions in covered mall buildings where the walls are not required by provisions elsewhere in the code to extend to the underside of the floor or roof sheathing, slab or deck above.
3. The duct system is constructed of approved materials in accordance with the *International Mechanical Code* and the duct penetrating the wall complies with all of the following requirements:
 - 3.1. The duct shall not exceed 100 square inches (0.06 m²).
 - 3.2. The duct shall be constructed of steel ~~a minimum of 0.0217-inch (0.55 mm) in thickness~~ ~~having a minimum thickness of 0.0157 inches (0.3950 mm) (No. 28 Gage).~~
 - 3.3. The duct shall not have openings that communicate the corridor with adjacent spaces or rooms.
 - 3.4. The duct shall be installed above a ceiling.
 - 3.5. The duct shall not terminate at a wall register in the fire-resistance-rated wall.
 - 3.6. A minimum 12-inch-long (305 mm) ~~by 0.060-inch thick (1.52 mm)~~ steel sleeve ~~having a minimum thickness of 0.0575 inches (1.465 mm) (No. 16 Gage)~~ shall be centered in each duct opening. The sleeve shall be secured to both sides of the wall and all four sides of the sleeve with minimum 1 1/2-inch by 1 1/2-inch by 0.060-inch (38 mm by 38 mm by 1.52 mm) steel retaining angles. The retaining angles shall be secured to the sleeve and the wall with No. 10 (M5) screws. The annular space between the steel sleeve and the wall opening shall be filled with mineral wool batting on all sides.

716.6.1(Supp) Through penetrations. In occupancies other than Groups I-2 and I-3, a duct constructed of approved materials in accordance with the *International Mechanical Code* that penetrates a fire-resistance-rated floor/ceiling assembly that connects not more than two stories is permitted without shaft enclosure protection, provided a listed fire damper is installed at the floor line or the duct is protected in accordance with Section 712.4. For air transfer openings, see Exception 7 to Section 707.2.

Exception: A duct is permitted to penetrate three floors or less without a fire damper at each floor, provided it meets all of the following requirements:

1. The duct shall be contained and located within the cavity of a wall and shall be constructed of steel having a minimum wall thickness of 0.0187-inches ((0.4712 mm) (No. 26 Gage).
2. The duct shall open into only one dwelling or sleeping unit and the duct system shall be continuous from the unit to the exterior of the building.
3. The duct shall not exceed 4-inch (102 mm) nominal diameter and the total area of such ducts shall not exceed 100 square inches (0.065 m²) in any 100 square feet (9.3 m²) of floor area.
4. The annular space around the duct is protected with materials that prevent the passage of flame and hot gases sufficient to ignite cotton waste where subjected to ASTM E 119 or UL 263 time-temperature conditions under a minimum positive pressure differential of 0.01-inch (2.49 Pa) of water at the location of the penetration for the time period equivalent to the fire-resistance rating of the construction penetrated.
5. Grille openings located in a ceiling of a fire-resistance- rated floor/ceiling or roof/ceiling assembly shall be protected with a listed ceiling radiation damper installed in accordance with Section 716.6.2.1.

Committee Reason: The committee agreed that this revised language was appropriate to bring consistency in language as it relates to decimals and gages stated within the code. Further, the committee agreed that the modification adding the term “wall” in two places to define thickness was an appropriate clarification. Lastly, the committee agreed with the modification to undo the proposed changes for items 3.2 and 3.6 of Section 716.5.4 based on the fact that these thicknesses were based on specific testing results.

2006 INTERNATIONAL PLUMBING CODE

Code Change No: **P10-07/08**

Original Proposal

Section: 310.4

Proponent: A. Brooks Ballard, Virginia Department of Corrections

Revise as follows:

310.4 Water closet compartment. Each water closet utilized by the public or employees shall occupy a separate compartment with walls or partitions and a door enclosing the fixtures to ensure privacy.

Exceptions:

1. Water closet compartments shall not be required in a single-occupant toilet room with a lockable door.
2. Toilet rooms located in day care and child-care facilities and containing two or more water closets shall be permitted to have one water closet without an enclosing compartment.
3. This provision is not applicable to toilet areas located within Group I-3 housing areas.

Reason: Occupants of an I-3 facility must be watched closely to assure that they do not harm others or themselves. This clarification is needed to assure supervision and sightlines needed for security in detention and correctional facilities is allowed to be maintained.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The absence of compartments or partitions in I-3 housing is necessary for monitoring inmates for illegal activities.

Assembly Action:

None

Final Hearing Results

Code Change No: P15-07/08

Original Proposal

Table 403.1 (IBC [P] Table 2902.1)

Proponent: Paul Rimel, City of Staunton, VA, representing Virginia Plumbing & Mechanical Inspectors Association

Revise table as follows:

**TABLE 403.1 ((Table [P] 2902.1) (Supp)
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES^a
(See Sections 403.2 and 403.3)**

No.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSETS	LAVATORIES	BATHTUBS/ SHOWERS
5	Institutional	I-4	Adult day care and child care	1 per 15	1 per 15	<u>1</u>

(Portions of table and footnotes not shown remain unchanged)

Reason: At least one bathtub or shower should be provided to ensure sanitary conditions in this use group. Such facilities are commonly needed to bath clients that have soiled themselves.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The decision on whether a tub or shower is needed for these occupancies is the responsibility of the facility owner. Some licensing agencies prohibit bathtubs or showers in child and adult care facilities.

Code Change No: **P17-07/08**

Original Proposal

Table 403.1 (IBC [P] Table 2902.1)

Proponent: Don Davies, Salt Lake City Corp., representing Utah Chapter ICC

Revise table by adding footnote e to every entry in the “Drinking Fountain” column:

TABLE 403.1 (Supp) (IBC TABLE [P] 2902.1) (Supp)
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES^a
(See Sections 403.2 and 403.3)

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSET (URINALS SEE SECTION 419.2)		LAVATORIES		BATHTUBS/SHOWERS	DRINKING FOUNTAIN ^b (SEE SECTION 410.1)	OTHER
				MALE	FEMALE	MALE	FEMALE			

(Portions of table not shown remain unchanged)

- a. The fixtures shown are based on one fixture being the minimum required for the number of persons indicated or any fraction of the number of persons indicated. The number of occupants shall be determined by the *International Building Code*.
- b. Toilet facilities for employees shall be separate from facilities for inmates or patients.
- c. A single-occupant toilet room with one water closet and one lavatory serving not more than two adjacent patient sleeping units shall be permitted where such room is provided with direct access from each patient room and with provisions for privacy.
- d. The occupant load for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of facilities required.
- e. Drinking fountains are not required for occupant loads fewer than 50.

Reason: Now that two drinking fountains are required in I.B.C. Section 1109.5.1 for high and low spouts the requirement for drinking fountains becomes excessive for smaller spaces. There is currently no lower limit for the requirement for drinking fountains in the code. The requirement for two restrooms starts at 15 occupants and for retail sales starts at 50 occupants and yet there is no lower limit for drinking fountains. Typically smaller offices provide bottled water or an ice and water dispenser on the refrigerator. Because there is no lower limit we feel that this requirement is ignored or overlooked in smaller occupant load areas anyway and because of that they may be overlooked altogether even in larger spaces. By requiring a reasonable lower limit we feel that this requirement will be more often enforced overall.

Cost Impact: The code change proposal will not increase the cost of construction. This proposal actually reduces the cost of construction by eliminating the requirement for drinking fountains in smaller buildings and spaces.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Drinking water is a basic necessity that must be provided for in all buildings, regardless of the occupant load.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 2:

Don K. Davies, Salt Lake City Corporation, representing Utah Chapter of ICC, requests Approval as Modified.

Modify proposal as follows:

**TABLE 403.1 (Supp) (IBC TABLE [P] 2902.1) (Supp)
MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES^a
(See Sections 403.2 and 403.3)**

NO.	CLASSIFICATION	OCCUPANCY	DESCRIPTION	WATER CLOSET (URINALS SEE SECTION 419.2)		LAVATORIES		BATHTUBS/SHOWERS	DRINKING FOUNTAIN ^b (SEE SECTION 410.1)	OTHER
				MALE	FEMALE	MALE	FEMALE			

(Portions of table not shown remain unchanged)

- The fixtures shown are based on one fixture being the minimum required for the number of persons indicated or any fraction of the number of persons indicated. The number of occupants shall be determined by the *International Building Code*.
- Toilet facilities for employees shall be separate from facilities for inmates or patients.
- A single-occupant toilet room with one water closet and one lavatory serving not more than two adjacent patient sleeping units shall be permitted where such room is provided with direct access from each patient room and with provisions for privacy.
- The occupant load for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of facilities required.
- Drinking fountains are not required for an occupant loads of 15 or fewer ~~than 50~~.

Commenter's Reason: Now that two drinking fountains are required in I.B.C. Section 1109.5.1 for high and low spouts the requirement for drinking fountains becomes excessive for smaller spaces. There is currently no lower limit for the requirement for drinking fountains in the code. The requirement for two restrooms starts at 15 occupants and for retail sales starts at 50 occupants and yet there is no lower limit for drinking fountains. Typically smaller offices are provided with break rooms which have sinks in them which can be used for drinking water or a water dispenser is provided in the refrigerator. We have reduced the lower limit from 49 to 15 occupants to align with the requirements where two restrooms are required. Because there is no lower limit we feel that this requirement is ignored or overlooked in smaller occupant load areas anyway and because of that they may be overlooked altogether even in larger spaces. By requiring a reasonable lower limit we feel that this requirement will be more uniformly enforced overall.

Final Hearing Results

P17-07/08

AMPC2

Code Change No: P26-07/08

Original Proposal

Sections: 403.4, 403.4.1(New)

Proponent: Guy Tomberlin, Fairfax County, VA, representing himself

1. Revise as follows:

403.4 Required public toilet facilities. Customers, patrons and visitors shall be provided with public toilet facilities in structures and tenant spaces intended for public utilization. ~~The accessible route to public facilities shall not pass through kitchens, storage rooms, closets or similar spaces.~~ The number of plumbing fixtures located within the required toilet facilities shall be provided in accordance with Section 403 for all users. Employees shall be provided with toilet facilities in all occupancies. Employee toilet facilities shall be either separate or combined employee and public toilet facilities.

2. Add new text as follows:

403.4.1 Access. The route to the public toilet facilities required by Section 403.4 shall not pass through kitchens, storage rooms and closets and shall not cross a property line other than onto a public way. Access to the required facilities shall be from within the building or from the exterior of the building. All routes shall comply with the accessibility requirements of the *International Building Code*. The public shall have access to the required toilet facilities at all times that the building is occupied.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

Reason: This proposed change provides useful guidance that the current code does not contain. The situation where the required plumbing facilities are located outside of the actual building itself is not an uncommon practice. However current code fails to state whether this type of configuration is permitted or prohibited. There are 3 basic areas of concern that this proposal attempts to resolve. 1) Yes, facilities do not have to be within the structure itself, as long as they are within the current requirements for maximum distance. 2) The required facilities shall always be open and available to all the intended users at all times of occupancy. 3) The current minimum fixture requirements and calculations are applicable and accountable for all intended users of the facilities.

During the final action hearings in Rochester it was stated that the code was already “clear on this subject and everyone knows the bathrooms are required inside of the structures.” This statement begs the questions:

1. What about gas stations? A typical gas station design requires that you walk outside of the structure and around the side to gain access to the bathrooms.
2. What about a typical outlet mall situation? It is not uncommon for a “strip” type outlet mall (a design that requires you travel outdoors to get from one store to the next) to provide bathrooms in one central location for several stores. Sometimes these facilities may be located out in a parking lot as long as the permitted travel distances are not exceeded.
3. Lastly what about Use Group A 5, bleachers? How do you install bathroom fixtures in a structure where no indoor area exists?

These 3 examples are common everyday designs that occur routinely across the US. So why not have the code say that this type of installation is acceptable instead of leaving it up to local interpretation?

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

403.4 Required public toilet facilities. Customers, patrons and visitors shall be provided with public toilet facilities in structures and tenant spaces intended for public utilization. The number of plumbing fixtures located within the required toilet facilities shall be provided in accordance with Section 403 for all users. Employees shall be provided with toilet facilities in all occupancies. Employee toilet facilities shall be either be separate or combined employee and public toilet facilities.

403.4.1 Access. The route to the public toilet facilities required by Section 403.4 shall not pass through kitchens, storage rooms ~~and or~~ closets ~~and shall not cross a property line other than onto a public way.~~ Access to the required facilities shall be from within the building or from the exterior of the building. All routes shall comply with the accessibility requirements of the *International Building Code*. The public shall have access to the required toilet facilities at all times that the building is occupied.

Committee Reason: The proposed text resolves the current code’s silence on whether toilet rooms can be accessed from the exterior of a building. The modification deletes the reference to property line because they do not have any impact on the location of toilet facilities.

Assembly Action:

None

2006 INTERNATIONAL RESIDENTIAL CODE

Code Change No: **RB227-07/08**

Original Proposal

Sections: AG 106.1, AG106.2, AG106.3, AG106.4, AG106.4.1, AG106.4.2, AG106.4.3, AG106.4.4, AG106.4.5, AG106.5, AG106.6, AG 108; IBC 3109.5, 3109.5.1, 3109.5.2, 3109.5.3, 3109.5.4, Chapter 35

Proponent: Lorraine Ross, Intech Consulting, Inc., representing the Association of Pool and Spa Professionals

THESE PROPOSALS ARE ON THE AGENDA OF THE IRC BUILDING/ENERGY AND THE IBC GENERAL CODE DEVELOPMENT COMMITTEES AS 2 SEPARATE CODE CHANGES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IRC

1. Delete and substitute as follows:

~~**AG106.1 General.** Suction outlets shall be designed to produce circulation throughout the pool or spa. Single outlet systems, such as automatic vacuum cleaner systems, or multiple suction outlets, whether isolated by valves or otherwise, shall be protected against user entrapment.~~

AG106.1 Suction entrapment avoidance. Pools, spas, hot tubs, catch basins and other similar bather accessible bodies of water associated with swimming pool construction shall be designed to produce circulation throughout the body of water and provide means to protect against user suction entrapment in accordance with ANSI/APSP 7.

2. Delete without substitution:

~~**AG106.2 Suction fittings.** Pool and spa suction outlets shall have a cover that conforms to ANSI/ASME A112.19.8M, or an 18 inch×23 inch (457mmby 584 mm) drain grate or larger, or an approved channel drain system.~~

~~**Exception:** Surface skimmers~~

~~**AG106.3 Atmospheric vacuum relief system required.** Pool and spa single or multiple-outlet circulation systems shall be equipped with atmospheric vacuum relief should grate covers located therein become missing or broken. This vacuum relief system shall include at least one approved or engineered method of the type specified herein, as follows:~~

- ~~1. Safety vacuum release system conforming to ASME A112.19.17; or~~
- ~~2. An approved gravity drainage system.~~

~~**AG106.4 Dual drain separation.** Single or multiple pump circulation systems shall be provided with a minimum of two suction outlets of the approved type. A minimum horizontal or vertical distance of 3 feet (914 mm) shall separate the outlets. These suction outlets shall be piped so that water is drawn through them simultaneously through a vacuum-relief-protected line to the pump or pumps.~~

~~**AG106.5 Pool cleaner fittings.** Where provided, vacuum or pressure cleaner fitting(s) shall be located in an accessible position(s) at least 6 inches (152 mm) and not more than 12 inches (305 mm) below the minimum operational water level or as an attachment to the skimmer(s).~~

3. Add standard in Section AG108 as follows:

ANSI/APSP-7-06 Standard for Suction Entrapment Avoidance in Swimming Pools, Wading Pools, Spas, Hot Tubs, and Catch Basins

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

Reason: This proposal adds a new standard, ANSI/APSP 7 Standard for Suction Entrapment Avoidance in Swimming Pools, Wading Pools, Spas, Hot Tubs, and Catch Basins into IRC Section AG 106. It also deletes Sections AG 106.2 through AG 106.6 because all of these requirements have been incorporated into ANSI/APSP 7.

The current code language was an early response to body entrapment only. New information and technology has contributed to this new ANSI/APSP consensus standard and addresses all forms of entrapment, including the underlying causes of entrapment.

Although rare, entrapment of bathers at suction outlets in pools and spas has gained considerable attention over the last decade, resulting in voluntary standards, building codes, and proposed national legislation to prevent these tragic accidents.

A survey of the Epidemiological Reports on Suction Entrapment collected by the U.S. Consumer Product Safety Commission by the Association of Pool and Spa Professionals (APSP) Technical Committee yielded 5 distinct modes of Entrapment:

Entrapment Type	Percentage of Incidents
Hair Entrapment - Hair becomes knotted or snagged in an outlet cover	33%
Limb Entrapment – A limb sucked or inserted into an opening of a circulation outlet with a broken or missing cover resulting in a mechanical bind or swelling	28%
Body Entrapment – Suction applied to a large portion of the body or limbs resulting in an entrapment	33%
Evisceration/Disembowelment – suction applied directly to the intestines by a circulation outlet with a broken or missing cover.	3%
Mechanical Entrapment - Potential for jewelry, swimsuit, hair decorations, finger, toe, or knuckle to be mechanically caught in an opening of a suction outlet or cover.	Included in limb

Early actions to address entrapment were aimed at *body* entrapment by attempting to control the suction pressure at the drain itself.

Unfortunately, these devices do not protect against the major forms of entrapment: hair or evisceration. **Additionally, if the pool circulation pump is off - meaning no suction at the outlet - a child can still get a limb trapped if there is a broken or missing cover.**

Suction is only one factor to control in entrapment avoidance.

In order to address avoidance of all forms of entrapment, a comprehensive study of the causes of all types of entrapment was undertaken. It is now known that there are three basic underlying physical phenomena that govern all 5 modes of entrapment:

- Suction (or delta pressure)
- Water flow rate through the outlet or cover
- Mechanical binding

The Technical Committee of the Association of Pool and Spa Professionals (APSP) examined various means to prevent these types of entrapments recognizing the diverse nature of pool construction. Using this knowledge, a new national consensus standard was developed in accordance with the American National Standards Institute (ANSI) process. ANSI/APSP 7 *Standard for Suction Entrapment Avoidance in Swimming Pools, Wading Pools, Spas, Hot tubs, and Catch Basins (ANSI/APSP 7)* is based upon sound engineering principles, research, and field experience, that, when applied properly, provides the most comprehensive approach to protect bathers against all modes of entrapment. The ANSI standard approval process itself ensured that a wide variety of stakeholders were involved in the development of this standard, including building code officials, governmental health and pool industry experts.

The ANSI/APSP 7 standard applies to both commercial and residential pools, for flow rates from a few gallons per minute to thousands of gallons per minute. Although it includes the use of devices or systems that prevent suction, it also expands the lists of options for the pool contractor, while maintaining necessary protective principles.

ANSI/APSP-7 contains design performance criteria including components, devices and related technology installed to protect against entrapment. Analysis of past entrapments along with extensive testing shows:

- An outlet cover that complies with ASME/ANSI A112.19.8 will protect against limb, evisceration and mechanical entrapment

If the cover is missing or broken, there is no single device or system that can protect against entrapment. **For example, if the pool circulation pump is off - meaning no suction at the outlet - a child can still get a limb mechanically trapped,**

Therefore, ANSI/APSP 7 contains a warning to shut down the pool.

Unlike suction release devices that must be tested monthly, a pool owner can easily see if the cover is broken or missing. Having a SVRS with a missing or broken cover does not protect against limb, hair or mechanical entrapment and may give a pool owner a false sense of security regarding entrapment prevention.

- The maximum water flow rate in ANSI/APSP-7 is based on 6 fps and when combined with the required outlet cover provides protection against hair, limb, evisceration and mechanical entrapment.

Testing shows that water flow has a significant impact on entrapment avoidance.

- When used with a proper outlet cover and maximum water flow rate, options to address body entrapment in ANSI/APSP-7 include:
 - Dual Outlets at least 36" apart, measured center to center
 - Three or more outlets
 - Single Unblockable
 - Swim Jet
 - Alternative Suction System
 - Gravity Flow Systems
 - Outlet pumps in Series plus
 - SVRS, or
 - Vent, or
 - Additional Suction

The ability of dual drains to prevent body entrapment was recently demonstrated by a series of tests conducted by the APSP Technical Committee. Results showed that even with one drain blocked and a missing cover on the other, the low water flow rate mandated by ANSI/APSP-7 prevented the necessary suction to hold down the 15 lb buoyant block used as a "pass" criteria when testing SVRS.

This test series illustrates the importance of water flow at the outlet when developing entrapment avoidance measures.

ANSI/APSP-7 utilizes the most comprehensive approach to outlet entrapment because it considers all underlying causes: suction, water flow and mechanical – while recognizing the diverse nature of pool and spa design. It covers all 5 forms of entrapment.

Tests conducted on dual outlets configured as described in ANSI/APSP-7 demonstrate:

- The size of the outlets and piping do have an effect on safe installation
- Water velocity of 6 fps (ANSI/APSP-7 maximum) *passed* an analogous ASME/ASTM SVRS test protocol,
- The combination of maximum water flow rates and dual outlets prevent body entrapment (with no SVRS), even if one outlet is blocked.
- Dual outlets, when installed according to ANSI/APSP-7, pass the same test criteria as the SVRS in both ASME/ANSI A112.19.17-2002 and ASTM F2387-2003, reacting faster than the 3 seconds response time and work properly in combination with skimmers.

Using submerged piping as is found in pools and spas, tests conducted on SVRS systems and both the ASME/ASTM SVRS standards demonstrate:

- Not all SVRS tested to the ASME/ASTM SVRS Standards will reliably "trip" when combined with dual outlets and/or skimmers – Those that fail seem to interpret residual flow from the second outlet as a priming pump.
- Not all SVRS tested to the ASME/SVRS Standards "trip" with partial outlet blockage.
- Water dynamics, in particular water hammer can facilitate release. Once the block is forced off the cover by these spikes in pressure, it floats to the surface. Neutrally buoyant blocks have been documented to "hammer" on and off open pipes for several seconds.
- Water dynamics continue for several seconds. The longest on an SVRS test lasted 2.72 seconds, which may call into question the 3 second limit.

Tests conducted on a U-Tube Vent on a single 18 x 18 suction outlet demonstrates:

- A single 18 x 18 drain grate can be successfully vented operating at 420 gpm with a 1 inch PVC vent pipe.
- Release is very fast – shortest release was 2.5 seconds
- While it was difficult to completely block the drain using a Human test subject, it was possible to do so sufficiently to trip the vent. The actual suction sensation of this experience was far less than what is experienced when an 8 inch sump is blocked.

ANSI/APSP -7 is the appropriate national consensus standard that is recommended for adoption in building codes. It has taken into account the initial steps taken in the building codes for specific devices and has expanded entrapment protection to include all 5 forms of entrapment by controlling all 3 underlying entrapment causes. In short, pool and spas designed and installed in accordance with ANSI/APSP – 7 are safer than those that rely upon a single device alone.

The technical committee of APSP is committed to continuing the effort to seek new understanding and knowledge regarding entrapment avoidance. Education of building code officials, legislators, pool designers and contractors and pool owners will always be a major activity of the APSP.

Cost Impact: The code change proposal will not increase the cost of construction.

PART II – IBC GENERAL

1. Delete and substitute as follows:

~~**3109.5 Entrapment avoidance.** Suction outlets shall be designed to produce circulation throughout the pool or spa. Single outlet systems, such as automatic vacuum cleaner systems, or other such multiple suction outlets whether isolated by valves or otherwise shall be protected against user entrapment.~~

3109.5 Suction entrapment avoidance. Pools, spas, hot tubs, catch basins and other similar bather accessible bodies of water associated with swimming pool construction shall be designed to produce circulation throughout the body of water and provide means to protect against user suction entrapment in accordance with ANSI/APSP 7.

2. Delete without substitution:

~~**3109.5.1 Suction fittings.** All pool and spa suction outlets shall be provided with a cover that conforms to ASME A112.19.8M, a 12-inch by 12-inch (305 mm by 305 mm) drain grate or larger, or an approved channel drain system.~~

~~**Exception:** Surface skimmers.~~

~~**3109.5.2 Atmospheric vacuum relief system required.** All pool and spa single or multiple outlet circulation systems shall be equipped with an atmospheric vacuum relief approved or engineered method of the type specified herein, as follows:~~

- ~~1. Safety vacuum release systems conforming to ASME A112.19.17; or~~
- ~~2. Approved gravity drainage system.~~

~~**3109.5.3 Dual drain separation.** Single or multiple pump circulation systems shall be provided with a minimum of two suction outlets of the approved type. A minimum horizontal or vertical distance of 3 feet (914 mm) shall separate such outlets. These suction outlets shall be piped so that water is drawn through them simultaneously through a vacuum-relief-protected line to the pump or pumps.~~

~~**3109.5.4 Pool cleaner fittings.** Where provided, vacuum or pressure cleaner fitting(s) shall be located in an accessible position(s) at least 6 inches (152 mm) and not greater than 12 inches (305 mm) below the minimum operational water level or as an attachment to the skimmer(s).~~

3. Add standard to Chapter 35 as follows:

ANSI/APSP-7-06 Standard for Suction Entrapment Avoidance in Swimming Pools, Wading Pools, Spas, Hot Tubs, and Catch Basins

Reason: This proposal adds a new standard, ANSI/APSP 7 Standard for Suction Entrapment Avoidance in Swimming Pools, Wading Pools, Spas, Hot Tubs, and Catch Basins into IBC Section 3109.5. It also deletes Sections 3109.5.1 through 3109.5.5 because all of these requirements have been incorporated into ANSI/APSP 7.

The current code language was an early response to body entrapment only. New information and technology has contributed to this new ANSI/APSP consensus standard and addresses all forms of entrapment, including the underlying causes of entrapment.

Although rare, entrapment of bathers at suction outlets in pools and spas has gained considerable attention over the last decade, resulting in voluntary standards, building codes, and proposed national legislation to prevent these tragic accidents.

A survey of the Epidemiological Reports on Suction Entrapment collected by the U.S. Consumer Product Safety Commission by the Association of Pool and Spa Professionals (APSP) Technical Committee yielded 5 distinct modes of Entrapment:

Entrapment Type	Percentage of Incidents
Hair Entrapment - Hair becomes knotted or snagged in an outlet cover	33%
Limb Entrapment – A limb sucked or inserted into an opening of a circulation outlet with a broken or missing cover resulting in a mechanical bind or swelling	28%
Body Entrapment – Suction applied to a large portion of the body or limbs resulting in an entrapment	33%
Evisceration/Disembowelment – suction applied directly to the intestines by a circulation outlet with a broken or missing cover.	3%
Mechanical Entrapment - Potential for jewelry, swimsuit, hair decorations, finger, toe, or knuckle to be mechanically caught in an opening of a suction outlet or cover.	Included in limb

Early actions to address entrapment were aimed at *body* entrapment by attempting to control the suction pressure at the drain itself. Unfortunately, these devices do not protect against the major forms of entrapment: hair or evisceration. **Additionally, if the pool circulation pump is off - meaning no suction at the outlet - a child can still get a limb trapped if there is a broken or missing cover.**

Suction is only one factor to control in entrapment avoidance.

In order to address avoidance of all forms of entrapment, a comprehensive study of the causes of all types of entrapment was undertaken. It is now known that there are three basic underlying physical phenomena that govern all 5 modes of entrapment:

- Suction (or delta pressure)
- Water flow rate through the outlet or cover
- Mechanical binding

The Technical Committee of the Association of Pool and Spa Professionals (APSP) examined various means to prevent these types of entrapments recognizing the diverse nature of pool construction. Using this knowledge, a new national consensus standard was developed in accordance with the American National Standards Institute (ANSI) process. ANSI/APSP 7 *Standard for Suction Entrapment Avoidance in Swimming Pools, Wading Pools, Spas, Hot tubs, and Catch Basins (ANSI/APSP 7)* is based upon sound engineering principles, research, and field experience, that, when applied properly, provides the most comprehensive approach to protect bathers against all modes of entrapment. The ANSI standard approval process itself ensured that a wide variety of stakeholders were involved in the development of this standard, including building code officials, governmental health and pool industry experts.

The ANSI/APSP 7 standard applies to both commercial and residential pools, for flow rates from a few gallons per minute to thousands of gallons per minute. Although it includes the use of devices or systems that prevent suction, it also expands the lists of options for the pool contractor, while maintaining necessary protective principles.

ANSI/APSP-7 contains design performance criteria including components, devices and related technology installed to protect against entrapment. Analysis of past entrapments along with extensive testing shows:

- An outlet cover that complies with ASME/ANSI A112.19.8 will protect against limb, evisceration and mechanical entrapment

If the cover is missing or broken, there is no single device or system that can protect against entrapment. **For example, if the pool circulation pump is off - meaning no suction at the outlet - a child can still get a limb mechanically trapped,**

Therefore, ANSI/APSP 7 contains a warning to shut down the pool.

Unlike suction release devices that must be tested monthly, a pool owner can easily see if the cover is broken or missing. Having a SVRS with a missing or broken cover does not protect against limb, hair or mechanical entrapment and may give a pool owner a false sense of security regarding entrapment prevention.

- The maximum water flow rate in ANSI/APSP-7 is based on 6 fps and when combined with the required outlet cover provides protection against hair, limb, evisceration and mechanical entrapment.

Testing shows that water flow has a significant impact on entrapment avoidance.

- When used with a proper outlet cover and maximum water flow rate, options to address body entrapment in ANSI/APSP-7 include:
 - Dual Outlets at least 36" apart, measured center to center
 - Three or more outlets
 - Single Unblockable
 - Swim Jet
 - Alternative Suction System
 - Gravity Flow Systems
 - Outlet pumps in Series plus
 - SVRS, or
 - Vent, or
 - Additional Suction

The ability of dual drains to prevent body entrapment was recently demonstrated by a series of tests conducted by the APSP Technical Committee. Results showed that even with one drain blocked and a missing cover on the other, the low water flow rate mandated by ANSI/APSP -7 prevented the necessary suction to hold down the 15 lb buoyant block used as a "pass" criteria when testing SVRS.

This test series illustrates the importance of water flow at the outlet when developing entrapment avoidance measures.

ANSI/APSP-7 utilizes the most comprehensive approach to outlet entrapment because it considers all underlying causes: suction, water flow and mechanical – while recognizing the diverse nature of pool and spa design. It covers all 5 forms of entrapment.

Tests conducted on dual outlets configured as described in ANSI/APSP-7 demonstrate:

- The size of the outlets and piping do have an effect on safe installation
- Water velocity of 6 fps (ANSI/APSP-7 maximum) *passed* an analogous ASME/ASTM SVRS test protocol,
- The combination of maximum water flow rates and dual outlets prevent body entrapment (with no SVRS), even if one outlet is blocked.
- Dual outlets, when installed according to ANSI/APSP-7, pass the same test criteria as the SVRS in both ASME/ANSI A112.19.17-2002 and ASTM F2387-2003, reacting faster than the 3 seconds response time and work properly in combination with skimmers.

Using submerged piping as is found in pools and spas, tests conducted on SVRS systems and both the ASME/ASTM SVRS standards demonstrate:

- Not all SVRS tested to the ASME/ASTM SVRS Standards will reliably "trip" when combined with dual outlets and/or skimmers – Those that fail seem to interpret residual flow from the second outlet as a priming pump.
- Not all SVRS tested to the ASME/SVRS Standards "trip" with partial outlet blockage.
- Water dynamics, in particular water hammer can facilitate release. Once the block is forced off the cover by these spikes in pressure, it float to the surface. Neutrally buoyant blocks have been documented to "hammer" on and off open pipes for several seconds.
- Water dynamics continue for several seconds. The longest on an SVRS test lasted 2.72 seconds, which may call into question the 3 second limit.

Tests conducted on a U-Tube Vent on a single 18 x 18 suction outlet demonstrates:

- A single 18 x 18 drain grate can be successfully vented operating at 420 gpm with a 1 inch PVC vent pipe.
- Release is very fast – shortest release was 2.5 seconds
- While it was difficult to completely block the drain using a Human test subject, it was possible to do so sufficiently to trip the vent. The actual suction sensation of this experience was far less than what is experienced when an 8 inch sump is blocked.

ANSI/APSP -7 is the appropriate national consensus standard that is recommended for adoption in building codes. It has taken into account the initial steps taken in the building codes for specific devices and has expanded entrapment protection to include all 5 forms of entrapment by controlling all 3 underlying entrapment causes. In short, pool and spas designed and installed in accordance with ANSI/APSP – 7 are safer than those that rely upon a single device alone.

The technical committee of APSP is committed to continuing the effort to seek new understanding and knowledge regarding entrapment avoidance. Education of building code officials, legislators, pool designers and contractors and pool owners will always be a major activity of the APSP.

Cost Impact: This code change proposal will not increase the cost of construction

Public Hearing Results

PART I – IRC

Committee Action:

Disapproved

Committee Reason: This is a critical safety issue. The organizations need to work together to bring back a proposal that gives us better guidance. Section AG106.1 is poorly written. It is not known what is meant by "similar bather accessible bodies of water associated with swimming pools construction". Section AG106.1 is not the language directly out of the standard. This could be interpreted to apply to a drainage pond or goldfish pond in the yard. Also, this section will require all pools to have a circulation system and there are some pools that do not require this.

Assembly Action:

None

PART II – IBC GENERAL

Committee Action:

Disapproved

Committee Reason: Based upon proponents request.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted for Part I.

Public Comment 2:

Lorraine Ross, Intech Consulting Inc., representing the Association of Pool and Spa Professionals, requests Approval as Modified by this Public Comment.

Modify proposal as follows:

~~AG106.1 Suction entrapment avoidance. Pools, spas, hot tubs, catch basins and other similar bather accessible bodies of water associated with swimming pool construction shall be designed to produce circulation throughout the body of water and provide means to protect against user suction entrapment in accordance with ANSI/APSP-7.~~ **General.** Suction outlets shall be designed and installed in accordance with ANSI/APSP-7.

Revise standard in AG108 as follows:

ASME/ANSI

A112.19.8M-1987(R1996) 8-2007 Suction Fittings for Use in Swimming Pools, Wading Pools, Spas, Hot Tubs and Whirlpool Bathing Appliances

Commenter's Reason: Current 2006 IRC entrapment avoidance language is in direct conflict with The Virginia Graeme Baker Federal Pool and Spa Safety Act, (Act) adopted in December 2007. The Act preempts sections of the IRC, and any code or state law that adopts the 2006 IRC after December 20, 2008 will be in violation of this Act. APSP realizes that this code development cycle will result in the 2009 IBC. So we are working diligently in those states where 2006 adoption has taken place or are contemplating adoption of the 2006 IBC to make necessary amendments to the entrapment avoidance section of the code.

APSP proposes this Public Comment for RB-227 Part I (IRC) to follow the intent of the Federal Act in its findings to increase pool safety by recognizing that there have been great strides in technology and pool and spa design regarding entrapment avoidance.

With respect to entrapment avoidance, the provisions in the new law are consistent with ANSI/APSP-7 American National Standard for Suction Entrapment Avoidance (ANSI/APSP-7). This standard provides that all swimming pools and spas are to use proper anti-entrapment drain covers and circulation and drainage systems. The new standard will eliminate all future risk of all five forms of entrapment in pools and spas designed and installed in accordance with ANSI/APSP-7.

Some of the areas of conflict between the 2006 IRC and the Federal Act:

- As of December 20, 2008, Section 1404 (b) of the Federal Pool and Spa Safety Act expressly prohibits the manufacture sale or introduction into commerce of any drain cover that does not comply with ASME/ANSI A112.19.8 2007. This provision is defined as a "Consumer Product Safety Rule," meaning that the issue has been pre-empted. Hence, under the Consumer Product Safety Act, state and local governments may not establish or continue in effect any standard or regulation designed to deal with this same risk of injury unless said state or local requirements are identical the federal standard. 15 U.S.C. 2075(a).
- The 2006 IRC Section AG108 currently refers to the prior and now superseded 1987 (reaffirmed 1996) edition of the ASME A112.19.8 standard. This modification, which adopts the 2007 version of the standard corrects this conflict between the 2006 IBC and the Federal Act. There are substantial differences between this earlier edition and the 2007 version which is cited in the Act. For example, the newer standard includes enhanced resistance to UV rays, enhanced fastening requirements, resistance to hair entanglement and a new body block test that requires each drain to prevent body entrapment even when installed as a single, blockable drain.
- Section AG 106.2 of the IRC requires ASME 19.8 complaint covers, **or** a grate 12 x 12 **or** larger **or** a channel drain. Section 1404(c)(1) of the Act requires that all outlets/drains in all public pools be protected with ASME A112.19.8 - 2007 covers, regardless of size or shape. .
- Section 1406 of the Act calls for states to allow residential pools that have
 - (I) more than one drain
 - (II) 1 or more unblockable drains, or
 - (III) no main drain)

Section AG106.1 of the IRC states "Suction outlets shall be designed to produce circulation throughout the pool or spa," and code officials have at times interpreted this provision to mean that a pool or spa may not be built without a main drain. This is in direct conflict with the intent of Congress, which is to allow states to permit pools without drains. Elimination of drains is the most effective way to eliminate entrapment injuries.

ANSI/APSP-7 (section 5.2) expressly allows for pools without suction outlets.

- 1406(d)(1) of the Act calls for states to require one of a series of options on residential pools "except for pools constructed without a single main drain." This is consistent with ANSI/APSP-7, which recognizes that SVRS and other shut off devices are only intended to work and are tested to work on pools or spas that have a single source of suction, not pools or spas with multiple drains. The Act also allows for eight backup options including any device which complies with either SVRS standard ASME or ASTM. However, the 2006 IRC section excludes five of these options, ignores one of the recognized SVRS standards cited in the Act and also requires "a backup for another backup" when multiple outlets are present –a clear conflict with the Federal Act. This IRC provision is also not consistent with the Act.

COMPARISON OF FEDERAL POOL AND SPA SAFETY ACT 2007*, ANSI/APSP-7 AND 2006 IRC CODE

Federal Pool & Spa Safety Act of 2007 *	ANSI/APSP-7 (See Note 1)	2006 ICC International Residential Codes
1404 (b) FEDERAL ACT (See Note 2) Requires that all drain (suction outlet) covers be tested and certified to ASME/ANSI A112.19.8-2007	Yes Section 4.5	No Section AG106.2 Exempts drains 18" x 23" or larger Exempts channel drains Permits grates 18" x 23" or larger
1406(a)(1)(A)(iv) <u>GRANT PROGRAM</u> Requires such covers to comply with "any successor standard" or version of ASME/ANSI A112.19.8	Yes Section 4.5	No Section AG108 Standards lists ANSI/ASME A112.19.8M-1987 (R1996) Suction Fittings for Use in Swimming Pools, Wading Pools, Spas, Hot Tubs and Whirlpool Bathing Appliances
1406(d)(1)(A-F) <u>GRANT PROGRAM</u> Existing pools with single drain that is not unblockable to have added protection	Yes Section 6.3	Yes Section AG106.3
1406(d)(1)(A-F) <u>GRANT PROGRAM</u> Allows all options recognized in ASME/ANSI A112.19.17 to protect single drain installations in residential pools and spas	Yes Section 7	No Section AG106.3 Prescriptive language requires "atmospheric vacuum relief" eliminating reversing circulation flow inconsistent with ASME/ANSI A112.19.17 Section 1.4 <i>Safety Vacuum Release System</i>
1406(d)(1)(A-F) <u>GRANT PROGRAM</u> Allows all devices that comply with ASTM F2387 to protect single drain installations in residential pools and spas	Yes Section 7.1	No Section AG106.3 Sub 1. Section AG108 Standards: ASTM F2387 not included
1406(d)(1)(A-F) <u>GRANT PROGRAM</u> Recognizes that SVRS or other devices are not required on pools or spas with multiple drains or an unblockable drain in residential pools	Yes Section 5.5.2	No Section AG3109.5.2

1. ANSI/APSP-7 2006 Standard for Suction Entrapment Avoidance in Swimming Pools, wading Pools, Spas, hot Tubs and Catch Basins.

2. Federal Act refers to section 1404, which creates a Federal Swimming Pool and Spa Drain Cover Standard, and requires that public pools be equipped with certain devices.

* The Federal Pool and Spa safety Act also known as the Virginia Graeme Baker Pool & Spa Safety Act

Adopting ANSI/APSP-7 into the IRC easily satisfies the Federal Act mandates and requirements for the optional grant program for states in regulating residential pools and spas.

ANSI/APSP-7 was reviewed and found to be in compliance with ICC policy regarding consensus standards by the ICC Staff prior to the Code Development Hearings in Palm Springs. The Committee recommended that APSP re-examine the "charging language" regarding the reference to ANSI/APSP-7. This has been accomplished in this modification.

APSP also realizes that this code development cycle will result in the 2009 IRC. So we are working diligently in those states where 2006 adoption has taken place or are contemplating adoption of the 2006 IBC to make necessary amendments to the entrapment avoidance section of the code.

More than 420 feet	1,000 psf								
Deleted	405.7	<p>Delete without substitution:</p> <p>[F] 405.7 Public address. A public address system shall be provided where required by Section 907.2.19.1.</p>	2008						
407.2.1	407.2.1	<p>407.2.1 Spaces of unlimited area. Waiting areas and similar spaces constructed as required for corridors shall be permitted to be open to a corridor, only where all of the following criteria are met:</p> <ol style="list-style-type: none"> 1. The spaces are not occupied for patient sleeping units, treatment rooms, hazardous or incidental accessory occupancies uses in accordance with Section 508.2. 2. The open space is protected by an automatic fire detection system installed in accordance with Section 907. 3. The corridors onto which the spaces open, in the same smoke compartment, are protected by an automatic fire detection system installed in accordance with Section 907, or the smoke compartment in which the spaces are located is equipped throughout with quick-response sprinklers in accordance with Section 903.3.2. 4. The space is arranged so as not to obstruct access to the required exits. 	2007						
407.2.3	407.2.3	<p>407.2.3 Mental health treatment areas. Areas wherein mental health patients who are not capable of self-preservation are housed, or group meeting or multipurpose therapeutic spaces other than incidental accessory occupancies uses in accordance with Section 508.2, under continuous supervision by facility staff, shall be permitted to be open to the corridor, where the following criteria are met:</p> <ol style="list-style-type: none"> 1. Each area does not exceed 1,500 square feet (140 m²). 2. The area is located to permit supervision by the facility staff. 3. The area is arranged so as not to obstruct any access to the required exits. 4. The area is equipped with an automatic fire detection system installed in accordance with Section 907.2. 5. Not more than one such space is permitted in any one smoke compartment. 6. The walls and ceilings of the space are constructed as required for corridors. 	2007						
408.3.7 (New)		<p>408.3.7 Guard tower doors. A hatch or trap door not less than 16 square feet (610 m²) in area through the floor and having minimum dimensions of not less than 2 feet (610 mm) in any direction shall be permitted to be used as a portion of the means of egress from to access guard towers.</p>	2008						

2009 SECTION	2006 SECTION	DESCRIPTION OF REVISION	CCC REF YEAR
408.4	408.4	408.4 Locks. Egress doors are permitted to be locked in accordance with the applicable use condition. Doors from an area of refuge area to the exterior are permitted to be locked with a key in lieu of locking methods described in Section 408.4.1. The keys to unlock the exterior doors shall be available at all times and the locks shall be operable from both sides of the door.	2006
408.5.1 (New) 408.5.2 (New)		<p>408.5.1 Floor openings. Openings in floors within a housing unit are permitted without enclosure protection a <u>shaft enclosure</u>, provided all the following conditions are met:</p> <ol style="list-style-type: none"> 1. The entire normally occupied areas so interconnected are open and unobstructed so as to enable observation of the areas by supervisory personnel; 2. Means of egress capacity is sufficient for all occupants from all interconnected cell tiers and areas; 3. The height difference between the floor levels of the highest and lowest cell tiers shall not exceed 23 feet (7010 mm); and 4. Egress from any portion of the cell tier to an exit or exit access door shall not require travel on more than one additional floor level within the housing unit. <p>408.5.2 Shaft openings in communicating floor levels. Where a floor opening is permitted between communicating floor levels of residential a housing unit in accordance with Section 408.5.1, plumbing chases serving vertically stacked individual cells contained with the area housing unit shall be permitted without a <u>shaft enclosure</u>.</p>	2008
410.5.3	410.5.3	410.5.3 Stage exits. At least one approved means of egress shall be provided from each side of the stage and from each side of the space under the stage. At least one means of escape shall be provided from each fly gallery and from the gridiron. A steel ladder, alternating tread stairway device or spiral stairway is permitted to be provided from the gridiron to a scuttle in the stage roof.	2007
412.2 (New)	412.3.1 412.5.1	<p>412.2 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meaning shown herein.</p> <p>FIXED BASE OPERATOR (FBO). A commercial business granted the right by the airport sponsor to operate on an airport and provide aeronautical services such as fueling, hangaring, tie-down and parking, aircraft rental, aircraft maintenance and flight instruction.</p> <p>HELIPORT. An area of land or water or a structural surface that is used, or intended for use, for the landing and taking off of helicopters, and any appurtenant areas that are used, or intended for use, for heliport buildings or other heliport facilities.</p> <p>HELISTOP. The same as "Heliport," except that no fueling, defueling, maintenance, repairs or storage of helicopters is permitted.</p> <p>RESIDENTIAL AIRCRAFT HANGAR. An accessory building less than 2,000 square feet (186 m²) and 20 feet (6096 mm) in building height constructed on a one- or two-family property where aircraft are stored. Such use will be considered as a residential accessory use incidental to the dwelling.</p> <p>TRANSIENT AIRCRAFT. Aircraft based at another location and at the transient location for not more than 90 days.</p>	2008
414.1.3	414.1.3	<p>[F] 414.1.3 [Supp] Information required. <u>A report shall be submitted to the building official identifying the maximum expected quantities of hazardous materials to be stored, used in a closed system and used in an open system, and subdivided to separately address hazardous materials classification categories based on Tables 307.1(1) and 307.1(2). The methods of protection from such hazards, including but not limited to control areas, fire protection systems and Group H occupancies shall be indicated in the report and on the construction documents. The opinion and report shall be prepared by a qualified person, firm or corporation approved by the building official and shall be provided without charge to the enforcing agency.</u></p> <p>For buildings and structures with an occupancy in Group H, separate floor plans shall be submitted identifying the locations of anticipated contents and processes so as to reflect the nature of each occupied portion of every building and structure. A report shall be submitted to the code official identifying the maximum expected quantities of hazardous materials to be stored, used in a closed system and used in an open system, and subdivided to separately address hazardous materials classification categories based on Tables 307.1(1) and 307.1(2). The methods of protection from such hazards, including but not limited to control areas, fire protection systems and Group H occupancies shall be indicated in the report and on the construction documents. The opinion and report shall be prepared by a qualified person, firm or corporation approved by the building official and shall be provided without charge to the enforcing agency.</p>	2007

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

2009 SECTION	2006 SECTION	DESCRIPTION OF REVISION	CCC REF YEAR
419.3.1	419.3.1	419.3.1 (Supp) Egress capacity. The egress capacity for each element of the live/work unit shall be based on the occupancy <u>occupant</u> load for the occupancy <u>function</u> served in accordance with Table 1004.1.1.	2008
509.8	509.8	<p>509.8 Group B or M with Group S-2 open parking garage. Group B or M occupancies located no higher than the first story above grade plane <u>and located below a Group S-2 open parking garage</u> shall be considered as a separate and distinct building for the purpose of determining the type of construction where all of the following conditions are met:</p> <ol style="list-style-type: none"> 1. The buildings are separated with a horizontal assembly having a minimum 2-hour fire-resistance rating. 2. The occupancies in the building below the horizontal assembly are limited to Groups B and M. 3. The occupancy above the horizontal assembly is limited to a Group S-2 open parking garage. 4. The building below the horizontal assembly is of Type I or II construction but not less than the type of construction required for the Group S-2 open parking garage above. 5. The height and area of the building below the horizontal assembly does not exceed the limits set forth in Section 503. 6. The height and area of the Group S-2 open parking garage does not exceed the limits set forth in Section 406.3. The height, in both feet and stories, of the Group S-2 open parking garage shall be measured from grade plane and shall include the building below the horizontal assembly. 7. Exits serving the Group S-2 open parking garage discharge directly to a street or public way and are separated from the building below the horizontal assembly by 2-hour fire barriers constructed in accordance with Section 706 or 2-hour horizontal assemblies constructed in accordance with Section 711, or both. 	2008

907.3 (New)		907.3 Where required – existing buildings. The installation and maintenance of fire alarm systems in existing buildings shall be in accordance with the <i>International Fire Code</i> .	2008				
907.6.2	907.7.2	Section 907.7.2 (Suppl) Revise exception to read as follows: "...as required in Sections 907.2.10.4 and 907.3.4.3. "	2008				
915 (New)		SECTION 913 EMERGENCY RESPONDER RADIO COVERAGE	2008				
		[F] 913.1 General. Emergency responder radio coverage shall be provided in all new buildings in accordance with Section 510 of the <i>International Fire Code</i> .					
1005.1	1005.1	1005.1 (IFC [B] 1005.1) Minimum required egress width. The means of egress width shall not be less than required by this section. The total width of means of egress in inches (mm) shall not be less than the total occupant load served by the means of egress multiplied by <u>0.3 inches (7.62 mm) per occupant for stairways, and by 0.2 inches (5.08 mm) per occupant for other egress components.</u> the factors in Table 1005.1 and The width shall not be less than specified elsewhere in this code. Multiple means of egress shall be sized such that the loss of any one means of egress shall not reduce the available capacity to less than 50 percent of the required capacity. The maximum capacity required from any story of a building shall be maintained to the termination of the means of egress. Exception: Means of egress complying with Section 1025.	2008				
1009.11 (New)		1009.11 Ships ladders. Ship ladders are permitted to be used in <u>Group I-3</u> as a component of a means of egress to and from control rooms or elevated facility observation stations not more than 250 SF (23sq m) with not more than 3 occupants and for access to unoccupied roofs in Group I-3. Ship ladders shall have a minimum projected tread of 5 inches (127 mm), a minimum tread depth of 8.5 inches (216 mm), a minimum tread width of 15 inches (612 mm) and a maximum riser height of 9.5 inches (241 mm). Handrails shall be provided on both sides of ship ladders.	2008				
1012.3 1012.3.1 1012.3.2	1012.3 1012.3 1012.3	1012.3 Handrail graspability. All Required handrails shall <u>comply with Section 1012.3.1 meet Type I as follows</u> or shall provide equivalent graspability. Exception: In Group R-3 occupancies; within dwelling units in Group R-2 occupancies; and in Group U occupancies that are accessory to a Group R-3 occupancy or accessory to individual dwelling units in Group R-2 occupancies; handrails shall comply with Section 1012.3.1 or 1012.3.2 or shall provide equivalent graspability.	2007				

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

2009 SECTION	2006 SECTION	DESCRIPTION OF REVISION	CCC REF YEAR
		<p>1012.3.1 Type I. Handrails with a circular cross-section shall have an outside diameter of at least 1.25 inches (32 mm) and not greater than 2 inches (51 mm). If the handrail is not circular, it shall have a perimeter dimension of at least 4 inches (102 mm) and not greater than 6.25 inches (160 mm) with a maximum cross-section dimension of 2.25 inches (57 mm). Edges shall have a minimum radius of 0.01 inch (0.25 mm).</p> <p>Exception: In Group R-3 occupancies; within dwelling units in Group R-2 occupancies; and in Group U occupancies that are accessory to a Group R-3 occupancy or accessory to individual dwelling units in Group R-2 occupancies; handrails shall be Type I, Type II as follows or shall provide equivalent graspability.</p> <p>1012.3.2 Type II. Handrails with a perimeter greater than 6.25 inches (160 mm) shall provide a graspable finger recess area on both sides of the profile. The finger recess shall begin within a distance of 0.75 inch (19 mm) measured vertically from the tallest portion of the profile and achieve a depth of at least .3125 inch (8 mm) within 0.875 inch (22 mm) below the widest portion of the profile. This required depth shall continue for at least 0.375 inch (10mm) to a level that is not less than 1.75 inches (45 mm) below the tallest portion of the profile. The minimum width of the handrail above the recess shall be 1.25 inches (32 mm) to a maximum of 2.75 inches (70 mm). Edges shall have a minimum radius of 0.01 inch (0.25 mm).</p>	
1012.6	1012.5	<p>1012.5 Handrail extensions. Handrails shall return to a wall, guard or the walking surface or shall be continuous to the handrail of an adjacent stair flight. Where handrails are not continuous between flights the handrails shall extend horizontally at least 12 inches (305 mm) beyond the top riser and continue to slope for the depth of one tread beyond the bottom riser. At ramps where handrails are not continuous between runs, the handrail shall extend horizontally above the landing 12 inches (305 mm) minimum beyond the top and bottom of ramp runs.</p> <p>Exceptions:</p> <ol style="list-style-type: none"> 1. Handrails within a dwelling unit that is not required to be accessible need extend only from the top riser to the bottom riser. 2. Aisle handrails in Group A and E occupancies in accordance with Section 1025.13. 3. Handrails for alternating tread devices may <u>are permitted to</u> terminate at a location vertically above the top and bottom risers. Handrails for alternating tread devices are not required to be continuous between flights or to extend beyond the top or bottom risers. 	2007
1018.2 1018.3	1017.3	<p>1017.2 Corridor width. The minimum corridor width shall be as determined in Section 1005.1, but not less than 44 inches (1118 mm).</p> <p>Exceptions:</p> <ol style="list-style-type: none"> 1. Twenty-four inches (610 mm)—For access to and utilization of electrical, mechanical or plumbing systems or equipment. 2. Thirty-six inches (914 mm)—With a required occupant capacity of less than 50. 3. Thirty-six inches (914 mm)—Within a dwelling unit. 4. Seventy-two inches (1829 mm)—In Group E with a corridor having a required capacity of 100 or more. 5. Seventy-two inches (1829 mm)—In corridors serving surgical Group I, health care centers for ambulatory patients receiving outpatient medical care, which causes the patient to be not capable of self-preservation 6. Ninety-six inches (2438 mm)—In Group I-2 in areas where required for bed movement. <p>1017.3 Corridor obstruction. The required width of corridors shall be unobstructed.</p> <p>Exception: Doors complying with Section 1005.2.</p>	2007
1022	1020	<p>SECTION 1020 VERTICAL EXIT ENCLOSURE</p>	2007
1023.5	1021.4	<p>1021.4 Openings and penetrations. Exit passageway opening protectives shall be in accordance with the requirements of Section 715.</p> <p>Except as permitted in Section 402.4.6, openings in exit passageways other than unexposed unprotected exterior openings shall be limited to those necessary for exit access to the exit passageway from normally occupied spaces and for egress from the exit passageway.</p> <p>Where an exit enclosures is extended to an exit discharge or a public way by an exit passageway, the exit passageway shall also comply with Section 1020.2.1.</p> <p>Elevators shall not open into an exit passageway.</p>	2008

2009 SECTION	2006 SECTION	DESCRIPTION OF REVISION	CCC REF YEAR
1022.4	1020.1.2	<p>1020.1.2 Penetrations. Penetrations into and openings through an exit enclosure are prohibited except for required exit doors, equipment and ductwork necessary for independent <u>ventilation or</u> pressurization, sprinkler piping, standpipes, electrical raceway for fire department communication systems and electrical raceway serving the exit enclosure and terminating at a steel box not exceeding 16 square inches (0.010 m²). Such penetrations shall be protected in accordance with Section 712. There shall be no penetrations or communication openings, whether protected or not, between adjacent exit enclosures.</p>	2007
1109.2.3 (New)		<p>1109.2.3 Lavatories. Where lavatories are provided, at least 5 percent, but not less than one shall be accessible. Where the total lavatories provided in a toilet room or bathing facility <u>room</u> is six or more, at least one lavatory with enhanced reach ranges in accordance with ICC A117.1, shall be provided.</p>	2008
1406.2.2 1406.2.4 1406.3	1406.2.2 1406.2.4 1406.3	<p>1406.2.2 Architectural trim. In buildings of Type I, II, III and IV construction, exterior wall coverings shall be permitted to be constructed of wood where permitted by Section 1405.4 or other equivalent combustible material. Combustible exterior wall coverings, other than fire-retardant-treated wood complying with Section 2303.2 for exterior installation, shall not exceed 10 percent of an exterior wall surface area where the fire separation distance is 5 feet (1524 mm) or less. Combustible architectural trim shall be limited to three stories or 40 feet (12 192 mm) above grade plane. Noncombustible materials shall be permitted to be of any height provided the materials are secured to the wall with metal or other approved noncombustible brackets.</p> <p>Exception: Combustible architectural trim of fire-retardant treated wood shall be permitted up to four stories or 60 feet in height above grade plane.</p> <p>1406.2.4 Fireblocking. Where the combustible exterior wall covering is furred from the wall and forms a solid surface, the distance between the back of the covering and the wall shall not exceed 1.625 inches (41 mm). Where required by Section 717, the space thereby created shall be fireblocked.</p> <p>1406.3 Balconies and similar projections. Balconies and similar projections of combustible construction other than fire-retardant-treated wood shall be fire-resistance rated in accordance with Table 601 for floor construction or shall be of Type IV construction in accordance with Section 602.4. The aggregate length shall not exceed 50 percent of the building-s perimeter on each floor.</p> <p>Exceptions:</p> <ol style="list-style-type: none"> 1. On buildings of Type I and II construction, three stories or less above grade plane, fire-retardant treated wood shall be permitted for balconies, porches, decks and exterior stairways not used as required exits. 2. Untreated wood is permitted for pickets and rails or similar guardrail devices that are limited to 42 inches (1067 mm) in height. 3. Balconies and similar projections on buildings of Type III, IV and V construction shall be permitted to be of Type V construction, and shall not be required to have a fire-resistance rating where sprinkler protection is extended to these areas. 4. Where sprinkler protection is extended to the balcony areas, the aggregate length of the balcony on each floor shall not be limited. 	2007
Deleted	T. 1504.2.1	<p>TABLE 1504.2.1 ROOF COVERING CLASSIFICATION USING ALTERNATIVE METHOD</p>	2008
1509.2.4	1509.2.1	<p>1509.2.1 Type of construction. Penthouses shall be constructed with walls, floors and roof as required for the building.</p> <p>Exceptions:</p> <ol style="list-style-type: none"> 1. On buildings of Type I construction, the exterior walls and roofs of penthouses with a fire separation distance of more than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be of at least 1-hour fire-resistance-rated noncombustible construction. Walls and roofs with a fire separation distance of 20 feet (6096 mm) or greater shall be of noncombustible construction. Interior framing and walls shall be of noncombustible construction. 2. On buildings of Type I <u>construction</u> two stories above grade plane or less in height and Type II construction, the exterior walls and roofs of penthouses with a fire separation distance of more than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be of at least 1-hour fire-resistance-rated noncombustible or fire-retardant-treated wood construction. Walls and roofs with a fire separation distance of 20 feet (6096 mm) or greater shall be of noncombustible or fire-retardant-treated wood construction. Interior framing and walls shall be of noncombustible or fire-retardant-treated wood construction. 	2007

The diaphragms are rigid as defined in Section 12.3.1 of ASCE 7 or, for diaphragms that are flexible, the distances between vertical elements of the seismic-force-resisting system does not exceed 40 feet (12 192 mm).</p>	
1704.5	1704.5	<p>1704.5 Masonry construction. Masonry construction shall be inspected and evaluated in accordance with the requirements of Sections 1704.5.1 through 1704.5.3, depending on the classification <u>Occupancy Category</u> of the building or structure or nature of occupancy, as defined by this code.</p> <p>Exceptions: (No change)</p>	2007
1708.3	1708.4	<p>1708.4 Structural steel. The testing contained in the quality assurance plan <u>statement of special inspections</u> shall be as required by AISC Seismic and the additional requirements herein. The acceptance criteria for nondestructive testing shall be as required in AWS D1.1 as specified by the registered design professional.</p> <p>Base metal thicker than 1.5 inches (38 mm), where subject to through-thickness weld shrinkage strains, shall be ultrasonically tested for discontinuities behind and adjacent to such welds after joint completion. Any material discontinuities shall be accepted or rejected on the basis of ASTM A 435 or A 898 (Level 1 Criteria) and criteria as established by the registered design professional(s) in responsible charge and the construction documents.</p>	2007
1810.3.3.1.4 (New)		<p>1810.3.3.1.4 Allowable frictional resistance. The assumed frictional resistance developed by any uncased cast-in-place deep foundation element shall not exceed one-sixth of the bearing value of the soil material at minimum depth as set forth in Table 1806.2, up to a maximum of 500 psf (24 kPa), unless a greater value is allowed by the building official on the basis of a geotechnical investigation as specified in Section 1803 is submitted or a greater value is substantiated by a load test in accordance with Section 1810.3.3.1.2. Frictional resistance and bearing resistance shall not be assumed to act simultaneously unless determined by a geotechnical investigation in accordance with Section 1803.</p>	2008
1902.1	1902.1	<p>1902.1 General. The words and terms defined in ACI 318 shall, for the purposes of this chapter and as used elsewhere in this code for concrete construction, have the meanings shown in ACI 318 <u>as modified by Section 1908.1.1.</u></p>	2008
2209.2 (New)		<p>2209.2 Steel decks. <u>The design and construction of cold-formed steel decks shall be in accordance with this section.</u></p> <p>2209.2.1 Composite slabs on steel decks. Composite slabs of concrete and steel deck shall be designed and constructed in accordance with ASCE 3.</p> <p>2209.2.2 Non-composite steel floor decks. Non-composite steel floor decks shall be permitted to be designed and constructed in accordance with ANSI/SDI-NC1.0, as modified in Section 2209.2.1.1 <u>2209.2.1.</u></p> <p>2209.2.2.1 ANSI/SDI-NC1.0 Section 2.4B1. Replace Section 2.4B1 of ANSI/SDI-NC1.0 with the following:</p> <p>1. General: The design of the concrete slabs shall be done in accordance with the ACI <i>Building Code Requirements for Reinforced Concrete</i>. The minimum concrete thickness above the top of the deck shall be 1-1/2 inches (38 mm).</p> <p>2209.2.3 Steel roof deck. Steel roof decks shall be permitted to be designed and constructed in accordance with ANSI/SDI-RD1.0.</p>	2008
2303.1.3	2303.1.3	<p>2303.1.3 Structural glued-laminated timber. Glued-laminated timbers shall be manufactured and identified as required in ANSI/AITC A190.1 and ASTM D 3737.</p>	2007
2306.1	2306.1	<p>2306.1 Allowable stress design. American Institute of Timber Construction. ANSI/AITC A190.1 Structural Glued Laminated Timber</p>	2007
2406.3.1	2406.2.1	<p>2406.2.1 2406.3.1 Multilight Multipane assemblies. Multilight Multipane glazed assemblies having individual lights <u>panes</u> not exceeding 1 square foot (0.09 m²) in exposed areas shall have at least one light pane <u>pane</u> in the assembly marked as indicated in Section 2406.3. Other lights <u>panes</u> in the assembly shall be marked "CPSC 16 CFR 1201" or "ANSI Z97.1," as appropriate.</p>	2008
2902.3.1 (New)		<p>2902.4.1 [P] 2902.3.1 Access. The route to the public toilet facilities required by Section 2902.3 shall not pass through kitchens, storage rooms or closets. Access to the required facilities shall be from within the building or from the exterior of the building. All routes shall comply with the accessibility requirements of the <i>International Building Code</i>. The public shall have access to</p>	2008

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

2009 SECTION	2006 SECTION	DESCRIPTION OF REVISION	CCC REF YEAR
		the required toilet facilities at all times that the building is occupied.	
2902.6.1 (New)		[P] 2902.5.1 2902.6.1 Directional signage. Directional signage indicating the route to the public facilities shall be posted in accordance with Section 3107. Such signage shall be located in a corridor or aisle, at the entrance to the facilities for customers and visitors.	2008
3006.4	3006.4	<p>3006.4 Machine rooms and machinery spaces. Elevator machine rooms and machinery spaces shall be enclosed with fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both. The fire-resistance rating shall not be less than the required rating of the hoistway enclosure served by the machinery. Openings in the fire barriers shall be protected with assemblies having a fire protection rating not less than that required for the hoistway enclosure doors.</p> <p>Exceptions:</p> <ol style="list-style-type: none"> 1. Where machine rooms and machinery spaces do not abut and have no openings to the hoistway enclosure they serve the fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, <u>or both</u>, shall be permitted to be reduced to a 1-hour fire-resistance rating. 2. In buildings 4 stories or less, above grade plane when machine room and machinery spaces do not abut and have no openings to the hoistway enclosure they serve, the machine room and machinery spaces need not be rated <u>are not required to be fire-resistance rated</u>. 	2007
3401.4.1 (New)		3401.4.1 Existing materials. Materials already in use in a building in conformance with requirements or approvals in effect at the time of their erection or installation shall be permitted to remain in use unless determined by the code official to be detrimental <u>dangerous</u> to life, health or safety. Where such conditions are determined to be dangerous to life, health or safety, they shall be mitigated or made safe.	2008
3403.2 (New)		<p>3403.2 Flood hazard areas. For buildings and structures in flood hazard areas established in Section 1612.3, any addition that constitutes substantial improvement of the existing structure, as defined in Section 1612.2, shall comply with the flood design requirements for new construction, and all aspects of the existing structure shall be brought into compliance with the requirements for new construction for flood design.</p> <p><u>For buildings and structures in flood hazard areas established in Section 1612.3, any additions that do not constitute substantial improvement or substantial damage of the existing structure, as defined in Section 1612.2, are not required to comply with the flood design requirements for new construction.</u></p>	2008
3403.4.1 (New) 3404.4.1 (New)		<p>3403.4 Existing structural elements carrying lateral load. (No change)</p> <p>3403.4.1 Seismic. <u>Seismic requirements for additions shall be in accordance with this section. Values of R, Ω_o, and C_d for the existing seismic force-resisting system shall be those specified by this code for an Ordinary system unless it is demonstrated that the existing system will provide performance equivalent to that of an Intermediate or Special system.</u></p> <p>3404.4 Existing structural elements carrying lateral load. (No change)</p> <p>3404.4.1 Seismic. <u>Seismic requirements for alterations shall be in accordance with this section. Values of R, Ω_o, and C_d for the existing seismic force-resisting system shall be those specified by this code for an Ordinary system unless it is demonstrated that the existing system will provide performance equivalent to that of an Intermediate or Special system.</u></p>	2008
3404.5 (New)		<p>3404.5 Voluntary seismic improvements. Alterations to existing structural elements or additions of new structural elements that are not otherwise required by this chapter and are initiated for the purpose of improving the performance of the seismic force-resisting system of an existing structure or the performance of seismic bracing or anchorage of existing nonstructural elements shall be permitted, provided that an engineering analysis is submitted demonstrating the following:</p> <ol style="list-style-type: none"> 1. The design strength of existing structural elements required to resist seismic forces is not reduced. The altered structure and the altered non structural elements are no less conforming with the provisions of this code with respect to earthquake design than they were prior to the alteration. 2. The seismic force to required existing structural elements is not increased beyond their design strength. 	2008

2009 SECTION	2006 SECTION	DESCRIPTION OF REVISION	CCC REF YEAR
		<p>3- 2. New structural elements are detailed and connected to the existing structural elements as required by Chapter 16.</p> <p>4- 3. New or relocated nonstructural elements are detailed and connected to existing or new structural elements as required by Chapter 16.</p> <p>5- 4. The alterations do not create a structural irregularity as defined in ASCE 7 or make an existing structural irregularity more severe.</p> <p>6- The alterations do not result in the creation of an unsafe condition.</p>	
3405		<p>3405.1 General. Buildings and structures, and parts thereof, shall be repaired in conformance with Section 3401.2. Work on non-damaged components that is necessary for the required repair of damaged components shall be considered part of the repair and shall not be subject to the requirements for alterations in this chapter. <u>Routine maintenance required by section 3401.2, ordinary repairs exempt from permit per Section 105.2, and abatement of wear due to normal service conditions shall not be subject to the requirements for repairs in this section.</u></p> <p>3405.1.1 Dangerous conditions. <u>Regardless of the extent of structural or nonstructural damage, the code official shall have the authority to require the elimination of conditions deemed dangerous.</u></p> <p>3405.2 Substantial structural damage to vertical elements of the lateral-force-resisting system. <u>A building that has sustained substantial structural damage to the vertical elements of its lateral-force-resisting system shall be evaluated and repaired in accordance with the applicable provisions of Sections 3404.2.1 through 3404.2.3.</u></p> <p>3405.2.1 Evaluation. <u>The building shall be evaluated by a registered design professional, and the evaluation findings shall be submitted to the code official. The evaluation shall establish whether the damaged building, if repaired to its pre-damage state, would comply with the provisions of this code for wind and earthquake loads. Evaluation for earthquake loads shall be required if the substantial structural damage was caused by or related to earthquake effects or if the building is in Seismic Design Category C, D, E, or F.</u> <u>Wind loads for this evaluation shall be those prescribed in Section 1609. Earthquake loads for this evaluation, if required, shall be permitted to be seventy-five percent of those prescribed in Section 1613. Values of R, Ω_0, and C_d for the existing seismic force-resisting system shall be those specified by this code for an Ordinary system unless it is demonstrated that the existing system will provide performance equivalent to that of an Intermediate or Special system.</u></p> <p>3405.2.2 Extent of repair for compliant buildings. <u>If the evaluation establishes compliance of the pre-damage building in accordance with Section 3404.2.1, then repairs shall be permitted that restore the building to its pre-damage state using materials and strengths that existed prior to the damage.</u></p> <p>3405.2.3 Extent of repair for noncompliant buildings. <u>If the evaluation does not establish compliance of the pre-damage building in accordance with Section 3404.2.1, then the building shall be rehabilitated to comply with applicable provisions of this code for load combinations, including wind or seismic loads. The wind loads for the repair shall be as required by the building code in effect at the time of original construction, unless the damage was caused by wind, in which case the wind loads shall be as required by the code in effect at the time of original construction or as required by this code, whichever are greater. Earthquake loads for this rehabilitation design shall be those required for the design of the pre-damage building, but not less than seventy-five percent of those prescribed in Section 1613. New structural members and connections required by this rehabilitation design shall comply with the detailing provisions of this code for new buildings of similar structure, purpose and location.</u></p> <p>3404.3 Substantial structural damage to gravity load-carrying components. <u>Gravity load-carrying components that have sustained substantial structural damage shall be rehabilitated to comply with the applicable provisions of this code for dead and live loads. Snow loads shall be considered if the substantial structural damage was caused by or related to snow load effects. Existing gravity load-carrying structural elements shall be permitted to be designed for live loads approved prior to the damage. Non-damaged gravity load-carrying components that receive dead, live, or snow loads from rehabilitated components shall also be rehabilitated or shown to have the capacity to carry the design loads of the rehabilitation design. New structural members and connections required by this rehabilitation design shall comply with the detailing provisions of this code for new buildings of similar structure, purpose and location.</u></p> <p>3405.3.1 Lateral force-resisting elements. <u>Regardless of the level of damage to vertical elements of the lateral force-resisting system, if substantial structural damage to gravity load-carrying components was caused primarily by wind or earthquake effects, then the building shall be evaluated in accordance with Section 3404.2.1 and, if noncompliant, rehabilitated in accordance with Section 3404.2.3.</u></p> <p>3405.4 Less than substantial structural damage. <u>For damage less than substantial structural damage, repairs shall be allowed that restore the building to its pre-damage state using materials and strengths that existed prior to the damage. New structural members and</u></p>	2008

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE
