INTRODUCTION

Why did IBC/2009 section [fill-in section number] change from the 2006 edition?@ This resource collection has been compiled to provide the answers to such questions.

This resource collection provides the published documentation for each successful code change in the IBC/2009 since the 2006 edition. Each changed code section is listed in the Table of Changes which contains three headings. The first heading is "2009 IBC" which lists the section number in the 2009 code. If (new) appears after the section number it indicates that the section is new in 2009. If (deleted) is indicated in 2009 it means that the section no longer exists and the second column "2006 IBC@ will show the section number that was deleted. Also, the second heading will indicate if a section number has changed from 2006 to 2009. If there is nothing indicated in the 2006 column, the section number remained the same. The third heading lists the code change number(s) which affected that particular section. The published material for each change is contained in the Documentation section.

HOW TO USE THE RESOURCE COLLECTION

This resource collection makes it possible for the reader to examine, in one location, all published information about a particular code change. For any given change, the text of the proposed change, committee actions and modifications, assembly actions, successful public comments, and final action can be found by using the following steps:

1. Locate the code section in the Table of Changes using the 2009 IBC section number.
2. Note the corresponding proposed code change number(s) from the list.
3. Locate the proposed code change number (listed in numerical order under the appropriate year and letter designation) in the Documentation section to read the complete chronological documentation of the proposed change.

SOURCE DOCUMENTS

The code development cycle (see page vii) involves the publication of four documents, the result of 1) public submittal of proposed changes, 2) a public hearing and committee/assembly actions, 3) submittal of public comments to the committee or assembly actions, and 4) final action results. Under each code change number in the Documentation section of this handbook, material corresponding to that individual proposed change has been drawn from each of the four publications. Two code change cycles occurred between published editions of the 2006 and 2009 IBC; therefore, the Documentation section of this handbook contains material collected from the following published documents:

2006/2007 Documentation

2006/2007 Proposed Changes to the International Codes
2006 Report of the Public Hearing on the International Codes
2007 Final Action Agenda on the International Codes
Final Action on 2006/2007 Proposed Changes to the International Codes

2007/2008 Documentation

2007/2008 Proposed Changes to the International Codes
2008 Report of the Public Hearing on the International Codes
2008 Final Action Agenda on the International Codes
Final Action on 2007/2008 Proposed Changes to the International Codes

Unsuccessful proposed changes have not been included since they do not directly affect the final content of the code section.

RESOURCE COLLECTION FORMAT

Code Change No: FS11-07/08

Code change numbers are identified with a letter and a year designation. For instance, **FS11-07/08** is proposed change number **11** to the International Building Code Fire Safety Committee (FS) and was submitted in the **07/08** (2007/2008) code change cycle. (See *ACode Change Numbers*® on page v for a discussion of code committees)

Original Proposal

This is the proposal as published in the *A2007/2008 Proposed Changes to the International Codes*.® It includes the section number(s), proponent-s name, who they are representing, the text of the proposed change and their reason for the change. This is a change to IBC Section 703.6 - note the term *ASupp*® following the section numbers which means this text is found in the 2007 Accumulative Supplement to the International Codes.

Public Hearing Results

This is the result of the Code Development Hearing held to consider the change, as published in the *A2008 Report of the Public Hearing to the International Codes*.® It includes the committee-s action (disapproved) and reason for the action and also identifies if there was an assembly motion (none).

Public Comments

This is text of the submitted public comment, as published in the A2008 Final Action Agenda to the International Codes®. It includes the public commentor-s name and affiliation, the requested action to be considered at the Final Action Hearing (Approved as Modified) and the reason.

Note: Only those code changes which received a public comment which resulted in a final hearing action different than a committee action are published.

Final Hearing Results

This is the action taken by the eligible voting members of the ICC at the Final Action Hearing, as published in the AFinal Action on 2007/2008 Proposed Changes to the International Codes®. The Final Action was AAMPC2® which means the eligible voting members of ICC overturned the committee-s action and approved the change based on the submitted public comment.

CODE CHANGE NUMBERS

The following is the legend for code change numbers, along with the applicable committee and the committee-s primary area of responsibility relative to the IBC.

Prefix	Code Committee	Primary IBC Chapters Affected
E	IBC Means of Egress Committee	Chapters 10, 11
F	IFC Committee	Chapters 3, 4, 8, 9, 27
FS	IBC Fire Safety Committee	Chapters 7, 8, 9, 14, 26
G	IBC General Committee	Chapters 1-6, 12, 13, 27-34
EB	IEBC Code Committee	Chapter 34
P	IPC Code Committee	Chapter 29
RB	IRC Building/Energy Committee	Chapters 14, 25, 31
S	IBC Structural Committee	Chapters 15-25

Although most changes to the IBC are found under proposed change numbers beginning with an E, FS, G, or S, some changes to the IBC are published within a proposed change to the other *International Codes*, and therefore are found under a proposed code change number beginning with one of the other letters listed above. Use the table of contents to locate appropriate sections by year and letter designation.

CODE SECTION NUMBER DIFFERENCES

For editorial reasons, some code section numbers in the 2009 edition have changed from the 2006 edition. The numbering of code sections is an editorial task which takes place outside of the normal code development cycle, and is necessary to avoid duplicate or nonsequential section numbers.

The Table of Changes typically references the 2006 code section numbers that have been deleted. (See Introduction)

In most cases the section numbers have not changed from the 2006 to the 2009 edition. However, the reader should remember that it is always the 2006 code section numbers (or in rare cases, a different number corresponding to a 2007 Supplement numbering change) which appear in the material contained in the Documentation section. This is due to proposed changes which have as their basis, a section number in the 2006 edition. Since an attempt to correlate code sections by number may lead to confusion, the user is advised to rely on the section content rather than the numbers to locate and compare parallel sections in the two editions.

ABBREVIATIONS FOR ACTIONS

In the Documentation section, the following abbreviations are used to signify committee or final action:

Legend for 2006/2007 and 2007/2008 Documentation:

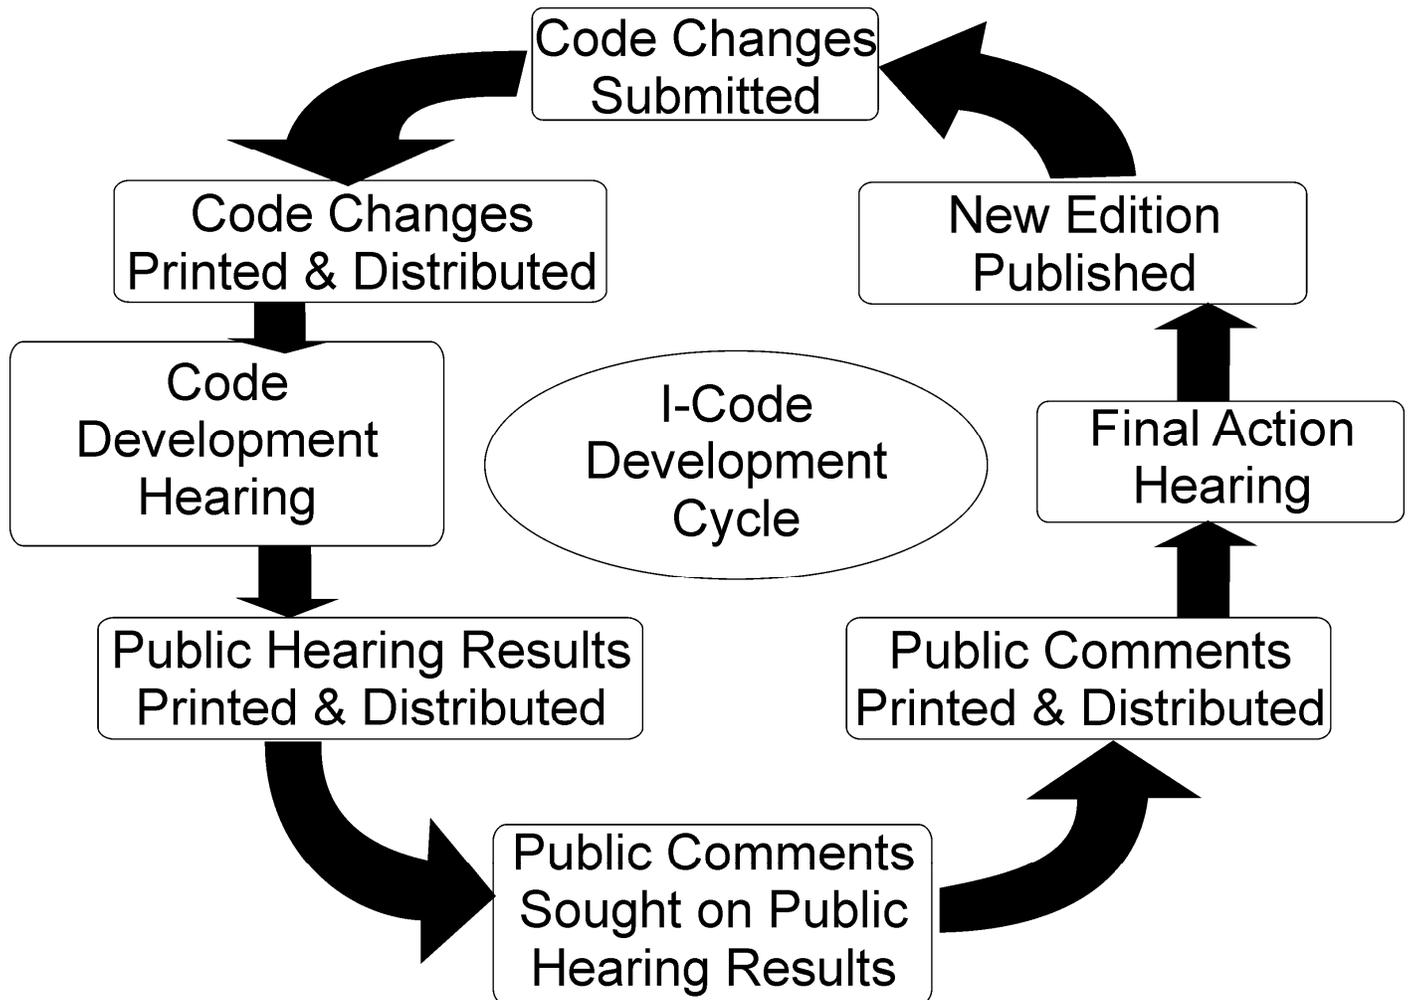

AS	=	Approved as Submitted
D	=	Disapproved
AM	=	Approved as Modified by the Code Committee
AMPC	=	Approved as Modified by a Public Comment
WP	=	Withdrawn by Proponent

CODE CORRELATION COMMITTEE

During the course of the code development process, there are editorial issues, issues related to code correlation problems arising from code changes, and issues related to the appropriate committee that should consider certain topics. These issues are placed before the ICC Code Correlation Committee for resolution. During the development of the 2009 Code, from 2006 to 2009, the Code Correlation Committee met 3 times to discuss and resolve these issues. The parts of the code that were affected by a Code Correlation Committee action are indicated with the letters ACCC® beside that section of the code. All Code Correlation Committee actions are listed at the end of this handbook.

ICC CODE DEVELOPMENT PROCESS

The following depicts the key steps in ICC's Code Development Process:

The procedures governing ICC Code Development are entitled ACode Development Process for the International Codes®. These procedures are updated periodically and therefore not included here. To obtain the current version, visit ICC's website at www.iccsafe.org.

TABLE OF CHANGES

CHAPTER 1 ADMINISTRATION

2009 IBC	2006 IBC	CODE CHANGE NUMBER(S)

IBC – FIRE SAFETY

Code Change No: **FS1-06/07**

Original Proposal

Section: 701.1

Proponent: Bill McHugh, Firestop Contractors International Association

Revise as follows:

701.1 Scope. The provisions of this chapter shall govern the materials and systems assemblies used for structural fire resistance and fire-resistance-rated construction separation of adjacent spaces to safeguard against the spread of fire and smoke within a building and the spread of fire to or from buildings through compartmentation systems.

Reason: The purpose of this code change is to bring the concept of systems and compartmentation into this area of the code. Each component of compartmentation features and structural protection are tested and listed as a total system. The wall, floor, penetrating item (duct, damper, door, glass,) and the materials used are tested and listed as a system.

The code should state that these are systems which points to tested and listed assemblies, rather than simply assemblies. Assemblies alone could be non tested assemblies. Additionally, the scope of this chapter is really compartmentation and structural protection, but never states compartmentation.

The code needs to state that compartmentation is the correct term for 'fire-resistance-rated construction that separates spaces inside a building and to or from the building'.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

701.1 Scope. The provisions of this chapter shall govern the materials, systems and ~~systems~~ assemblies used for structural fire resistance and fire-resistance-rated construction separation of adjacent spaces to safeguard against the spread of fire and smoke within a building and the spread of fire to or from buildings ~~through compartmentation systems~~.

Committee Reason: The modifications help to provide terms which are used in the field and also recognized by building officials and those conducting tests. While some items are tested as a "system" most people are familiar with the phrase "assembly" which picks up all of the items involved. This modification simply combines the two terms. The deletion at the end is because "compartmentation systems" are not defined or a commonly used term.

Assembly Action:

None

Final Hearing Results

FS1-06/07

AM

Code Change No: **FS4-06/07**

Original Proposal

Sections: 702.1, 702.3, 602.1

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

THIS PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY AND THE IBC GENERAL CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC FIRE SAFETY

1. Add new definition as follows:

702.1 Definitions. The following words and terms shall, for the purposes of this chapter, and as used elsewhere in this code, have the meanings shown herein.

BUILDING ELEMENT: A fundamental component of building construction which may or may not be of fire-resistance-rated construction and which is constructed of materials based on the building type of construction.

2. Revise as follows:

703.2 Fire-resistance ratings. The fire-resistance rating of building elements shall be determined in accordance with the test procedures set forth in ASTM E 119 or in accordance with Section 703.3. Where materials, systems or devices that have not been tested as part of a fire-resistance rated assembly are incorporated into the assembly, sufficient data shall be made available to the building official to show that the required fire-resistance rating is not reduced. ~~Materials and methods of construction used to protect joints and penetrations in fire-resistance rated building elements shall not reduce the required fire-resistance rating.~~

Exception: In determining the fire-resistance rating of exterior bearing walls, compliance with the ASTM E 119 criteria for unexposed surface temperature rise and ignition of cotton waste due to passage of flame or gases is required only for a period of time corresponding to the required fire-resistance rating of an exterior nonbearing wall with the same fire separation distance, and in a building of the same group. When the fire-resistance rating determined in accordance with this exception exceeds the fire-resistance rating determined in accordance with ASTM E 119, the fire exposure time period, water pressure, and application duration criteria for the hose stream test of ASTM E 119 shall be based upon the fire-resistance rating determined in accordance with this exception.

PART II – IBC GENERAL

Revise as follows:

602.1 General. Buildings and structures erected or to be erected, altered or extended in height or area shall be classified in one of the five construction types defined in Sections 602.2 through 602.5. The building elements shall have a fire-resistance rating not less than that specified in Table 601 and exterior walls shall have a fire-resistance rating not less than that specified in Table 602. Where required to have a fire-resistance rating by Table 601, building elements shall comply with the applicable provisions of Section 703.2. The protection of openings, penetrations, joints and ducts and air transfer openings in building elements shall not be required unless required by other provisions of this code.

Reason: The International Building Code provides a considerable level of detail for the requirements of fire-resistance-rated assemblies. Currently, only Section 602.1 provides technical charging language for the fundamental building elements listed in Table 601. There are many misunderstood details associated with the application of Table 601. Most deal with fire-resistance rated construction requirements. For example, many assume that opening protection is inherently required when Table 601 specifies that a building element be of fire-resistance rated construction. The protection of openings, however, triggers off of the requirement for a given assembly such as a fire wall, fire barrier, exterior wall, etc. This is somewhat counterintuitive for those lacking experience in the application of the provisions of the IBC. Additionally, there are those who attempt to apply fire barrier or fire partition requirements to simple building elements that are required to be of fire-resistance rated construction. Although Section 703.2 states, "The fire-resistance rating of building elements shall be determined in accordance with the test procedures set forth in ASTM E119...", that provision is often overlooked.

Accordingly, fundamental charging language has been provided to assist in the proper determination of construction requirements for basic building elements. This includes an appropriate cross reference to Section 703.2. Additionally, a general statement addressing the continuity of building elements is introduced. This proposed language is consistent with the charging language currently provided in Section 715.1, which states, "Opening protectives required by other sections of this code shall comply with the provisions of this section." It is recognized that each portion of the proposed language is currently contained in the IBC. Nevertheless, the proposed language will provide code users with a construction base line for simple building elements as opposed to formal fire-resistance rated assemblies. Additionally, it is felt that the ultimate sentence in Section 703.2 is redundant and somewhat out of context. The proposed language in Section 602.1 properly addresses the continuity issue. And perhaps most importantly, the charging provisions of Sections 712 and 713 clearly describe the continuity requirements for fire-resistance rated construction. Lastly, a definition of BUILDING ELEMENT is created. It is largely intended to raise the awareness of the term while providing for initial construction provisions.

Approval of this proposal will greatly assist design professionals and code enforcement officials in the proper application of these fundamental and essential International Building Code provisions, especially those individuals with minimal experience.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I — IBC FIRE SAFETY

Committee Action:

Approved as Modified

Modify the proposal as follows:

702.1 Definitions. The following words and terms shall, for the purposes of this chapter, and as used elsewhere in this code, have the meanings shown herein.

BUILDING ELEMENT: A fundamental component of building construction, listed in Table 601, which may or may not be of fire-resistance-rated construction and which is constructed of materials based on the building type of construction.

703.2 Fire-resistance ratings. The fire-resistance rating of building elements shall be determined in accordance with the test procedures set forth in ASTM E 119 or in accordance with Section 703.3. Where materials, systems or devices that have not been tested as part of a fire-resistance rated assembly are incorporated into the assembly, sufficient data shall be made available to the building official to show that the required fire-resistance rating is not reduced. Materials and methods of construction used to protect joints and penetrations in fire-resistance rated building elements shall not reduce the required fire-resistance rating.

Exception: In determining the fire-resistance rating of exterior bearing walls, compliance with the ASTM E 119 criteria for unexposed surface temperature rise and ignition of cotton waste due to passage of flame or gases is required only for a period of time corresponding to the required fire-resistance rating of an exterior nonbearing wall with the same fire separation distance, and in a building of the same group. When the fire-resistance rating determined in accordance with this exception exceeds the fire-resistance rating determined in accordance with ASTM E 119, the fire exposure time period, water pressure, and application duration criteria for the hose stream test of ASTM E 119 shall be based upon the fire-resistance rating determined in accordance with this exception.

Committee Reason: The definition helps to explain a fundamental item and when combined with the revisions proposed to Section 602.1 will help get people started with using the code. The modification to keep the existing text in Section 703.2 will help make it clear that the ratings are not to be reduced. Adding the reference to Table 601 in the definition helps clarify that the "building elements" are only those items listed in the table.

Assembly Action:

None

PART II — IBC GENERAL

Committee Action:

Approved as Modified

Modify proposal as follows:

602.1 General. Buildings and structures erected or to be erected, altered or extended in height or area shall be classified in one of the five construction types defined in Sections 602.2 through 602.5. The building elements shall have a fire-resistance rating not less than that specified in Table 601 and exterior walls shall have a fire-resistance rating not less than that specified in Table 602. Where required to have a fire-resistance rating by Table 601, building elements shall comply with the applicable provisions of Section 703.2. The protection of openings, ~~penetrations, joints and~~ ducts and air transfer openings in building elements shall not be required unless required by other provisions of this code.

Committee Reason: The committee felt that these two sentences provided a benefit to the code user as opening protection is not always required. The modification addresses the fact that penetration protection and fire resistant joints systems are generally required for fire resistive construction whereas openings, ducts and air transfer may not require any special protection.

Assembly Action:

None

Final Hearing Results

FS4-06/07, Part I	AM
FS4-06/07, Part II	AM

Code Change No: **FS7-06/07**

Original Proposal

Section: 702.1 (IFC 902.1)

Proponent: Greg Rogers, Kitsap Fire District 7, representing ICC Joint Fire Service Review Committee

Revise definition as follows:

FIRE AREA. The aggregate floor area enclosed and bounded by fire walls, fire barriers, exterior walls or fire-resistance-rated horizontal assemblies of a building. Areas of the building not provided with surrounding walls shall be included in the fire area if such areas are included within the horizontal projection of the roof or floor above.

Reason: Sprinkler and fire alarm requirements in Chapter 9 of the IBC and IFC are based on the square footage or occupant load of a fire area. It is not clear from the definition of a fire area that building areas without surrounding walls are included in the fire area. This concept is clear in the definition of building area found in IBC 502.1, "Areas of the building not provided with surrounding walls shall be included in the building area if such areas are included within the horizontal projection of the roof or floor above". This was confirmed by IFC Interpretation No. 25-05, dated 09-12-05.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Although this issue is not clear in the existing code, placing this requirement within the definition is not the best solution and may be overlooked. The testimony discussed items such as picnic shelters, flea-markets and other items which don't have walls around them that would be affected by this requirement and now need sprinklers or alarms due to exceeding the fire area. Another example given was a canopy which was 44 feet tall and open on all sides. Items which are open and unenclosed do not create the same fire hazard and should not be regulated by the same requirements that apply to enclosed buildings.

Assembly Action:

Approved as Submitted

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because an assembly action was successful and public comments were submitted.

Public Comment 1:

Edmund Domian, West Valley City, Utah, requests Approval as Submitted.

Commenter's Reason: The real issue of this code change is not what meets the definition of "building" but what warrants a need for compartmentation. Many big box warehouse-type stores have a large attached open yard of combustible products for sale, which often meet the definition of high piled combustible storage. This "open yard" has a metal or fabric canopy overhead; the public are trapped in this area within a fenced perimeter. The fire load in these "open yards" can be substantial. Occupants must often re-enter the main building from this enclosed "open yard" to egress the building in an emergency. Such areas should be included in the calculations of any defined "FIRE AREA."

Final Hearing Results

FS7-06/07

AS

Code Change No: FS8-06/07**Original Proposal**

Sections: 702.1; IMC 506.3.10

Proponent: Bob Eugene, Underwriters Laboratories Inc.

THIS PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY AND THE IMC CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC FIRE SAFETY

Revise definitions as follows:

F RATING. The time period that the through-penetration firestop system limits the spread of fire through the penetration when tested in accordance with ASTM E 814 or UL 1479.

T RATING. The time period that the penetration firestop system, including the penetrating item, limits the maximum temperature rise to 325°F (163°C) above its initial temperature through the penetration on the nonfire side when tested in accordance with ASTM E 814 or UL 1479.

THROUGH-PENETRATION FIRESTOP SYSTEM. An assemblage of specific materials or products that are designed, tested and fire-resistance rated to resist for a prescribed period of time the spread of fire through penetrations. The F and T rating criteria for penetration firestop systems shall be in accordance with ASTM E 814 or UL 1479. See definitions of “F rating” and “T rating.”

PART II – IMC

506.3.10 Grease duct enclosure. A grease duct serving a Type I hood that penetrates a ceiling, wall or floor shall be enclosed from the point of penetration to the outlet terminal. A duct shall penetrate exterior walls only at locations where unprotected openings are permitted by the *International Building Code*. Ducts shall be enclosed in accordance with the *International Building Code* requirements for shaft construction. The duct enclosure shall be sealed around the duct at the point of penetration and vented to the outside of the building through the use of weather-protected openings. Clearance from the duct to the interior surface of enclosures of combustible construction shall be not less than 18 inches (457 mm). Clearance from the duct to the interior surface of enclosures of noncombustible construction or gypsum wall board attached to noncombustible structures shall be not less than 6 inches (152 mm). The duct enclosure shall serve a single grease exhaust duct system and shall not contain any other ducts, piping, wiring or systems.

Exceptions:

1. The shaft enclosure provisions of this section shall not be required where a duct penetration is protected with a through-penetration firestop system classified in accordance with ASTM E 814 or UL 1479 and having an “F” and “T” rating equal to the fire-resistance rating of the assembly being penetrated and where the surface of the duct is continuously covered on all sides from the point at which the duct penetrates a ceiling, wall or floor to the outlet terminal with a classified and labeled material, system, method of construction or product specifically evaluated for such purpose, in accordance with ASTM E 2336. Exposed ductwrap systems shall be protected where subject to physical damage.
2. The shaft enclosure provisions of this section shall not be required where a duct penetration is protected with a through-penetration firestop system classified in accordance with ASTM E 814 or UL 1479 and having an “F” and “T” rating equal to the fire resistance rating of the assembly being penetrated and where a prefabricated grease duct enclosure assembly is protected on all sides from the point at which the duct penetrates a ceiling, wall or floor to the outlet terminal with a classified and labeled prefabricated system specifically evaluated for such purposes in accordance with UL 2221.
3. A duct enclosure shall not be required for a grease duct that penetrates only a nonfire-resistance-rated roof/ceiling assembly.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

Reason: (Part I) The purpose of this code change is to include reference to UL 1479 as an alternate to ASTM E 814 in the definitions Section of Chapter 7 of the International Building Code. UL 1479 is currently referenced for walls in Section 712.3.1.2; for horizontal assemblies in Section 712.4.1.1.2; and for air leakage in smoke barriers in Section 712.5.

Both Standards are referenced together in all other pertinent sections of the International Building Code and the International Residential Code. The fire testing and hose stream testing portions of these two Standards describe the same test method. The specifications for the test apparatus and test procedure are identical between the two standards. As such, identical test results would be obtained from tests conducted using each of these methods.

The inclusion of this alternate test method would provide the authority having jurisdiction with the flexibility to accept listed and labeled products evaluated in accordance with ASTM E 814 or UL 1479.

UL 1479 is an ANSI approved standard. UL 1479 requirements cover through-penetration firestops of various materials and construction that are intended for use in openings in fire resistive wall or floor-ceiling assemblies, or both.

(Part II) The purpose of this code change is to include reference to UL 1479 as an alternate to ASTM E 814 in the International Mechanical Code.

Both Standards are referenced together in all other pertinent sections of the International Building Code and the International Residential Code. The fire testing and hose stream testing portions of these two Standards describe the same test method. The specifications for the test apparatus and test procedure are identical between the two standards. As such, identical test results would be obtained from tests conducted using each of these methods.

The inclusion of this alternate test method would provide the authority having jurisdiction with the flexibility to accept listed and labeled products evaluated in accordance with ASTM E 814 or UL 1479.

UL 1479 is an ANSI approved standard. UL 1479 requirements cover through-penetration firestops of various materials and construction that are intended for use in openings in fire resistive wall or floor-ceiling assemblies, or both.

Cost Impact: The code change proposal will not increase cost of construction.

Public Hearing Results

Note: The following analysis was not in the Code Change Proposal book but was published in the “Errata to the 2006/2007 Proposed Changes to the International Codes and Analysis of Proposed Referenced Standards” provided at the code development hearings:

Analysis: Review of proposed new standard indicated that, in the opinion of staff, the standard did comply with ICC standards criteria

PART I — IBC

Committee Action:

Approved as Submitted

Committee Reason: The addition of this standard provides an alternative means of demonstrating compliance with the code. Having an additional option provides flexibility and additional design options. UL 1479 is already used in the code in Section 712 and the standard addresses air leakage while the current referenced standard does not.

Assembly Action:

None

PART II — IMC

Committee Action:

Approved as Submitted

Committee Reason: The proposed change provides more flexibility for approving firestop material by adding another nationally recognized standard.

Assembly Action:

None

Final Hearing Results

AS

Code Change No: **FS9-06/07**

Original Proposal

Sections: 703.2, 703.3, 720.1

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

1. Revise as follows:

703.2 Fire-resistance ratings. The fire-resistance rating of building elements, components or assemblies shall be determined in accordance with the test procedures set forth in ASTM E 119 or in accordance with Section 703.3. Where materials, systems or devices that have not been tested as part of a fire-resistance-rated assembly are incorporated into the building element, component or assembly, sufficient data shall be made available to the building official to show that the required fire-resistance rating is not reduced. Materials and methods of construction used to protect joints and penetrations in fire-resistance-rated building elements, components or assemblies shall not reduce the required fire-resistance rating.

Exception: In determining the fire-resistance rating of exterior bearing walls, compliance with the ASTM E 119 criteria for unexposed surface temperature rise and ignition of cotton waste due to passage of flame or gases is required only for a period of time corresponding to the required fire-resistance rating of an exterior nonbearing wall with the same fire separation distance, and in a building of the same group. When the fire-resistance rating determined in accordance with this exception exceeds the fire-resistance rating determined in accordance with ASTM E 119, the fire exposure time period, water pressure, and application duration criteria for the hose stream test of ASTM E 119 shall be based upon the fire-resistance rating determined in accordance with this exception.

2. Revise as follows:

703.3 Alternative methods for determining fire resistance. The application of any of the alternative methods listed in this section shall be based on the fire exposure and acceptance criteria specified in ASTM E 119. The required fire resistance of a building element, component or assemblies shall be permitted to be established by any of the following methods or procedures:

- ~~1.~~ ~~Fire-resistance designs documented in approved sources.~~
- ~~2.~~ 1. Prescriptive designs of fire-resistance-rated building elements, component or assemblies as prescribed in Section 720.
- ~~3.~~ 2. Calculations in accordance with Section 721.
3. ~~Fire-resistance designs documented in approved sources.~~
4. Engineering analysis based on a comparison of building element, component or assemblies designs having fire-resistance ratings as determined by the test procedures set forth in ASTM E 119.
5. Alternative protection methods as allowed by Section 104.11.

3. Revise as follows:

720.1 General. The provisions of this section contain prescriptive details of fire-resistance-rated building elements, component or assemblies. The materials of construction listed in Tables 720.1(1), 720.1(2), and 720.1(3) shall be assumed to have the fire-resistance ratings prescribed therein. Where materials that change the capacity for heat dissipation are incorporated into a fire-resistance-rated assembly, fire test results or other substantiating data shall be made available to the building official to show that the required fire-resistance-rating time period is not reduced.

Reason: Section 703.2 is the genesis for the determination of fire-resistance ratings. The definition of "FIRE-RESISTANCE RATING" in Section 702 properly identifies that fire-resistance ratings apply to building elements, components and assemblies. Unfortunately, that level of detail is lost in several key charging provisions in the IBC. This proposal corrects that situation for a very important reason. For legal and technical reasons it is imperative that the construction component system be formalized so as to recognize and support the notion that there are fundamental building element fire-resistance rating requirements in Chapter 6 which are potentially modified through component and assembly provisions in Chapter 7. Additionally, this clarification will assist code users in the proper application of these fundamental provisions. Towards the goal of user friendliness, the five alternative methods for determining fire resistance in Section 703.3 have been editorially shuffled to reflect the typical order of progression used in the application of alternate methods. Those prescriptive procedures internal to the IBC are now listed first and followed by methods normally requiring external expertise.

Approval of this proposal will improve the technical accuracy of the International Building Code and in doing so will contribute to the proper interpretation and application of these key provisions.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal provides consistency between the three terms in both the definition of fire-resistance rating and also within the various code sections. The reorganization of the items in Section 703.3 start with the prescriptive elements and then move on to the calculation and performance options which is appropriate for a prescriptive code.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Bob Eugene, Underwriters Laboratories, Inc., requests Approval as Modified by this public comment.

Modify proposal as follows:

703.3 Alternative methods for determining fire resistance. The application of any of the alternative methods listed in this section shall be based on the fire exposure and acceptance criteria specified in ASTM E 119. The required fire resistance of a building element, component or assemblies shall be permitted to be established by any of the following methods or procedures:

1. Fire-resistance designs documented in approved sources.
2. ~~4.~~ Prescriptive designs of fire-resistance-rated building elements, component or assemblies as prescribed in Section 720.
3. ~~2.~~ Calculations in accordance with Section 721.
3. ~~Fire-resistance designs documented in approved sources.~~
4. Engineering analysis based on a comparison of building element, component or assemblies designs having fire-resistance ratings as determined by the test procedures set forth in ASTM E 119.
5. Alternative protection methods as allowed by Section 104.11.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: This modification to the committee action re-establishes the original published order of the five alternative methods for determining fire resistance. This modification does not make any substantive change to the text. The original published order reflects the order of Chapter 7. The first method should be fire-resistant designs documented in approved sources. These designs are typically based on testing to the performance level of ASTM E119 (UL 263). In following the guidance established in 703.2, the fire-resistance rating shall be established by ASTM E119 (UL 263) or the alternative methods in Section 703.3. Those methods reflecting conformance to the ASTM E119 (UL 263) test should be listed first as originally published.

THIS PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY, GENERAL AND STRUCTURAL AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC FIRE SAFETY

Revise as follows:

703.2 Fire-resistance ratings. The fire-resistance rating of building elements shall be determined in accordance with the test procedures set forth in ASTM E 119 or UL 263, or in accordance with Section 703.3. Where materials, systems or devices that have not been tested as part of a fire-resistance-rated assembly are incorporated into the assembly, sufficient data shall be made available to the building official to show that the required fire-resistance rating is not reduced. Materials and methods of construction used to protect joints and penetrations in fire-resistance-rated building elements shall not reduce the required fire-resistance rating.

Exception: In determining the fire-resistance rating of exterior bearing walls, compliance with the ASTM E 119 or UL 263 criteria for unexposed surface temperature rise and ignition of cotton waste due to passage of flame or gases is required only for a period of time corresponding to the required fire-resistance rating of an exterior nonbearing wall with the same fire separation distance, and in a building of the same group. When the fire-resistance rating determined in accordance with this exception exceeds the fire-resistance rating determined in accordance with ASTM E 119 or UL 263, the fire exposure time period, water pressure, and application duration criteria for the hose stream test of ASTM E 119 or UL 263 shall be based upon the fire-resistance rating determined in accordance with this exception.

703.2.1 Nonsymmetrical wall construction. Interior walls and partitions of nonsymmetrical construction shall be tested with both faces exposed to the furnace, and the assigned fire-resistance rating shall be the shortest duration obtained from the two tests conducted in compliance with ASTM E 119 or UL 263. When evidence is furnished to show that the wall was tested with the least fire-resistant side exposed to the furnace, subject to acceptance of the building official, the wall need not be subjected to tests from the opposite side (see Section 704.5 for exterior walls).

703.2.3 Restrained classification. Fire-resistance-rated assemblies tested under ASTM E 119 shall not be considered to be restrained unless evidence satisfactory to the building official is furnished by the registered design professional showing that the construction qualifies for a restrained classification in accordance with ASTM E 119 or UL 263. Restrained construction shall be identified on the plans.

703.3 Alternative methods for determining fire resistance. The application of any of the alternative methods listed in this section shall be based on the fire exposure and acceptance criteria specified in ASTM E 119 or UL 263. The required fire resistance of a building element shall be permitted to be established by any of the following methods or procedures:

1. Fire-resistance designs documented in approved sources.
2. Prescriptive designs of fire-resistance-rated building elements as prescribed in Section 720.
3. Calculations in accordance with Section 721.
4. Engineering analysis based on a comparison of building element designs having fire-resistance ratings as determined by the test procedures set forth in ASTM E 119 or UL 263.
5. Alternative protection methods as allowed by Section 104.11.

704.7 Unexposed surface temperature. Where protected openings are not limited by Section 704.8, the limitation on the rise of temperature on the unexposed surface of exterior walls as required by ASTM E 119 or UL 263 shall not apply. Where protected openings are limited by Section 704.8, the limitation on the rise of temperature on the unexposed surface of exterior walls as required by ASTM E 119 or UL 263 shall not apply provided that a correction is made for radiation from the unexposed exterior wall surface in accordance with the following formula:

$$A_e = A + (A_f \times F_{eo}) \quad \text{(Equation 7-1)}$$

where:

A_e = Equivalent area of protected openings.

A = Actual area of protected openings.

A_f = Area of exterior wall surface in the story under consideration exclusive of openings, on which the temperature limitations of ASTM E 119 or UL 263 for walls are exceeded.

F_{eo} = An "equivalent opening factor" derived from Figure 704.7 based on the average temperature of the unexposed wall surface and the fire-resistance rating of the wall.

704.9 Vertical separation of openings. Openings in exterior walls in adjacent stories shall be separated vertically to protect against fire spread on the exterior of the buildings where the openings are within 5 feet (1524 mm) of each other horizontally and the opening in the lower story is not a protected opening with a fire protection rating of not less than 3/4 hour. Such openings shall be separated vertically at least 3 feet (914 mm) by spandrel girders, exterior walls or other similar assemblies that have a fire-resistance rating of at least 1 hour or by flame barriers that extend horizontally at least 30 inches (762 mm) beyond the exterior wall. Flame barriers shall also have a fire-resistance rating of at least 1 hour. The unexposed surface temperature limitations specified in ASTM E 119 or UL 263 shall not apply to the flame barriers or vertical separation unless otherwise required by the provisions of this code.

Exceptions:

1. This section shall not apply to buildings that are three stories or less in height.
2. This section shall not apply to buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.
3. Open parking garages.

706.2.1 Fire-resistance-rated glazing. Fire-resistance-rated glazing, when tested in accordance with ASTM E 119 or UL 263 and complying with the requirements of Section 706, shall be permitted. Fire-resistance-rated glazing shall bear a label or other identification showing the name of the manufacturer, the test standard and the identifier "W-XXX," where the "XXX" is the fire-resistance rating in minutes. Such label or identification shall be issued by an approved agency and shall be permanently affixed to the glazing.

706.7 Openings. Openings in a fire barrier wall shall be protected in accordance with Section 715. Openings shall be limited to a maximum aggregate width of 25 percent of the length of the wall, and the maximum area of any single opening shall not exceed 156 square feet (15m²). Openings in exit enclosures and exit passageways shall also comply with Sections 1020.1.1 and 1021.4, respectively.

Exceptions:

1. Openings shall not be limited to 156 square feet (15 m²) where adjoining fire areas are equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.
2. Fire doors serving an exit enclosure.
3. Openings shall not be limited to 156 square feet (15 m²) or an aggregate width of 25 percent of the length of the wall where the opening protective assembly has been tested in accordance with ASTM E 119 or UL 263 and has a minimum fire-resistance rating not less than the fire-resistance rating of the wall.
4. Fire windows permitted in atrium separation walls shall not be limited to a maximum aggregate width of 25 percent of length of the wall.

711.3.2 Access doors. Access doors shall be permitted in ceilings of fire-resistance-rated floor/ceiling and roof/ceiling assemblies provided such doors are tested in accordance with ASTM E 119 or UL 263 as horizontal assemblies and labeled by an approved agency for such purpose.

712.3.1 Through penetrations. Through penetrations of fire-resistance-rated walls shall comply with Section 712.3.1.1 or 712.3.1.2.

Exception: Where the penetrating items are steel, ferrous or copper pipes, tubes or conduits, the annular space between the penetrating item and the fire-resistance-rated wall is permitted to be protected as follows:

1. In concrete or masonry walls where the penetrating item is a maximum 6-inch (152 mm) nominal diameter and the area of the opening through the wall does not exceed 144 square inches (0.0929 m²), concrete, grout or mortar is permitted where it is installed the full thickness of the wall or the thickness required to maintain the fire-resistance rating; or
2. The material used to fill the annular space shall prevent the passage of flame and hot gases sufficient to ignite cotton waste when subjected to ASTM E 119 or UL 263 time-temperature fire conditions under a minimum positive pressure differential of 0.01 inch (2.49 Pa) of water at the location of the penetration for the time period equivalent to the fire-resistance rating of the construction penetrated.

712.4.1.1 Through penetrations. Through penetrations of fire-resistance-rated horizontal assemblies shall comply with Section 712.4.1.1.1 or 712.4.1.1.2.

Exceptions:

1. Penetrations by steel, ferrous or copper conduits, pipes, tubes or vents or concrete or masonry items through a single fire-resistance-rated floor assembly where the annular space is protected with materials that prevent the passage of flame and hot gases sufficient to ignite cotton waste when subjected to ASTM E 119 or UL 263 time-temperature fire conditions under a minimum positive pressure differential of 0.01 inch (2.49 Pa) of water at the location of the penetration for the time period equivalent to the fire-resistance rating of the construction penetrated. Penetrating items with a maximum 6-inch (152 mm) nominal diameter shall not be limited to the penetration of a single fire-resistance-rated floor assembly, provided the aggregate area of the openings through the assembly does not exceed 144 square inches (92 900 mm²) in any 100 square feet (9.3 m²) of floor area.
2. Penetrations in a single concrete floor by steel, ferrous or copper conduits, pipes, tubes or vents with a maximum 6-inch (152 mm) nominal diameter, provided the concrete, grout or mortar is installed the full thickness of the floor or the thickness required to maintain the fire-resistance rating. The penetrating items shall not be limited to the penetration of a single concrete floor, provided the area of the opening through each floor does not exceed 144 square inches (92 900 mm²).
3. Penetrations by listed electrical boxes of any material, provided such boxes have been tested for use in fire-resistance-rated assemblies and installed in accordance with the instructions included in the listing.

713.1 General. Joints installed in or between fire-resistance-rated walls, floor or floor/ceiling assemblies and roofs or roof/ceiling assemblies shall be protected by an approved fire-resistant joint system designed to resist the passage of fire for a time period not less than the required fire-resistance rating of the wall, floor or roof in or between which it is installed. Fire-resistant joint systems shall be tested in accordance with Section 713.3. The void created at the intersection of a floor/ceiling assembly and an exterior curtain wall assembly shall be protected in accordance with Section 713.4.

Exception: Fire-resistant joint systems shall not be required for joints in all of the following locations:

1. Floors within a single dwelling unit.
2. Floors where the joint is protected by a shaft enclosure in accordance with Section 707.
3. Floors within atriums where the space adjacent to the atrium is included in the volume of the atrium for smoke control purposes.
4. Floors within malls.
5. Floors within open parking structures.
6. Mezzanine floors.
7. Walls that are permitted to have unprotected openings.
8. Roofs where openings are permitted.
9. Control joints not exceeding a maximum width of 0.625 inch (15.9 mm) and tested in accordance with ASTM E 119 or UL 263.

713.4 Exterior curtain wall/floor intersection. Where fire resistance-rated floor or floor/ceiling assemblies are required, voids created at the intersection of the exterior curtain wall assemblies and such floor assemblies shall be sealed with an approved material or system to prevent the interior spread of fire. Such material or systems shall be securely installed and capable of preventing the passage of flame and hot gases sufficient to ignite cotton waste where subjected either to ASTM E 119 or UL 263 time-temperature fire conditions under a minimum positive pressure differential of 0.01 inch (0.254 mm) of water column (2.5 Pa) or installed as tested in accordance with ASTM E 2307 for the time period at least equal to the fire-resistance rating of the floor assembly. Height and fire-resistance requirements for curtain wall spandrels shall comply with Section 704.9.

714.7 Seismic isolation systems. Fire-resistance ratings for the isolation system shall meet the fire-resistance rating required for the columns, walls or other structural elements in which the isolation system is installed in accordance with Table 601. Isolation systems required to have a fire-resistance rating shall be protected with approved materials or construction assemblies designed to provide the same degree of fire resistance as the structural element in which it is installed when tested in accordance with ASTM E 119 or UL 263 (see Section 703.2).

Such isolation system protection applied to isolator units shall be capable of retarding the transfer of heat to the isolator unit in such a manner that the required gravity load-carrying capacity of the isolator unit will not be impaired after exposure to the standard time-temperature curve fire test prescribed in ASTM E 119 or UL 263 for a duration not less than that required for the fire-resistance rating of the structure element in which it is installed.

Such isolation system protection applied to isolator units shall be suitably designed and securely installed so as not to dislodge, loosen, sustain damage or otherwise impair its ability to accommodate the seismic movements for which the isolator unit is designed and to maintain its integrity for the purpose of providing the required fire-resistance protection.

715.2 Fire-resistance-rated glazing. Labeled fire-resistance-rated glazing tested as part of a fire-resistance-rated wall assembly in accordance with ASTM E 119 or UL 263 shall not be required to comply with this section.

716.5.2 (IMC 607.5.2) Fire barriers. Ducts and air transfer openings of fire barriers shall be protected with approved fire dampers installed in accordance with their listing. Ducts and air transfer openings shall not penetrate exit enclosures and exit passageways except as permitted by Sections 1020.1.2 and 1021.5, respectively.

Exception: Fire dampers are not required at penetrations of fire barriers where any of the following apply:

1. Penetrations are tested in accordance with ASTM E 119 or UL 263 as part of the fire-resistance rated assembly.
2. Ducts are used as part of an approved smoke control system in accordance with Section 909 and where the use of a fire damper would interfere with the operation of a smoke control system.
3. Such walls are penetrated by ducted HVAC systems, have a required fire-resistance rating of 1 hour or less, are in areas of other than Group Hand are in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2. For the purposes of this exception, a ducted HVAC system shall be a duct system for conveying supply, return or exhaust air as part of the structure's HVAC system. Such a duct system shall be constructed of sheet steel not less than 26 gage thickness and shall be continuous from the air-handling appliance or equipment to the air outlet and inlet terminals.

716.5.3 (IMC 607.5.5) Shaft enclosures. Shaft enclosures that are permitted to be penetrated by ducts and air transfer openings shall be protected with approved fire and smoke dampers installed in accordance with their listing.

Exceptions:

1. Fire dampers are not required at penetrations of shafts where:
 - 1.1. Steel exhaust subducts are extended at least 22 inches (559 mm) vertically in exhaust shafts, provided there is a continuous airflow upward to the outside; or
 - 1.2. Penetrations are tested in accordance with ASTM E 119 or UL 263 as part of the rated assembly; or
 - 1.3. Ducts are used as part of an approved smoke control system designed and installed in accordance with Section 909 and where the fire damper will interfere with the operation of the smoke control system; or
 - 1.4. The penetrations are in parking garage exhaust or supply shafts that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
2. In Group B and R occupancies, equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, smoke dampers are not required at penetrations of shafts where:
 - 2.1. Kitchen, clothes dryer, bathroom and toilet room exhaust openings are installed with steel exhaust subducts, having a wall thickness of at least 0.019 inch (0.48 mm); and
 - 2.2. That extend at least 22 inches (559 mm) vertically; and
 - 2.3. An exhaust fan is installed at the upper terminus of the shaft that is, powered continuously in accordance with the provisions of Section 909.11, so as to maintain a continuous upward airflow to the outside.
3. Smoke dampers are not required at penetration of exhaust or supply shafts in parking garages that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
4. Smoke dampers are not required at penetrations of shafts where ducts are used as part of an approved mechanical smoke control system designed in accordance with Section 909 and where the smoke damper will interfere with the operation of the smoke control system.

716.6.1 (IMC 607.6.1) Through penetrations. In occupancies other than Groups I-2 and I-3, a duct constructed of approved materials in accordance with the *International Mechanical Code* that penetrates a fire-resistance-rated floor/ceiling assembly that connects not more than two stories is permitted without shaft enclosure protection, provided a listed fire damper is installed at the floor line or the duct is protected in accordance with Section 712.4. For air transfer openings, see Exception 7 to Section 707.2.

Exception: A duct is permitted to penetrate three floors or less without a fire damper at each floor, provided it meets all of the following requirements:

1. The duct shall be contained and located within the cavity of a wall and shall be constructed of steel not less than 0.019 inch (0.48 mm) (26 gage) in thickness.
2. The duct shall open into only one dwelling or sleeping unit and the duct system shall be continuous from the unit to the exterior of the building.
3. The duct shall not exceed 4-inch (102 mm) nominal diameter and the total area of such ducts shall not exceed 100 square inches (0.065 m²) in any 100 square feet (9.3 m²) of floor area.
4. The annular space around the duct is protected with materials that prevent the passage of flame and hot gases sufficient to ignite cotton waste where subjected to ASTM E 119 or UL 263 time-temperature conditions under a minimum positive pressure differential of 0.01 inch (2.49 Pa) of water at the location of the penetration for the time period equivalent to the fire-resistance rating of the construction penetrated.
5. Grille openings located in a ceiling of a fire-resistance-rated floor/ceiling or roof/ceiling assembly shall be protected with a listed ceiling radiation damper installed in accordance with Section 716.6.2.1.

716.6.2.1 (IMC 607.6.2.1) Ceiling radiation dampers. Ceiling radiation dampers shall be tested in accordance with UL 555C and installed in accordance with the manufacturer's installation instructions and listing. Ceiling radiation dampers are not required where either of the following applies:

1. Tests in accordance with ASTM E 119 or UL 263 have shown that ceiling radiation dampers are not necessary in order to maintain the fire-resistance rating of the assembly.
2. Where exhaust duct penetrations are protected in accordance with Section 712.4.1.2, are located within the cavity of a wall and do not pass through another dwelling unit or tenant space.

TABLE 720.1(1)
MINIMUM PROTECTION OF STRUCTURAL PARTS BASED ON TIME PERIODS
FOR VARIOUS NONCOMBUSTIBLE INSULATING MATERIALS^m

(Portions of table not shown do not change)

For SI: 1 inch = 25.4 mm, 1 square inch = 645.2 mm², 1 cubic foot = 0.0283 m³.

- a. Reentrant parts of protected members to be filled solidly.
- b. Two layers of equal thickness with a 3/4-inch airspace between.
- c. For all of the construction with gypsum wallboard described in Table 720.1(1), gypsum base for veneer plaster of the same size, thickness and core type shall be permitted to be substituted for gypsum wallboard, provided attachment is identical to that specified for the wallboard and the joints on the face layer are reinforced, and the entire surface is covered with a minimum of 1/16-inch gypsum veneer plaster.
- d. An approved adhesive qualified under ASTM E 119 or UL 263.
- e. Where lightweight or sand-lightweight concrete having an oven-dry weight of 110 pounds per cubic foot or less is used, the tabulated minimum cover shall be permitted to be reduced 25 percent, except that in no case shall the cover be less than 3/4 inch in slabs or 1 1/2 inches in beams or girders.
- f. For solid slabs of siliceous aggregate concrete, increase tendon cover 20 percent.
- g. Adequate provisions against spalling shall be provided by U-shaped or hooped stirrups spaced not to exceed the depth of the member with a clear cover of 1 inch.
- h. Prestressed slabs shall have a thickness not less than that required in Table 720.1(3) for the respective fire resistance time period.
- i. Fire coverage and end anchorages shall be as follows: Cover to the prestressing steel at the anchor shall be 1/2 inch greater than that required away from the anchor. Minimum cover to steel-bearing plate shall be 1 inch in beams and 3/4 inch in slabs.
- j. For beam widths between 8 inches and 12 inches, cover thickness shall be permitted to be determined by interpolation.
- k. Interior spans of continuous slabs, beams and girders shall be permitted to be considered restrained.
- l. For use with concrete slabs having a comparable fire endurance where members are framed into the structure in such a manner as to provide equivalent performance to that of monolithic concrete construction.
- m. Generic fire-resistance ratings (those not designated as PROPRIETARY* in the listing) in GA 600 shall be accepted as if herein listed.
- n. No additional insulating material is required on the exposed outside face of the column flange to achieve a 1-hour fire-resistance rating.

1407.10.2 Thermal barriers. MCM shall be separated from the interior of a building by an approved thermal barrier consisting of 0.5-inch (12.7 mm) gypsum wallboard or equivalent thermal barrier material that will limit the average temperature rise of the unexposed surface to not more than 250°F (121°C) after 15 minutes of fire exposure in accordance with the standard time-temperature curve of ASTM E 119 or UL 263. The thermal barrier shall be installed in such a manner that it will remain in place for not less than 15 minutes based on a test conducted in accordance with UL 1715.

2603.4 Thermal barrier. Except as provided for in Sections 2603.4.1 and 2603.9, foam plastic shall be separated from the interior of a building by an approved thermal barrier of 0.5-inch (12.7 mm) gypsum wallboard or equivalent thermal barrier material that will limit the average temperature rise of the unexposed surface to not more than 250 F (120 C) after 15 minutes of fire exposure, complying with the standard time-temperature curve of ASTM E 119 or UL 263. The thermal barrier shall be installed in such a manner that it will remain in place for 15 minutes based on FM 4880, UL 1040, NFPA 286 or UL 1715. Combustible concealed spaces shall comply with Section 717.

2603.5.1 Fire-resistance-rated walls. Where the wall is required to have a fire-resistance rating, data based on tests conducted in accordance with ASTM E 119 or UL 263 shall be provided to substantiate that the fire-resistance rating is maintained.

PART II – IBC GENERAL

Revise as follows:

410.3.5.2 Fire test. A sample curtain with a minimum of two vertical seams shall be subjected to the standard fire test specified in ASTM E 119 or UL 263 for a period of 30 minutes. The curtain shall overlap the furnace edges by an amount that is appropriate to seal the top and sides. The curtain shall have a bottom pocket containing a minimum of 4 pounds per linear foot (5.9 kg/m) of batten. The exposed surface of the curtain shall not glow, and flame or smoke shall not penetrate the curtain during the test period. Unexposed surface temperature and hose stream test requirements are not applicable to the proscenium fire safety curtain test.

PART III – IBC STRUCTURAL

1. Revise as follows:

2103.2 Clay or shale masonry units. Clay or shale masonry units shall conform to the following standards: ASTM C 34 for structural clay load-bearing wall tile; ASTM C56 for structural clay nonload-bearing wall tile; ASTM C 62 for building brick (solid masonry units made from clay or shale); ASTM C 1088 for solid units of thin veneer brick; ASTM C 126 for ceramic-glazed structural clay facing tile, facing brick and solid masonry units; ASTM C 212 for structural clay facing tile; ASTM C 216 for facing brick (solid masonry units made from clay or shale); ASTM C 652 for hollow brick (hollow masonry units made from clay or shale); and ASTM C 1405 for glazed brick (single-fired solid brick units).

Exception: Structural clay tile for nonstructural use in fireproofing of structural members and in wall furring shall not be required to meet the compressive strength specifications. The fire-resistance rating shall be determined in accordance with ASTM E 119 or UL 263 and shall comply with the requirements of Table 602.

2. Add standard to Chapter 35 as follows:

UL

UL 263-03 Standard for Fire Test of Building Construction and Materials

PART IV – IRC BUILDING/ENERGY

Revise as follows:

R314.4 Thermal barrier. Unless otherwise allowed in Section R314.5 or Section R314.6, foam plastic shall be separated from the interior of a building by an approved thermal barrier of minimum 0.5 inch (12.7 mm) gypsum wallboard or an approved finish material equivalent to a thermal barrier material that will limit the average temperature rise of the unexposed surface to no more than 250°F (139°C) after 15 minutes of fire exposure complying with the ASTM E 119 or UL 263 standard time temperature curve. The thermal barrier shall be installed in such a manner that it will remain in place for 15 minutes based on NFPA 286 with the acceptance criteria of Section R315.4, FM 4880, UL 1040 or UL 1715.

R317.1 Two-family dwellings. Dwelling units in two-family dwellings shall be separated from each other by wall and/or floor assemblies having not less than a 1-hour fire-resistance rating when tested in accordance with ASTM E 119 or UL 263. Fire-resistance-rated floor-ceiling and wall assemblies shall extend to and be tight against the exterior wall, and wall assemblies shall extend to the underside of the roof sheathing.

Exceptions:

1. A fire-resistance rating of ½ hour shall be permitted in buildings equipped throughout with an automatic sprinkler system installed in accordance with NFPA 13.
2. Wall assemblies need not extend through attic spaces when the ceiling is protected by not less than 5/8-inch (15.9 mm) Type X gypsum board and an attic draft stop constructed as specified in Section R502.12.1 is provided above and along the wall assembly separating the dwellings. The structural framing supporting the ceiling shall also be protected by not less than ½-inch (12.7 mm) gypsum board or equivalent.

R317.3.1 Through penetrations. Through penetrations of fire-resistance-rated wall or floor assemblies shall comply with Section R317.3.1.1 or R317.3.1.2.

Exception: Where the penetrating items are steel, ferrous or copper pipes, tubes or conduits, the annular space shall be protected as follows:

1. In concrete or masonry wall or floor assemblies where the penetrating item is a maximum 6 inches (152 mm) nominal diameter and the area of the opening through the wall does not exceed 144 square inches (92 900 mm²), concrete, grout or mortar is permitted where installed to the full thickness of the wall or floor assembly or the thickness required to maintain the fire-resistance rating.
2. The material used to fill the annular space shall prevent the passage of flame and hot gases sufficient to ignite cotton waste where subjected to ASTM E 119 or UL 263 time temperature fire conditions under a minimum positive pressure differential of 0.01 inch of water (3 Pa) at the location of the penetration for the time period equivalent to the fire resistance rating of the construction penetrated.

Reason: Add a direct reference to UL 263 where ASTM E119 is currently referenced.

The purpose of this code change is to include reference to UL 263 as an alternate to ASTM E 119, which is currently referenced in these code sections. These two Standards describe the same test method. The specifications for the test apparatus and test procedure are identical between the two standards. As such, identical test results would be obtained from tests conducted using each of these methods. UL 263 is an ANSI approved standard.

The inclusion of this alternate test method would provide the authority having jurisdiction with the flexibility to accept listed and labeled products evaluated in accordance with ASTM E 119 or UL 263.

These fire tests are applicable to assemblies of masonry units and to composite assemblies of structural materials for buildings, including bearing and other walls and partitions, columns, girders, beams, slabs, and composite slab and beam assemblies for floors and roofs. They are also applicable to other assemblies and structural units that constitute permanent integral parts of a finished building.

Bibliography: UL 263

Cost Impact: The code change proposal will not increase the cost of construction

Analysis: Results of the review of the proposed standard(s) will be posted on the ICC website by August 20, 2006.

Public Hearing Results

Note: The following analysis was not in the Code Change Proposal book but was published in the "Errata to the 2006/2007 Proposed Changes to the International Codes and Analysis of Proposed Referenced Standards" provided at the code development hearings:

Analysis: Review of proposed new standard indicated that, in the opinion of staff, the standard did comply with ICC standards criteria

PART I — IBC FIRE SAFETY

Committee Action:

Approved as Submitted

Committee Reason: Similar to the action taken on FS8-06/07 the addition of the new standard does provide additional flexibility for the designer and building official. While there was some uncertainty regarding whether the UL standard has incorporated some of the recent changes that have been made to the ASTM E 119 standard, the proposed UL standard does match up with the currently referenced E 119 standard.

Assembly Action:

None

PART II — IBC GENERAL

Committee Action:

Approved as Submitted

Committee Reason: The inclusion of UL 263 as an alternate and equivalent standard to ASTM E 119 was felt to be an appropriate addition to the code. This is also consistent with the actions taken on the other portions of this code change.

Assembly Action:

None

PART III — IBC STRUCTURAL

Committee Action:

Approved as Submitted

Committee Reason: The change adds a needed reference to a fire test standard.

Assembly Action:

None

PART IV — IRC

Committee Action:

Approved as Submitted

Committee Reason: The new reference to the Standard UL 263 adds depth to the code and provides an alternative to ASTM E119. These two standards describe the same test method. The addition of this alternate test method provides the authority having jurisdiction with the flexibility to accept listed and labeled products evaluated under UL 263.

Assembly Action:

None

Public Comments

PARTS II, III AND IV DID NOT RECEIVE ANY PUBLIC COMMENTS AND WERE APPROVED AS SUBMITTED, PER THE COMMITTEE RECOMMENDATIONS.

Individual Consideration Agenda

PART I

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Bob Eugene, Underwriters Laboratories, Inc., requests Approval as Modified by this public comment for Part I.

Modify proposal as follows:

703.2.3 Restrained classification. Fire-resistance-rated assemblies tested under ASTM E 119 or UL 263 shall not be considered to be restrained unless evidence satisfactory to the building official is furnished by the registered design professional showing that the construction qualifies for a restrained classification in accordance with ASTM E 119 or UL 263. Restrained construction shall be identified on the plans.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: Editorial. The term "or UL 263" was added throughout the I-codes wherever ASTM E 119 was referenced, but in this one section, the revision was missed in the first sentence.

Final Hearing Results

FS10-06/07, Part I	AMPC1
FS10-06/07, Part II	AS
FS10-06/07, Part III	AS
FS10-06/07, Part IV	AS

Code Change No: **FS11-06/07**

Original Proposal

Sections: 402.10, 402.15.4, 406.5.2, 406.6.6.3 and 410.3.5.3, 703.4.2, 719.1, 719.4, 802.1, 803.1, 803.5, 803.6.1, 803.6.2, 1407.10.1, 2603.3, 2603.5.4, 2606.4, Chapter 35 (New) D102.2.8, D106; IFC 804.2.4, 803.5.1, [F] 806.5, [F] 2606.2.4, Chapter 45; IRC R314.3, R314.6, R315.3, R315.4, R316.1, R316.2, M1601.2.1, Chapter 43; IWUIC 202, Chapter 7

Proponent: Bob Eugene, Underwriters Laboratories Inc.

THIS PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY, GENERAL AND STRUCTURAL, IFC, IRC BUILDING/ENERGY, MECHANICAL AND WUIC CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC FIRE SAFETY

1. Revise as follows:

703.4.2 Composite materials. Materials having a structural base of noncombustible material as determined in accordance with Section 703.4.1 with a surfacing not more than 0.125 inch (3.18 mm) thick that has a flame spread index not greater than 50 when tested in accordance with ASTM E 84 or UL 723 shall be acceptable as noncombustible materials.

719.1 General. Insulating materials, including facings such as vapor retarders and vapor-permeable membranes, similar coverings, and all layers of single and multilayer reflective foil insulations, shall comply with the requirements of this section. Where a flame spread index or a smoke-developed index is specified in this section, such index shall be determined in accordance with ASTM E 84 or UL 723. Any material that is subject to an increase in flame spread index or smoke-developed index beyond the limits herein established through the effects of age, moisture, or other atmospheric conditions shall not be permitted.

Exceptions:

1. Fiberboard insulation shall comply with Chapter 23.
2. Foam plastic insulation shall comply with Chapter 26.
3. Duct and pipe insulation and duct and pipe coverings and linings in plenums shall comply with the *International Mechanical Code*.

719.4 Loose-fill insulation. Loose-fill insulation materials that cannot be mounted in the ASTM E 84 or UL 723 apparatus without a screen or artificial supports shall comply with the flame spread and smoke-developed limits of Sections 719.2 and 719.3 when tested in accordance with CAN/ULC S102.2.

Exception: Cellulose loose-fill insulation shall not be required to comply with the flame spread index requirement of CAN/ULC S102.2, provided such insulation complies with the requirements of Section 719.6.

802.1 FLAME SPREAD INDEX. A comparative measure, expressed as a dimensionless number, derived from visual measurements of the spread of flame versus time for a material tested in accordance with ASTM E 84 or UL 723.

803.1 General. Interior wall and ceiling finishes shall be classified in accordance with ASTM E 84 or UL 723. Such interior finish materials shall be grouped in the following classes in accordance with their flame spread and smoke-developed indexes.

- Class A: Flame spread 0-25; smoke-developed 0-450.
- Class B: Flame spread 26-75; smoke-developed 0-450.
- Class C: Flame spread 76-200; smoke-developed 0-450.

Exception: Materials, other than textiles, tested in accordance with Section 803.2.

803.5 Interior finish requirements based on group. Interior wall and ceiling finish shall have a flame spread index not greater than that specified in Table 803.5 for the group and location designated. Interior wall and ceiling finish materials, other than textiles, tested in accordance with NFPA 286 and meeting the acceptance criteria of Section 803.2.1, shall be permitted to be used where a Class A classification in accordance with ASTM E 84 or UL 723 is required.

803.6.1 Surface burning characteristic test. Textile wall and ceiling coverings shall have a Class A flame spread index in accordance with ASTM E 84 or UL 723 and be protected by automatic sprinklers installed in accordance with Section 903.3.1.1 or 903.3.1.2.

1407.9 Surface-burning characteristics. Unless otherwise specified, MCM shall have a flame spread index of 75 or less and a smoke-developed index of 450 or less when tested as an assembly in the maximum thickness intended for use in accordance with ASTM E 84 or UL 723.

1407.10.1 Surface-burning characteristics. MCM shall have a flame spread index of not more than 25 and a smoke-developed index of not more than 450 when tested as an assembly in the maximum thickness intended for use in accordance with ASTM E 84 or UL 723.

2603.3 Surface-burning characteristics. Unless otherwise indicated in this section, foam plastic insulation and foam plastic cores of manufactured assemblies shall have a flame spread index of not more than 75 and a smoke-developed index of not more than 450 where tested in the maximum thickness intended for use in accordance with ASTM E 84 or UL 723. Loose fill-type foam plastic insulation shall be tested as board stock for the flame spread index and smoke-developed index.

Exceptions:

1. Smoke-developed index for interior trim as provided for in Section 2604.2.
2. In cold storage buildings, ice plants, food plants, food processing rooms and similar areas, foam plastic insulation where tested in a thickness of 4 inches (102 mm) shall be permitted in a thickness up to 10 inches (254 mm) where the building is equipped throughout with an automatic fire sprinkler system in accordance with Section 903.3.1.1. The approved automatic sprinkler system shall be provided in both the room and that part of the building in which the room is located.
3. Foam plastic insulation that is a part of a Class A, B or C roof-covering assembly provided the assembly with the foam plastic insulation satisfactorily passes FM 4450 or UL 1256. The smoke-developed index shall not be limited for roof applications.
4. Foam plastic insulation greater than 4 inches (102 mm) in thickness shall have a maximum flame spread index of 75 and a smoke-developed index of 450 where tested at a minimum thickness of 4 inches (102 mm), provided the end use is approved in accordance with Section 2603.9 using the thickness and density intended for use.
5. Flame spread and smoke-developed indexes for foam plastic interior signs in covered mall buildings provided the signs comply with Section 402.15.

2603.4.1.13 Type V construction. Foam plastic spray applied to a sill plate and header of Type V construction is subject to all of the following:

1. The maximum thickness of the foam plastic shall be 3¼ inches (82.6 mm).
2. The density of the foam plastic shall be in the range of 1.5 to 2.0 pcf (24 to 32 kg/m³).
3. The foam plastic shall have a flame spread index of 25 or less and an accompanying smoke-developed index of 450 or less when tested in accordance with ASTM E 84 or UL 723.

2603.5.4 Flame spread and smoke-developed indexes. Foam plastic insulation, exterior coatings and facings shall be tested separately in the thickness intended for use, but not to exceed 4 inches (102 mm), and shall each have a flame spread index of 25 or less and a smoke-developed index of 450 or less as determined in accordance with ASTM E 84 or UL 723.

Exception: Prefabricated or factory-manufactured panels having minimum 0.020-inch (0.51 mm) aluminum facings and a total thickness of 0.25 inch (6.4 mm) or less are permitted to be tested as an assembly where the foam plastic core is not exposed in the course of construction.

2606.4 Specifications. Light-transmitting plastics, including thermoplastic, thermosetting or reinforced thermosetting plastic material, shall have a self-ignition temperature of 650°F (343°C) or greater where tested in accordance with ASTM D 1929; a smoke-developed index not greater than 450 where tested in the manner intended for use in accordance with ASTM E 84 or UL 723, or not greater than 75 where tested in the thickness intended for use in accordance with ASTM D 2843 and shall conform to one of the following combustibility classifications:

Class CC1: Plastic materials that have a burning extent of 1 inch (25 mm) or less where tested at a nominal thickness of 0.060 inch (1.5 mm), or in the thickness intended for use, in accordance with ASTM D 635,

Class CC2: Plastic materials that have a burning rate of 2.5 inches per minute (1.06 mm/s) or less where tested at a nominal thickness of 0.060 inch (1.5 mm), or in the thickness intended for use, in accordance with ASTM D 635.

D102.2.8 Permanent canopies. Permanent canopies are permitted to extend over adjacent open spaces provided:

1. The canopy and its supports shall be of noncombustible material, fire-retardant-treated wood, Type IV construction or of 1-hour fire-resistance-rated construction.

Exception: Any textile covering for the canopy shall meet the fire propagation performance criteria of NFPA 701 after both accelerated water leaching and accelerating weathering.

2. Any canopy covering, other than textiles, shall have a flame spread index not greater than 25 when tested in accordance with ASTM E 84 or UL 723 in the form intended for use.
3. The canopy shall have at least one long side open.
4. The maximum horizontal width of the canopy shall not exceed 15 feet (4572 mm).
5. The fire resistance of exterior walls shall not be reduced.

2. Add new standard to Chapter 35 and Appendix D as follows:

UL

723-03 Standard for Test for Surface Burning Characteristics of Building Materials, with Revisions through May 2005

SECTION D106 REFERENCED STANDARDS

ASTM

E 84-04 Test Method for Surface Burning Characteristics of Building Materials

PART II – IBC GENERAL

1. Revise as follows:

402.10 Kiosks. Kiosks and similar structures (temporary or permanent) shall meet the following requirements:

1. Combustible kiosks or other structures shall not be located within the mall unless constructed of any of the following materials:
 - 1.1. Fire-retardant-treated wood complying with Section 2303.2.
 - 1.2. Foam plastics having a maximum heat release rate not greater than 100kW (105 Btu/h) when tested in accordance with the exhibit booth protocol in UL 1975.
 - 1.3. Aluminum composite material (ACM) having a flame spread index of not more than 25 and a smoke-developed index of not more than 450 when tested as an assembly in the maximum thickness intended for use in accordance with ASTM E 84 or UL 723.
2. Kiosks or similar structures located within the mall shall be provided with approved fire suppression and detection devices.
3. The minimum horizontal separation between kiosks or groupings thereof and other structures within the mall shall be 20 feet (6096 mm).
4. Each kiosk or similar structure or groupings thereof shall have a maximum area of 300 square feet (28 m²).

402.15.4 Plastics other than foam plastics. Plastics other than foam plastics used in signs shall be light-transmitting plastics complying with Section 2606.4 or shall have a self-ignition temperature of 650°F (343°C) or greater when tested in accordance with ASTM D 1929, and a flame spread index not greater than 75 and smoke-developed index not greater than 450 when tested in the manner intended for use in accordance with ASTM E 84 or UL 723 or meet the acceptance criteria of Section 803.2.1 when tested in accordance with NFPA 286.

406.5.2 Canopies. Canopies under which fuels are dispensed shall have a clear, unobstructed height of not less than 13 feet 6 inches (4115 mm) to the lowest projecting element in the vehicle drive-through area. Canopies and their supports over pumps shall be of noncombustible materials, fire-retardant-treated wood complying with Chapter 23, wood of Type IV sizes or of construction providing 1-hour fire resistance. Combustible materials used in or on a canopy shall comply with one of the following:

1. Shielded from the pumps by a noncombustible element of the canopy, or wood of Type IV sizes;
2. Plastics covered by aluminum facing having a minimum thickness of 0.010 inch (0.30 mm) or corrosion-resistant steel having a minimum base metal thickness of 0.016 inch (0.41 mm). The plastic shall have a flame spread index of 25 or less and a smoke-developed index of 450 or less when tested in the form intended for use in accordance with ASTM E 84 or UL 723 and a self-ignition temperature of 650 F (343°C) or greater when tested in accordance with ASTM D 1929; or
3. Panels constructed of light-transmitting plastic materials shall be permitted to be installed in canopies erected over motor vehicle fuel-dispensing station fuel dispensers, provided the panels are located at least 10 feet (3048 mm) from any building on the same lot and face yards or streets not less than 40 feet (12 192 mm) in width on the other sides. The aggregate areas of plastics shall not exceed 1,000 square feet (93 m²). The maximum area of any individual panel shall not exceed 100 square feet (9.3 m²).

410.3.5.3 Smoke test. Curtain fabrics shall have a smoke-developed rating of 25 or less when tested in accordance with ASTM E 84 or UL 723.

3105.4 Canopy materials. Canopies shall be constructed of a rigid framework with an approved covering that meets the fire propagation performance criteria of NFPA 701 or has a flame spread index not greater than 25 when tested in accordance with ASTM E 84 or UL 723.

2. Add new standard to Chapter 35 as follows:

UL
723-03 Standard for Test for Surface Burning Characteristics of Building Materials, with Revisions through May 2005

PART III – IBC STRUCTURAL

Revise as follows:

2303.2 Fire-retardant-treated wood. Fire-retardant-treated wood is any wood product which, when impregnated with chemicals by a pressure process or other means during manufacture, shall have, when tested in accordance with ASTM E 84 or UL 723, a listed flame spread index of 25 or less and show no evidence of significant progressive combustion when the test is continued for an additional 20-minute period. In addition, the flame front shall not progress more than 10.5 feet (3200 mm) beyond the centerline of the burners at any time during the test.

PART IV – IFC

1. Revise as follows:

803.5.1 Textile wall coverings. Textile wall coverings shall comply with one of the following:

1. The coverings shall have a Class A flame spread index in accordance with ASTM E 84 or UL 723 and be protected by automatic sprinklers installed in accordance with Section 903.3.1.1 or 903.3.1.2,
2. The covering shall meet the criteria of Section 803.5.1.1 or 803.5.1.2 when tested in the manner intended for use in accordance with NFPA 265 using the product-mounting system, including adhesive, of actual use, or
3. The covering shall meet the criteria of Section 803.1.2.1 when tested in accordance with NFPA 286 using the product-mounting system, including adhesive, of actual use.

804.2.4 Flame spread. The flame spread rating shall not exceed 75 where tested in accordance with ASTM E 84 or UL 723. The smoke-developed index shall not be limited.

[F] 806.5 Interior trim. Material, other than foam plastic used as interior trim shall have a minimum Class C flame spread and smoke-developed index when tested in accordance with ASTM E 84 or UL 723, as described in Section 803.1. Combustible trim, excluding handrails and guardrails, shall not exceed 10 percent of the aggregate wall or ceiling area in which it is located.

[F] 2604.2.4 Flame spread. The flame spread index shall not exceed 75 where tested in accordance with ASTM E 84 or UL 723. The smoke-developed index shall not be limited.

2. Add new standard to Chapter 45 as follows:

UL 723-03 Standard for Test for Surface Burning Characteristics of Building Materials, with Revisions through May 2005

PART V – IRC BUILDING/ENERGY**1. Revise as follows:**

R314.3 Surface burning characteristics. Unless otherwise allowed in Section R314.5 or R314.6, all foam plastic or foam plastic cores used as a component in manufactured assemblies used in building construction shall have a flame spread index of not more than 75 and shall have a smoke-developed index of not more than 450 when tested in the maximum thickness intended for use in accordance with ASTM E84 or UL 723. Loose-fill type foam plastic insulation shall be tested as board stock for the flame spread index and smoke-developed index.

Exception: Foam plastic insulation more than 4 inches thick shall have a maximum flame spread index of 75 and a smoke-developed index of 450 where tested at a minimum thickness of 4 inches, provided the end use is approved in accordance with Section R314.6 using the thickness and density intended for use.

R314.6 Specific approval. Foam plastic not meeting the requirements of Sections R314.3 through R314.5 shall be specifically approved on the basis of one of the following approved tests: NFPA 286 with the acceptance criteria of Section R315.4, FM4880, UL 723, UL1040 or UL1715, or fire tests related to actual end-use configurations. The specific approval shall be based on the actual end use configuration and shall be performed on the finished foam plastic assembly in the maximum thickness intended for use. Assemblies tested shall include seams, joints and other typical details used in the installation of the assembly and shall be tested in the manner intended for use.

R315.3 Testing. Tests shall be made in accordance with ASTM E 84 or UL 723.

R315.4 Alternate test method. As an alternate to having a flame-spread classification of not greater than 200 and a smoke developed index of not greater than 450 when tested in accordance with ASTM E 84 or UL 723, wall and ceiling finishes, other than textiles, shall be permitted to be tested in accordance with NFPA 286. Materials tested in accordance with NFPA 286 shall meet the following criteria:

During the 40 kW exposure, the interior finish shall comply with Item 1. During the 160 kW exposure, the interior finish shall comply with Item 2. During the entire test, the interior finish shall comply with Item 3.

1. During the 40 kW exposure, flames shall not spread to the ceiling.
2. During the 160 kW exposure, the interior finish shall comply with the following:
 - 2.1. Flame shall not spread to the outer extremity of the sample on any wall or ceiling.
 - 2.2. Flashover, as defined in NFPA 286, shall not occur.
3. The total smoke released throughout the NFPA 286 test shall not exceed 1,000 m².

R316.1 Insulation. Insulation materials, including facings, such as vapor retarders or vapor permeable membranes installed within floor-ceiling assemblies, roof-ceiling assemblies, wall assemblies, crawl spaces and attics shall have a flame-spread index not to exceed 25 with an accompanying smoke-developed index not to exceed 450 when tested in accordance with ASTM E 84 or UL 723.

Exceptions:

1. When such materials are installed in concealed spaces, the flame-spread and smoke-developed limitations do not apply to the facings, provided that the facing is installed in substantial contact with the unexposed surface of the ceiling, floor or wall finish.
2. Cellulose loose-fill insulation, which is not spray applied, complying with the requirements of Section R316.3, shall only be required to meet the smoke-developed index of not more than 450.

R316.2 Loose-fill insulation. Loose-fill insulation materials that cannot be mounted in the ASTM E 84 or UL 723 apparatus without a screen or artificial supports shall comply with the flame spread and smoke-developed limits of Sections R316.1 and R316.4 when tested in accordance with CAN/ULC S102.2.

Exception: Cellulose loose-fill insulation shall not be required to comply with the flame spread index requirement of CAN/ULC S102.2, provided such insulation complies with the requirements of Section R316.3.

2. Add standard to Chapter 43 as follows:**UL**

723-03 Standard for Test for Surface Burning Characteristics of Building Materials, with Revisions through May 2005

PART VI – IRC MECHANICAL

Revise as follows:

M1601.2.1 Duct insulation materials. Duct insulation materials shall conform to the following requirements:

1. Duct coverings and linings, including adhesives where used, shall have a flame spread index not higher than 25, and a smoke-developed index not over 50 when tested in accordance with ASTM E 84 or UL 723, using the specimen preparation and mounting procedures of ASTM E 2231.
2. Duct coverings and linings shall not flame, glow, smolder or smoke when tested in accordance with ASTM C 411 at the temperature to which they are exposed in service. The test temperature shall not fall below 250°F (121°C).
3. External duct insulation and factory-insulated flexible ducts shall be legibly printed or identified at intervals not longer than 36 inches (914 mm) with the name of the manufacturer; the thermal resistance *R*-value at the specified installed thickness; and the flame spread and smoke-developed indexes of the composite materials. All duct insulation product *R*-values shall be based on insulation only, excluding air films, vapor retarders or other duct components, and shall be based on tested *C*-values at 75°F (24°C) mean temperature at the installed thickness, in accordance with recognized industry procedures. The installed thickness of duct insulation used to determine its *R*-value shall be determined as follows:
 - 3.1. For duct board, duct liner and factory-made rigid ducts not normally subjected to compression, the nominal insulation thickness shall be used.
 - 3.2. For ductwrap, the installed thickness shall be assumed to be 75 percent (25-percent compression) of nominal thickness.
 - 3.3. For factory-made flexible air ducts, The installed thickness shall be determined by dividing the difference between the actual outside diameter and nominal inside diameter by two.

PART VII - WUIC

1. Revise as follows:

**SECTION 202
DEFINITIONS**

NONCOMBUSTIBLE. As applied to building construction material means a material that, in the form in which it is used, is either one of the following:

1. Material of which no part will ignite and burn when subjected to fire. Any material conforming to ASTM E 136 shall be considered noncombustible within the meaning of this section.
2. Material having a structural base of noncombustible material as defined in Item 1 above, with a surfacing material not over 1/8 inch (3.2 mm) thick, which has a flame spread rating of 50 or less. Flame spread rating as used herein refers to rating obtained according to tests conducted as specified in ASTM E 84 or UL 723.

“Noncombustible” does not apply to surface finish materials. Material required to be noncombustible for reduced clearances to flues, heating appliances or other sources of high temperature shall refer to material conforming to Item 1. No material shall be classed as noncombustible that is subject to increase in combustibility or flame spread rating, beyond the limits herein established, through the effects of age, moisture or other atmospheric condition.

2. Add referenced standard to Chapter 7 as follows:

UL

723-03 Standard for Test for Surface Burning Characteristics of Building Materials, with Revisions through May 2005

Reason: (IBC, IFB, IMC, IRC and IWUIC) Add a direct reference to UL 723 where ASTM E84 is referenced throughout the family of I-codes. The purpose of this code change is to include reference to UL 723 as an alternate to ASTM E 84 throughout the family of I-codes. These two Standards describe the same test method. The specifications for the test apparatus and test procedure are identical between the two standards. As such, identical test results would be obtained from tests conducted using each of these methods. UL 723 is an ANSI approved standard. The inclusion of this alternate test method would provide the authority having jurisdiction with the flexibility to accept listed and labeled products evaluated in accordance with ASTM E 84 or UL 723. The purpose of the test is to determine the comparative burning characteristics of the material under test by evaluating the spread of flame over its surface and the density of the smoke developed when exposed to a test fire, and thus to establish a basis on which surface burning characteristics of different materials are compared.

Bibliography: UL 723

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Results of the review of the proposed standard will be posted on the ICC website by August 20, 2006.

Public Hearing Results

Note: The following analysis was not in the Code Change Proposal book but was published in the "Errata to the 2006/2007 Proposed Changes to the International Codes and Analysis of Proposed Referenced Standards" provided at the code development hearings:

Analysis: Review of proposed new standard indicated that, in the opinion of staff, the standard did comply with ICC standards criteria

PART I — IBC FIRE SAFETY

Committee Action:

Approved as Submitted

Committee Reason: Similar to the action taken with both FS10 and FS8 above, the addition of the standard will provide added flexibility for both the designer and the building official. This action also coordinates with the action taken by the IFC and IBC Structural committees which have already met and approved this item.

Assembly Action:

None

PART II — IBC GENERAL

Committee Action:

Approved as Submitted

Committee Reason: The inclusion of UL 723 as an alternate and equivalent standard to E 119 was felt to be an appropriate addition to the code. This is also consistent with the actions taken on the other portions of this code change.

Assembly Action:

None

PART III — IBC STRUCTURAL

Committee Action:

Approved as Submitted

Committee Reason: The proposal clarifies fire-retardant treated wood requirements by adding an appropriate reference to a test standard.

Assembly Action:

None

PART IV — IFC

Committee Action:

Approved as Submitted

Committee Reason: Including a reference to UL 723 will provide the code official with greater flexibility in approving materials tested to either ASTM E84 or UL723, since both test standards are equivalent.

Assembly Action:

None

PART V — IRC

Committee Action:

Approved as Modified

Modify the proposal as follows:

R314.6 Specific approval. Foam plastic not meeting the requirements of Sections R314.3 through R314.5 shall be specifically approved on the basis of one of the following approved tests: NFPA 286 with the acceptance criteria of Section R315.4, FM4880, ~~UL 723~~, UL 1040 or UL 1715, or fire tests related to actual end-use configurations. The specific approval shall be based on the actual end use configuration and shall be performed on the finished foam plastic assembly in the maximum thickness intended for use. Assemblies tested shall include seams, joints and other typical details used in the installation of the assembly and shall be tested in the manner intended for use.

(Portions of proposal not shown remain unchanged)

Committee Reason: The new reference to UL 723 adds depth to the code and provides an alternative to ASTM E84. These two standards describe the same test method. The addition of this alternate test method provides the authority having jurisdiction with the flexibility to accept listed and labeled products evaluated under UL 723.

Section R314.6 was modified to remove the reference to UL723. The reference was not needed in this particular section of the IRC.

Assembly Action:

None

PART VI — IRC MECHANICAL

Committee Action:

Approved as Submitted

Committee Reason: The proposed change provides an alternate method of testing fire-rated assemblies by adding another consensus standard.

Assembly Action:

None

**PART VII — WUIC
Committee Action:**

Approved as Submitted

Committee Reason: Including a reference to UL 723 will provide the code official with greater flexibility in approving materials tested to either ASTM E84 or UL723, since both test standards are equivalent.

Assembly Action:

None

Code Change No: FS14-06/07

Original Proposal

Sections: 703.5 (New); IFC 703.5 (New)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY AND THE IFC CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC FIRE SAFETY

Add new text as follows:

703.5 Marking and identification. Firewalls, fire barriers and fire partitions required to have a fire-resistance rating shall be identified with signs or stenciling in a manner acceptable to the building official, Such identification shall be above any decorative ceiling or in concealed spaces, and shall include the wording: FIRE WALL, FIRE BARRIER OR FIRE PARTITION: PROTECT ALL OPENINGS, or other approved wording.

PART II – IFC

Add new text as follows:

703.5 Marking and identification. Firewalls, fire barriers and fire partitions required to have a fire-resistance rating shall be identified with signs or stenciling in a manner acceptable to the fire code official, Such identification shall be above any decorative ceiling or in concealed spaces, and shall include the wording: FIRE WALL, FIRE BARRIER OR FIRE PARTITION: PROTECT ALL OPENINGS, or other approved wording.

Reason: The purpose of the codes is to establish the minimum requirements to safeguard the public health, safety and general welfare through structural strength, means of egress facilities, stability, sanitation, etc. The concern that is addressed by this proposed code change is the need for installed fire-resistance rated assemblies to maintain their fire-resistance over the life of the building. Many people writing on fire safety issues complain about the fact that rated assemblies are often compromised over time. It can probably be assumed that most of that damage done to rated assemblies does not occur maliciously, with the intent to damage a needed safety feature. Rather, the installation of an incorrect replacement door or window, or the penetration of the assembly without proper firestopping, is probably done due to the lack of information regarding the assembly's fire rating. Without some type of identification, how can tradespeople, maintenance workers or inspectors determine that an assembly is being compromised and below minimum requirements? If the building's code-mandated fire compartmentation is below minimum requirements, then we can assume the building will not perform as designed with the proper protections for the occupants or the fire fighters responding.

Across the country fire departments are reducing staffing in an effort to meet more restrictive budgets. One of the areas where there have been reductions is the inspection capabilities. In Cleveland, Ohio, the fire department cut staffing by approximately one hundred positions in the last few years. The Fire Prevention Bureau levels have been cut by two thirds, this means the department is relying on the front line companies to identify code violations and then refer those violations to individuals with the expertise to follow up. The problem is the lack of ability for untrained personnel to identify rated partitions and barriers. There is simply a lack of funding for enhanced training. Clearly identifying rated barriers and partitions will help the fire fighter on his inspection to identify any unacceptable breaches to rated assemblies. He can then refer the structure for a follow up inspection by a higher trained individual with the ability to identify the exact need to bring the structure back to the "Minimum Standard" of protection for the occupants.

Cost Impact: The code change proposal will have minimal cost impact.

Public Hearing Results

PART I – IBC FIRE SAFETY

Committee Action:

Disapproved

Committee Reason: See the comments provided with FS13-06/07 above. In addition, there was concern regarding the subjective Adecorative ceiling or in concealed spaces language of this proposal.

Assembly Action:

None

PART II – IFC

Committee Action:

Disapproved

Committee Reason: The proposal contains no guidance as to the size or stroke of the required wording. The change would require signs or stenciling to be installed in a concealed location and provides no guidance as to where signs would go if there were no decorative ceiling present. In existing buildings, the lack of construction documents would be problematic since there would be no guidance as to what assemblies in the building were constructed as fire walls, fire barriers or fire partitions, thereby making such a requirement more appropriate for new buildings. The change also provides no requirement for on-going maintenance of the markings.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 2:

Tony Crimi, A.C. Consulting Solutions, Inc., representing International Firestop Council, requests Approval as Modified by this public comment for Parts I and II.

Replace proposal with the following:

Add new text as follows:

703.5 Marking and identification. Fire walls, fire barriers, fire partitions, smoke barriers and smoke partitions or any other wall required to have protected openings or penetrations shall be effectively and permanently identified with signs or stenciling. Such identification shall:

1. Be located above any decorative ceiling, in concealed spaces or other approved location; and
2. Be repeated at intervals not exceeding 30 ft (9.14 m) measured horizontally along the wall or partition; and
3. Include lettering not less than 0.5 inch (12.7 mm) in height, incorporating the suggested wording: "FIRE AND/OR SMOKE BARRIER – PROTECT ALL OPENINGS", or other approved wording.

(Renumber subsequent section)

Commenter's Reason: Building modifications, installed equipment, inspections, change orders and construction projects can all generate a need to identify whether a particular assembly is required to act as a barrier to smoke or fire. This proposed code change addresses the need for installed fire-resistance rated assemblies to maintain their fire-resistance over the life of the building. This code change would introduce (or in the case of some Jurisdictions, re-introduce) a requirement for Marking and Identification of walls required to have a fire resistance rating, or intended to serve as barriers to smoke movement. This proposal will aid code officials, maintenance workers and contractors with enforcement and compliance to Codes and Standards.

This revised proposal takes into account the Committees reasons for disapproval of FS13-06/07, FS-14-06/07, FS15-06/07, FS73-06/07, and FS94-06/07 which were all related to barrier labeling or marking. Establishing the requirement for identification of building elements installed specifically to prevent the movement of fire and/or smoke is beneficial to the AHJ's responsible for issuing C of O and for building managers, maintenance workers and contractors working in buildings during daily building operation, future building renovations or routine inspections.

When buildings are engineered with fire rated walls and floors designed to contain smoke and/or fire, openings created in these assemblies by ducts, dampers, doors, windows, cable, conduit, pipe, ductwork, and installed equipment can compromise safety and jeopardize business continuity if not protected effectively. The addition of new through-penetrations over the life of a building is essentially inevitable, whether for wiring, plumbing or ventilation modifications. The tradesmen doing that work will not often be given the master plans of the building, and not know that their work may effective the performance of a critical building element. This can apply to several elements in a fire-resistive assembly such as dampers for ducts, firestopping, fire doors, and fire-rated glazing, which can easily be overlooked over the life of the building.

In providing testimony to the U.S. House of Representatives Committee on Science in the matter of NIST’s investigation of the world trade center collapse, in October 2005, on the lessons learned and application of those experiences to improve building safety, the ICC President testified as follows:

“NIST calls for more rigorous enforcement of codes. ICC believes a more appropriate term than enforcement is compliance. Enforcement is a means to achieve the goal of safe buildings, something embodied in compliance. There are other ways to secure compliance such as incentives or labeling that not only ensures the goal is reached but can secure results above and beyond simple enforcement of minimum codes and standards.”¹

Even if only in one small way, the addition of the proposed labeling during the construction phase of a building is of great benefit to over the course of the buildings life cycle and occupancy, and will facilitate ease of inspection throughout the life the building and during building renovation. Equally importantly, such identification marking also serves to alert trades people working within the building that, as penetrations are being made, the openings require additional consideration or protection.

The 1999 Standard Building Code contained requirements for the marking and identification of horizontal and vertical barriers required to either to have a fire-resistance rating or be effective barriers to the movement of smoke within a building. OSHA also has requirements for marking and labeling of safety features in buildings. Very similar language has also been a requirement of the Florida Building Code until the 2004 FBC. In those jurisdictions, the industry is already familiar with this requirement. Jurisdictions that have had this requirement in the past, have not reported widespread difficulties in trying to understand or enforce its application. To the contrary, in past cycles, we have heard testimony from those jurisdictions in support of this principal.

Final Hearing Results

**FS14-06/07, Part I AMPC2
FS14-06/07, Part II D**

Code Change No: FS22-06/07

Original Proposal

Table 704.8

Proponent: Marshall A. Klein, P.E., Marshall A. Klein & Associates, Inc., representing Marshall A. Klein & Associates, Inc.

Add table footnote as follows:

**TABLE 704.8
MAXIMUM AREA OF EXTERIOR WALL OPENINGS^a**

CLASSIFICATION OF OPENING	FIRE SEPARATION DISTANCE (feet)							
	0 to 3 ^{f,i,k}	Greater than 3 to 5 ^{c,g}	Greater than 5 to 10 ^{c,e,g,h}	Greater than 10 to 15 ^{d,e,g}	Greater than 15 to 20 ^{d,g}	Greater than 20 to 25 ^{d,g}	Greater than 25 to 30 ^{d,g}	Greater than 30
Unprotected	Not Permitted	Not Permitted ^c	10% ⁱ	15% ⁱ	25% ⁱ	45% ⁱ	70% ⁱ	No Limit ^b
Protected	Not Permitted	15%	25%	45%	75%	No Limit ^b	No Limit ^b	No Limit ^b

For SI: 1 foot = 304.8 mm.

- a. Values given are percentage of the area of the exterior wall.
- b. See Section 704.7 for unexposed surface temperature.
- c. For occupancies in Group R-3, the maximum percentage of unprotected and protected exterior wall openings shall be 25 percent.
- d. The area of openings in an open parking structure with a fire separation distance of greater than 10 feet shall not be limited.
- e. For occupancies in Group H-2 or H-3, unprotected openings shall not be permitted for openings with a fire separation distance of 15 feet or less.
- f. For requirements for fire walls for buildings with differing roof heights, see Section 705.6.1.

- g. The area of unprotected and protected openings is not limited for occupancies in Group R-3, with a fire separation distance greater than 5 feet.
- h. For special requirements for Group U occupancies, see Section 406.1.2.
- i. Buildings whose exterior bearing wall, exterior nonbearing wall and exterior structural frame are not required to be fire-resistance rated by Table 601 or 602 shall be permitted to have unlimited unprotected openings.
- j. Includes accessory buildings to Group R-3.
- k. For openings in a firewall for buildings on the same lot, see Section 705.8.

Reason: Addition of this new footnote "k" is proposed for editorial purposes as well as for user friendliness. There has been some confusion by code users on whether or not a firewall can have openings between buildings on the same lot under the IBC.

Under Table 704.8, since the exterior walls of two buildings on the same lot with a fire separation distance of 0' would not be permitted to have any openings in these exterior walls, some users are confused that replacing such exterior walls with a common firewall designed under Section 705 would then permit protected openings between the two buildings in the firewall.

Therefore, this new footnote "k" placed over the 0' fire separation distance column in the Table will eliminate such confusion, and direct the user to the appropriate section of the Code for opening protectives when a firewall is used between two buildings on the same lot.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal does provide clarification regarding how openings for fire walls are to be addressed. This will help to eliminate some confusion and will be consistent with the committee's understanding as to how this section should be interpreted.

Assembly Action:

None

Code Change No: **FS24-06/07**

Original Proposal

Sections: 704.8, 704.12

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

1. Delete and substitute as follows:

~~**704.8 Allowable area of openings.** The maximum area of unprotected or protected openings permitted in an exterior wall in any story shall not exceed the values set forth in Table 704.8. Where both unprotected and protected openings are located in the exterior wall in any story, the total area of the openings shall comply with the following formula:~~

$$\frac{A}{a} + \frac{A_u}{a_u} \leq 1.0 \quad \text{(Equation 7-2)}$$

where:

~~A = Actual area of protected openings, or the equivalent area of protected openings, A_e (see Section 704.7).~~

~~a = Allowable area of protected openings.~~

~~A_u = Actual area of unprotected openings.~~

~~a_u = Allowable area of unprotected openings.~~

TABLE 704.8
MAXIMUM AREA OF EXTERIOR WALL OPENINGS^a

704.8.1 Automatic sprinkler system. In buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, the maximum allowable area of unprotected openings in occupancies other than Groups H-1, H-2 and H-3 shall be the same as the tabulated limitations for protected openings.

704.8.2 First story. In occupancies other than Group H, unlimited unprotected openings are permitted in the exterior walls of the first story above grade facing a street that have a fire separation distance of greater than 15 feet (4572 mm) or facing an unoccupied space. The unoccupied space shall be on the same lot or dedicated for public use, shall not be less than 30 feet (9144 mm) in width and shall have access from a street by a posted fire lane in accordance with the *International Fire Code*.

704.8 Openings. Openings in exterior walls shall have a degree of opening protection based on the fire separation distance as specified in Table 704.8.

704.8.1 Allowable area of openings. The maximum area of unprotected and protected openings permitted in an exterior wall in any story of a building shall not exceed the percentages specified in Table 704.8.

Exceptions:

1. In other than Group H occupancies, unlimited unprotected openings are permitted in the exterior walls of the first story above grade facing a street that has a fire separation distance of greater than 15 feet (4572 mm), or facing an unoccupied space. Such unoccupied space shall be on the same lot or dedicated for public use, shall not be less than 30 feet (9144 mm) in width, and shall have access from a street by a posted fire lane in accordance with the *International Fire Code*.
2. Buildings whose exterior bearing walls, exterior nonbearing walls and exterior structural frame are not required to be fire-resistance rated shall be permitted to have unlimited unprotected openings.

704.8.2 Protected openings. Where required to be protected, fire doors and fire shutters shall comply with Section 715.4 and fire window assemblies shall comply with Section 715.5.

Exception: Opening protective assemblies are not required where the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 and the exterior openings are protected by a water curtain using automatic sprinklers approved for that use.

704.8.3 Unprotected openings. Where unprotected openings are permitted, windows and doors shall be constructed of any approved materials. Glazing shall conform to the requirements of Chapters 24 and 26.

704.8.4 Mixed openings. Where both unprotected and protected openings are located in the exterior wall in any story of a building, the total area of openings shall be determined in accordance with the following:

$$(A_p \div a_p) + (A_u \div a_u) \leq 1 \qquad \text{(Equation 7-2)}$$

where:

- A_p = Actual area of protected openings, or the equivalent area of protected openings, A_e (see Section 704.7).
- a_p = Allowable area of protected openings.
- A_u = Actual area of unprotected openings.
- a_u = Allowable area of unprotected openings.

**TABLE 704.8
MAXIMUM AREA OF EXTERIOR WALL
OPENINGS BASED ON FIRE SEPARATION DISTANCE
AND DEGREE OF OPENING PROTECTION**

FIRE SEPARATION DISTANCE (feet)	0 to less than 3^b			3 to less than 5^{c,d}			5 to less than 10^{d,e}		
DEGREE OF OPENING PROTECTION	UP NS	UP S ^h	P	UP NS	UP S ^h	P	UP NS	UP S ^h	P
ALLOWABLE AREA^a	NP	NP	NP	NP	15%	15%	10% ^g	25%	25%

10 to less than 15^{d,e,f}			15 to less than 20^{e,f}			20 to less than 25^{e,f}		
UP NS	UP S ^h	P	UP NS	UP S ^h	P	UP NS	UP S ^h	P
15% ^g	45%	45%	25%	75%	75%	45%	NL	NL

25 to less than 30^{e,f}			30 or greater		
UP NS	UP S ^h	P	UP NS	UP S ^h	P
70%	NL	NL	NL	NR	NR

For SI: 1 foot = 304.8 mm.

UP, NS = Unprotected openings in buildings not equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

UP, S = Unprotected openings in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

P = Openings protected with an opening protective assembly in accordance with Section 704.8.1.

NP = Not permitted.

NL = No limit

NR = Not required

- Values indicated are the percentage of the area of the exterior wall, per story.
- For the requirements for fire walls of buildings with differing heights, see Section 705.6.1.
- The maximum percentage of unprotected and protected openings shall be 25 percent for Group R-3 occupancies, as applicable in Section 101.2.
- Unprotected openings shall not be permitted for openings with a fire separation distance of less than 15 feet for Group H-2 and H-3 occupancies.
- The area of unprotected and protected openings shall not be limited for Group R-3 occupancies, as applicable in Section 101.2, with a fire separation distance of 5 feet or greater.
- The area of openings in an open parking structure with a fire separation distance of 10 feet or greater shall not be limited.
- Includes buildings accessory to Group R-3, as applicable in Section 101.2.
- Not applicable to Group H-1, H-2 and H-3 occupancies.

704.8.5 Vertical separation of openings. (Text to remain unchanged--former Section 704.9)

704.8.6 Vertical exposure. (Text to remain unchanged--former Section 704.10)

704.9 Joints. (Text to remain unchanged--former Section 704.13)

704.10 Ducts and air transfer openings. (Text to remain unchanged--former Section 704.14)

704.11 Parapets. (Text to remain unchanged--former Section 704.11)

2. Delete without substitution:

~~**704.12 Opening protection.** Windows in exterior walls required to have protected openings in accordance with other sections of this code or determined to be protected in accordance with Section 704.3 or 704.8 shall comply with Section 715.5. Other openings required to be protected with fire door or shutter assemblies in accordance with other sections of this code or determined to be protected in accordance with Section 704.3 or 704.8 shall comply with Section 715.4.~~

~~**Exception:** Opening protectives are not required where the building is protected throughout by an automatic sprinkler system and the exterior openings are protected by an approved water curtain using automatic sprinklers approved for that use. The sprinklers and the water curtain shall be installed in accordance with Section 903.3.1.1 and shall have an automatic water supply and fire department connection.~~

~~**704.12.1 Unprotected openings.** Where protected openings are not required by Section 704, windows and doors shall be constructed of any approved materials. Glazing shall conform to the requirements of Chapters 24 and 26.~~

Reason: This proposal is intended to clarify the provisions for the determination of opening protection requirements in exterior wall construction in a logical and understandable format. Presently, exterior wall opening protection requirements are fragmented in several sections and contain no clear charging language. General opening protection requirements are located in Section 704.12 while more specific allowable area of opening requirements are found in preceding Section 704.8. The latter provisions should be subordinate to the former. For legal purposes a defining charging statement should be provided.

One of the strengths of the International Building Code is the orderly method for the determination of opening protection requirements contained in the fire resistance assembly sections of Chapter 7. For instance, given the requirement for a fire wall, one would go to Section 705 for detailed construction provisions, to include openings at Section 705.8, penetrations at Section 705.9, joints at Section 705.10 and ducts and air transfer openings at Section 705.11. These sections in turn, reference one to the applicable sections for specific details for the various methods of maintaining continuity of construction. This proposal organizes exterior wall opening protection requirements in a similar fashion. This enhances user friendliness and technical accuracy as it supports a consistent procedure for the determination of opening protection requirements throughout Chapter 7.

A general description of the alterations is as follows:

Section 704.8: The section heading is more general and is consistent with Sections 705.8, 706.6, 707.7, 708.6, 709.5 and 710.5. The section provides general charging language for the determination of exterior wall opening protection requirements that is currently not stated.

Section 704.8.1: This specific provision was formally located in Section 704.8. Exception 1 is a generally applicable provision that was formally located in Section 704.8.2. Exception 2 is a generally applicable provision that was formally located in Table 704.8, Footnote i.

Section 704.8.2: This general charging provision is similar to that formally located in Section 704.12. The exception was formerly located in Section 704.12.

Section 704.8.3: This is a generally applicable provision that was formally located in Section 704.12.1.

Section 704.8.4: Minor editorial modifications have been made to the mixed opening provisions, such as, making the equation more simple and better identifying the equation variables.

Table 704.8: The format of Table 704.8 has been modified for purposes of the accurate determination of technical requirements. Perhaps most importantly, horizontal cells under each applicable fire separation distance entry value describe each possible degree of opening protection condition and the allowable area for each such condition. Of particular importance is the introduction of a column recognizing unprotected openings in sprinklered buildings. This provision is currently only contained in the text at Section 704.8.1. Unfortunately, many code users seek requirements in the tables without consulting the charging text. The proposed table would minimize the possibility of erroneously determining the allowable area of unprotected openings in sprinklered buildings--a very common design condition. A subtle feature of the reformatted table is the threshold values for the listed fire separation distances. They have been adjusted to coincide with Table 602. For example, current Table 704.8 specifies a fire distance spread of, "greater than 5 to 10." Conversely, Table 602 references, "equal to or greater than 5 to less than 10." This modification will allow for the correct and relative determination of opening protective assemblies which occur exactly at those threshold fire separation distances. The footnotes have been reorganized to coincide with the increasing fire separation distances. Numerous minor editorial changes have been made to clarify the understanding of technical intent (i.e. No Limit to No Requirement for protected openings greater than 30 feet).

Sections 704.8.5 and 704.8.6: Both sections which are applicable to openings in exterior walls have been incorporated into Section 704.8 (openings). These provisions were formerly located at Sections 704.9 and 704.10, respectively.

Sections 704.9 through 704.11: The remaining sections have been reorganized to be consistent with the continuity provisions of the other fire-resistance rated assembly sections. These provisions were formerly located at Sections 704.13, 704.14 and 704.11, respectively.

In summary, the proposed submittal will clarify the intent of the International Building Code by providing a logical organization of technical requirements while using accepted terminology and format. As previously stated, the proposal is not intended to achieve any technical changes. The proposed technical reorganization and language contained in this submittal would represent a significant improvement to the 2009 Edition of the International Building Code in this important and frequently applicable area.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

Table 704.8 footnotes:

P = Openings protected with an opening protective assembly in accordance with Section ~~704.8.1~~ 704.8.2.

(Portions of proposal not shown remain unchanged)

Committee Reason: This provides a clear connection between Table 704.8 and the code text which currently exists in Section 704.8.1. The modifications will correct a section reference which is not correct. The committee also expressed their desire that the various headings be spelled out instead of abbreviated. Additionally the action taken with FS22-06/07 will be added into this table if both of the items do get approved at the final action hearings.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Maureen Traxler, City of Seattle Department of Planning and Development, requests Approval as Modified by this public comment.

Further modify proposal as follows:

704.8 Openings. Openings in exterior walls shall ~~have a degree of opening protection based on the fire separation distance as specified in Table 704.8~~ comply with Sections 704.8.1 through 704.8.6.

704.8.1 Allowable area of openings. The maximum area of unprotected and protected openings permitted in an exterior wall in any story of a building shall not exceed the percentages specified in Table 704.8.

Exceptions:

1. In other than Group H occupancies, unlimited unprotected openings are permitted in the ~~exterior walls of the~~ first story above grade ~~that~~ facing either:
 - 1.1. Where the wall either faces a street ~~that~~ and has a fire separation distance of ~~greater~~ more than 15 feet (4572 mm); or
 - 1.2. Where the wall faces ~~facing~~ an unoccupied space. ~~Such~~ The unoccupied space shall be on the same lot or dedicated for public use, shall not be less than 30 feet (9144 mm) in width, and shall have access from a street by a posted fire lane in accordance with the *International Fire Code*.
2. Buildings whose exterior bearing walls, exterior nonbearing walls and exterior structural frame are not required to be fire-resistance rated shall be permitted to have unlimited unprotected openings.

704.8.2 Protected openings. Where openings are required to be protected, fire doors and fire shutters shall comply with Section 715.4 and fire window assemblies shall comply with Section 715.5.

Exception: Opening protective assemblies are not required where the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 and the exterior openings are protected by a water curtain using automatic sprinklers approved for that use.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: This comment proposes only editorial modifications. The charging language in Section 704.8 is revised to more accurately describe the scope of the section. The reference to Table 704.8 is misplaced in Section 704.8 because the table is only one of the requirements in the section, and because the table is referenced again in Section 704.8.1.

As proposed, exception 1 states that the street is required to have a fire separation distance; the modification clarifies that the wall is required to have a fire separation distance. The phrase "exterior walls" is deleted from exception 1 because that's the subject of the entire section, and opening protection isn't required anywhere else. Other edits are intended to make the exception read more clearly.

In Section 704.8.2, it is the openings that are required to be protected; fire doors and shutters are the method of protecting the openings.

Editor's note: The phrase "as applicable in Section 101.2" has been deleted from Table 704.8 Footnotes C, E and G of the original proposal. During the previous code cycle the Code Correlating Committee took action to delete this phrase from the IBC since it is not necessary. Therefore this phrase will not be added back into the code as a part of proposal FS24-06/07.

Final Hearing Results

FS24-06/07

AMPC1

Code Change No: FS25-06/07

Original Proposal

Section: 704.10

Proponent: Philip Brazil, P.E., Reid Middleton, Inc., representing himself

704.10 Vertical exposure. For buildings on the same lot, opening protectives having a fire protection rating of not less than 3/4 hour shall be provided in every opening that is less than 15 feet (4572 mm) vertically above the roof of an ~~adjacent adjoining~~ building or ~~adjacent~~ structure ~~that is within a horizontal~~ based on assuming an imaginary line between them. ~~The opening protectives are required where the fire separation distance of between the imaginary line and the adjacent building or structure is less than 15 feet (4572 mm) of the wall in which the opening is located.~~ Application of the exception to Section 704.3 for two or more buildings on the same lot as portions of one building is not permitted.

Exception: Opening protectives are not required where the roof construction of the adjacent building or structure has a fire-resistance rating of not less than 1 hour for a minimum distance of 10 feet (3048 mm) from the adjoining building exterior wall facing the imaginary line and the entire length and span of the supporting elements for the fire-resistance-rated roof assembly has a fire-resistance rating of not less than 1 hour. Application of the exception to Section 704.3 for two or more buildings on the same lot as portions of one building is permitted.

Reason: The purpose of this proposal is to correct technical flaws in the current provisions on vertical exposure of the exterior walls of a building by an adjacent (lower) building or structure. The threshold for requiring opening protection is a horizontal fire separation distance of less than 15 feet. By definition (see Section 702.1), fire separation distance is measured from a building face to an interior lot line, the centerline of a public way, or an imaginary line between two buildings on the same lot. The current language does not establish the existence of an imaginary line from which to measure fire separation distance.

It is possible that an imaginary line could exist between the buildings. Section 704.3 requires the assumption of an imaginary line between two adjacent buildings on the same lot for the purpose of determining required wall and opening protection and roof covering requirements. The exception to Section 704.3, however, permits two or more buildings on the same lot to be considered portions of one building making the presence of an imaginary line moot.

The threshold for requiring opening protection in Section 704.10 is also a single horizontal fire separation distance of less than 15 feet. Since fire separation distance is measured between the faces of two buildings on the same lot and an imaginary line between them, there are always two fire separation distances, not just one fire separation distance. It is not clear from the current language which one of the fire separation distances is intended.

The proposal corrects these and other technical flaws by establishing the presence of an imaginary line between the buildings and by basing the requirement for opening protection on the fire separation distance between the imaginary line and the adjacent (lower) building or structure. Establishing an imaginary line eliminates the option of considering the buildings as portions of one building, which is permitted by the exception to Section 704.3. Instead, the fire separation distance between the imaginary line and higher building must be considered and fire resistance and opening protection will be required at the exterior wall of the higher building based on that fire separation distance (see Section 704.3). Consequently, opening protection may be required at areas of the exterior wall other than required by Section 704.10. It is also conceivable that opening protection may be prohibited or limited in area based on the more severe of the provisions in Sections 704.3 and 704.10. A sentence is added at the end of Section 704.10 making it clear that the exception to Section 704.3 is not permitted to be used in this case.

In the exception to Section 704.10, “of the adjacent building or structure” is added because it is not clear from the current language which roof construction is intended: the higher building or the adjacent (lower) building or structure. Also, “adjoining building” is replaced by “exterior wall facing the imaginary line” because the current language literally requires the roof construction of one of the buildings (which one is not clear) to be 1-hour fire-resistance-rated for a distance of 10 feet from the adjoining building, which could apply to the fire separation distance and not to any portion of the roof construction of either building.

The exception to Section 704.10 intends to exempt the requirements for opening protectives at the higher building provided the roof of the adjacent (lower) building or structure is 1-hour fire-resistance-rated for at least 10 feet from the exterior wall facing the imaginary line. If this exception is employed, it is reasonable to permit the exception to Section 704.3 permitting two or more buildings on the same lot to be considered as portions of the same building to also be employed. The proposal adds language making this clear.

The reference to “horizontal” for fire separation distance is deleted for consistency with use of “fire separation distance” without reference to “horizontal” elsewhere in the code (i.e., Section 704.5 and Table 704.8).

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proponent requested disapproval so that he could continue to work with others to resolve some concerns. Additionally the committee did note that the last sentence of Section 704.10 was not clear.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Philip Brazil, Reid Middleton, Inc. representing himself, requests Approval as Modified by this public comment.

Replace proposal with the following:

704.10 Vertical exposure. For buildings on the same lot, opening protectives having a fire protection rating of not less than 3/4 hour shall be provided in every opening that is less than 15 feet (4572 mm) vertically above the roof of an ~~adjacent~~ adjoining building or ~~adjacent~~ structure ~~that is within a horizontal based on assuming an imaginary line between them.~~ The opening protectives are required where the fire separation distance of ~~between the imaginary line and the adjacent building or structure is less than~~ 15 feet (4572 mm) ~~of the wall in which the opening is located.~~

Exceptions:

1. Opening protectives are not required where the roof construction of ~~the adjacent building or structure~~ has a fire-resistance rating of not less than 1 hour for a minimum distance of 10 feet (3048 mm) from the ~~adjoining building exterior wall facing the imaginary line~~ and the entire length and span of the supporting elements for the fire-resistance-rated roof assembly has a fire-resistance rating of not less than 1 hour.
2. Buildings on the same lot and considered as portions of one building in accordance with Section 704.3 are not required to comply with Section 704.10.

Commenter's Reason: The public comment revises the original proposal by establishing that buildings on the same lot and considered as portions of one building in accordance with Section 704.3 are exempt from the requirements of Section 704.10. The original proposal prohibited application of the exception to Section 704.3 for buildings on the same lot from the basic requirement of Section 704.10, but permitted its application when compliance with the exception to Section 704.10 is chosen over the basic requirement. This public comment recognizes that the concept behind the exception to Section 704.3 is equally valid when applying the requirements of Section 704.10.

The exception to Section 704.3 permitting two buildings on the same lot to be considered as portions of the same building recognizes that two such buildings pose no greater hazard to the occupants than if they were combined into a single building of equivalent building area and building height. In the case of Section 704.3, the hazard to each building is fire exposure from the exterior wall of the opposite building. In the case of Section 704.10, the hazard to the higher building is fire exposure from the roof of the opposite (lower) building. Two buildings on the same lot that qualify for exemption from the requirements of Section 704.3 should also be permitted to qualify for exemption from the requirements of Section 704.10

Original Proposal

Section: 705.5.1

Proponent: Philip Brazil, P.E., Reid Middleton, Inc., representing himself

705.5.1 Exterior walls. Where the fire wall ~~intersects the~~ terminates within an exterior walls ~~the fire-resistance rating for the exterior walls on both sides of the fire wall shall have a 1-hour fire-resistance rating with 3/4-hour opening protection where opening protection is required. The fire-resistance rating of the exterior wall shall extend a minimum of 4 feet (1220 mm) on each side of the intersection of the fire wall to exterior wall as permitted by Section 705.5, the buildings on either side of the fire wall shall be assumed to have an imaginary line between them. The location of the assumed imaginary line shall be such that the exterior wall and opening protection of each building shall comply with the criteria set forth in Sections 704.5 and 704.8. Such protection is not required for exterior walls intersections terminating at fire walls that form an angle equal to or greater than 180 degrees (3.14 rad) ~~do not need exterior wall protection.~~~~

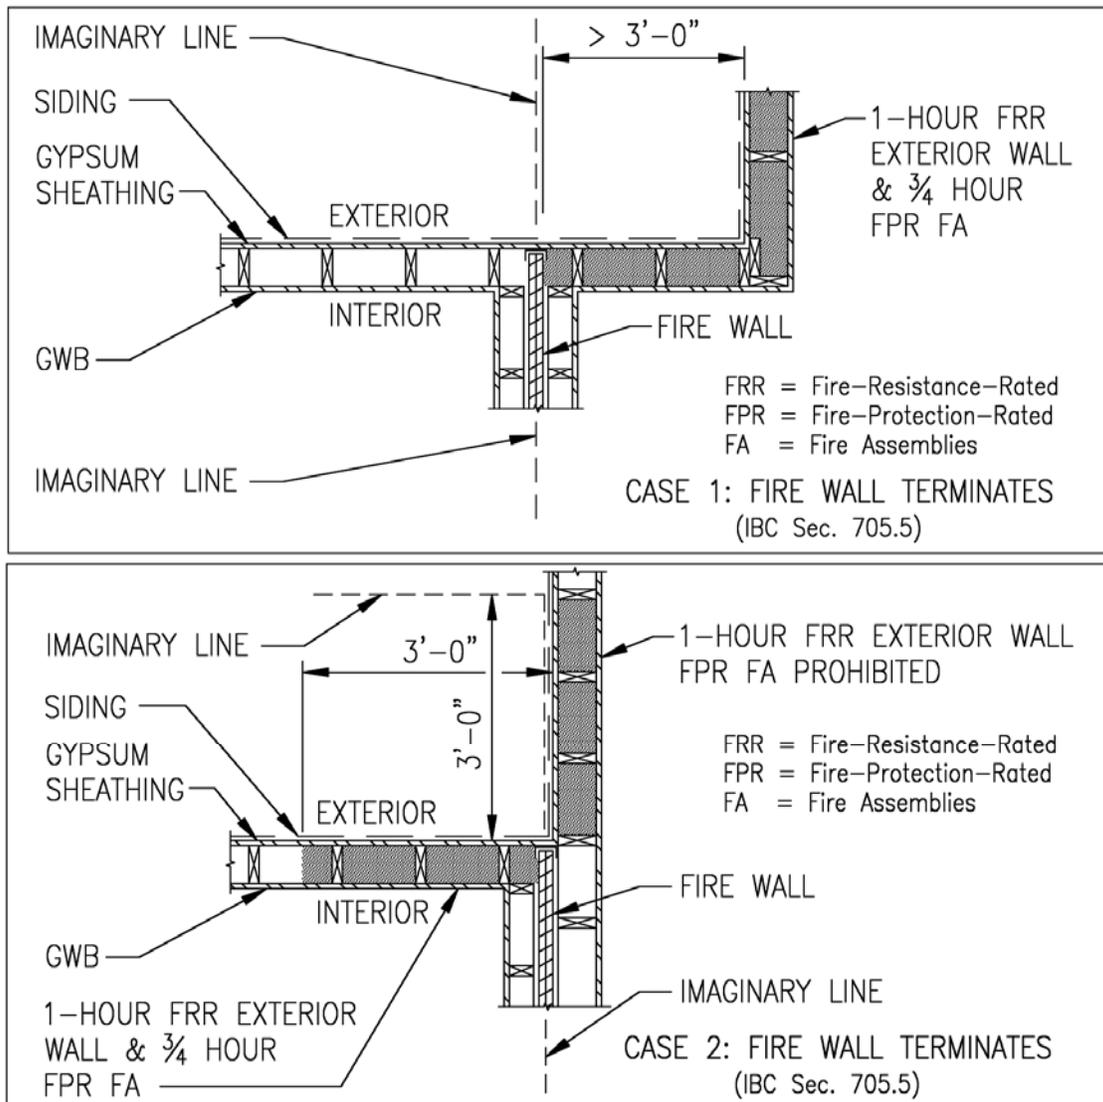

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

Reason: Section 705.1 states that each portion of a building separated by one or more fire walls complying with Section 705 shall be considered a separate building. Section 704.3 states that buildings on the same lot shall be assumed to have an imaginary line between them. This imaginary line is employed in the same fashion as a lot line is used between buildings on adjoining lots. It determines the required fire resistance and opening protection of exterior walls at buildings on the same lot. This approach is equally valid at portions of buildings considered separate buildings due to the presence of a fire wall. The purpose of this proposal is to establish requirements for the protection of exterior walls on either side of fire walls that are comparable to the requirements for buildings on the same lot.

The proposal also addresses several problematic aspects of the current provisions. Section 705.5.1 applies to exterior walls intersected by fire walls, not exterior walls where fire walls are permitted to terminate. Consequently, the current requirements are limited to the basic case of horizontal continuity: extension of the fire wall at least 18 inches beyond the exterior surface of the exterior walls. The current requirements do not apply when the exceptions to Section 705.5 are employed, which permit termination within the exterior wall (i.e., interior surface of exterior sheathing). The hazard addressed by Section 705.5.1, however, is more evident when the exceptions to Section 705.5 are employed rather than the basic case.

Determining the fire-resistance rating and opening protection of the exterior wall “where opening protection is required” is also problematic. The protection ought to be based on the proximity of the exterior wall on one side of the fire wall to the exterior wall on the other side of the fire wall, which is moot when the exterior angle formed by the exterior walls is equal or greater than 180 degrees.

The accompanying diagrams illustrate applications of the proposed changes requiring fire-resistance-rated construction at the exterior wall on either side of the fire wall but also permitting openings at certain fire separation distances from the imaginary line provided they are 3/4-hour fire-protection-rated assemblies. Once permitted, the allowable percentage of fire-protection-rated would be small at small fire separation distances, increasing at larger distances until unprotected openings are permitted.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Further modify proposal as follows:

705.5.1 Exterior walls. Where the fire wall terminates within an exterior wall as permitted by Section 705.5, the buildings on either side of the fire wall shall be assumed to have an imaginary line between them. The location of the assumed imaginary line shall be such that the exterior wall and opening protection of each building shall comply with the criteria set forth in Sections 704.5 and 704.8. Such protection is not required for exterior walls terminating at fire walls that form an angle equal to or greater than 180 degrees (3.14 rad).

Committee Reason: This proposal helps explain how to deal with these items where the fire wall terminates at the exterior wall.

Analysis: This item needs to be reviewed based on the committee's later action to approve FS31-06/07. Without public comments, there will be coordination issues, see FS31.

Assembly Action:

None

Final Hearing Results

FS29-06/07

AM

Code Change No: FS31-06/07

Original Proposal

Section: 705.5.1

Proponent: Peter Bemelen, PE, City and County of Denver, representing Colorado Chapter ICC

Delete and substitute as follows:

~~**705.5.1 Exterior walls.** Where the fire wall intersects the exterior walls, the fire-resistance rating for the exterior walls on both sides of the fire wall shall have a 1-hour fire-resistance rating with 3/4-hour opening protection where opening protection is required. The fire-resistance rating of the exterior wall shall extend a minimum of 4 feet (1220 mm) on each side of the intersection of the firewall to exterior wall. Exterior wall intersections at fire walls that form an angle equal to or greater than 180 degrees (3.14 rad) do not need exterior wall protection.~~

705.5.1 Exterior walls. Where the fire wall intersects exterior walls, the fire-resistance rating and opening protection of the exterior walls shall comply with one of the following:

1. The exterior walls on both sides of the fire wall shall have a 1-hour fire-resistance rating with ¾ hour protection where opening protections is required by Section 704.8 The fire-resistance rating of the exterior wall shall extend a minimum of 4 feet (1220 mm) on each side of the intersection of the firewall to exterior wall. Exterior wall intersections at fire walls that form an angle equal to or greater than 180 degrees (3.14 rad) do not need exterior wall protection.
2. Buildings or spaces on both sides of the intersecting firewall shall assume to have an imaginary lot line at the firewall and extending beyond the exterior of the firewall. The location of the assumed line in relation to the exterior walls and the firewall shall be such that the exterior wall and opening protection meet the requirements set forth in Section 704.5 and 704.8.

Reasons: Add flexibility to the provision. Add alternate method

The proposed language adds an alternate method to Section 705.5.1 by adding a similar application as allowed Section 704.3 by inclusion of assumed property lines for determination of exterior wall and opening protections. This application will add flexibility to the design and still meets the intent of the present code section, that is to prevent the spread of fire and smoke to the adjacent building at the fire wall. For example, a fire wall terminating at exterior walls that intersect at 90 degrees from each other, with construction type of II-B, would allow one exterior wall to have a one hour fire resistance rating without any openings for 10 ft and the other exterior wall and openings to be unprotected.

The proposed method has been an acceptable method for many years and presently is allowed per section 704.3 under similar circumstances.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal provides a better clarification for how to handle walls which are at an angle greater than 180 degrees. This item needs to be reviewed based on the previous action to approve FS29-06/07.

Analysis: Public comments may be needed to coordinate FS29 and FS31 and address any inconsistencies or conflicts which may result if both items are approved. Some committee members expressed that they liked the numbered list that this proposal provided as compared to FS29.

Assembly Action:

None

Final Hearing Results

FS31-06/07

AS

Code Change No: FS32-06/07

Original Proposal

Section: 705.6

Proponent: Maureen Traxler, City of Seattle, representing Washington Association of Building Officials

Revise as follows:

705.6 Vertical continuity. Fire walls shall extend from the foundation to a termination point at least 30 inches (762 mm) above both adjacent roofs.

Exceptions:

1. Stepped buildings in accordance with Section 705.6.1.
2. Two-hour fire-resistance-rated walls shall be permitted to terminate at the underside of the roof sheathing, deck or slab provided:
 - 2.1. The lower roof assembly within 4 feet (1220 mm) of the wall has not less than a 1-hour fire-resistance rating and the entire length and span of supporting elements for the rated roof assembly has a fire-resistance rating of not less than 1 hour.
 - 2.2. Openings in the roof shall not be located within 4 feet (1220 mm) of the fire wall.
 - 2.3. Each building shall be provided with not less than a Class B roof covering.
3. Walls shall be permitted to terminate at the underside of noncombustible roof sheathing, deck, or slabs where both buildings are provided with not less than a Class B roof covering. Openings in the roof shall not be located within 4 feet (1220 mm) of the fire wall.
4. In buildings of Type III, IV and V construction, walls shall be permitted to terminate at the underside of combustible roof sheathing or decks provided:
 - 4.1. There are no openings in the roof within 4 feet (1220 mm) of the fire wall,
 - 4.2. The roof is covered with a minimum Class B roof covering, and
 - 4.3. The roof sheathing or deck is constructed of fire-retardant-treated wood for a distance of 4 feet (1220 mm) on both sides of the wall or the roof is protected with 5/8 inch (15.9 mm) Type X gypsum board directly beneath the underside of the roof sheathing or deck, supported by a minimum of 2-inch (51 mm) nominal ledgers attached to the sides of the roof framing members for a minimum distance of 4 feet (1220 mm) on both sides of the fire wall.
5. ~~Buildings located above a parking garage designed in accordance with Section 509.2 shall be permitted to have the fire walls for the buildings located above the parking garage extend from the horizontal separation between the parking garage and the buildings.~~

Reason: The purpose of the proposed code change is to delete an unnecessary paragraph. Exception 5 is unnecessary because Section 509.2 clearly states that the basement or first story is treated as a separate building for the purpose of continuity of fire walls. IBC Section 509.2

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the existing code as follows:

705.6 Vertical continuity. Fire walls shall extend from the foundation to a termination point at least 30 inches (762 mm) above both adjacent roofs.

Exceptions:

1. Stepped buildings in accordance with Section 705.6.1.
2. Two-hour fire-resistance-rated walls shall be permitted to terminate at the underside of the roof sheathing, deck or slab provided:
 - 2.1. The lower roof assembly within 4 feet (1220 mm) of the wall has not less than a 1-hour fire-resistance rating and the entire length and span of supporting elements for the rated roof assembly has a fire-resistance rating of not less than 1 hour.
 - 2.2. Openings in the roof shall not be located within 4 feet (1220 mm) of the fire wall.
 - 2.3. Each building shall be provided with not less than a Class B roof covering.
3. Walls shall be permitted to terminate at the underside of noncombustible roof sheathing, deck, or slabs where both buildings are provided with not less than a Class B roof covering. Openings in the roof shall not be located within 4 feet (1220 mm) of the fire wall.
4. In buildings of Type III, IV and V construction, walls shall be permitted to terminate at the underside of combustible roof sheathing or decks provided:
 - 4.1. There are no openings in the roof within 4 feet (1220 mm) of the fire wall,
 - 4.2. The roof is covered with a minimum Class B roof covering, and
 - 4.3. The roof sheathing or deck is constructed of fire-retardant-treated wood for a distance of 4 feet (1220 mm) on both sides of the wall or the roof is protected with 5/8 inch (15.9 mm) Type X gypsum board directly beneath the underside of the roof sheathing or deck, supported by a minimum of 2-inch (51 mm) nominal ledgers attached to the sides of the roof framing members for a minimum distance of 4 feet (1220 mm) on both sides of the fire wall.
5. In buildings located above a parking garage designed in accordance with Section 509.2, shall be permitted to have the fire walls for the buildings located above the parking garage 3 hour fire rated horizontal separation required by Section 509.2 item 1 shall be permitted to extend from the top of this horizontal separation between the parking garage and the buildings.

Committee Reason: The modification which was submitted and approved does help to clarify the application of these provisions. The changes by the proposal and modification are essentially editorial changes and do not intend to make technical changes to the requirements. The intent is to simply clarify the termination of the fire wall at the horizontal separation or "pedestal" and also address the fact that uses other than garages are permitted below the horizontal separation.

Assembly Action:

None

Final Hearing Results

FS32-06/07

AM

Code Change No: FS33-06/07

Original Proposal

Section: 705.8

Proponent: Joseph R. Hetzel, P.E., Door & Access Systems Manufacturers Association

Revise as follows:

705.8 Openings. Each opening through a fire wall shall be protected in accordance with Section 715.4 and shall not exceed ~~420~~ 156 square feet (~~44~~ 15 m²). The aggregate width of openings at any floor level shall not exceed 25 percent of the length of the wall.

Exceptions:

1. Openings are not permitted in party walls constructed in accordance with Section 705.1.1.
2. Openings shall not be limited to ~~420~~ 156 square feet (~~44~~ 15 m²) where both buildings are equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.

Reason: The purpose of this proposed code change is to coordinate the provisions of Section 706.6 with Section 705.8, as they relate to maximum opening size. The maximum opening size as specified in Section 706.6 was changed from 120 SF to 156 SF via ICC code change proposal FS27-04/05.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: These new size limitations are appropriate based on changes in the test standards and help provide consistency with the requirements in Section 706.7.

Assembly Action:

None

Final Hearing Results

FS33-06/07

AS

Code Change No: FS34-06/07

Original Proposal

Section: 705.11

Proponent: Vickie Lovell, Delray, FL, representing Air Movement and Control Association and 3M Company

Revise as follows:

705.11 Ducts and air transfer openings. Ducts and air transfer openings shall not penetrate fire walls.

Exception: Penetrations by ducts and air transfer openings of fire walls that are not on a lot line shall be allowed provided the penetrations comply with Sections ~~712 and 716.5.1~~. The size and aggregate width of all openings shall not exceed the limitations of Section 705.8.

Reason: The protection of ducts is not a compliance option between Sections 712 and 716. The specific requirements for duct protection requirements are located in 716, not 712. Under certain conditions the code may direct the user to back to 712, or other sections of the code which permit a percentage of unprotected openings based on separation distance, but the starting point is in Section 716.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

705.11 Ducts and air transfer openings. Ducts and air transfer openings shall not penetrate fire walls.

Exception: Penetrations by ducts and air transfer openings of fire walls that are not on a lot line shall be allowed provided the penetrations comply with Section ~~716.5.4~~. The size and aggregate width of all openings shall not exceed the limitations of Section 705.8.

Committee Reason: This helps to clarify the application of the fire wall provisions and direct the code user to the requirements of Section 716 which do require dampers at these locations. The modification changed the reference to Section 716 instead of Section 716.5.1 since that section does not really provide any added clarity and it would miss the provisions of Section 716.2, 716.3 and 716.4 that are also applicable.

Assembly Action:

None

Final Hearing Results

FS34-06/07

AM

Code Change No: **FS36-06/07**

Original Proposal

Sections: 706.2.1, 703.5 (New)

Proponent: William E. Koffel, P.E., Koffel Associates, Inc., representing Fire Rated Glazing Industry

1. Delete without substitution:

~~**706.2.1 Fire-resistance-rated glazing.** Fire-resistance-rated glazing, when tested in accordance with ASTM E 119 and complying with the requirements of Section 706, shall be permitted. Fire-resistance-rated glazing shall bear a label or other identification showing the name of the manufacturer, the test standard and the identifier "W-XXX," where the "XXX" is the fire-resistance rating in minutes. Such label or identification shall be issued by an approved agency and shall be permanently affixed to the glazing.~~

2. Add new text as follow:

706.2.1 703.5 Fire-resistance-rated glazing. Fire-resistance-rated glazing, when tested in accordance with ASTM E 119 and complying with the requirements of Section 706, shall be permitted. Fire-resistance-rated glazing shall bear a label or other identification showing the name of the manufacturer, the test standard and the identifier "W-XXX," where the "XXX" is the fire-resistance rating in minutes. Such label or identification shall be issued by an approved agency and shall be permanently affixed to the glazing.

Reason: Fire resistance rated glazing may be used in fire barriers, fire partitions, and exterior wall assemblies. The current location in the Code implies that fire resistance rated glazing may only be used in fire barriers. Moving the text to Section 703 will clarify that fire resistance rated glazing may be used in assemblies other than fire barriers.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The relocation to Section 703 will assist code users in understanding that the requirements are applicable to more than fire barriers.

Assembly Action:

None

Final Hearing Results

FS36-06/07

Sections: 402.4.6, 402.7.1, 403.2, [F]404.3, 410.5.1, 410.5.2, [F]415.6.1.2, [F]415.6.2.2, [F]415.6.3.4.1, [F]415.6.3.5.2, [F]415.7.1, [F]415.7.3, [F]415.8.2.2, 415.8.5.2.1, 415.8.5.2.2, [F]416.2, [F]418.4, [F]418.5, [F]418.6, 706.3.3, 706.3.9, Table 706.3.9, 707.11, 707.13.3, 707.13.4, 712.3, 901.7, 903.2, [F]909.11 (IMC 513.11 & IFC 909.11), 909.20.2, 909.20.6.1, [F]910.3.4, [F]910.4.4, 1021.3 (IFC [B] 1021.3), 1022.2 (IFC [B] 1022.2) 3006.4, 3104.5, 3410.6.16.1 (IEBC [B] 1301.6.16.1)

Proponent: Philip Brazil, P.E, Reid Middleton, Inc., representing himself

THIS PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY, IBC GENERAL AND IBC MEANS OF EGRESS AND IFC CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC FIRE SAFETY

706.3.3 Exit passageway. The fire-resistance rating of the ~~separation between~~ fire barrier separating building areas ~~and from~~ an exit passageway shall comply with Section ~~1021.4~~ 1021.3.

706.3.9. Single-occupancy fire areas. The fire barriers or horizontal ~~assembly~~ assemblies, or both, separating a single occupancy into different fire areas shall have a fire-resistance rating of not less than that indicated in Table 706.3.9.

707.11 Enclosure at the bottom. Shafts that do not extend to the bottom of the building or structure shall comply with one of the following:

1. They shall be enclosed at the lowest level with construction of the same fire-resistance rating as the lowest floor through which the shaft passes, but not less than the rating required for the shaft enclosure; ~~;~~
2. They shall terminate in a room having a use related to the purpose of the shaft. The room shall be separated from the remainder of the building by a fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both. ~~having a~~ The fire-resistance rating and opening protectives shall be at least equal to the protection required for the shaft enclosure; ~~or.~~
3. They shall be protected by approved fire dampers installed in accordance with their listing at the lowest floor level within the shaft enclosure.

Exceptions:

1. The fire-resistance-rated room separation is not required, provided there are no openings in or penetrations of the shaft enclosure to the interior of the building except at the bottom. The bottom of the shaft shall be closed off around the penetrating items with materials permitted by Section 717.3.1 for draftstopping, or the room shall be provided with an approved automatic fire suppression system.
2. A shaft enclosure containing a refuse chute or laundry chute shall not be used for any other purpose and shall terminate in a room protected in accordance with Section 707.13.4.
3. The fire-resistance-rated room separation and the protection at the bottom of the shaft are not required provided there are no combustibles in the shaft and there are no openings or other penetrations through the shaft enclosure to the interior of the building.

707.13.3 Refuse and laundry chute access rooms. Access openings for refuse and laundry chutes shall be located in rooms or compartments enclosed by a not less than 1-hour fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both ~~that has a fire-resistance rating of not less than 1 hour.~~ Openings into the access rooms shall be protected by opening protectives having a fire protection rating of not less than 3/4 hour. Doors shall be self- or automatic closing upon the detection of smoke in accordance with Section 715.4.7.3.

707.13.4 Termination room. Refuse and laundry chutes shall discharge into an enclosed room separated from the remainder of the building by a not less than 1-hour fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both ~~that has a fire-resistance rating of not less than 1 hour~~. Openings into the termination room shall be protected by opening protectives having a fire protection rating of not less than 3/4 hour. Doors shall be self- or automatic closing upon the detection of smoke in accordance with Section 715.4.7.3. Refuse chutes shall not terminate in an incinerator room. Refuse and laundry rooms that are not provided with chutes need only comply with Table 508.2.

712.3 Fire-resistance-rated walls. Penetrations into or through fire walls, fire barriers ~~walls~~, smoke barrier walls, and fire partitions shall comply with Sections 712.3.1 through 712.3.4.

901.7 Fire areas. Where buildings, or portions thereof, are divided into fire areas so as not to exceed the limits established for requiring a fire protection system in accordance with this chapter, such fire areas shall be separated by fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both having a fire-resistance rating of not less than that determined in accordance with Section 706.3.9.

[B] 909.20.2 Construction. The smokeproof enclosure shall be separated from the remainder of the building by not less than a 2-hour fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both. ~~without~~ Openings are not permitted other than the required means of egress doors. The vestibule shall be separated from the stairway by not less than a 2-hour fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both. The open exterior balcony shall be constructed in accordance with the fire-resistance-rating requirements for floor construction.

[B] 909.20.6.1 Ventilation systems. Smokeproof enclosure ventilation systems shall be independent of other building ventilation systems. The equipment and ductwork shall comply with one of the following:

1. Equipment and ductwork shall be located exterior to the building and directly connected to the smokeproof enclosure or connected to the smokeproof enclosure by ductwork enclosed by not less than 2-hour fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both.
2. Equipment and ductwork shall be located within the smokeproof enclosure with intake or exhaust directly from and to the outside or through ductwork enclosed by not less than 2-hour fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both.
3. Equipment and ductwork shall be located within the building if separated from the remainder of the building, including other mechanical equipment, by not less than 2-hour fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both.

PART II – IBC GENERAL

Revise as follows:

402.4.6 Service areas fronting on exit passageways. Mechanical rooms, electrical rooms, building service areas and service elevators are permitted to open directly into exit passageways, provided the exit passageway is separated from such rooms with not less than 1-hour ~~fire-resistance-rated~~ fire barriers ~~and 1-hour opening protectives~~ constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both. The minimum fire-protection rating of openings in the fire barriers shall be 1 hour.

402.7.1 Attached garage. An attached garage for the storage of passenger vehicles having a capacity of not more than nine persons and open parking garages shall be considered as a separate building where it is separated from the covered mall building by a not less than 2-hour fire barriers ~~having a fire-resistance rating of at least 2 hours~~ constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both.

Exception: Where an open parking garage or enclosed parking garage is separated from the covered mall building or anchor building a distance greater than 10 feet (3048 mm), the provisions of Table 602 shall apply. Pedestrian walkways and tunnels which attach the open parking garage or enclosed parking garage to the covered mall building or anchor building shall be constructed in accordance with Section 3104.

410.5.1 Separation from stage. ~~Where the stage height is greater than 50 feet (15 240 mm), The stage shall be separated from dressing rooms, scene docks, property rooms, workshops, storerooms and compartments appurtenant to the stage and other parts of the building by a fire barriers with not less than a 2-hour fire-resistance rating with approved opening protectives constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both. The minimum fire-resistance rating shall be 2 hours for stage heights greater than 50 feet (15 240 mm) and 1 hour for stage heights of 50 feet (15 240 mm) or less, the required stage separation shall be a fire barrier with not less than a 1-hour fire-resistance rating with approved opening protectives.~~

410.5.2 Separation from each other. Dressing rooms, scene docks, property rooms, workshops, storerooms and compartments appurtenant to the stage shall be separated from each other by not less than 1-hour fire barriers with not less than a 1-hour fire-resistance rating with approved opening protectives constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both.

3006.4 Machine rooms and machinery spaces. Elevator machine rooms and machinery spaces shall be enclosed with fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both with a The fire-resistance rating shall not be less than the required rating of the hoistway enclosure served by the machinery. Openings in the fire barriers shall be protected with assemblies having a fire protection rating not less than that required for the hoistway enclosure doors.

3104.5 Fire barriers between pedestrian walkways and buildings. Walkways shall be separated from the interior of the building by not less than 2-hour fire barriers walls with a fire-resistance rating of not less than 2-hours constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both. This protection shall extend vertically from a point 10 feet (3048 mm) above the walkway roof surface or the connected building roof line, whichever is lower, down to a point 10 feet (3048 mm) below the walkway and horizontally 10 feet (3048 mm) from each side of the pedestrian walkway. Openings within the 10-foot (3048 mm) horizontal extension of the protected walls beyond the walkway shall be equipped with devices providing a 3/4-hour fire protection rating in accordance with Section 715.

Exception: The walls separating the pedestrian walkway from a connected building are not required to have a fire-resistance rating by this section where any of the following conditions exist:

1. The distance between the connected buildings is more than 10 feet (3048 mm), the pedestrian walkway and connected buildings, except for open parking garages, are equipped throughout with an automatic sprinkler system in accordance with ~~NFPA 13~~ Section 903.3.1.1 and the wall is constructed of a tempered, wired or laminated glass wall and doors subject to the following:
 - 1.1. The glass shall be protected by an automatic sprinkler system in accordance with ~~NFPA 13~~ Section 903.3.1.1 and the sprinkler system shall completely wet the entire surface of interior sides of the glass wall when actuated.
 - 1.2. The glass shall be in a gasketed frame and installed in such a manner that the framing system will deflect without breaking (loading) the glass before the sprinkler operates.
 - 1.3. Obstructions shall not be installed between the sprinkler heads and the glass.
2. The distance between the connected buildings is more than 10 feet (3048 mm) and both sidewalls of the pedestrian walkway are at least 50 percent open with the open area uniformly distributed to prevent the accumulation of smoke and toxic gases.
3. Buildings are on the same lot in accordance with Section 503.1.2.
4. Where exterior walls of connected buildings are required by Section 704 to have a fire-resistance rating greater than 2 hours, the walkway shall be equipped throughout with an automatic sprinkler system installed in accordance with ~~NFPA 13~~ Section 903.3.1.1.

3410.6.16.1 (IEBC [B] 1301.6.16.1) Categories. The categories for mixed occupancies are:

1. Category a — ~~Minimum 1-hour fire barriers between~~ Occupancies separated by minimum 1-hour fire barriers or minimum 1-hour horizontal assemblies, or both.
2. Category b — ~~Fire barriers~~ Separations between occupancies in accordance with Section 508.3.3.
3. Category c — ~~Fire barriers~~ Separations between occupancies having a fire-resistance rating of not less than twice that required by Section 508.3.3.

PART III – IBC MEANS OF EGRESS

1021.3 (IFC 1021.3) Construction. Exit passageway enclosures shall have walls, floors and ceilings of not less than 1-hour fire-resistance rating, and not less than that required for any connecting exit enclosure. Exit passageways shall be constructed as fire barriers in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both.

1022.2 (IFC 1022.2) Separation. The separation between buildings or areas of refuge connected by a horizontal exit shall be provided by a fire wall complying with Section 705; or it shall be provided by a fire barrier complying with Section 706 or a horizontal assembly complying with Section 711, or both, and having a ~~The minimum~~ fire-resistance rating of ~~not less than the separation shall be~~ 2 hours. Opening protectives in horizontal exit walls shall also comply with Section 715. The horizontal exit separation shall extend vertically through all levels of the building unless floor assemblies have a fire resistance rating of not less than 2 hours with no unprotected openings.

Exception: A fire-resistance rating is not required at horizontal exits between a building area and an above-grade pedestrian walkway constructed in accordance with Section 3104, provided that the distance between connected buildings is more than 20 feet (6096 mm).

Horizontal exit walls constructed as fire barriers shall be continuous from exterior wall to exterior wall so as to divide completely the floor served by the horizontal exit.

PART IV – IFC

Revise as follows:

[F] 403.2 Automatic sprinkler system. Buildings and structures shall be equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 and a secondary water supply where required by Section 903.3.5.2.

Exception: An automatic sprinkler system shall not be required in spaces or areas of:

1. Open parking garages in accordance with Section 406.3.
2. Telecommunications equipment buildings used exclusively for telecommunications equipment, associated electrical power distribution equipment, batteries and standby engines, provided that those spaces or areas are equipped throughout with an automatic fire detection system in accordance with Section 907.2 and are separated from the remainder of the building by not less than 1-hour fire barriers consisting of not less than 1-hour fire-resistance-rated walls and constructed in accordance with Section 706 or not less than 2-hour fire-resistance-rated floor/ceiling horizontal assemblies constructed in accordance with Section 711, or both.

[F] 404.3 Automatic sprinkler protection. An approved automatic sprinkler system shall be installed throughout the entire building.

Exceptions:

1. That area of a building adjacent to or above the atrium need not be sprinklered provided that portion of the building is separated from the atrium portion by not less than a 2-hour ~~fire-resistance-rated~~ fire barriers constructed in accordance with Section 706 or horizontal assembly assemblies constructed in accordance with Section 711, or both.
2. Where the ceiling of the atrium is more than 55 feet (16 764 mm) above the floor, sprinkler protection at the ceiling of the atrium is not required.

[F] 415.6.1.2 Grinding rooms. Every room or space occupied for grinding or other operations that produce combustible dusts shall be enclosed with fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both. ~~that have not less than a 2-hour~~ The minimum fire-resistance rating shall be 2-hours where the area is not more than 3,000 square feet (279 m²), and ~~not less than a 4-hour fire-resistance rating~~ 4 hours where the area is greater than 3,000 square feet (279 m²).

[F] 415.6.2.2 Tank protection. Storage tanks shall be noncombustible and protected from physical damage. A Fire barriers ~~wall~~ or horizontal assemblies or both around the storage tank(s) shall be permitted as the method of protection from physical damage.

[F] 415.6.3.4.1 Fire separation. ~~Separation of the Attached structures shall be provided separated from the building by fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both, having a The minimum fire-resistance rating of not less than shall be 1 hour and the fire barriers shall not have openings. Fire barriers between attached structures occupied only for the storage of LP-gas are permitted to have fire door assemblies that comply with Section 715.~~ Such fire barriers and horizontal assemblies shall be designed to withstand a static pressure of at least 100 pounds per square foot (psf) (4788 Pa), except where the building to which the structure is attached is occupied by operations or processes having a similar hazard.

Exception: Fire barriers between attached structures occupied only for the storage of LP-gas are permitted to have fire door assemblies complying with Section 715.

[F] 415.6.3.5.2 Common construction. ~~Walls and floor/ceiling assemblies common to the room and to the building within which the room is located shall be fire barriers with not less than a 1-hour fire-resistance rating and without openings. Common walls for rooms occupied only for storage of LP-gas are permitted to have opening protectives complying with Section 715. The walls and ceilings shall be designed to withstand a static pressure of at least 100 psf (4788 Pa).~~

Exception: Where the building, within which the room is located, is occupied by operations or processes having a similar hazard.

[F] 415.6.3.5.2 Fire separation. The rooms shall be separated from the building by fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both. The minimum fire-resistance rating shall be 1 hour and the fire barriers shall not have openings. Such fire barriers and horizontal assemblies shall be designed to withstand a static pressure of at least 100 pounds per square foot (4788 Pa), except where the building, within which the room is located, is occupied by operations or processes having a similar hazard.

Exception: Fire barriers between common walls occupied only for the storage of LP-gas are permitted to have opening protectives complying with Section 715.

[F] 415.7.1 Gas rooms. When gas rooms are provided, such rooms shall be separated from other areas by not less than a 1-hour fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both.

[F] 415.7.3 Separation - highly toxic solids and liquids. Highly toxic solids and liquids not stored in approved hazardous materials storage cabinets shall be isolated from other hazardous materials storage by a not less than 1-hour fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both having a fire-resistance rating of not less than 1 hour.

[F] 415.8.2.2 Separation. Fabrication areas, whose sizes are limited by the quantity of hazardous materials allowed by Table 415.8.2.1.1, shall be separated from each other, from corridors, and from other parts of the building by not less than 1-hour fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both.

Exceptions:

1. Doors within such fire barrier walls, including doors to corridors, shall be only self-closing fire door assemblies having a fire-protection rating of not less than 3/4 hour.
2. Windows between fabrication areas and corridors are permitted to be fixed glazing listed and labeled for a fire protection rating of at least 3/4 hour in accordance with Section 715.

[F] 415.8.5.2.1 HPM rooms and gas rooms. HPM rooms and gas rooms shall be separated from other areas by ~~not less than a 2-hour~~ fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both. The minimum fire-resistance rating shall be 2-hours where the area is 300 square feet (27.9 m²) or more and ~~not less than a 1-hour fire barrier~~ 1 hour where the area is less than 300 square feet (27.9 m²).

[F] 415.8.5.2.2 Liquid storage rooms. Liquid storage rooms shall be constructed in accordance with the following requirements:

1. Rooms in excess of 500 square feet (46.5 m²) shall have at least one exterior door approved for fire department access.
2. Rooms shall be separated from other areas by fire barriers ~~having a~~ constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both. The fire-resistance rating of shall be not less than 1-hour for rooms up to 150 square feet (13.9 m²) in area and not less than 2 hours where the room is more than 150 square feet (13.9 m²) in area.
3. Shelving, racks and wainscoting in such areas shall be of noncombustible construction or wood of not less than 1 inch (25 mm) nominal thickness.
4. Rooms used for the storage of Class I flammable liquids shall not be located in a basement.

[F] 416.2 Spray rooms. Spray rooms shall be enclosed with not less than 1-hour fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both ~~with not less than a 1-hour fire-resistance rating.~~ Floors shall be waterproofed and drained in an approved manner.

[F] 418.4 Tank storage. Storage areas for flammable and combustible liquid tanks inside of structures shall be located at or above grade and shall be separated from the processing area by not less than 2-hour fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both.

[F] 418.5 Nitrocellulose storage. Nitrocellulose storage shall be located on a detached pad or in a separate structure or a room enclosed with no less than 2-hour fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both.

[F] 418.6 Finished products. Storage rooms for finished products that are flammable or combustible liquids shall be separated from the processing area by not less than 2-hour fire barriers having a fire-resistance rating of at least 2 hours, and openings in the walls shall be protected with approved opening protectives constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both.

[F] 420.4 Design and construction. Hydrogen cutoff rooms shall be classified with respect to occupancy in accordance with Section 302.1 and separated from other areas of the building by not less than 1-hour fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both; or as required by Section 508.2 or 508.3 as applicable.

[F] 420.4.1 Opening protectives. Doors within ~~such~~ the fire barriers walls, including doors to corridors, shall be self-closing in accordance with Section 715. Interior door openings shall be electronically interlocked to prevent operation of the hydrogen system when doors are opened or ajar or the room shall be provided with a mechanical exhaust ventilation system designed in accordance with Section 420.4.1.1.

[F] 903.2 Where required. Approved automatic sprinkler systems in new buildings and structures shall be provided in the locations described in this section.

Exception: Spaces or areas in telecommunications buildings used exclusively for telecommunications equipment, associated electrical power distribution equipment, batteries and standby engines, provided those spaces or areas are equipped throughout with an automatic fire alarm system and are separated from the remainder of the building by not less than 1 hour fire barriers consisting of not less than 1-hour fire-resistance-rated walls and constructed in accordance with Section 706 or not less than 2 hour fire-resistance-rated floor/ceiling horizontal assemblies constructed in accordance with Section 711, or both.

[F] 909.11 (IMC [F] 513.11, IFC 909.11) Power systems. The smoke control system shall be supplied with two sources of power. Primary power shall be the normal building power systems. Secondary power shall be from an approved standby source complying with the *International Code Council Electrical Code Administrative Provisions*. The standby power source and its transfer switches shall be in a ~~separate room~~ separate from the normal power transformers and switch gear and ventilated directly to and from the exterior, and The room shall be enclosed in a room constructed of with not less than 1-hour fire barriers ~~ventilated directly to and from the exterior~~ constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both. Power distribution from the two sources shall be by independent routes. Transfer to full standby power shall be automatic and within 60 seconds of failure of the primary power. The systems shall comply with this code or the *International Code Council Electrical Code Administrative Provisions*.

[F] 910.3.4 Vent locations. Smoke and heat vents shall be located 20 feet (6096 mm) or more from adjacent lot lines and fire walls and 10 feet (3048 mm) or more from fire barriers ~~walls~~. Vents shall be uniformly located within the roof area above high-piled storage areas, with consideration given to roof pitch, draft curtain location, sprinkler location and structural members.

[F] 910.4.4 Wiring and control. Wiring for operation and control of smoke exhaust fans shall be connected ahead of the main disconnect and protected against exposure to temperatures in excess of 1,000°F (538°C) for a period of not less than 15 minutes. Controls shall be located so as to be immediately accessible to the fire service from the exterior of the building and protected against interior fire exposure by not less than 1-hour fire barriers ~~having a fire-resistance rating not less than 1 hour~~ constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both.

Reason: Code change proposal FS2-04/05 (AMPC1) changed the concept of a fire barrier from being a fire containment assembly to begin a component of a fire containment assembly. This was accomplished by changing the definition of fire barrier from begin a vertical or horizontal assembly to being a wall assembly and by deleting the provisions for horizontal fire barriers. The proposal made the necessary revisions to several sections of the IBC for consistency with the change in concept (i.e., Sections 403.10.1, 404.5, 414.2.1, 508.2.2.1, 508.3.3.4.1, 706.3.5, 706.3.7, 706.3.9, 707.5, 911.1 and 1020.1). The proposal, however, did not make the necessary revisions to other sections of the IBC, which are needed in order for the concept to be fully incorporated into the provisions of the IBC. The purpose of this proposal is to make the necessary revisions to the provisions in those code sections.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I C IBC FIRE SAFETY

Committee Action:

Approved as Submitted

Committee Reason: The proponent has correctly addressed an inconsistency in the code which has been caused by the changes made by FS2-04/05 in a previous code change cycle. Those changes made the distinction that fire barriers were walls and did not include horizontal assemblies. By going through these sections and making these changes, it provides consistency between the intent of FS2-04/05 and between the sections which were not addressed by that proposal. This action also is consistent with the action taken by the IFC committee earlier.

Assembly Action:

None

PART II C IBC GENERAL

Committee Action:

Approved as Submitted

Committee Reason: The revisions to add horizontal assemblies in addition to fire barriers is consistent with changes made to other portions of the code in the 2006 edition. This action is also consistent with the action on Part I of the proposal.

Assembly Action:

None

PART III C IBC MEANS OF EGRESS

Committee Action:

Approved as Submitted

Committee Reason: The revised language in Sections 1021.3 and 1022.2. would provide consistency in the code for the usage of the terms fire barriers and horizontal assemblies.

Assembly Action:

None

PART IV C IFC

Committee Action:

Approved as Submitted

Committee Reason: The proposal completes a needed correlation effort undertaken in the 2004/2005 cycle to provide consistent terminology and references when referring to fire barrier and horizontal assembly enclosures.

Assembly Action:

None

Final Hearing Results

FS37-06/07, Part I	AS
FS37-06/07, Part II	AS
FS37-06/07, Part III	AS
FS37-06/07, Part IV	AS

Code Change No: **FS40-06/07**

Original Proposal

Sections: 508.2.2.1, 706.5

Proponent: Philip Brazil, P.E., Reid Middleton, Inc., representing himself

THIS PROPOSAL IS ON THE AGENDA OF THE IBC GENERAL AND THE IBC FIRE SAFETY CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC FIRE SAFETY

Revise as follows:

706.5 Continuity. Fire barriers shall extend from the top of the floor/ceiling assembly below to the underside of the floor or roof sheathing, slab or deck above and shall be securely attached thereto. Such fire barriers shall be continuous through concealed spaces, such as the space above a suspended ceiling. The supporting construction for fire barriers shall be protected to afford the required fire-resistance rating of the fire barrier supported, except for 1-hour fire-resistance-rated incidental use area separations as required by Table 508.2 in buildings of Type IIB, IIIB and VB construction. Hollow vertical spaces within a fire barrier shall be fireblocked in accordance with Section 717.2 at every floor level.

Exceptions:

1. The maximum required fire-resistance rating for assemblies supporting fire barriers separating tank storage as provided for in Section 415.6.2.1 shall be 2 hours, but not less than required by Table 601 for the building construction type.
2. Shaft enclosures shall be permitted to terminate at a top enclosure complying with Section 707.12.

PART II – IBC GENERAL

Revise as follows:

508.2.2.1 Construction. Where Table 508.2 requires a fire-resistance-rated separation, the incidental use area shall be separated from the remainder of the building by a fire barrier constructed in accordance with Section 706 or a horizontal assembly constructed in accordance with Section 711, or both. Where Table 508.2 permits an automatic fire-extinguishing system without a fire barrier, the incidental use area shall be separated from the remainder of the building by construction capable of resisting the passage of smoke. The partitions shall extend from top of the foundation or the floor/ceiling assembly below to the underside of the fire-resistance-rated floor/ceiling assembly above or fire-resistance-rated roof/ceiling assembly above or to the underside of the floor or roof sheathing, ~~or sub deck or slab~~ above. Doors shall be self- or automatic closing upon detection of smoke in accordance with Section 715.3.7.3. Doors shall not have air transfer openings and shall not be undercut in excess of the clearance permitted in accordance with NFPA 80.

Reason: The purpose of this proposal is to restore the revisions approved by code change proposals FS19-03/04(AM) and FS26-04/05(AS) and for consistency with Sections 705.6 (Exceptions 2 and 3), 705.6.1 (Exception), 707.12, 708.4, 709.4 and 710.4. They were inadvertently eliminated by code change proposals G14-04/05(AMPC1) and FS2-04/05(AMPC1).

Cost Impact: The code change proposal will not increase the cost of construction

Analysis: Copies of and information about code changes from previous code change cycles can be obtained at <http://www.iccsafe.org/cs/codes>.

Public Hearing Results

**PART I C IBC FIRE SAFETY
Committee Action:**

Approved as Submitted

Committee Reason: This helps clear up confusion as stated by the proponent and resolves some concerns with the actions taken by several previous code changes. This provides better clarity as to where a fire barrier is expected to extend.

Assembly Action: **None**

PART II C IBC GENERAL

Committee Action: **Approved as Submitted**

Committee Reason: The proposal restores issues that had been previously approved but had been lost due to extensive changes to this particular section in the previous code change cycle.

Assembly Action: **None**

Final Hearing Results

FS40-06/07, Part I	AS
FS40-06/07, Part II	AS

Code Change No: FS42-06/07

Original Proposal

Section: 706.7

Proponent: Sarah A. Rice, C.B.O., Schirmer Engineering Corp.

Revise as follows:

706.7 Openings. Openings in a fire barrier wall shall be protected in accordance with Section 715. Openings shall be limited to a maximum aggregate width of 25 percent of the length of the wall, and the maximum area of any single opening shall not exceed 156 square feet (15m²). Openings in exit enclosures and exit passageways shall also comply with Sections 1020.1.1 and 1021.4, respectively.

Exceptions:

1. Openings shall not be limited to 156 square feet (15 m²) where adjoining fire areas are equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.
2. Openings shall not be limited to 156 square feet (15 m²) or an aggregate width of 25 percent of the length of the wall where the opening protective is a fire doors serving an exit enclosure.
3. Openings shall not be limited to 156 square feet (15 m²) or an aggregate width of 25 percent of the length of the wall where the opening protective assembly has been tested in accordance with ASTM E 119 and has a minimum fire-resistance rating not less than the fire-resistance rating of the wall.
4. Fire windows permitted in atrium separation walls shall not be limited to a maximum aggregate width of 25 percent of length of the wall.

Reason: Without the proposed language the code literally exempts fire doors in exit enclosures from all the requirements of Section 706.7, which would include the requirement in the first that requires "Openings in a fire barrier wall shall be protected in accordance with Section 715." and the last sentence which requires "Openings in exit enclosures and exit passageways shall also comply with Sections 1020.1.1 and 1021.4, respectively."

The proposed language makes it clear that Exception 2 is intended only to allow the omission of the size limitations.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: This proposal provides continuity with other sections on the amount of openings and coordinates with the action taken on FS33-06/07 earlier. In addition, this will address a very common situation that would not be permitted based on the literal interpretation of the current code text.

Assembly Action:

None

Final Hearing Results

FS42-06/07

AS

Code Change No: FS43-06/07

Original Proposal

Sections: 706.7, 712.3.1.1 (IMC 607.5.4), 2603.8

Proponent: Philip Brazil, P.E., Reid Middleton, Inc., representing himself

Revise as follows:

706.7 Openings. Openings in a fire barrier wall shall be protected in accordance with Section 715. Openings shall be limited to a maximum aggregate width of 25 percent of the length of the wall, and the maximum area of any single opening shall not exceed 156 square feet (15m²). Openings in exit enclosures and exit passageways shall also comply with Sections 1020.1.1 and 1021.4, respectively.

Exceptions:

1. Openings shall not be limited to 156 square feet (15 m²) where adjoining fire areas are equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.
2. Fire doors serving an exit enclosure.
3. Openings shall not be limited to 156 square feet (15 m²) or an aggregate width of 25 percent of the length of the wall where the opening protective assembly has been tested in accordance with ASTM E 119 and has a minimum fire-resistance rating not less than the fire-resistance rating of the wall.
4. Fire windows assemblies permitted in atrium separation walls shall not be limited to a maximum aggregate width of 25 percent of length of the wall.

716.5.4 (IMC 607.5.4) Fire partitions. Ducts and air transfer openings that penetrate fire partitions shall be protected with listed fire dampers installed in accordance with their listing.

Exceptions: In occupancies other than Group H, fire dampers are not required where any of the following apply:

1. The partitions are tenant separation or corridor walls in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and the duct is protected as a through penetration in accordance with Section 712.
2. Tenant partitions in covered mall buildings where the walls are not required by provisions elsewhere in the code to extend to the underside of the floor or roof sheathing, slab or deck above.
3. The duct system is constructed of approved materials in accordance with the *International Mechanical Code* and the duct penetrating the wall complies with all of the following requirements:
 - 3.1. The duct shall not exceed 100 square inches (0.06 m²).
 - 3.2. The duct shall be constructed of steel a minimum of 0.0217 inch (0.55 mm) in thickness.
 - 3.3. The duct shall not have openings that communicate the corridor with adjacent spaces or rooms.
 - 3.4. The duct shall be installed above a ceiling.
 - 3.5. The duct shall not terminate at a wall register in the fire-resistance-rated wall.
 - 3.6. A minimum 12-inch-long (305 mm) by 0.060-inch-thick (1.52 mm) steel sleeve shall be centered in each duct opening. The sleeve shall be secured to both sides of the wall and all four sides of the

sleeve with minimum 1 1/2-inch by 1 1/2-inch by 0.060-inch (38 mm by 38 mm by 1.52 mm) steel retaining angles. The retaining angles shall be secured to the sleeve and the wall with No. 10 (M5) screws. The annular space between the steel sleeve and the wall opening shall be filled with mineral wool batting on all sides.

2603.8 Protection against termites. In areas where the probability of termite infestation is very heavy in accordance with Figure 2603.8, extruded and expanded polystyrene, polyisocyanurate and other foam plastics shall not be installed on the exterior face or under interior or exterior foundation walls or slab foundations located below grade. The clearance between foam plastics installed above grade and exposed earth shall be at least 6 inches (152 mm).

Exceptions:

1. Buildings where the structural members of walls, floors, ceilings and roofs are entirely of noncombustible materials or ~~preservatively~~ preservative-treated wood.
2. An approved method of protecting the foam plastic and structure from subterranean termite damage is provided.
3. On the interior side of basement walls.

Reason:

1. 706.7: Consistency with Section 715.4.
2. 716.5.4: Consistency with code change proposal FS19-03/04 (AM).
3. 2603.8: Consistency with current definition in Section 2302.1.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal provides more specific language which will make the sections consistent with other sections of the code. In addition, Section 716.5.4 will help clarify exactly where the wall is required to extend to.

Assembly Action:

None

Final Hearing Results

FS43-06/07

AS

Code Change No: FS46-06/07

Original Proposal

Sections: 707.2, 712.1.1 712.3.3, 716.1.1 (IMC 607.1.1) and 716.1.1.1 (New), (IMC 607.1.1.1) (New)

Proponent: Vickie Lovell, Delray, FL, representing Air Movement and Control Association

707.2 Shaft enclosure required. Openings through a floor/ceiling assembly shall be protected by a shaft enclosure complying with this Section.

Exceptions:

1. A shaft enclosure is not required for openings totally within an individual residential dwelling unit and connecting four stories or less.

2. A shaft enclosure is not required in a building equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 for an escalator opening or stairway that is not a portion of the means of egress protected according to Item 2.1 or 2.2:
 - 2.1. Where the area of the floor opening between stories does not exceed twice the horizontal projected area of the escalator or stairway and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. In other than Groups B and M, this application is limited to openings that do not connect more than four stories.
 - 2.2. Where the opening is protected by approved power-operated automatic shutters at every penetrated floor. The shutters shall be of noncombustible construction and have a fire-resistance rating of not less than 1.5 hours. The shutter shall be so constructed as to close immediately upon the actuation of a smoke detector installed in accordance with Section 907.11 and shall completely shut off the well opening. Escalators shall cease operation when the shutter begins to close. The shutter shall operate at a speed of not more than 30 feet per minute (152.4 mm/s) and shall be equipped with a sensitive leading edge to arrest its progress where in contact with any obstacle, and to continue its progress on release there from.
3. A shaft enclosure is not required for penetrations by pipe, tube, conduit, wire, cable and vents protected in accordance with Section 712.4.
4. A shaft enclosure is not required for penetrations by air ducts protected in accordance with Section ~~712.4~~ 716.5. Grease ducts and other hazardous exhaust ducts shall be protected in accordance with the *International Mechanical Code*.
5. In other than Group H occupancies, a shaft enclosure is not required for floor openings complying with the provisions for atriums in Section 404.
6. A shaft enclosure is not required for approved masonry chimneys where annular space protection is provided at each floor level in accordance with Section 717.2.5.
7. In other than Groups I-2 and I-3, a shaft enclosure is not required for a floor opening or an air transfer opening that complies with the following:
 - 7.1. Does not connect more than two stories.
 - 7.2. Is not part of the required means of egress system, except as permitted in Section 1020.1.
 - 7.3. Is not concealed within the building construction.
 - 7.4. Is not open to a corridor in Group I and R occupancies.
 - 7.5. Is not open to a corridor on nonsprinklered floors in any occupancy.
 - 7.6. Is separated from floor openings and air transfer openings serving other floors by construction conforming to required shaft enclosures.
 - 7.7. Is limited to the same smoke compartment.
8. A shaft enclosure is not required for automobile ramps in open and enclosed parking garages constructed in accordance with Sections 406.3 and 406.4, respectively.
9. A shaft enclosure is not required for floor openings between a mezzanine and the floor below.
10. A shaft enclosure is not required for joints protected by a fire-resistant joint system in accordance with Section 713.
11. A shaft enclosure shall not be required for floor openings created by unenclosed stairs or ramps in accordance with Exception 8 or 9 in Section 1020.1.
12. Floor openings protected by floor fire doors in accordance with Section 711.8.
13. Where permitted by other sections of this code.

~~712.3.3~~ 712.1.1 Ducts and air transfer openings. Penetrations of fire-resistance-rated walls by ducts that are not protected with dampers shall comply with Sections 712.2 through 712.3.4. Penetrations of horizontal assemblies not protected with a shaft as permitted by Exception #4 of Section 707, and are not required to be protected with fire dampers by other sections of the code, shall comply with Sections 712.4 through 712.4.4. Ducts and air transfer openings that are protected with dampers shall comply with Section 716.

716.1.1 (IMC 607.1.1) Ducts that penetrate fire resistance rated assemblies without dampers. Ducts that penetrate fire-resistance-rated assemblies and are not required by this section to have dampers shall comply with the requirements of Sections 712.2 through 712.3.4. Ducts that penetrate horizontal assemblies not required to be contained within a shaft and are not required by this section to have dampers shall comply with the requirements of Sections 712.4 through 712.4.4

716.1.1.1 (IMC 607.1.1.1) Ducts that penetrate non-fire resistance rated assemblies The space around a duct penetrating a non-fire resistance rated wall assembly shall be filled with an approved material to limit the free passage of smoke. The space around a duct penetrating a non-fire resistance rated floor assembly shall comply with 716.6.3.

Reason: The incorrect correlation between sections 707, 712 and 716 has lead to misinterpretation of the requirements for fire dampers by code users.

Fire dampers and through penetration firestops are not equivalent alternatives for one another. However, either could be considered an alternative to a shaft enclosure, under specific, appropriate conditions. The 2006 Edition of the IBC outlines the minimum requirements as to when fire dampers are required, and specific conditions as to when dampers can be omitted due to other provisions in the code. But the code also states that when ducts are not enclosed in a shaft, and are permitted to penetrate a fire resistance rated assembly without fire dampers, the assembly still must be protected with through penetration protection. Unfortunately, due to the way the code is currently formatted, that is not clearly laid out.

The current hierarchy of code sections in the 2006 IBC that applies to ducts is as follows:

1. Section 707 - Shafts are acceptable, traditional protection for duct penetrations through floor assemblies.
2. Exception 4 of Section 707 permits alternate protection of ducts and directs the user to 712.4 for the protection of penetrations
3. Section 712.4 .1.3 directs the user to Section 716 specifically for protection of ducts and air transfer openings.

The correct and more user friendly hierarchy of code sections that applies to ducts in floor assemblies should be as follows:

Section 707 - Shafts are acceptable, traditional protection for duct penetrations through floor assemblies.

Exception 4 of Section 707 permits alternate protection of ducts other than shafts and should send the user directly to Section 716, "Ducts and Air Transfer Openings", where the protection requirements specifically for ducts are located, or to the Mechanical Code for protection for exhaust ducts.

Where Section 716 (or some other section of the code) does not require a fire damper in the duct, then the section should send the user to 712.4 for protection requirements of the duct.

We believe that these code change proposals help the code user to more quickly find the correct method of protection for ducts.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

707.2 Shaft enclosure required. Openings through a floor/ceiling assembly shall be protected by a shaft enclosure complying with this Section.

Exceptions:

1. A shaft enclosure is not required for openings totally within an individual residential dwelling unit and connecting four stories or less.
2. A shaft enclosure is not required in a building equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 for an escalator opening or stairway that is not a portion of the means of egress protected according to Item 2.1 or 2.2:
 - 2.1. Where the area of the floor opening between stories does not exceed twice the horizontal projected area of the escalator or stairway and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. In other than Groups B and M, this application is limited to openings that do not connect more than four stories.
 - 2.2. Where the opening is protected by approved power-operated automatic shutters at every penetrated floor. The shutters shall be of noncombustible construction and have a fire-resistance rating of not less than 1.5 hours. The shutter shall be so constructed as to close immediately upon the actuation of a smoke detector installed in accordance with Section 907.11 and shall completely shut off the well opening. Escalators shall cease operation when the shutter begins to close. The shutter shall operate at a speed of not more than 30 feet per minute (152.4 mm/s) and shall be equipped with a sensitive leading edge to arrest its progress where in contact with any obstacle, and to continue its progress on release there from.
3. A shaft enclosure is not required for penetrations by pipe, tube, conduit, wire, cable and vents protected in accordance with Section 712.4.
4. A shaft enclosure is not required for penetrations by ducts protected in accordance with Section 712.4. Grease ducts shall be protected in accordance with the *International Mechanical Code*.
5. In other than Group H occupancies, a shaft enclosure is not required for floor openings complying with the provisions for atriums in Section 404.
6. A shaft enclosure is not required for approved masonry chimneys where annular space protection is provided at each floor level in accordance with Section 717.2.5.
7. In other than Groups I-2 and I-3, a shaft enclosure is not required for a floor opening or an air transfer opening that complies with the following:
 - 7.1. Does not connect more than two stories.
 - 7.2. Is not part of the required means of egress system, except as permitted in Section 1020.1.
 - 7.3. Is not concealed within the building construction.
 - 7.4. Is not open to a corridor in Group I and R occupancies.
 - 7.5. Is not open to a corridor on nonsprinklered floors in any occupancy.
 - 7.6. Is separated from floor openings and air transfer openings serving other floors by construction conforming to required shaft enclosures.
 - 7.7. Is limited to the same smoke compartment.
8. A shaft enclosure is not required for automobile ramps in open and enclosed parking garages constructed in accordance with Sections 406.3 and 406.4, respectively.
9. A shaft enclosure is not required for floor openings between a mezzanine and the floor below.
10. A shaft enclosure is not required for joints protected by a fire-resistant joint system in accordance with Section 713.
11. A shaft enclosure shall not be required for floor openings created by unenclosed stairs or ramps in accordance with Exception 8 or 9 in Section 1020.1.
12. Floor openings protected by floor fire doors in accordance with Section 711.8.
13. Where permitted by other sections of this code.

(Existing 712.3.3) 712.1.1 Ducts and air transfer openings. Penetrations of fire-resistance-rated walls by ducts that are not protected with dampers shall comply with Sections 712.2 through 712.3.4. Penetrations of horizontal assemblies not protected with a shaft as permitted by Exception #4 of Section 707, and are not required to be protected with fire dampers by other sections of the code, shall comply with Sections 712.4 through 712.4.4. Ducts and air transfer openings that are protected with dampers shall comply with Section 716.

716.1.1 (IMC 607.1.1) Ducts that penetrate fire resistance rated assemblies without dampers. Ducts that penetrate fire-resistance-rated assemblies and are not required by this section to have dampers shall comply with the requirements of Sections 712.2 through 712.3.4. Ducts that penetrate horizontal assemblies not required to be contained within a shaft and are not required by this section to have dampers shall comply with the requirements of Sections 712.4 through 712.4.4

716.1.1.1 (IMC 607.1.1.1) Ducts that penetrate non-fire resistance rated assemblies. ~~The space around a duct penetrating a non-fire resistance rated wall assembly shall be filled with an approved material to limit the free passage of smoke.~~ The space around a duct penetrating a non-fire resistance rated floor assembly shall comply with 716.6.3.

Committee Reason: This proposal helps to provide references and direction to the applicable code section. These revisions should help clarify the application of the various sections. The modifications eliminate the changes in Section 707.2 item 4 which was acted on in FS45-06/07. The revision in 716.1.1.1 eliminates the requirement being applied to walls and leaves it so it simply references existing requirements for floors in 716.6.3. The revisions in Sections 712.1.1 and 716.1.1 are strictly editorial.

Final Hearing Results

FS46-06/07

AM

Code Change No: FS48-06/07

Original Proposal

Section: 707.2

Proponent: Tom Rubottom, City of Lakewood, representing The Colorado Chapter of ICC

Revise as follows:

707.2 Shaft enclosure required. Openings through a floor/ceiling assembly shall be protected by a shaft enclosure complying with this Section.

Exceptions:

1. A shaft enclosure is not required for openings totally within an individual residential dwelling unit and connecting four stories or less.
2. A shaft enclosure is not required in a building equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 for an escalator opening or stairway that is not a portion of the means of egress protected according to Item 2.1 or 2.2:
 - 2.1. Where the area of the floor opening between stories does not exceed twice the horizontal projected area of the escalator or stairway and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. In other than Groups B and M, this application is limited to openings that do not connect more than four stories.
 - 2.2. Where the opening is protected by approved power-operated automatic shutters at every penetrated floor. The shutters shall be of noncombustible construction and have a fire-resistance rating of not less than 1.5 hours. The shutter shall be so constructed as to close immediately upon the actuation of a smoke detector installed in accordance with Section 907.11 and shall completely shut off the well opening. Escalators shall cease operation when the shutter begins to close. The shutter shall operate at a speed of not more than 30 feet per minute (152.4 mm/s) and shall be equipped with a sensitive leading edge to arrest its progress where in contact with any obstacle, and to continue its progress on release therefrom.
3. A shaft enclosure is not required for penetrations by pipe, tube, conduit, wire, cable and vents protected in accordance with Section 712.4.

4. A shaft enclosure is not required for penetrations by ducts protected in accordance with Section 712.4. Grease ducts shall be protected in accordance with the *International Mechanical Code*.
5. In other than Group H occupancies, a shaft enclosure is not required for floor openings complying with the provisions for atriums in Section 404.
6. A shaft enclosure is not required for approved masonry chimneys where annular space protection is provided at each floor level in accordance with Section 717.2.5.
7. In other than Groups I-2 and I-3, a shaft enclosure is not required for a floor opening or an air transfer opening that complies with the following:
 - 7.1. Does not connect more than two stories.
 - 7.2. Is not part of the required means of egress system, except as permitted in Section 1020.1.
 - 7.3. Is not concealed within the building construction.
 - 7.4. Is not open to a corridor in Group I and R occupancies.
 - 7.5. Is not open to a corridor on nonsprinklered floors in any occupancy.
 - 7.6. Is separated from floor openings and air transfer openings serving other floors by construction conforming to required shaft enclosures.
 - 7.7. Is limited to the same smoke compartment.
8. A shaft enclosure is not required for automobile ramps in open and enclosed parking garages constructed in accordance with Sections 406.3 and 406.4, respectively.
9. A shaft enclosure is not required for floor openings between a mezzanine and the floor below.
10. A shaft enclosure is not required for joints protected by a fire-resistant joint system in accordance with Section 713.
11. A shaft enclosure shall not be required for floor openings created by unenclosed stairs or ramps in accordance with Exception 8 or 9 in Section 1020.1.
12. Floor openings protected by floor fire doors in accordance with Section 711.8.
13. Where permitted by other sections of this code.
14. A shaft enclosure is not required for floor openings for elevators within a single use open parking garage.

Reason: Adding this language will clarify that a fire rated shaft enclosure would not be required for an elevator when located within a single use open parking garage. Section 707.2 exception 8 allows the ramps within open parking garages to not meet the shaft requirements. Section 1020.1 exception 5 allows stairways serving only the parking structure to be unenclosed and not meet the shaft requirements. This new language will clarify that the elevator floor penetration would also not require shaft protection.

Cost Impact: The code change proposal will not increase the cost of construction. This would result in a cost reduction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

707.2 Shaft enclosure required. Openings through a floor/ceiling assembly shall be protected by a shaft enclosure complying with this Section.

Exceptions:

1. A shaft enclosure is not required for openings totally within an individual residential dwelling unit and connecting four stories or less.
2. A shaft enclosure is not required in a building equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 for an escalator opening or stairway that is not a portion of the means of egress protected according to Item 2.1 or 2.2:
 - 2.1. Where the area of the floor opening between stories does not exceed twice the horizontal projected area of the escalator or stairway and the opening is protected by a draft curtain and closely spaced sprinklers in accordance with NFPA 13. In other than Groups B and M, this application is limited to openings that do not connect more than four stories.
 - 2.2. Where the opening is protected by approved power-operated automatic shutters at every penetrated floor. The shutters shall be of noncombustible construction and have a fire-resistance rating of not less than 1.5 hours. The shutter shall be so constructed as to close immediately upon the actuation of a smoke detector installed in accordance with Section 907.11 and shall completely shut off the well opening. Escalators shall cease operation when the shutter begins to close. The shutter shall operate at a speed of not more than 30 feet per minute (152.4 mm/s) and shall be equipped with a sensitive leading edge to arrest its progress where in contact with any obstacle, and to continue its progress on release therefrom.
3. A shaft enclosure is not required for penetrations by pipe, tube, conduit, wire, cable and vents protected in accordance with Section 712.4.
4. A shaft enclosure is not required for penetrations by ducts protected in accordance with Section 712.4. Grease ducts shall be protected in accordance with the *International Mechanical Code*.
5. In other than Group H occupancies, a shaft enclosure is not required for floor openings complying with the provisions for atriums in Section 404.
6. A shaft enclosure is not required for approved masonry chimneys where annular space protection is provided at each floor level in accordance with Section 717.2.5.
7. In other than Groups I-2 and I-3, a shaft enclosure is not required for a floor opening or an air transfer opening that complies with the following:
 - 7.1. Does not connect more than two stories.
 - 7.2. Is not part of the required means of egress system, except as permitted in Section 1020.1.

- 7.3. Is not concealed within the building construction.
- 7.4. Is not open to a corridor in Group I and R occupancies.
- 7.5. Is not open to a corridor on nonsprinklered floors in any occupancy.
- 7.6. Is separated from floor openings and air transfer openings serving other floors by construction conforming to required shaft enclosures.
- 7.7. Is limited to the same smoke compartment.
8. A shaft enclosure is not required for automobile ramps in open and enclosed parking garages constructed in accordance with Sections 406.3 and 406.4, respectively.
9. A shaft enclosure is not required for floor openings between a mezzanine and the floor below.
10. A shaft enclosure is not required for joints protected by a fire-resistant joint system in accordance with Section 713.
11. A shaft enclosure shall not be required for floor openings created by unenclosed stairs or ramps in accordance with Exception 8 or 9 in Section 1020.1.
12. Floor openings protected by floor fire doors in accordance with Section 711.8.
13. Where permitted by other sections of this code.
14. ~~A shaft enclosure is not required for floor openings for elevators within a single use open parking garage. Elevators in open parking garages that serve only the parking garage are not required to be enclosed.~~

Committee Reason: This proposal helps make the code more consistent by allowing the elevator to not be within a shaft enclosure. The code currently permits the elimination of the enclosure for stairs and ramps, but not for elevators. As originally proposed the requirement limited the application to single use[®] open parking garages. This was accepted because the hazards are low and have not been a problem for the other unprotected floor openings. The modification did eliminate the limitation to single use garages but still only applies the exception to an open garage portion of the building where the floor opening is not affected by other occupancies or connecting to openings at other floors. This modification uses language that is consistent with Section 1020.1 Exception 5.

None

Final Hearing Results

FS48-06/07

AM

Code Change No: FS52-06/07

Original Proposal

Section: 707.14.1

Proponent: Bill Ziegert, Smoke Guard, division of RectorSeal

707.14.1 Elevator lobby. An enclosed elevator lobby shall be provided at each floor where an elevator shaft enclosure connects more than three stories. The lobby shall separate the elevator shaft enclosure doors from each floor by fire partitions equal to the fire-resistance rating of the corridor and the required opening protection. Elevator lobbies shall have at least one means of egress complying with Chapter 10 and other provisions within this code.

Exceptions:

1. Enclosed elevator lobbies are not required at the street floor, provided the entire street floor is equipped with an automatic sprinkler system in accordance with Section 903.3.1.1.
2. Elevators not required to be located in a shaft in accordance with Section 707.2 are not required to have enclosed elevator lobbies.
3. Where additional doors are provided at the hoistway opening in accordance with Section 3002.6. Such doors shall be tested in accordance with UL 1784 without an artificial bottom seal.
4. In other than Group I-2 and I-3, and buildings having occupied floors located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access, enclosed elevator lobbies are not required where the building is protected by an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
5. Smoke partitions shall be permitted in lieu of fire partitions to separate the elevator lobby at each floor where the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
6. Enclosed elevator lobbies are not required where the elevator hoistway is pressurized in accordance with Section 707.14.2.

Reason: The purpose of the elevator lobby is to prevent smoke migration between floors. This change would clarify that elevator shaft smoke protection is required in I-2 occupancies.

Patients in hospitals and nursing homes are the least likely of building occupants to be able to provide self directed evacuation in a fire emergency. Currently the code requires the establishment of at least 2 smoke compartments on each floor which allows patients to be relocated to another area of the floor on the other side of the smoke barrier construction, however the elevator shaft penetrates the floor assemblies and the elevator hoistway doors allow excessive amounts of smoke to leak into the elevator shaft and then to other floors when the hoistway opening is not protected.

Many states and local jurisdictions already enforce a requirement such as this based upon either protection of entrances into corridors from smoke migration or alternately the requirement that the smoke compartments must seal all openings (vertical and horizontal) against the movement of smoke. Adding the proposed language to Exception 4 would insure uniform enforcement.

Cost Impact: The code change proposal will increase the cost of construction. There may be a cost increase in those jurisdictions not requiring this level of protection in I-2 occupancies now, however there is no cost increase for those jurisdictions already enforcing this requirement based upon other language in the IBC.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal helps provide better smoke control within this occupancy which tends to use a “defend in place” method of protection instead of evacuation. The I-2 non-ambulatory occupants need the same level of protection as I-3. Since the I-2 and I-3 have similar smoke compartment rules, the committee felt that the requirements should be consistent here also and help stop the spread of smoke between stories. Because elevator doors have a large air-leakage rate, the elevator openings should be protected by a lobby.

Assembly Action:

None

Final Hearing Results

FS52-06/07

AS

Code Change No: FS55-06/07

Original Proposal

Section: 707.14.2.1

Proponent: Bill Ziegert, Smoke Guard, division of RectorSeal

Revise as follows:

707.14.2.1 Pressurization requirements. Elevator hoistways shall be pressurized to maintain a minimum positive pressure of 0.04 inches of water column and a maximum positive pressure of 0.06 inches of water column with respect to adjacent occupied space on all floors. This pressure shall be measured at the midpoint of each hoistway door, with all ground floor level hoistway doors open and all other hoistway doors closed, and the opening and closing of hoistway doors at each level must be demonstrated during this test. The supply air intake shall be from an outside, uncontaminated source located a minimum distance of 20 feet (6096 mm) from any air exhaust system or outlet.

Reason: The purpose of this change is to ensure the proper operatin of the hoistway doors when the shaft pressurization system is activated and the Firefighters are using the elevators in Phase 2 service.

Elevator shaft pressurization systems are difficult to design due to the variable leakage rates through hoistway doors. As a result of this the system design at times results in excessive pressures at some floors in order to achieve the minimum pressure differentials at all floors. The result of this over pressurization can be binding of the hoistway’s doors during opening and closing operation resulting in sticking in a partially open position which places the emergency responders in the Elevator at risk.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal will assure that the elevator will operate when the fire department uses them during an emergency and help to assure the door closes if the door is accidentally opened at the fire floor. This is a relatively simple and cost effective item which will demonstrate performance of the doors during phase two elevator recall. The doors do need to be tested at each level because each door can have the force adjusted differently.

Assembly Action:

None

Final Hearing Results

FS55-06/07

AS

Code Change No: FS56-06/07

Original Proposal

Section: 707.14.2.1

Proponent: Janet Reed, City of Phoenix, AZ – Development Services Department

Revise as follows:

707.14.2.1 Pressurization requirements. Elevator hoistways shall be pressurized to maintain a minimum positive pressure of ~~0.04~~ 0.05 inches of water column and a maximum positive pressure of ~~0.06 inches of water column~~ as allowed by the elevator door manufacturer's specifications with respect to adjacent occupied space on all floors. This pressure shall be measured at the midpoint of each hoistway door, with all ~~ground floor level~~ elevator cars at the floor of recall and all hoistway doors on the floor of recall open and all other hoistway doors closed. The supply air intake shall be from an outside, uncontaminated source located a minimum distance of 20 feet (6096 mm) from any air exhaust system or outlet.

Reason: As written, this code would be extremely difficult to implement if not impossible.

The narrow pressure range prescribed, 0.04 to 0.06 inches H₂O, is approximately the range of stack effect that could be experienced per floor when inside temperature is 70 degrees Fahrenheit greater than outside. Under this condition it would require a system capable of providing a pressurized air supply injection and relief venting capability at each floor in the elevator shaft to maintain the 0.02 inches H₂O range of pressure called for. Furthermore, the minimum of 0.04 inches water column is less than the smoke barrier minimum of 0.05 inches water column called for elsewhere in this code and numerous other codes. The current code requires ground floor doors to be open under the apparent assumption that the ground floor is always the floor of recall. This is not always true, in fact in some express arrangements some elevators don't even go to the ground floor. It is therefore prescribed that the cars be at the floor of recall with those doors open.

A lower limit of 0.05 inches of water column would satisfy the minimum required for smoke barriers in Section 909.6.1. The upper limit would give enough range to allow a reasonable number of injection points and relief dampers to maintain the prescribed pressures. The maximum based on manufacturer's specifications would ensure that the system could be designed with the greatest flexibility while avoiding conditions that impair elevator operations. The rational analysis would then need to include the manufacturer's specifications.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

707.14.2.1 Pressurization requirements. Elevator hoistways shall be pressurized to maintain a minimum positive pressure of 0.04 ~~0.05~~ inches of water column and a maximum positive pressure of 0.06 inches of water column ~~as allowed by the elevator door manufacturer's specifications~~ with respect to adjacent occupied space on all floors. This pressure shall be measured at the midpoint of each hoistway door, with all elevator cars at the floor of recall and all hoistway doors on the floor of recall open and all other hoistway doors closed. The supply air intake shall be from an outside, uncontaminated source located a minimum distance of 20 feet (6096 mm) from any air exhaust system or outlet.

Committee Reason: This modified proposal provides clarity on the testing conditions and where the elevator car is supposed to be during the test. This will help to provide consistency in the way the systems are tested and reflect the general condition that the elevators will be in during their emergency recall. There was also concern that tying the forces to the maximum the manufacturers specify could result in the door design going directly up to the maximum amount without any margin for error. The proposal will also clarify that the level of recall is used instead of the Aground floor level[®] since the ground floor is not always the appropriate location for the elevator to return to. The modification keeps the first sentence as it currently is in the code while the changes which were proposed to the second sentence are made as submitted.

Assembly Action:

None

Final Hearing Results

FS156-06/07

AS

Code Change No: **FS59-06/07**

Original Proposal

Sections: 707.14.2.2.1 (New), 3004.2

Proponent: Gregory J. Cahanin, Cahanin Fire & Code Consulting, representing Smoke Safety Council

THIS PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY AND THE IBC GENERAL CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC FIRE SAFETY

Add new text as follows:

707.14.2.2 Ducts for system. Any duct system that is part of the pressurization system shall be protected with the same fire-resistance rating as required for the elevator shaft enclosure.

707.14.2.2.1 Ducts. Ducts shall open either directly to the outer air or through noncombustible ducts to the outer air. Noncombustible ducts shall be permitted to pass through the elevator machine room provided that portions of the ducts located outside the hoistway or machine room are enclosed by construction having not less than the fire resistance rating required for the hoistway.

PART II – IBC GENERAL

Revise as follows:

3004.2 Location of vents. Vents shall be located at the top the hoistway and shall open either directly to the outer air through noncombustible ducts to the outer air. Noncombustible ducts shall be permitted to pass through the elevator machine room, provided that portions of the ducts located outside the hoistway or machine room are enclosed by construction having not less than the fire ~~protection~~ resistance rating required for the hoistway. Holes in the machine room floors for the passage of ropes, cables or other moving elevator equipment shall be limited as not to provide greater than 2 inches (51 mm) of clearance on all sides.

Reason: This new section provides fire-resistance requirements equal to those now mandated for hoistway vents.

Section 3004.2 for location of Hoistway Vents contains specific requirements for ducting of vents. The new 707.14.2.2 section does not contain requirements equal to the compartmentation requirements established for the Hoistway itself when the hoistway penetrates more than three floors. New language is taken directly from 3004.2 and changed as appropriate for shaft pressurization ducts connecting to the hoistway shaft.

This change brings continuity to the isolation of shaft pressurization systems for elevator shafts that are established elsewhere in the IBC and clarifies the intent of the original proposal.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing Results

PART I C IBC FIRE SAFETY

Committee Action:

Disapproved

Committee Reason: This proposal is attempting to apply the requirements for hoistway venting from Chapter 30, which deals with smoke and heat within the hoistway for a very different situation. The ducts under this proposed new section are for pressurization and would not be anticipated to handle the heat and increased temperatures that the hoistway vent system of Chapter 30 is addressing. These ducts serve simply to pressurize the hoistway so that the smoke and heat do not get into it. Therefore, it would not be important for these ducts to be protected to the same level as the vents when they pass through the machine room.

Assembly Action:

None

PART II C IBC GENERAL

Committee Action:

Approved as Submitted

Committee Reason: Fire resistance rating® is more appropriate terminology than fire protection rating® when referring to enclosure of ducts as such protection it is not being used in the context of opening protection.

None

Final Hearing Results

FS59-06/07, Part I	D
FS59-06/07, Part II	AS

Code Change No: **FS60-06/07**

Original Proposal

Section: 707.14.2.3.3

Proponent: Edward A. Donoghue, Edward A. Donoghue Associates, Inc., representing National Elevator Industry, Inc.

Revise as follows:

707.14.2.3.3 Separate systems. A separate fan system shall be used for each ~~bank of elevators~~ hoistway.

Reason: The purpose of this code change is to correct an apparent mistake in the 2006 code. A "bank of elevators" is a group of elevators or a single elevator controlled by a common operating system; that is, all those elevators that respond to a single call button constitute a bank of elevators. There is no limit on the number of elevator cars that may be in a bank or group, but there may not be more than four elevator cars within a common hoistway (Section 3002.2). A hoistway is constructed as a shaft (Section 3002.1) and would be separated from all other hoistways. The code will require at least two separate hoistways where four or more elevator cars serve all or the same portion of a building. It would therefore appear to be better, and also the intent, that a separate fan system be provided for each separate hoistway (shaft enclosure) instead of allowing a single fan to serve multiple hoistways. The redundancy of protection provided by having a separate fan serve each separate hoistway enclosure will provide a higher margin of safety than allowing a single fan to serve an entire bank of elevators. As the text is currently written, most buildings would only have a single fan system. The revision would mean that in a building where four or more elevator cars were installed which served the same portion of a building, at least two fan systems would be installed so that each separate hoistway (shaft enclosure) would be independently protected.

Cost Impact: This code change proposal will increase the cost of construction by possibly requiring additional fans. This increase may be somewhat offset because the cost of a smaller fan should be less than a large fan.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal does clarify an apparent mistake in the 2006 edition of the code. This uses a term which is defined within the elevator standard and it uses it correctly.

Assembly Action:

None

Final Hearing Results

FS60-06/07

AS

Code Change No: **FS66-06/07**

Original Proposal

Sections: 419.2, 419.3, 708.1, 711.3**Proponent:** Philip Brazil, P.E, Reid Middleton, Inc., representing himself**1. Revise as follows:**

419.2 Separation walls. Walls separating dwelling units in the same building and walls separating sleeping units in the same building shall ~~comply~~ be constructed as fire partitions in accordance with Section 708.

419.3 Horizontal separation. Floor/~~ceiling~~ assemblies separating dwelling units in the same buildings and floor/~~ceiling~~ assemblies separating sleeping units in the same building shall be constructed as horizontal assemblies in accordance with Section 711.

2. Revise as follows:

708.1 General. The following wall assemblies shall comply with this section.

1. Walls separating dwelling units in the same building as required by Section 419.2.
2. Walls separating sleeping units in ~~occupancies in Group R-1 hotel, R-2 and I-1 occupancies~~ the same building as required by Section 419.2.
3. Walls separating tenant spaces in covered mall buildings as required by Section 402.7.2.
4. Corridor walls as required by Section 1017.1.
5. Elevator lobby separation as required by Section 707.14.1.
6. ~~Residential aircraft hangars.~~

711.3 Fire-resistance rating. The fire-resistance rating of floor and roof assemblies shall not be less than that required by the building type of construction. Where the floor assembly separates mixed occupancies, the assembly shall have a fire-resistance rating of not less than that required by Section 508.3.2 based on the occupancies being separated. Where the floor assembly separates a single occupancy into different fire areas, the assembly shall have a fire-resistance rating of not less than that required by Section 706.3.9. ~~Floor~~ Horizontal assemblies separating dwelling units in the same building ~~or and horizontal assemblies separating sleeping units in occupancies in Group R-1, hotel occupancies, R-2 and I-1 the same building~~ shall be a minimum of 1-hour fire-resistance-rated construction.

Exception: Dwelling unit and sleeping unit separations in buildings of Types IIB, IIIB, and VB construction shall have fire-resistance ratings of not less than 1/2 hour in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

Reason: The purpose of this proposal is eliminate overlapping charging language for fire containment assemblies consisting of fire partitions and horizontal assemblies between dwelling units in the same building and sleeping in the same building. The charging language in Section 708.1 for fire partitions and Section 711.3 for horizontal assemblies has existed in the IBC for several years. In the 2004/2005 code development cycle, however, a new Section 419.1 was approved adding charging language that overlaps and conflicts with the language in Sections 708.1 and 711.3.

In Section 419.2, "comply with" is changed to "be constructed as fire partitions in accordance with" in order to establish clear charging language.

In Section 419.3, "floor/ceiling assemblies" are changed to "floor assemblies" for consistency with the charging language for floor and roof assemblies in Section 711.1. Note that floor and roof assemblies, not floor/ceiling and roof/ceiling assemblies, required to have a fire-resistance rating are, in turn, required to comply with Section 711 on horizontal assemblies. Note also that "horizontal assembly" is defined in Section 702.1 as a fire-resistance-rated floor or roof assembly. The current language in Section 419.3 intends to require a fire-resistance rating between dwelling units and sleeping units but it fails to do so by merely referencing the technical provisions in Section 711.

In Item #6 of Section 708.1, the reference is deleted for consistency with Section 412.3.2 which was modified in the 2006 edition to require a fire barrier.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: It is appropriate to delete Section 708.1 item 6 as indicated. Section 412.3.2 was revised by G50-03/04 (AM) to require a fire barrier for that separation.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal coordinates the requirements with the appropriate sections of the code which regulate the separation and is consistent with the other items in this section. This will help clarify the requirements and make the code easier to use. The deletion of item 6 provides consistency with other sections of the code which were modified in the last code change cycle to require a fire barrier instead of a fire partition.

Assembly Action:

None

Final Hearing Results

FS66-06/07

AS

Code Change No: FS68-06/07

Original Proposal

Section: 708.3

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

Revise as follows:

708.3 Fire-resistance rating. Fire partitions shall have a fire-resistance rating of not less than 1 hour.

Exceptions:

1. Corridor walls ~~as permitted~~ to have a 0.5 hour fire-resistance rating by Table 1017.1.
2. Dwelling and sleeping unit separations in buildings of Type IIB, IIIB and VB construction shall have fire-resistance ratings of not less than $\frac{1}{2}$ hour in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

Reason: The purpose of this proposal is to clarify that Table 1017.1 reduces the fire-resistance rating by one-half hour, it does not eliminate the rating requirement for corridors in Group R occupancies.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The reference to Table 1017.1 is more appropriate since that table does permit non-rated corridor walls for many occupancies when the occupant load is less than 10 or if other means of protection are provided. If the ratings exceptions are added, it raises the question of whether it is appropriate to only list the 2 hour exception or if the section should also address the non-rated corridors even though a non-rated corridor wall is not a fire partition. The committee felt that reference to Table 1017.1 in the existing exception is the correct and appropriate manner to address all possible scenarios.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Gregory R. Keith, Professional heuristic Development, representing the Boeing Company, requests Approval as Submitted.

Commenter's Reason: The purpose of this proposal is to clarify that Table 1017.1 reduces the fire-resistance rating by one-half hour; it does not eliminate the rating requirement for corridors in Group R occupancies. During committee discussion in Orlando, and as indicated in the published reason for committee disapproval, there was a comment that this proposal may be inappropriate because it does not address non-rated corridors even though a non-rated corridor wall is not a fire partition. The committee felt that it was preferable to retain the current language as it addressed all possible scenarios. This was based on one committee member's comment that Table 1017.1 contained "0" rating requirements, which are also less than 1-hour. We contend that the current vague general provision creates more confusion than it corrects. As was indicated in the published reason, a non-rated corridor permitted by Table 1017.1 does not require a fire partition and as such, there is no reason to go to Section 708.3. In context, Exception 1 to Section 708.3 only applies to the reduction from the normally required one-hour fire partition rating to a one-half hour rating when specified by Table 1017.1. Approval of this proposal as submitted will clarify fire partition rating requirements and lend to uniformity in the interpretation and application of very important corridor wall rating requirements.

FS68-06/07

AS

Code Change No: FS69-06/07

Original Proposal

Sections: 708.4, 711.4

Proponent: Philip Brazil, P.E, Reid Middleton, Inc., representing himself

Revise as follows:

708.4 Continuity. Fire partitions shall extend from the top of the foundation or floor/ceiling assembly below to the underside of the floor or roof sheathing, slab or deck above or to the fire-resistance-rated floor/ceiling or roof/ceiling assembly above, and shall be securely attached thereto. If the partitions are not continuous to the sheathing, deck or slab, and where constructed of combustible construction, the space between the ceiling and the sheathing, deck or slab above shall be fireblocked or draftstopped in accordance with Sections 717.2 and 717.3 at the partition line. The supporting construction shall be protected to afford the required fire-resistance rating of the wall supported, except for walls separating tenant spaces in covered mall buildings, and walls separating sleeping units ~~separation walls~~ and corridor walls, in buildings of Types IIB, IIIB, and VB construction.

Exceptions:

1. The wall need not be extended into the crawl space below where the floor above the crawl space has a minimum 1-hour fire-resistance rating.
2. Where the room-side fire-resistance-rated membrane of the corridor is carried through to the underside of the floor or roof sheathing, deck or slab of a fire-resistance-rated floor or roof above, the ceiling of the corridor shall be permitted to be protected by the use of ceiling materials as required for a 1-hour fire-resistance-rated floor or roof system.
3. Where the corridor ceiling is constructed as required for the corridor walls, the walls shall be permitted to terminate at the upper membrane of such ceiling assembly.
4. The fire partition separating tenant spaces in a covered mall building, complying with Section 402.7.2, are not required to extend beyond the underside of a ceiling that is not part of a fire-resistance-rated assembly. A wall is not required in attic or ceiling spaces above tenant separation walls.
5. Fireblocking or draftstopping is not required at the partition line in Group R-2 buildings that do not exceed four stories in height, provided the attic space is subdivided by draftstopping into areas not exceeding 3,000 square feet (279 m²) or above every two dwelling units, whichever is smaller.
6. Fireblocking or draftstopping is not required at the partition line in buildings equipped with an automatic sprinkler system installed throughout in accordance with Section 903.3.1.1 or 903.3.1.2, provided that automatic sprinklers are installed in combustible floor/ceiling and roof/ceiling spaces.

711.4 Continuity. Assemblies shall be continuous without openings, penetrations or joints except as permitted by this section and Sections 707.2, 712.4, 713 and 1020.1. Skylights and other penetrations through a fire-resistance-rated roof deck or slab are permitted to be unprotected, provided that the structural integrity of the fire-resistance-rated roof construction is maintained. Unprotected skylights shall not be permitted in roof construction required to be fire-resistance rated in accordance with Section 704.10. The supporting construction shall be protected to afford the required fire-resistance rating of the horizontal assembly supported.

Exception: In buildings of Type IIB, IIIB or VB construction, the construction supporting the horizontal assembly is not required to be fire-resistance-rated at the following:

1. Horizontal assemblies at the separations of incidental uses as specified by Table 508.2, provided the required fire-resistance rating does not exceed 1-hour.
2. Horizontal assemblies at the separations of sleeping units as required by Section 419.3.
3. Horizontal assemblies at smoke barriers constructed in accordance with Section 709.

714.1 Requirements. The fire-resistance rating of structural members and assemblies shall comply with the requirements for the type of construction and shall not be less than the rating required for the fire-resistance-rated assemblies supported.

Exception: Fire barriers, fire partitions, ~~and~~ smoke barriers and horizontal assemblies as provided in Sections 706.5, 708.4, ~~and~~ 709.4 and 711.4, respectively.

Reason: The purpose of the proposal is to eliminate apparent conflicts in the provisions for the fire resistance of construction supporting fire containment assemblies in buildings of Types IIB, IIIB and VB construction. The continuity provisions for fire barriers, shaft enclosures (by reference to the provisions for fire barriers) and fire partitions and smoke barriers typically require the supporting construction to be protected with fire-resistance-rated construction at least equal to that of the fire containment assembly being supported. The continuity provisions for all but horizontal assemblies, however, exempt supporting construction from the requirement to be fire-resistance-rated in buildings of Types IIB, IIIB and VB construction in certain circumstances.

A horizontal assembly is defined in Section 702.1 as being fire-resistance-rated. Horizontal assemblies are required by numerous provisions in the IBC and IFC. Many of these provisions specify a separation consisting of fire barriers or horizontal assemblies, or both. In this regard, the horizontal assembly is considered equivalent to the fire barrier.

Sections 419.2 and 419.3 on walls and floor/ceiling assemblies separating dwelling units and sleeping units intend to require them to be fire-resistance-rated in accordance with Section 708 for fire partitions and Section 711 for horizontal assemblies, respectively. In this regard, the horizontal assembly is considered equivalent to the fire partition. A separate proposal addresses the intended changing language in Sections 419.2 and 419.3.

The continuity provisions for fire barriers and fire partitions and smoke barriers currently exempt supporting construction from the requirement to be fire-resistance-rated in the following circumstances:

1. Fire barriers: 1-hour fire-resistance-rated incidental use area separations as required by Table 508.2.
2. Fire partitions: tenant and sleeping unit separation walls and corridor walls.
3. Smoke barriers: all cases.

This proposal exempts the supporting construction of horizontal assemblies in the same manner as the code currently exempts the supporting construction of fire barriers and fire partitions and smoke barriers but only in those circumstances where the horizontal assembly is a component of the same fire containment assembly as the fire barrier or fire partition or smoke barrier. It is not reasonable to exempt construction supporting a fire containment assembly for some components of the assembly but not for other components. If the exemptions for buildings of Types IIB, IIIB and VB construction are valid, they should be applied to the entire fire containment assembly, not just a portion of it.

Item #2 of the proposed exception to Section 711.4 is limited to sleeping units, which appears to exclude dwelling units, tenant spaces in covered mall buildings and corridors. Dwelling units are not included because the current exemption from the requirement for fire-resistance-rated construction at the supporting construction of fire partitions also excludes dwelling units (see Section 708.4). Tenant spaces in covered mall buildings and corridors are not included because the fire partitions required in these cases are limited to walls. Horizontal assemblies in combination with fire partitions are currently not required for them as is the case for separations between dwelling units and sleeping units (see Sections 419.2 and 419.3).

In Exception #4 to Section 708.4, "mall" is changed to "covered mall building" for consistency with the provisions of Section 402.7.2 on the separation of tenant spaces in covered mall buildings. Note that Sections 402.7 and 402.7.2 state that a tenant separation wall is not required between tenant spaces and the mall.

The other revisions in Section 708.4 are for consistency with the assemblies listed in Section 708.1 as requiring compliance with Section 708. The changes in Section 714.1 are for coordination with the changes in Section 711.4

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

708.4 Continuity. Fire partitions shall extend from the top of the foundation or floor/ceiling assembly below to the underside of the floor or roof sheathing, slab or deck above or to the fire-resistance-rated floor/ceiling or roof/ceiling assembly above, and shall be securely attached thereto. If the partitions are not continuous to the sheathing, deck or slab, and where constructed of combustible construction, the space between the ceiling

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

and the sheathing, deck or slab above shall be fireblocked or draftstopped in accordance with Sections 717.2 and 717.3 at the partition line. The supporting construction shall be protected to afford the required fire-resistance rating of the wall supported, except for walls separating tenant spaces in covered mall buildings, walls separating dwelling units, sleeping units and corridor walls, in buildings of Types IIB, IIIB, and VB construction.

711.4 Continuity. Assemblies shall be continuous without openings, penetrations or joints except as permitted by this section and Sections 707.2, 712.4, 713 and 1020.1. Skylights and other penetrations through a fire-resistance-rated roof deck or slab are permitted to be unprotected, provided that the structural integrity of the fire-resistance-rated roof construction is maintained. Unprotected skylights shall not be permitted in roof construction required to be fire-resistance rated in accordance with Section 704.10. The supporting construction shall be protected to afford the required fire-resistance rating of the horizontal assembly supported.

Exception: In buildings of Type IIB, IIIB or VB construction, the construction supporting the horizontal assembly is not required to be fire-resistance-rated at the following:

1. Horizontal assemblies at the separations of incidental uses as specified by Table 508.2, provided the required fire-resistance rating does not exceed 1-hour.
2. Horizontal assemblies at the separations of dwelling units and sleeping units as required by Section 419.3.
3. Horizontal assemblies at smoke barriers constructed in accordance with Section 709.

Committee Reason: This provides consistency with the existing wall exceptions. The concern was that if vertical elements (walls) do not need the continuity, then why do the floors? The modifications made by the committee inserted dwelling units into both Section 708.4 and the exception in Section 711.4. These modifications were needed so that both sleeping units and dwelling units are regulated in the same manner.

Assembly Action:

None

Final Hearing Results

FS69-06/07

AM

Code Change No: FS75-06/07

Original Proposal

Sections: 711.1, 712.4

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

Revise as follows:

711.1 General. Floor and roof assemblies required to have a fire-resistance rating shall comply with this section.

Exception: Nonfire-resistance-rated horizontal assemblies shall comply with Section 712.4.2.

712.4 Horizontal assemblies. Penetrations of a floor, floor/ceiling assembly or the ceiling membrane of a roof/ceiling assembly shall be protected in accordance with Section 707 or this section.

Reason: This proposal is intended to clarify very important penetration requirements associated with the construction of horizontal assemblies. Fundamental charging language currently contained in Section 712.4 would indicate that penetrations in horizontal assemblies would only be protected in accordance with Section 707 with shaft enclosures. Obviously, penetrations could also be protected in accordance with Sections 712.4.1 and 712.4.2. Accordingly, the section is proposed to be amended to reflect both acceptable solutions.

Additionally, Section 712.4.2 provides penetration protection requirements for nonfire-resistance-rated horizontal assemblies. These provisions tend to go unnoticed as many persons do not necessarily associate protection requirements with nonrated assemblies. Section 711.5 lends to this confusion in stating, "Penetrations through fire-resistance-rated horizontal assemblies shall comply with Section 712." The inference being, perhaps, that penetrations through nonfire-resistance-rated horizontal assemblies need not comply with Section 712. To assist users in the proper determination of penetration protection requirements in nonrated assemblies, a cross reference has been added to Section 711.1. The exception was not made to Section 711.5 as the general charging language in Section 711.1 would indicate that the provisions of the section would only apply to rated horizontal assemblies.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

711.1 General. Floor and roof assemblies required to have a fire-resistance rating shall comply with this section. **Exception:** Nonfire-resistance-rated ~~horizontal~~ floor and roof assemblies shall comply with Section 712.4.2.

712.4 Horizontal assemblies. Penetrations of a floor, floor/ceiling assembly or the ceiling membrane of a roof/ceiling assembly shall be protected in accordance with Section 707 or this section.

Committee Reason: This will help to flag the requirements which are applicable to non-rated assemblies in Section 712.4.2 so that they are not missed. Because Sections 711 and 712.4 are generally dealing with rated assemblies, the requirements which of 712.4.2 are often ignored or overlooked. Whether these items should be applied to penetrations of the roof is questionable. The modification eliminated the exception and made it the second sentence in Section 711.1. It also revised the text of the proposed exception to reference "floor and roof" assemblies.

Assembly Action:**None**

Final Hearing Results

FS75-06/07

AM

Code Change No: FS77-06/07

Original Proposal

Sections: 712.3, 712.4

Proponent: Sarah A. Rice, CBO, Schirmer Engineering Corp., representing American Hotel & Lodging Association (AH&LA)

Revise as follows:

712.3 Fire-resistance-rated walls. Penetrations into or through fire walls, fire-barriers ~~walls~~, smoke-barrier walls and fire partitions shall comply with Sections 712.3.1 through 712.3.4. Penetrations in smoke barrier walls shall also comply with 712.5.

712.4.1 Fire-resistance rated assemblies. Penetrations of the fire-resistance rated floor, floor/ceiling assembly or the ceiling membrane of a roof/ceiling assembly shall comply with Sections 712.4.1.1 through 714.4.1.5. Penetrations in horizontal smoke barriers shall also comply with 712.5.

Reason: A new section has been added to Section 712 to specifically address penetrations in smoke barriers, Section 712.5. The proposed language makes it clear that penetrations in smoke barriers, whether horizontal or vertical, are to comply with only Section 712.5.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Approved as Submitted**

Committee Reason: The additional text helps to clarify the requirements and will provide a direct reference to address the smoke barrier penetrations in both walls and horizontal assemblies.

Assembly Action:**None**

Final Hearing Results

FS77-06/07

AS

Code Change No: **FS82-06/07**

Original Proposal

Section: 712.3.2

Proponent: Tony Crimi, A.C. Consulting Services Inc., representing International Firestop Council

Revise as follows:

712.3.2 Membrane penetrations. Membrane penetrations shall comply with Section 712.3.1. Where walls or partitions are required to have a fire-resistance rating, recessed fixtures shall be installed such that the required fire resistance will not be reduced.

Exceptions:

1. Membrane penetrations of maximum two-hour fire-resistance-rated walls and partitions by steel electrical boxes that do not exceed 16 square inches (0.0103 m²) in area, provided the aggregate area of the openings through the membrane does not exceed 100 square inches (0.0645 m²) in any 100 square feet (9.29m²) of wall area. The annular space between the wall membrane and the box shall not exceed 1/8 inch (3.1 mm). Such boxes on opposite sides of the wall or partition shall be separated by one of the following:
 - 1.1. By a horizontal distance of not less than 24 inches (610 mm);
 - 1.2. By a horizontal distance of not less than the depth of the wall cavity where the wall cavity is filled with cellulose loose-fill, rockwool or slag mineral wool insulation;
 - 1.3. By solid fireblocking in accordance with Section 717.2.1;
 - 1.4. By protecting both outlet boxes with listed putty pads; or
 - 1.5. By other listed materials and methods.
2. Membrane penetrations by listed electrical boxes of any material, provided such boxes have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing. The annular space between the wall membrane and the box shall not exceed 1/8 inch (3.1 mm) unless listed otherwise. Such boxes on opposite sides of the wall or partition shall be separated as follows:
 - 2.1. By a horizontal distance of not less than 24 inches (610 mm);
 - 2.2. By solid fireblocking in accordance with Section 717.2.1;
 - 2.3. By protecting both boxes with listed putty pads; or
 - 2.4. By other listed materials and methods.
3. Membrane penetrations by electrical boxes of any size or type, which have been listed as part of a wall opening protective material system for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing.
- ~~3- 4.~~ The annular space created by the penetration of a fire sprinkler, provided it is covered by a metal escutcheon plate.

Reason: To add a new exception to the Code related to membrane penetrations of fire resistance rated assemblies in Section 712.3.2 for membrane penetrations.

The addition of this new exception will permit additional tested and listed systems to be used to protect membrane penetrations in fire resistance rated assemblies.

Section 712.3.2 of the IBC already permits several exceptions to the basic requirement for recessed fixtures to be installed such that the required fire resistance rating will not be reduced by the membrane penetrations. In the same way, Certification and Listing Agencies have published Listings covering proprietary compositions that are used to maintain the hourly ratings of fire resistive walls and partitions incorporating flush mounted devices such as outlet boxes, electrical cabinets, and mechanical cabinets penetrating membranes of fire resistance rated assemblies. The individual systems indicate the specific applications and the method of installation for which the materials have been evaluated. The basic standards used to investigate these products is ANSI/UL 263 and ASTM E119.

For example, UL Classifies these materials and systems as "Wall Opening Protective Materials". This category includes Classifications for both generic steel electrical boxes as well as specific types and models of outlet and switch boxes composed of other materials, all listed for specific usage in fire resistive rated wall assemblies. The UL Listings for wall opening protective materials indicates that, depending upon the testing conducted for the individual Listing, their use can allow for any combination of; (1) reducing the spacing between boxes contained on opposite sides of the wall, (2) increasing the size of the boxes, (3) increasing the density of boxes, and/or (4) allowing the use of boxes on each side of staggered stud walls. Because these systems are tested for the specific end-use applications, the individual and aggregate restrictions on maximum sizes and quantities (i.e. 16 sq in for an individual box, and the aggregate maximum of 100 sq in. per 100 sq ft.) are not required for these systems to maintain the fire resistance ratings of the assemblies penetrated.

The information provided for each Classification includes the model numbers for the Classified products, a description of the rated assemblies, the spacing limitations for the boxes and the installation details.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This addresses a new UL listing category. These are listed products and are applicable for this use. This new text is needed in the code to permit these new listed systems to be accepted. This code change was preferred over FS81-06/07 because it addresses the size of the boxes, addresses both issues and provides additional flexibility in designs.

Assembly Action:

None

Final Hearing Results

FS82-06/07

AS

Code Change No: FS85-06/07

Original Proposal

Sections: 702.1, 712.3.3 (New)

Proponent: Tony Crimi, A.C., Consulting Solutions Inc., representing International Firestop Council

1. Add new text as follows:

702.1 Definitions. The following words and terms shall, for the purposes of this chapter, and as used elsewhere in this code, have the meanings shown herein.

UTILITY BOXES. An enclosure constructed for indoor use to provide a degree of mechanical Protection to equipment or materials.

2. Add new text as follows:

712.3.3 Utility Boxes. Through penetrations shall comply with Section 712.3.1. Where walls or partitions are required to have a fire-resistance rating, membrane penetrations by utility boxes shall be protected by an approved membrane penetration firestop system installed as tested in accordance with ASTM E 814 or UL 1479, with a minimum positive pressure differential of 0.01 inch (2.49 Pa) of water, and shall have an F and T rating of not less than the required fire-resistance rating of the wall penetrated and be installed in accordance with the instructions included in the listing.

(Renumber subsequent sections)

Reason: To add a new allowance which expands upon the ability to install utility boxes such as electrical panels, dryer exhaust boxes, washing machine hose connection boxes and manual fire alarm pull boxes in fire resistance rated assemblies when properly protected.

There are many types of utility boxes installed in fire resistance rated walls, where the membrane penetrations need to be protected. The addition of this new requirement will both permit these general utility boxes to be used and provide some assurance that any box or cabinet penetrations will not compromise the fire resistance rating of the wall.

The IBC currently permits both metallic and nonmetallic electrical boxes to be installed, under specified conditions, in fire resistance rated assemblies. Section 712.3.2 also permits membrane penetrations by listed electrical boxes of any material, provided such boxes have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing. These membrane penetrations in fire resistance rated walls are permitted when evaluated for such installations and provided with the appropriate testing in accordance with Section 712. However, there still exists a need to introduce requirements to cover a variety of other types of general utility boxes such as fire or police alarm boxes, manual fire alarm boxes, switch boxes, valve boxes, special purpose boxes, electrical panels, washer and dryer boxes, and hose cabinets.

This code change proposal would create a direct parallel between the requirements for electrical outlet boxes and these utility boxes. The protection systems are to be tested for use in fire-resistance-rated assemblies and installed in accordance with the instructions included in the listings. However, because these utility boxes can exceed 100 square inches aggregate area, both an F and T rating should be required in order to be directly equivalent to the fire resistance rating of the assemblies penetrated. Given that these are membrane penetrations, there is a greater likelihood that someone could unknowingly place or store combustible materials, potentially even furniture and bedding, directly in contact with the un-penetrated membrane on the opposite side of the wall. This could significantly increase threat of fire spread.

The information provided for each Classification would include the model numbers for the products, a description of the rated assemblies, the spacing limitations for the boxes and the installation details.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The term Amechanical® protection which is used within the definition is not a defined or clear term. Therefore the committee was uncertain as to what this statement was intended to provide. This proposal would require a AT® rating for the wall which typically would only require an AF® rating or allow the use of a number of exceptions. There is also uncertainty regarding whether an electrical outlet box or a fire alarm box may also be considered as a Autility box.® If the definition would require an F and T rating for the outlet boxes that would be contrary to years of testing and also the provisions found Section 712.3.3 Exceptions 1 and 2. It may also seem inconsistent to permit an outlet box to use the typical methods of protection and yet require the F and T ratings for these utility boxes. The provision does not distinguish between the sizes of the box when establishing the requirements.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Tony Crimi, A.C. Consulting Solutions Inc. representing International Firestop Council, requests Approval as Modified by this public comment.

Replace proposal with the following:

712.3.2 Membrane penetrations. Membrane penetrations shall comply with Section 712.3.1. Where walls or partitions are required to have a fire-resistance rating, recessed fixtures shall be installed such that the required fire resistance will not be reduced.

Exceptions:

1. Membrane penetrations of maximum two-hour fire-resistance-rated walls and partitions by steel electrical boxes that do not exceed 16 square inches (0.0103 m²) in area provided the aggregate area of the openings through the membrane does not exceed 100 square inches (0.0645 m²) for any 100 square feet (9.29 m²) of wall area. The annular space between the wall membrane and the box shall not exceed 1/8 in. (3.1 mm). Such boxes on opposite sides of the wall or partition shall be separated by one of the following:
 - 1.1. By a horizontal distance of not less than 24 inches (610 mm)
 - 1.2. By a horizontal distance of not less than the depth of the wall cavity where the wall cavity is filled with cellulose loose fill, rockwool or slag mineral wool insulation;
 - 1.3. By solid fireblocking in accordance with Section 717.2.1;
 - 1.4. By protecting both boxes with listed putty pads; or
 - 1.5. By other listed materials and methods.
2. Membrane penetrations by listed electrical boxes of any material provided such boxes have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing. The annular space between the wall membrane and the box shall not exceed 1/8 in. (3.1 mm) unless listed otherwise. Such boxes on opposite sides of the wall or partition shall be separated as follows:
 - 2.1. By a horizontal distance of not less than 24 inches (610 mm);
 - 2.2. By solid fireblocking in accordance with Section 717.2.1;
 - 2.3. By protecting both boxes with listed putty pads; or
 - 2.4. By other listed materials and methods.
3. Membrane penetrations by boxes other than electrical boxes provided such penetrating items and the annular space between the wall membrane and the box, are protected by an approved membrane penetration firestop system installed as tested in accordance with ASTM E 814 or UL 1479, with a minimum positive pressure differential of 0.01 inch (2.49 Pa) of water, and shall have an F and T rating of not less than the required fire-resistance rating of the wall penetrated and be installed in accordance with the instructions included in the listing.

3 4. The annular space created by the penetration of an automatic sprinkler provided it is covered by a metal escutcheon plate.

Commenter's Reason: There are many other types of utility boxes and enclosures installed in fire resistance rated walls, where the membrane penetrations need to be protected. The addition of this new requirement will both permit these general utility boxes to be used and provide some assurance that any box or cabinet penetrations will not compromise the fire resistance rating of the wall. The original proposal submitted has been modified here to reflect the Committee's comments about the language introducing the defined term "Utility Box". Consequently, that definition has been eliminated from the proposal.

There still exists a need to introduce requirements to cover a variety of other types of general utility boxes such as dryer exhaust boxes, washing machine hose connection boxes, fire or police alarm boxes, manual fire alarm boxes, switch boxes, valve boxes, special purpose boxes, electrical panels and hose cabinets. This Code change proposals would treat these other box enclosures in a similar manner to what is already required in the charging statement in section 712.3.2. The protection systems are to be tested to demonstrate compare performance to fire-resistance-rated assemblies and installed in accordance with the instructions included in the listings.

The IBC currently permits both metallic and nonmetallic electrical boxes to be installed, under specified conditions, in fire resistance rated assemblies. Section 712.3.2 permits membrane penetrations by listed electrical boxes of any material, provided such boxes have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing. The charging statement in 712.3.2 states that "...recessed fixtures shall be installed such that the required fire resistance will not be reduced." Consequently, these provisions already require the F and T ratings to be applied. Exceptions 712.3.2 (1) through (3) impose additional restrictions on the size, type and use of electrical boxes specifically. However, for other types of boxes that may be installed, there is no such exception to the existing F and T (i.e. fire resistance) rating. Further, because these utility boxes can easily exceed the 100 square inches aggregate area limit that exists for electrical boxes, both an F and T rating should continue to be required in order to maintain the performance level directly equivalent to the fire resistance rating of the assemblies penetrated. Given that these are membrane penetrations, there is a greater likelihood that someone could unknowingly place or store combustible materials, potentially even furniture and bedding, directly in contact with the un-penetrated membrane on the opposite side of the wall. This could significantly increase threat of fire spread.

Final Hearing Results

FS85-06/07
AMPC1

Code Change No: FS86-06/07

Original Proposal

Section: 712.4

Proponent: Sarah A. Rice, C.B.O., Schirmer Engineering Corp., representing American Hotel & Lodging Association (AH&LA)

Revise as follows:

712.4 Horizontal assemblies. Penetrations of a floor, floor/ceiling assembly or the ceiling membrane of a roof/ceiling assembly not required to be enclosed in a shaft by Section 707.2 shall be protected in accordance with Sections 712.4.1 through 712.4.4 ~~707~~.

Reason: The proposed language is intended to add clarity to the provisions. The penetration protection methods in Sections 712.4 are permitted only to the extent indicated in Section 707.2.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:
Approved as Submitted

Committee Reason: This proposal will provide pointers to the applicable sections. This will provide clarity and make the code easier to use by referring to the exceptions in Section 707.2.

Assembly Action:
None

Final Hearing Results

FS86-06/07
AS

Code Change No: **FS89-06/07**

Original Proposal

Section: 712.4.1.2

Proponent: Tony Crimi, A.C., Consulting Solutions Inc., representing International Firestop Council

Revise as follows:

712.4.1.2 Membrane penetrations. Penetrations of membranes that are part of a fire-resistance-rated horizontal assembly shall comply with Section 712.4.1.1.1 or 712.4.1.1.2. Where floor/ceiling assemblies are required to have a ~~minimum 1-hour~~ fire-resistance rating, recessed fixtures shall be installed such that the required fire resistance will not be reduced.

Exceptions:

1. Membrane penetrations of maximum 2-hour fire-resistance-rated walls and partitions by steel, ferrous or copper conduits, pipes, tubes or vents, or concrete or masonry items where the annular space is protected either in accordance with Section 712.4.1.1 or to prevent the free passage of flame and the products of combustion. The aggregate area of the openings through the membrane shall not exceed 100 square inches (64 500 mm²) in any 100 square feet (9.3m²) of ceiling area in assemblies tested without penetrations.
2. Ceiling membrane penetrations of maximum 2-hour fire-resistance-rated horizontal assemblies by steel electrical boxes that do not exceed 16 square inches (10 323 mm²) in area, provided the aggregate area of such penetrations does not exceed 100 square inches (44 500 mm²) in any 100 square feet (9.29m²) of ceiling area, and the annular space between the ceiling membrane and the box does not exceed 1/8 inch (3.12 mm).
3. Membrane penetrations by listed electrical boxes of any material, provided such boxes have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing. The annular space between the ceiling membrane and the box shall not exceed 1/8 inch (3.1 mm) unless listed otherwise.
4. The annular space created by the penetration of a fire sprinkler, provided it is covered by a metal eschutcheon plate.

Reason: To delete the threshold value of 1 h in Section 714.1.2 for membrane penetrations in horizontal assemblies to make it consistent with 712.3.2 for membrane penetrations in fire resistance rated walls.

In the 2006 IBC cycle, 1/2 h fire-resistance ratings were introduced into additional occupancies. Membrane penetrations in these assemblies will still need to be protected in accordance with 712.4.1.2 in order to achieve the 1/2 h rating. When these 1/2 h ratings were introduced, the Code neglected to update this provision. This issue was corrected in 712.3.2 in the 2006 IBC, but also needs to be corrected in 712.4.1.2.

During a past cycle, Section 712.3.2 the IBC was revised to eliminate the 1 hour threshold value for recessed light fixtures installed as membrane penetrations in fire resistance rated walls. This was in recognition of the fact that 1/2 h ratings were introduced in a previous edition in combination with sprinkler trade offs in dwelling unit and sleeping unit separations in buildings of Type IIB, IIIB, and VB construction. The previous language in Section 712.3.2 and 712.4.1.2 for membrane penetrations was based on an assumption that, other than in R occupancies, the minimum fire-resistance ratings in the IBC were 1-h. Consequently, in those cases where the Committee felt a reduction to 1/2-h was warranted, and specifically did not reduce the ratings to 0-h as in some applications, protection of penetrations is still required in order to maintain the 1/2-h fire resistance rating. This is even more problematic and dangerous for a structural assembly like the floor. The risk is particularly severe for firefighters responding to residential occupancies, where they are likely to spend an extended amount of time to ensure that all occupants have evacuated safely. As currently written, the IBC inadvertently introduces the potential for an unlimited number of unprotected membrane penetrations through a required fire-resistance rated horizontal assembly, without any limitations as to their size or location.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal can help provide consistency with other code sections and coordinate with the fact that wall requirements allow for ratings less than 1-hour. This also recognizes that assemblies of any rating should maintain the protection at penetrations.

Assembly Action:

None

Final Hearing Results

FS89-06/07

AS

Code Change No: FS90-06/07

Original Proposal

Section: 712.4.1.2**Proponent:** Tony Crimi, A.C., Consulting Solutions Inc., representing International Firestop Council**Revise as follows:**

712.4.1.2 Membrane penetrations. Penetrations of membranes that are part of a fire-resistance-rated horizontal assembly shall comply with Section 712.4.1.1.1 or 712.4.1.1.2. Where floor/ceiling assemblies are required to have a minimum 1-hour fire-resistance rating, recessed fixtures shall be installed such that the required fire resistance will not be reduced.

Exceptions:

1. Membrane penetrations of maximum 2-hour fire-resistance-rated walls and partitions by steel, ferrous or copper conduits, pipes, tubes or vents, or concrete or masonry items where the annular space is protected either in accordance with Section 712.4.1.1 or to prevent the free passage of flame and the products of combustion. The aggregate area of the openings through the membrane shall not exceed 100 square inches (64 500 mm²) in any 100 square feet (9.3m²) of ceiling area in assemblies tested without penetrations.
2. Ceiling membrane penetrations of maximum 2-hour fire-resistance-rated horizontal assemblies by steel electrical boxes that do not exceed 16 square inches (10 323 mm²) in area, provided the aggregate area of such penetrations does not exceed 100 square inches (44 500 mm²) in any 100 square feet (9.29m²) of ceiling area, and the annular space between the ceiling membrane and the box does not exceed 1/8 inch (3.12 mm).
3. Membrane penetrations by electrical boxes of any size or type, which have been listed as part of a wall opening protective material system for use in horizontal fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing.
- ~~3.~~ 4. Membrane penetrations by listed electrical boxes of any material, provided such boxes have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing. The annular space between the ceiling membrane and the box shall not exceed 1/8 inch (3.1 mm) unless listed otherwise.
- 4- 5. The annular space created by the penetration of a fire sprinkler, provided it is covered by a metal eschutcheon plate.

Reason: To add a new exception to the Code related to membrane penetrations of fire resistance rated assemblies in Section 712.4.1.2 for membrane penetrations.

The addition of this new exception will permit additional tested and listed systems to be used for membrane penetrations in fire resistance rated assemblies. Many of these systems already exist, and are being used in the marketplace. The IBC should recognize current common practice of a proven, regulated technology.

Section 712.4.1.2 of the IBC already permits several exceptions to the basic requirement for membrane penetrations to be installed so that the required fire resistance rating will not be reduced by the membrane penetrations. In the same way, Certification and Listing Agencies have published Listings covering proprietary compositions that are used to maintain the hourly ratings of fire resistive walls and partitions incorporating flush mounted devices such as outlet boxes, electrical cabinets, and mechanical cabinets penetrating membranes of fire resistance rated assemblies. The individual systems indicate the specific applications and the method of installation for which the materials have been evaluated. The basic standards used to investigate these products is ANSI/UL 263 and ASTM E 119.

For example, UL classifies nonmetallic outlet boxes for installation in floors, walls and partitions, and/or ceilings in accordance with the provisions of NFPA 70, "National Electrical Code" (NEC). These systems are required to provide a degree of fire resistance when installed in the particular floors, walls and/or ceiling assemblies. The systems Listed for this application include nonmetallic outlet and switch boxes for use in fire resistance rated wall assemblies. Listing information includes the model numbers for the products, a description of the rated assemblies in which they can be used, the spacing limitations for the boxes and the installation details.

Product Listings specify the conditions under which Listed metallic outlet and switch boxes may be installed within fire resistance rated wall assemblies constructed with bearing and nonbearing wood or steel studs and gypsum board facings. Listings also exist for nonmetallic outlet boxes along with the conditions under which such outlet and switch boxes may be installed within fire resistive wall assemblies. With either type of outlet or switch box, it may be possible to install the boxes under less stringent conditions when such boxes are used in conjunction with wall opening protective materials. Use of wall opening protective materials may allow for any combination of; (1) reducing the spacing between boxes contained on opposite sides of the wall, (2) increasing the size of the boxes, (3) increasing the density of boxes installed, and/or (4) allowing the use of boxes on each side of staggered stud walls. The individual systems tested for compliance in these categories indicate the specific applications and the method of installation for which the materials have been evaluated.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal provides additional flexibility with an additional design option. This will coordinate with the action taken on FS82-06/07 but address horizontal assemblies. See FS82-06/07 for additional comments.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jonathan C. Siu, City of Seattle, representing WABO Technical Code Development Committee, requests Approval as Modified by this public comment.

Modify proposal as follows:

712.4.1.2 Membrane penetrations. Penetrations of membranes that are part of a fire-resistance-rated horizontal assembly shall comply with Section 712.4.1.1.1 or 712.4.1.1.2. Where floor/ceiling assemblies are required to have a minimum 1-hour fire-resistance rating, recessed fixtures shall be installed such that the required fire resistance will not be reduced.

Exceptions:

1. Membrane penetrations of maximum 2-hour fire-resistance-rated walls and partitions by steel, ferrous or copper conduits, pipes, tubes or vents, or concrete or masonry items where the annular space is protected either in accordance with Section 712.4.1.1 or to prevent the free passage of flame and the products of combustion. The aggregate area of the openings through the membrane shall not exceed 100 square inches (64 500 mm²) in any 100 square feet (9.3m²) of ceiling area in assemblies tested without penetrations.
2. Ceiling membrane penetrations of maximum 2-hour fire-resistance-rated horizontal assemblies by steel electrical boxes that do not exceed 16 square inches (10 323 mm²) in area, provided the aggregate area of such penetrations does not exceed 100 square inches (44 500 mm²) in any 100 square feet (9.29m²) of ceiling area, and the annular space between the ceiling membrane and the box does not exceed 1/8 inch (3.12 mm).
3. Membrane penetrations by electrical boxes of any size or type, which have been listed as part of an wall opening protective material system for use in horizontal fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing.
4. Membrane penetrations by listed electrical boxes of any material, provided such boxes have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing. The annular space between the ceiling membrane and the box shall not exceed 1/8 inch (3.1 mm) unless listed otherwise
5. The annular space created by the penetration of a fire sprinkler, provided it is covered by a metal escutcheon plate.

Commenters Reason: Editorial. The scope of this section is horizontal assemblies, so the term “wall opening protective” is not appropriate.

Final Hearing Results

FS90-06/07

AMPC1

Code Change No: FS91-06/07

Original Proposal

Section: 712.4.2

Proponent: Sarah A. Rice, C.B.O., Schirmer Engineering Corp., representing American Hotel & Lodging Association (AH&LA)

Revise as follows:

712.4.2 Nonfire-resistance-rated assemblies. Penetrations of ~~horizontal assemblies without a required fire-resistance rating~~ nonfire-resistance rated floor or floor/ceiling assemblies or the ceiling membrane of a nonfire-resistance rated roof/ceiling assembly shall meet the requirements of Section 707 or shall comply with Section 712.4.2.1 or 712.4.2.2.

Reason: The proposed change is editorial in nature, unintended to create consistency within Section 712.4. The new language proposed is identical to that found in Section 712.4.1.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Approved as Submitted**

Committee Reason: This revision provides clarity and consistency with the existing code text. The provision also distinguishes that only the ceiling portion of a roof/ceiling assembly is regulated.

Assembly Action:**None**

Final Hearing Results

FS91-06/07**AS**

Code Change No: FS98-06/07

Original Proposal

Table 601 and Sections: 714.1, 714.1.1 (New), 714.1.2 (New), 714.2, 714.2.1, 714.2.2, 714.3, 714.4

Proponent: Paul K. Heilstedt, PE, Chair, representing ICC Code Technology Committee (CTC)

Revise as follows:

**TABLE 601
FIRE-RESISTANCE RATING REQUIREMENTS FOR BUILDING ELEMENTS (hours)**

BUILDING ELEMENT	TYPE I		TYPE II		TYPE III		TYPE IV	TYPE V	
	A	B	A ^d	B	A ^d	B	HT	A ^d	B
Structural Primary structural frame^a See Section 714.1.1 Including columns, girders, trusses	3 ^b	2 ^b	1	0	1	0	HT	1	0
Bearing walls Exterior ^f Interior	3 3 ^b	2 2 ^b	1 1	0 0	2 1	2 0	2 1/HT	1 1	0 0
Nonbearing walls and partitions Exterior	See Table 602								
Nonbearing walls and partitions Interior ^e	0	0	0	0	0	0	See Section 602.4.6	0	0
Floor construction Including supporting beams and joists	2	2	1	0	1	0	HT	1	0
Roof construction Including supporting beams and joists	1½ ^c	1 ^{c,d}	1 ^{c,d}	0 ^{c,d}	1 ^{c,d}	0 ^{c,d}	HT	1 ^{c,d}	0

For SI: 1 foot = 304.8 mm.

~~a. The structural frame shall be considered to be the columns and the girders, beams, trusses and spandrels having direct connections to the columns and bracing members designed to carry gravity loads. The members of floor or roof panels which have no connection to the columns shall be considered secondary members and not a part of the structural frame.~~

b. through g. (No change to current text – re-letter to become a. through f.)

714.1 Requirements. The fire-resistance rating of structural members and assemblies shall comply with this section and the requirements for the type of construction as specified in Table 601 and shall not be less than the rating required for the fire-resistance-rated assemblies supported by the structural members.

Exception: Fire barriers, fire partitions and smoke barriers as provided in Sections 706.5, 708.4 and 709.4, respectively.

714.2 Protection of structural members. Protection of columns, girders, trusses, beams, lintels or other structural members that are required to have a fire-resistance rating shall comply with this section.

714.1.1 Primary structural frame. The primary structural frame shall be the columns and other structural members including the girders, beams, trusses and spandrels having direct connections to the columns and bracing members designed to carry gravity loads.

714.1.2 Secondary members. The members of floor or roof construction which are not connected to the columns shall be considered secondary members and not part of the primary structural frame

714.2.1 Individual encasement protection. Columns, girders, trusses, beams, lintels or other structural members that are required to have a fire-resistance rating and that support more than two floors or one floor and roof, or support a load-bearing wall or a nonload-bearing wall more than two stories high, shall be individually protected on all sides for the full length, including connections to other structural members, with materials having the required fire-resistance rating.

714.2.1 Alternative protection. The structural members that are required to have a fire-resistance rating and are not required to be provided individual encasement protection according to Section 714.2 ~~Other structural members required to have a fire-resistance rating~~ shall be protected by individual encasement protection, by a membrane or ceiling protection as specified in Section 711, or by a combination of both. ~~Columns shall also comply with Section 714.2.2.~~

714.2.1.1 714.3 Membrane protection. King studs and boundary elements that are integral elements in load-bearing walls of light-framed construction shall be permitted to have required fire-resistance ratings provided by the membrane protection provided for the load-bearing wall.

714.2.2 714.4 Column protection above ceilings. Where columns are required to be fire-resistance rated, the entire column, including its connections to beams or girders, shall be ~~protected~~ provided individual encasement protection on all sides for the full column length. Where the column extends through a ceiling, the fire resistance rating of the column shall be continuous from the top of the foundation or floor/ceiling assembly below through the ceiling space to the top of the column.

Reason: The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: <http://www.iccsafe.org/cs/cc/ctc/index.html> Since its inception, the CTC has held six meetings - all open to the public.

This proposed change is a result of the CTC's investigation of the area of study entitled "Review of NIST WTC Recommendations". The scope of the activity is noted as:

Review the recommendations issued by NIST in its report entitled "Final Report on the Collapse of the World Trade Center Towers", issued September 2005, for applicability to the building environment as regulated by the I-Codes.

This proposal is intended to address NIST recommendation 7. For this specific proposed change, CTC is working in cooperation with the NIBS/MMC Committee to Translate the NIST World Trade Center Investigation Recommendations for the Model Codes. The CTC notes in their investigation that many of the recommendations contained in the NIST report require additional information for the CTC to further investigate. As such, CTC intends to continue to study the other NIST recommendations.

NIST Recommendation #7 is summarized as "NIST recommends the adoption and use of the structural frame approach to fire resistance ratings." While the IBC currently contains this approach, the NIST team recommends that the concept be reinforced by incorporating text similar to that contained in Footnote a to Table 601 into the pertinent code text for a higher visibility and understanding by code users.

The proposed modification to line 1, column 1 of Table 601 is not intended to revise the intent but to incorporate the revised term. In lieu of a footnote, reliance on the reference to the specific code text of Section 714.1.1 enables a better understanding of the requirements for the pertinent building elements.

The modifications to the subsections of Section 714 are intended to retain the current intent. The assemblies for floors and roofs are not consistently referred to as "panels" and the apparent intent is to deal with "floor and roof construction".

The modifications to the several subsections of Section 714 are intended to work in concert with the reference from Table 601 and consolidate text into a more efficient format without a change in intent.

714.1 – The section is revised by incorporating the requirement that the fire-resistance rating of structural members is to comply with "this section" and "Table 601".

714.1.1 – Existing section 714.2 is not necessary and contains no particular requirements which are not contained in Section 714.1. The text of Section 714.1.1 was revised to more closely resemble the current terminology in line 1 and footnote a of Table 601 which is "structural frame". The incorporation of "other structural members" in Section 714.1.1 is to place reliance on the function of the member to determine its inclusion in the primary structural frame although a laundry list of commonly understood members is retained for understanding of the intent. The structural members named in the existing laundry list are included in the subsections which apply to such members. It should be noted that this section, as does the current footnote, does not consider the lateral load resisting system as part of the structural frame within the context of fire resistance ratings.

714.1.2 – This text is based on the second sentence of existing Footnote a to Table 601.

714.2 – The proposal utilizes the text and concept contained in existing Section 714.2.1. The inclusion of "encasement" in the section title is to enhance the focus of the section's intent. The proposed deletion of "columns" from the laundry list is to eliminate the implication that columns are not required to be individually protected to their full height when protected by Section 711 - Horizontal Assemblies. Individual protection for columns is required by existing Section 714.2.2. This is addressed in proposed Section 714.4. The connections of these elements to other structural members are required to be protected for the continuity of protection.

714.2.1 – The proposal is based on the text in the second sentence of the existing Section 714.2.1 and is addressing those structural members which are not required to be individually protected according to proposed Section 714.2. The last sentence of existing Section 714.2.1 is not needed as proposed Section 714.4 exclusively deals with columns.

714.2.2 – The proposal requires columns to be individually protected for the full column length and columns are not permitted to be protected by membrane protection.

Bibliography:

Interim Report No. 1 of the CTC, Area of Study – Review of NIST WTC Recommendations, March 9, 2006.

National Institute of Standards and Technology. Final Report of the National Construction Safety Team on the Collapses of the World Trade Center Towers. United States Government Printing Office: Washington, D.C. September 2005.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This helps to address a couple of concerns which were raised by the NIST report on issues related to the World Trade Center. This item was considered to help with the concerns that the structural frame be better defined and addressed so that the level of fire protection is easier to determine. Having these elements better defined helps to clarify the fire protection required for the structural frame and secondary members. It also helps to clarify that the floor is not considered as being a part of the structural frame. This proposal does not contain any technical changes to the requirements but appropriately moves the definition for structural frame from the table footnote into the proposed sections 714.1.1 and 714.1.2.

Assembly Action:

None

Final Hearing Results

FS98-06/07

AS

Code Change No: FS100-06/07

Original Proposal

Sections: 714.8 (New), 714.8.1 (New), 714.8.2 (New), 714.8.3 (New), 714.8.3.1 (New), 714.8.3.2 (New), 714.8.4 (New), 714.8.5 (New)

Proponent: William M. Connolly, State of New Jersey, Department of Community Affairs, Division of Codes and Standards, representing International Code Council Ad Hoc Committee on Terrorism Resistant Buildings

Add new text as follows:

714.8 Spray-Applied Fire Resistive Materials (SFRM). Spray-applied fire resistive materials shall comply with the 714.8.1 through 714.8.4.

714.8.1 Fire Resistance rating. The application of SFRM shall be consistent with its fire resistance rating listing including, but not limited to, minimum thickness and dry density of the applied SFRM, method of application, substrate surface conditions, the use of bonding adhesives, sealants and reinforcing or other materials.

714.8.2 Manufacturer's installation instruction. The application of SFRM shall be in accordance with the manufacturer's installation instruction. The instructions shall include, but are not limited to, substrate temperatures and surface conditions, and SFRM handling, storage, mixing, conveyance, method of application, curing and ventilation.

714.8.3 Substrate condition. The SFRM shall be applied to a substrate in compliance with 714.8.3.1 through 714.8.3.2.

714.8.3.1 Surface conditions. Substrates to receive SFRM shall be free of dirt, oil, grease, release agents, loose scale or paint, primers, paints and encapsulants other than those fire-tested and classified by a recognized testing agency, and any other condition that may prevent adequate adhesion. Primed, painted or encapsulated steel shall be allowed provided that testing has demonstrated that required adhesion is maintained.

714.8.3.2 Primers, Paints and Encapsulants. Where the SFRM is to be applied over primers, paints, or encapsulants other than those specified in the listing, the material shall be field tested in accordance with ASTM E 736. Where testing demonstrates that required adhesion is maintained, SFRM shall be permitted to be applied to primed, painted or encapsulated wide flange steel shapes in accordance with the following conditions:

1. The beam flange width does not exceed 12 in. (300 mm); or
2. The column flange width does not exceed 16 in. (400 mm); or
3. The beam or column web depth does not exceed 16 in. (400 mm).

4. The average and minimum bond strength values shall be determined based on a minimum of five bond tests conducted in accordance with ASTM E736. Bond tests conducted in accordance with ASTM E 736 indicate a minimum average bond strength of 80 percent and a minimum individual bond strength of 50 percent, when compared to the bond strength of the SFRM as applied to clean uncoated 1/8-in. (3-mm) thick steel plate.

714.8.4 Temperature. A minimum ambient and substrate temperature of 40°F (4.44°C) shall be maintained during and for a minimum of 24 hours after the application of the SFRM, unless the manufacturer's installation instructions allow otherwise.

714.8.5 Finished condition. The finished condition of SFRM applied to structural members or assemblies shall not, upon complete drying or curing, exhibit cracks, voids, spalls, delamination or any exposure of the substrate. Surface irregularities of spray-applied SFRM shall be deemed acceptable.

Reasons: This code change proposal is one of fourteen proposals being submitted by the International Code Council Ad Hoc Committee on Terrorism Resistant Buildings.

The purpose of this proposal is to increase the in-place durability of Spray Applied Fire Resistant Material (SFRM) by established code requirements for the application of the material. The Code currently lacks such provisions. The National Institute of Standards and Technology's (NIST) investigation of the World Trade Center (WTC) tragedy documented that the proximate cause of the actual collapse was the action of a building contents fire on light steel members in the absence of spray applied fire resistive material, which had been dislodged. Events far less dramatic than an airplane attack have been known to dislodge SFRM. Events as simple as an elevator movement, building sway or maintenance activities can dislodge SFRM if it is not adhered properly. Recommendation 6 of the NIST WTC Report calls for improvement of the in-place durability of SFRM. This proposal is one of three that seeks to achieve that objective. The other two are a proposal for a new Section 403.15 requiring higher bond strengths for SFRM in taller buildings, and a strengthened Section 1704.10 dealing with special inspections of SFRM installations. The proposed new Section 714.8 establishes for the first time in the Code specific requirements governing the application of SFRM.

Sections 714.8.1 and 714.8.2 require that application be in accordance with all terms and conditions of the listing and the manufacturer's instructions.

Section 714.8.3 deals with the very important issue of substrate. The in-place adhesion of SFRM can be reduced by a factor of 10 when applied over certain primers when compared to the adhesion obtained by the rated material applied on bare clean steel. The section specifies to a field test that must be performed to determine adhesion whenever the field substrate differs from that contemplated by the listing.

Section 714.8.4 specifies a minimum temperature for the application of SFRM.

Section 714.8.5 establishes requirements for the finished condition of SFRM.

These proposals are based upon existing industry guidelines that are presently being followed by many installers.

Association of the Wall and Ceiling Industries International. Technical Manual 12-A: Standard Practice for the Testing and Inspection of Field Applied Sprayed Fire-resistive Materials; an Annotated Guide. Falls Church, Virginia: Association of the Wall and Ceiling Industries International. 1997, Third Edition.

National Institute of Standards and Technology. Final Report of the National Construction Safety Team on the Collapses of the World Trade Center Towers. United States Government Printing Office: Washington, D.C. September 2005.

Cost Impact: This proposal will not increase cost since these procedures are already being followed in responsible installations. This code text is needed to ensure that they are always followed.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

714.8 ~~Spray-Applied~~ Sprayed Fire Resistive Materials (SFRM). ~~Spray-applied~~ Sprayed fire resistive materials shall comply with the 714.8.1 through 714.8.4.

714.8.1 Fire Resistance Rating. The application of SFRM shall be consistent with its fire resistance rating listing including, but not limited to, minimum thickness and dry density of the applied SFRM, method of application, substrate surface conditions, the use of bonding adhesives, sealants and reinforcing or other materials.

714.8.2 Manufacturer's Installation Instruction. The application of SFRM shall be in accordance with the manufacturer's installation instruction. The instructions shall include, but are not limited to, substrate temperatures and surface conditions, and SFRM handling, storage, mixing, conveyance, method of application, curing and ventilation.

714.8.3 Substrate condition. The SFRM shall be applied to a substrate in compliance with 714.8.3.1 through 714.8.3.2.

714.8.3.1 Surface Conditions. Substrates to receive SFRM shall be free of dirt, oil, grease, release agents, loose scale or paint, primers, paints and encapsulants other than those fire-tested and classified by a recognized testing agency, and any other condition that ~~may prevent~~ adequate adhesion. Primed, painted or encapsulated steel shall be allowed provided that testing has demonstrated that required adhesion is maintained.

714.8.3.2 Primers, Paints and Encapsulants. Where the SFRM is to be applied over primers, paints, or encapsulants other than those specified in the listing, the material shall be field tested in accordance with ASTM E 736. Where testing of the SFRM with primers, paints or encapsulants demonstrates that required adhesion is maintained, SFRM shall be permitted to be applied to primed, painted or encapsulated wide flange steel shapes in accordance with the following conditions:

1. The beam flange width does not exceed 12 in. (300 mm); or
2. The column flange width does not exceed 16 in. (400 mm); or
3. The beam or column web depth does not exceed 16 in. (400 mm).
4. The average and minimum bond strength values shall be determined based on a minimum of five bond tests conducted in accordance with ASTM E736. Bond tests conducted in accordance with ASTM E 736 indicate a minimum average bond strength of 80 percent and a minimum individual bond strength of 50 percent, when compared to the bond strength of the SFRM as applied to clean uncoated 1/8-in. (3-mm) thick steel plate.

714.8.4 Temperature. A minimum ambient and substrate temperature of 40°F (4.44°C) shall be maintained during and for a minimum of 24 hours after the application of the SFRM, unless the manufacturer’s installation instructions allow otherwise.

714.8.5 Finished condition. The finished condition of SFRM applied to structural members or assemblies shall not, upon complete drying or curing, exhibit cracks, voids, spalls, delamination or any exposure of the substrate. Surface irregularities of ~~spray-applied~~ SFRM shall be deemed acceptable.

Committee Reason: This proposal provides enforceable language to assure compliance with the code requirements. This helps to address the NIST report issue that testing is to un-primed steel but the actual field installation is done to steel with primers and therefore the adhesion is often greatly different. This proposal puts important provisions in the code and not just in the standard where the inspector often does not see them. The testimony did clarify that the size limitations of Section 714.8.3.2 items 1, 2, and 3 do not limit the size of members which may use SFRM but instead only limit the size of members which use this section and apply them to materials which are “other than those specified in the listing.” The modifications help coordinate with changes made by FS156-06/07 regarding the term “sprayed” versus “spray-applied” and also included other changes which were believed to clarify the provisions and eliminate vague language.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Philip Brazil, P.E., Reid Middleton, Inc., representing himself, requests Approval as Modified by this public comment.

Further modify proposal as follows:

714.8 Sprayed Fire ~~Resistive~~ Resistant Materials (SFRM). Sprayed fire ~~resistive resistant~~ materials (SFRM) shall comply with ~~the~~ Sections 714.8.1 through 714.8.4.

714.8.1 Fire Resistance Rating. The application of SFRM shall be consistent with ~~its~~ the fire resistance rating and the listing including, but not limited to, minimum thickness and dry density of the applied SFRM, method of application, substrate surface conditions; and the use of bonding adhesives, sealants, ~~and~~ reinforcing or other materials.

714.8.2 Manufacturer’s Installation Instruction. The application of SFRM shall be in accordance with the manufacturer’s installation instructions. The instructions shall include, but are not limited to, substrate temperatures and surface conditions, and SFRM handling, storage, mixing, conveyance, method of application, curing and ventilation.

714.8.3 Substrate condition. The SFRM shall be applied to a substrate in compliance with Sections 714.8.3.1 through 714.8.3.2.

714.8.3.1 Surface Conditions. Substrates to receive SFRM shall be free of dirt, oil, grease, release agents, loose scale ~~or paint and any other condition that prevents adhesion.~~ The substrates shall also be free of primers, paints and encapsulants other than those fire-tested and ~~classified listed~~ listed by a nationally recognized testing agency ~~and any other condition that prevents adhesion.~~ Primed, painted or encapsulated steel shall be allowed provided ~~that~~ testing has demonstrated that required adhesion is maintained.

714.8.3.2 Primers, Paints and Encapsulants. Where the SFRM is to be applied over primers, paints, or encapsulants other than those specified in the listing, the material shall be field tested in accordance with ASTM E 736. Where testing of the SFRM with primers, paints or encapsulants demonstrates that required adhesion is maintained, SFRM shall be permitted to be applied to primed, painted or encapsulated wide flange steel shapes in accordance with the following conditions:

1. The beam flange width does not exceed 12 in. (300 mm); or
2. The column flange width does not exceed 16 in. (400 mm); or
3. The beam or column web depth does not exceed 16 in. (400 mm).
4. The average and minimum bond strength values shall be determined based on a minimum of five bond tests conducted in accordance with ASTM E736. Bond tests conducted in accordance with ASTM E 736 shall indicate a minimum average bond strength of 80 percent and a minimum individual bond strength of 50 percent, when compared to the bond strength of the SFRM as applied to clean uncoated 1/8-in. (3-mm) thick steel plate.

714.8.4 Temperature. A minimum ambient and substrate temperature of 40°F (4.44°C) shall be maintained during and for a minimum of 24 hours after the application of the SFRM, unless the manufacturer’s installation instructions allow otherwise.

714.8.5 Finished condition. The finished condition of SFRM applied to structural members or assemblies shall not, upon complete drying or curing, exhibit cracks, voids, spalls, delamination or any exposure of the substrate. Surface irregularities of SFRM shall be deemed acceptable.

Commenter's Reason: The purpose for the public comment is to make the proposed language more technically sound. In Section 714.8, "sprayed fire resistive materials" is changed to "sprayed fire resistant materials" for consistency with use of the latter term elsewhere in the IBC. In Section 714.8.1, "its fire resistance rating" is changed to "the fire resistance rating" because sprayed fire resistant materials are typically not listed for fire resistance ratings but are components of fire-resistance-rated designs that include the structural member or element receiving the materials. In Section 714.8.3.1, "classified" is changed to "listed" for consistency with "listing" in Section 714.8.3.2. The first sentence of Section 714.8.3.1 is changed to two sentences to make it clear that listings by nationally recognized testing laboratories are applicable to primers, paints and encapsulants; but not to dirt, oil, grease, release agents and loose scale.

Final Hearing Results

FS100-06/07

AMPC1

Code Change No: FS101-06/07

Original Proposal

Section: 715.2

Proponent: William E. Koffel, P.E., Koffel Associates, Inc., representing Fire Rated Glazing Industry

Revise as follows:

715.2 Fire-resistance-rated glazing. ~~Labeled fire-resistance-rated glazing tested as part of a fire-resistance-rated wall assembly in accordance with ASTM E 119 and labeled in accordance with Section 706.2.1 shall be permitted in fire doors and fire window assemblies in accordance with their listings and shall not otherwise be required to comply with this section.~~

Reason: Currently the Code exempts fire resistance rated glazing from the requirements of Section 715 because such glazing should not be considered an opening since it has been tested and meets the performance requirements for a fire resistance rated wall assembly. However, the current Code provisions do not clearly indicate that such glazing should be permitted to be used wherever fire protection rated glazing is permitted. The purpose of this proposal is to make clear how fire resistance rated glazing used in fire doors and fire window assemblies should be labeled. Confusion could exist as to whether it should be labeled with a "W" in accordance with 706.2.1, or a "D" in accordance with 715.4.6.3.1, or an "OH" in accordance with 715.5.8.1. The proposed revision makes it clear that fire resistance rated glazing is to be labeled "W" wherever it is used, including fire doors and fire window assemblies.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This helps to clarify existing code labeling issues. This makes the current marking provisions clearer. This does accept the higher rated fire-resistance-rated glazing versus the fire-protection-rated glazing in both doors and windows. This proposal will work regardless of the labeling provisions which may be adopted later (FS103-06/07).

Analysis: The reference to Section 706.2.1 may be revised depending on the final result of FS36-06/07. If FS36-06/07 is approved, the reference will be changed to Section 703.5.

Assembly Action:

None

Final Hearing Results

FS101-06/07

AS

Code Change No: **FS102-06/07**

Original Proposal

Sections: 715.3, 715.4.3.2, 715.5, 715.5.1, 715.5.2, 715.5.8.1, Chapter 35 (New)

Proponent: Bob Eugene/ Underwriters Laboratories Inc.

1. Revise as follows:

715.3 Alternative methods for determining fire protection ratings. The application of any of the alternative methods listed in this section shall be based on the fire exposure and acceptance criteria specified in NFPA 252, ~~or NFPA 257~~ or UL 9. The required fire resistance of an opening protective shall be permitted to be established by any of the following methods or procedures:

1. Designs documented in approved sources.
2. Calculations performed in an approved manner.
3. Engineering analysis based on a comparison of opening protective designs having fire-protection ratings as determined by the test procedures set forth in NFPA 252, ~~or NFPA 257~~ or UL 9.
4. Alternative protection methods as allowed by Section 104.11.

715.4.3.2 Glazing in door assemblies. In a 20-minute fire door assembly, the glazing material in the door itself shall have a minimum fire-protection rating of 20 minutes and shall be exempt from the hose stream test. Glazing material in any other part of the door assembly, including transom lites and sidelites, shall be tested in accordance with NFPA 257 or UL 9, including the hose stream test, in accordance with Section 715.5.

715.5 Fire-protection-rated glazing. Glazing in fire window assemblies shall be fire-protection rated in accordance with this section and Table 715.5. Glazing in fire door assemblies shall comply with Section 715.4.6. Fire-protection-rated glazing shall be tested in accordance with and shall meet the acceptance criteria of NFPA 257 or UL 9. Fire-protection-rated glazing shall also comply with NFPA 80. Openings in nonfire-resistance-rated exterior wall assemblies that require protection in accordance with Section 704.3, 704.8, 704.9 or 704.10 shall have a fire-protection rating of not less than 3/4 hour.

Exceptions:

1. Wired glass in accordance with Section 715.5.3.
2. Fire-protection-rated glazing in 0.5-hour fire-resistance-rated partitions is permitted to have an 0.33-hour fire-protection rating.

715.5.1 Testing under positive pressure. NFPA 257 or UL 9 shall evaluate fire-protection-rated glazing under positive pressure. Within the first 10 minutes of a test, the pressure in the furnace shall be adjusted so at least two-thirds of the test specimen is above the neutral pressure plane, and the neutral pressure plane shall be maintained at that height for the balance of the test.

715.5.2 Nonsymmetrical glazing systems. Nonsymmetrical fire-protection-rated glazing systems in fire partitions, fire barriers or in exterior walls with a fire separation distance of 5 feet (1524 mm) or less pursuant to Section 704 shall be tested with both faces exposed to the furnace, and the assigned fire protection rating shall be the shortest duration obtained from the two tests conducted in compliance with NFPA 257 or UL 9.

715.5.8.1 Identification. For fire-protection-rated glazing, the label shall bear the following two-part identification: "OH – XXX." "OH" indicates that the glazing meets both the fire-resistance and the hose-stream requirements of NFPA 257 or UL 9 and is permitted to be used in openings. "XXX" represents the fire-protection rating period, in minutes, that was tested.

2. Add standard to Chapter 35 as follows:

UL

9-2000 Fire Tests of Window Assemblies, with Revisions through April 2005

Reason: The purpose of this code change is to include reference to UL 9 as an alternate to NFPA 257 which is currently referenced in these code sections. These two Standards describe the same test method. The specifications for the test apparatus and test procedure are identical between the two standards. As such, identical test results would be obtained from tests conducted using each of these methods.

UL 9 is an ANSI approved standard. The inclusion of this alternate test method would provide the authority having jurisdiction with the flexibility to accept listed and labeled products evaluated in accordance with NFPA 257 or UL 9.

Cost Impact: The code change proposal will not increase cost of construction.

Public Hearing Results

Note: The following analysis was not in the Code Change Proposal book but was published in the AErrata to the 2006/2007 Proposed Changes to the International Codes and Analysis of Proposed Referenced Standards® provided at the code development hearings:

Analysis: Review of proposed new standard indicated that, in the opinion of staff, the standard did comply with ICC standards criteria

Committee Action:

Approved as Submitted

Committee Reason: This action is consistent with the committee's action on similar proposals. This provides added flexibility by including a UL standard which is commonly used. The UL test standard also contains a positive pressure test which the committee felt is appropriate for the test standard.

Assembly Action:

None

Final Hearing Results

FS102-06/07

AS

Code Change No: FS105-06/07

Original Proposal

Sections: 715.4.1, 715.4.2, 715.4.4, 715.4.4.1

Proponent: Philip Brazil, P.E., Reid Middleton, Inc., representing himself

Revise as follows:

715.4.1 Side-hinged or pivoted swinging doors. Fire door assemblies with side-hinged and pivoted swinging doors shall be tested in accordance with NFPA 252 or UL 10C. After 5 minutes into the NFPA 252 test, the neutral pressure level in the furnace shall be established at 40 inches (1016 mm) or less above the sill.

715.4.2 Other types of doors. Fire door assemblies with other types of doors, including swinging elevator doors and fire shutter assemblies, shall be tested in accordance with NFPA 252 or UL 10B. The pressure in the furnace shall be maintained as nearly equal to the atmospheric pressure as possible. Once established, the pressure shall be maintained during the entire test period.

715.4.4 Doors in exit enclosures and exit passageways. Fire door assemblies in exit enclosures and exit passageways shall have a maximum transmitted temperature end point of not more than 450°F (250°C) above ambient at the end of 30 minutes of standard fire test exposure.

Exception: The maximum transmitted temperature rise is not limited in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

715.4.4.1 Glazing in doors. Fire-protection-rated glazing in excess of 100 square inches (0.065 m²) shall be permitted in fire door assemblies when tested in accordance with NFPA 252 as components of the door assemblies and not as glass lights, and shall have a maximum transmitted temperature rise of 450°F (250°C) in accordance with Section 715.4.4.

Exception: The maximum transmitted temperature end point is not required in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

Reason: The revisions to Section 715.4.1 and 715.4.2 are intended to make their terminology consistent with the charging statement in Section 715.4, which refers to fire door and fire shutter assemblies. The revision to Section 715.4.4.1 is intended to permit the installation of fire-protection-rated glazing greater than 100 square inches in area when determined by tests conducted in accordance with UL 10B, UL 10C or NFPA 252, as applicable. The current language would only permit the installation when established by NFPA 252 tests. The choice of test standard is governed by the applicable requirements in Section 715.4.1 or 715.4.2.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This helps clarify the intent of Section 715.4 by using similar terminology in Sections 715.4.1 and 715.4.2. The change to Section 715.4.4.1 will provide additional options to accept glazing which has been tested under several test standards instead of simply the one which is currently listed. The title to Section 715.4.2 may need to be modified since it does include fire shutters within this section. If FS105 is approved at the final action hearings, this change in title would be made editorially by the staff.

Assembly Action:

None

Final Hearing Results

FS105-06/07

AS

Code Change No: FS106-06/07

Original Proposal

Section: 715.4.3.1

Proponent: Bob Eugene, Underwriters Laboratories Inc.

Revise as follows:

715.4.3.1 Smoke and draft control. Fire door assemblies shall also meet the requirements for a smoke and draft control door assembly tested in accordance with UL 1784. The air leakage rate of the door assembly shall not exceed 3.0 cubic feet per minute per square foot ($0.01524 \text{ m}^3/\text{s} \cdot \text{m}^2$) of door opening at 0.10 inch (24.9 Pa) of water for both the ambient temperature and elevated temperature tests. Louvers shall be prohibited. Installation of smoke doors shall be in accordance with NFPA 105.

Reason: To add criteria for smoke and draft control doors consistent with doors in smoke partitions. With the reformatting of these provisions in the last code cycle, the leakage ratings were removed. As the code is currently drafted, the leakage criteria for smoke barriers are not clear. This change provides consistency with NFPA 105.

Cost Impact: The code change proposal will not increase cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The 0.10 inch water column pressure level is adequate for conducting this test. While the test standard does include higher pressure levels, this level is adequate to demonstrate compliance and it does coordinate with the door testing. This does help clarify and bring back this issue which was taken out in the previous code because it was confusing. This language eliminates the confusion.

Assembly Action:

None

Final Hearing Results

FS106-06/07

AS

Code Change No: FS108-06/07

Original Proposal

Sections: 715.4.4, 715.4.4.1

Proponent: William F. O’Keeffe, SAFTI FIRST

Revise as follows:

715.4.4 Doors in exit enclosures and exit passageways. Fire door assemblies in exit enclosures and exit passageways shall have a maximum transmitted temperature end point of not more than 450°F (250°C) above ambient at the end of 30 minutes of standard fire test exposure.

Exception: The maximum transmitted temperature rise is not ~~limited~~ required in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

715.4.4.1 Glazing in doors. Fire-protection-rated glazing in excess of 100 square inches (0.065 m²) shall be permitted in fire door assemblies when tested in accordance with NFPA 252 as components of the door assemblies and not as glass lights, and shall have a maximum transmitted temperature rise of 450°F (250°C) in accordance with Section 715.4.4.

Exception: The maximum transmitted temperature ~~end point~~ rise is not required in buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

Reason: Clarify the code for consistency between the exceptions in 715.4.4 and 715.4.4.1

The current code wording is inconsistent in the use of the terms “end point” and “rise”, and the words “limited” and “required”

The term “rise” was added to the exception in 715.4.4 during the last code cycle. To be consistent with the last code cycle, the term “rise” should also replace “end point” in the exception in 715.4.4.1. Likewise, the terms “limited” and “required” should both be the same for consistency. The term “required” is more definitive and clear than the term “limited”. With these changes, both exceptions would be consistent.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: As stated in the proponent-s reason statement, this will provide consistency between multiple code sections.

Assembly Action:

None

Final Hearing Results

FS108-06/07

AS

Code Change No: **FS110-06/07**

Original Proposal

Section: 715.4.5.1

Proponent: Thomas R. Janicak, Ceco Door Products, An ASSA ABLOY Door Group Company, representing Steel Door Institute

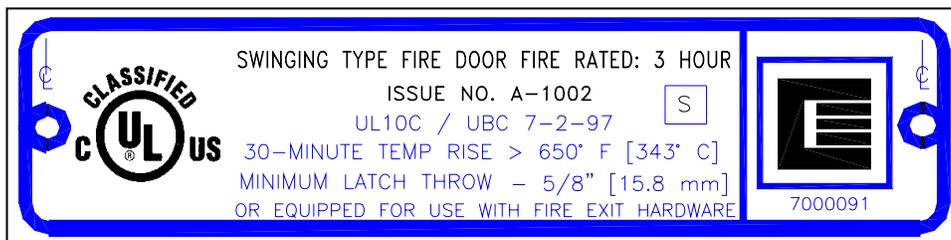

Revise as follows:

715.4.5.1 Fire door labeling requirements. Fire doors shall be labeled showing the name of the manufacturer or other identification readily traceable back to the manufacturer, the name or logo of the third-party inspection agency, the fire protection rating and, where required for fire doors in exit enclosures and exit passageways by Section 715.4.4, the maximum transmitted temperature end point. Smoke and draft control doors complying with UL 1784 shall be labeled as such and shall also comply with Section 715.4.5.3. Labels shall be approved and permanently affixed. The label shall be applied at the factory or location where fabrication and assembly are performed.

Reason: As written, Section 715.3.5 does not accurately define what is the standard labeling practice employed by fire door manufactures. To bring the code in line with the labeling methods currently authorized by Underwriters Laboratories and Intertek Testing services (Warnock Hersey).

1. In lieu of the company name, the use of a corporate logo has been a standard practice employed by manufacturers. A listing of these logos can be found at the rear of the Underwriters Laboratories Fire Resistance Directory.
2. Both UL and ITS provide what is termed a standard or stock label. These labels are generic in nature and do not include the name of the manufacturer producing the fire door. Smaller companies who do not have their own combination type labels printed and inventoried typically use them. What is required by the certification agencies when these labels are used is as follows:
 - a. Underwriters Laboratories requires that the fire door manufacturer engrave or stamp into the label either its Follow-Up service Procedure Number or Company name. In most cases, the file number will be entered. A building official would find these file numbers cross-referenced to the manufacturer on the UL website or by calling UL directly for the information.
 - b. Intertek Testing Services (Warnock Hersey) labels are traceable back to the fire door manufacturer by means of a serial number.

Below is a typical UL label currently being used by Ceco Door Products. You will note that logos for both the manufacturer and inspection agencies are used in lieu of the names.

Another issue of concern is a statement in the code that says: "Smoke and draft control doors complying with UL 1784 shall be labeled as such." You will note on the label on the label that the letter "S" appears in a box. This is a shorthand method of indicating compliance to that requirement. This needs to be reflected in the code.

Cost Impact: The code change proposal will not increase the cost of construction. Small fire door manufacturers and labeling distribution will see a cost reduction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

715.4.5.1 Fire door labeling requirements. Fire doors shall be labeled showing the name of the manufacturer or other identification readily traceable back to the manufacturer, the name or logo trademark of the third-party inspection agency, the fire protection rating and, where required for fire doors in exit enclosures and exit passageways by Section 715.4.4, the maximum transmitted temperature end point. Smoke and draft control doors complying with UL 1784 shall be labeled as such and shall also comply with Section 715.4.5.3. Labels shall be approved and permanently affixed. The label shall be applied at the factory or location where fabrication and assembly are performed.

Committee Reason: As stated in the proponent-s reason statement, this does coordinate with the current labeling practices. UL does accept either the inclusion of the company-s name or trademark. These trademarks are recorded and traceable should there be questions years from now when these labels are encountered by an inspector in the field.

Assembly Action:

None

Code Change No: **FS112-06/07**

Original Proposal

Section 715.4.6.1

Proponent: William F. O'Keeffe, SAFTI FIRST

Revise as follows:

715.4.6.1 Size limitations. Wired glass used in fire doors shall comply with Table 715.5.3. Other fire-protection-rated glazing shall comply with the size limitations of NFPA 80.

Exceptions:

1. Fire-protection-rated glazing ~~in fire doors~~ located in fire walls shall be prohibited except ~~that where serving~~ as where serving in a fire door in a horizontal exit, a self-closing swinging door shall be permitted to have a vision panel of not more than 100 square inches (0.065 m²) without a dimension exceeding 10 inches (254 mm).
2. Fire-protection-rated glazing shall not be installed in fire doors having a 1½-hour fire protection rating intended for installation in fire barriers, unless the glazing is not more than 100 square inches (0.065 m²) in area.

Reason: Clarify the code. This code change will clearly state that fire protective glazing is prohibited in fire walls with the exception of the use in vision panels limited to 100 square inches in doors.

This proposal is editorial and suggests wording to clarify the code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal does provide a better flow of the language and is a good clarification. The committee agrees that this is simply an editorial change and does not affect the application of the requirements.

Assembly Action:

None

Final Hearing Results

FS112-06/07

AS

Code Change No: FS113-06/07

Original Proposal

Sections: 715.4.6.1, 715.5, 715.5.3, Table 715.5.3, 715.5.4

Proponent: William F. O’Keeffe, SAFTI FIRST

1. Revise as follows:

715.4.6.1 Size limitations. ~~Wired glass~~ Fire-protective-rated glazing used in fire doors shall ~~comply with Table 715.5.3.~~ Other fire-protection-rated glazing shall comply with the size limitations of NFPA 80.

Exceptions:

1. Fire-protection-rated glazing in fire doors located in fire walls shall be prohibited except that where serving as a horizontal exit, a self-closing swinging door shall be permitted to have a vision panel of not more than 100 square inches (0.065 m²) without a dimension exceeding 10 inches (254 mm).
2. Fire-protection-rated glazing shall not be installed in fire doors having a 1 1/2-hour fire protection rating intended for installation in fire barriers, unless the glazing is not more than 100 square inches (0.065 m²) in area.

715.5 Fire-protection-rated glazing. Glazing in fire window assemblies shall be fire-protection rated in accordance with this section and Table 715.5. Glazing in fire door assemblies shall comply with Section 715.4.6. Fire-protection-rated glazing shall be tested in accordance with and shall meet the acceptance criteria of NFPA 257. Fire-protection-rated glazing shall also comply with NFPA 80. Openings in nonfire-resistance-rated exterior wall assemblies that require protection in accordance with Section 704.3, 704.8, 704.9 or 704.10 shall have a fire-protection rating of not less than ¾ hour.

Exceptions:

- ~~1. Wired glass in accordance with Section 715.5.3.~~
2. Fire-protection-rated glazing in 0.5-hour fire-resistance-rated partitions is permitted to have an 0.33-hour fire protection rating.

2. Delete without substitution as follows:

715.5.3 Wired glass. Steel window frame assemblies of 0.125-inch (3.2 mm) minimum solid section or of not less than nominal 0.048-inch thick (1.2 mm) formed sheet steel members fabricated by pressing, mitring, riveting, interlocking or welding and having provision for glazing with 1/4-inch (6.4 mm) wired glass where securely installed in the building construction and glazed with 1/4-inch (6.4 mm) labeled wired glass shall be deemed to meet the requirements for a 3/4-hour fire window assembly. ~~Wired glass panels shall conform to the size limitations set forth in Table 715.5.3.~~

**TABLE 715.5.3
LIMITING SIZES OF WIRED GLASS PANELS**

OPENING FIRE PROTECTION RATING	MAXIMUM AREA (square inches)	MAXIMUM HEIGHT (inches)	MAXIMUM WIDTH (inches)
3 hours	0	0	0
1 1/2-hour doors in exterior walls	0	0	0
1 and 1 1/2 hours	100	33	40
3/4 hour	1,296	54	54
20 minutes	Not Limited	Not Limited	Not Limited
Fire window Assemblies	1,296	54	54

For SI: 1 inch = 25.4 mm, 1 square inch = 645.2 mm².

715.5.4 Nonwired glass. ~~Glazing other than wired glass in fire window assemblies shall be fire-protection-rated glazing installed in accordance with and complying with the size limitations set forth in NFPA 80.~~

Reason: Delete current requirements. Wired glass should be designated as fire-protection-rated glazing to be consistent with how other types of glazing products are described.

Wired glass does not meet the safety glazing requirements in 715.4.6.4 and would normally not be eligible for use in all fire rated door assemblies and fire window assemblies in areas subject to human impact. The use of wired glass and the qualifications for use was permitted and specified in the code for fire rated applications because it was exempt from the safety glazing requirements of Section 2406 by the Federal Government and it needed to be specifically referenced in the code as an exemption. When wired glass loses this exemption for complying with Chapter 24, Section 2406, the need to have specific requirements covering this specific type of glazing is no longer needed. Describing a specific type of fire-protection-rated glazing without including all other types of fire-protection-rated glazing in similar detail creates a business advantage for the wired glass product by being specifically mentioned in the code. All glazing products are described as fire-protection-rated glazing and shall comply with NFPA 80 per 715.4.6.1 and 715.5. Wired glass should be included as fire-protection-rated glazing to be consistent and fair. The paragraphs and tables referencing wired glass should be deleted at this time to eliminate the marketing and business advantage created by reference in the code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

715.4.6.1 Size limitations. ~~Fire-protective~~ fire-protection-rated glazing used in fire doors shall comply with the size limitations of NFPA 80.

Exceptions:

1. Fire-protection-rated glazing in fire doors located in fire walls shall be prohibited except that where serving as a horizontal exit, a self-closing swinging door shall be permitted to have a vision panel of not more than 100 square inches (0.065 m²) without a dimension exceeding 10 inches (254 mm).
2. Fire-protection-rated glazing shall not be installed in fire doors having a 1 1/2-hour fire protection rating intended for installation in fire barriers, unless the glazing is not more than 100 square inches (0.065 m²) in area.

715.5 Fire-protection-rated glazing. Glazing in fire window assemblies shall be fire-protection rated in accordance with this section and Table 715.5. Glazing in fire door assemblies shall comply with Section 715.4.6. Fire-protection-rated glazing shall be tested in accordance with and shall meet the acceptance criteria of NFPA 257. Fire-protection-rated glazing shall also comply with NFPA 80. Openings in nonfire-resistance-rated exterior wall assemblies that require protection in accordance with Section 704.3, 704.8, 704.9 or 704.10 shall have a fire-protection rating of not less than 3/4 hour.

Exceptions:

1. Wired glass in accordance with Section 715.5.3.
2. Fire-protection-rated glazing in 0.5-hour fire-resistance-rated partitions is permitted to have an 0.33-hour fire protection rating.

715.5.3 Wired glass. Steel window frame assemblies of 0.125-inch (3.2 mm) minimum solid section or of not less than nominal 0.048-inch-thick (1.2 mm) formed sheet steel members fabricated by pressing, mitering, riveting, interlocking or welding and having provision for glazing with 1/4-inch (6.4 mm) wired glass where securely installed in the building construction and glazed with 1/4-inch (6.4 mm) labeled wired glass shall be deemed to meet the requirements for a 3/4-hour fire window assembly. Wired glass panels shall conform to the size limitations set forth in Table 715.5.3.

**TABLE 715.5.3
LIMITING SIZES OF WIRED GLASS PANELS**

OPENING FIRE PROTECTION RATING	MAXIMUM AREA (square inches)	MAXIMUM HEIGHT (inches)	MAXIMUM WIDTH (inches)
3 hours	0	0	0
1 1/2-hour doors in exterior walls	0	0	0
1 and 1 1/2 hours	100	33	10
3/4 hour	1,296	54	54
20 minutes	Not Limited	Not Limited	Not Limited
Fire window Assemblies	1,296	54	54

For SI: 1 inch = 25.4 mm, 1 square inch = 645.2 mm².

715.5.4 Nonwired glass. Glazing other than wired glass in fire window assemblies shall be fire-protection-rated glazing installed in accordance with and complying with the size limitations set forth in NFPA 80.

Committee Reason: Wired glass is no longer permitted as a safety glazing in hazardous locations. Therefore Section 715.4.6.1 should not include wired glass since it may not be used in the doors which are considered as a hazardous location. Additionally, the code should not be product specific but should address the required performance. The committee modified the proposal to keep Section 715.5 exception 1 and also keep all of the text which was proposed to be deleted in item 2 of this proposal. The modification recognizes that the code has historically accepted wired-glass in a steel frame as equivalent to a 3/4-hour assembly. The deletion of this section and table would require a listed frame

which would increase the cost of construction without justification supporting such a change. The listing of wired-glass assemblies use the steel frames specified in this section during their testing. These prescriptive steel frame products have worked well historically and the option of using this should remain in the code. The change to “fire-protection” instead of “fire-protective” in Section 715.4.6.1 is an editorial change and not a modification by the committee. This aspect of the change was discussed during the hearings and ruled to be editorial.

Assembly Action:

None

Final Hearing Results

FS113-06/07

AM

Code Change No: FS116-06/07

Original Proposal

Section: 715.4.6.3.1

Proponent: William E. Koffel, P.E., Koffel Associates, Inc., representing Fire Rated Glazing Industry

Revise as follows:

715.4.6.3.1 Identification. For fire-protection-rated glazing, the label shall bear the following four-part identification: “D – H or NH – T or NT – XXX.” “D” indicates that the glazing shall be used in fire door assemblies and that the glazing meets the fire ~~resistance~~ protection requirements of the test standard NFPA 252. “H” shall indicate that the glazing meets the hose stream requirements of the test standard. “NH” shall indicate that the glazing does not meet the hose stream requirements of the test. “T” shall indicate that the glazing meets the temperature requirements of Section 715.4.4.1. “NT” shall indicate that the glazing does not meet the temperature requirements of Section 715.4.4.1. The placeholder “XXX” shall specify the fire-protection-rating period, in minutes.

Reason: The proposal improves the current code text in two ways. First, the current Code text refers to “the test standard” without specifying what test standard. As a comparison, the other identification sections (706.2.1 and 715.5.8.1) both specifically identify the test standard. Secondly, the current text incorrectly refers to the performance of such glazing as having a fire resistance performance when in fact it is a fire protection rating.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

715.4.6.3.1 Identification. For fire-protection-rated glazing, the label shall bear the following four-part identification: AD B H or NH B T or NT B XXX.® AD® indicates that the glazing shall be used in fire door assemblies and that the glazing meets the fire protection requirements of NFPA 252. AH® shall indicate that the glazing meets the hose stream requirements of the test standard NFPA 252. ANH® shall indicate that the glazing does not meet the hose stream requirements of the test. AT® shall indicate that the glazing meets the temperature requirements of Section 715.4.4.1. ANT® shall indicate that the glazing does not meet the temperature requirements of Section 715.4.4.1. The placeholder AXXX® shall specify the fire-protection-rating period, in minutes.

Committee Reason: The direct reference to the NFPA 252 standard provides a specific reference which is easy to follow and clear. The revision to fire Aprotection® is correct and is justified. There is a difference between fire-resistance and fire-protection and the terms should be used correctly.

Assembly Action:

None

Final Hearing Results

FS116-06/07

AM

Code Change No: FS118-06/07

Original Proposal

Sections: 715.4.6.4, 715.5.3 (New)

Proponent: William E. Koffel, P.E., Koffel Associates, Inc., representing Fire Rated Glazing Industry

1. Revise as follows:

715.4.6.4 Safety glazing. Fire-protection-rated glazing installed in fire doors ~~or fire window assemblies~~ in areas subject to human impact in hazardous locations shall comply with Chapter 24.

2. Add new text as follows:

715.5.3 Safety glazing. Fire-protection-rated glazing installed in fire window assemblies in areas subject to human impact in hazardous locations shall comply with Chapter 24.

(Renumber subsequent sections)

Reason: Section 715.4.6 applies to glazing in fire door assemblies and therefore the requirement for safety glazing in fire window assemblies in incorrectly included in Section 715.4.6.4. The proposal retains the requirement but adds a new section in the fire window section (715.5) to reference the appropriate safety glazing requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal moves the requirement to a more appropriate section. This requirement for fire windows is difficult to find where it currently exists because the section it is currently in is applicable to doors.

Assembly Action:

None

Final Hearing Results

FS118-06/07

AS

Code Change No: FS124-06/07

Original Proposal

Table 715.5

Proponent: William E. Koffel, P.E., Koffel Associates, Inc., representing Fire Rated Glazing Industry

Revise table as follows:

**TABLE 715.5
FIRE WINDOW ASSEMBLY FIRE PROTECTION RATINGS**

TYPE OF ASSEMBLY	REQUIRED ASSEMBLY RATING (hours)	MINIMUM FIRE WINDOW ASSEMBLY RATING (hours)
Interior walls: Fire walls Fire barriers Smoke barriers and Fire partitions — <u>Fire partitions</u>	All > 1 1 1 <u>1/2</u>	NPa NPa $\frac{3}{4}$ $\frac{3}{4}$ <u>$\frac{1}{3}$</u>
Exterior walls	> 1 1	$1\frac{1}{2}$ $\frac{3}{4}$
Party wall	All	NP

NP = Not Permitted.

a. Not permitted except as specified in Section 715.2.

Reason: Although Exception No. 2 to Section 715.5 states the requirement for fire protection rated glazing in fire partitions having a fire resistance rating of ½ hour, Table 715.5 is silent for such fire partitions. The proposal merely makes the Table consistent with the requirements in the exception.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This change will coordinate with the requirements of the code which permit 1/2-hour fire partitions and will provide the rating required for the windows. This will help clarify an issue which is currently not addressed within the code but which does arise due to the available rating of the fire partition.

Assembly Action:

None

Final Hearing Results

FS124-06/07

AS

Code Change No: FS129-06/07

Original Proposal

Section: 715.5.8.1

Proponent: William E. Koffel, P.E., Koffel Associates, Inc., representing Fire Rated Glazing Industry

Revise as follows:

715.5.8.1 Identification. For fire-protection-rated glazing, the label shall bear the following two-part identification: "OH – XXX." "OH" indicates that the glazing meets both the fire-resistance protection and the hose-stream requirements of NFPA 257 and is permitted to be used in openings. "XXX" represents the fire-protection rating period, in minutes, that was tested.

Reason: The current text incorrectly refers to the performance of such glazing as having a fire resistance performance when in fact it is a fire protection rating.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Approved as Submitted**

Committee Reason: This corrects the terminology so that it uses the correct phrase and coordinates with the first portion of the paragraph that states it is for fire-protection rated glazing. These items do have a fire-protection rating and not a fire-resistance rating. This also coordinates with the action taken on FS116 to correct the terminology.

Assembly Action:**None**

Final Hearing Results

FS129-06/07

AS

Code Change No: FS130-06/07

Original Proposal

Sections: 716.3.2.1 (IMC 607.3.2.1)

Proponent: Vickie Lovell, Delray, FL, representing Air Movement and Control Association

Revise as follows:

716.3.2.1 (IMC 607.3.2.1) Smoke damper actuation methods. The smoke damper shall close upon actuation of a listed smoke detector or detectors installed in accordance with Section 907.10 and one of the following methods, as applicable:

1. Where a damper is installed within a duct, a smoke detector shall be installed in the duct within 5 feet (1524 mm) of the damper with no air outlets or inlets between the detector and the damper. The detector shall be listed for the air velocity, temperature and humidity anticipated at the point where it is installed. Other than in mechanical smoke control systems, dampers shall be closed upon fan shutdown where local smoke detectors require a minimum velocity to operate.

2. Where a damper is installed above smoke barrier doors in a smoke barrier, a spot-type detector listed for releasing service shall be installed on either side of the smoke barrier door opening.
3. Where a damper is installed within an ~~unducted~~ air transfer opening in a wall, a spot-type detector listed for releasing service shall be installed within 5 feet (1524 mm) horizontally of the damper.
4. Where a damper is installed in a corridor wall or ceiling, the damper shall be permitted to be controlled by a smoke detection system installed in the corridor.
5. Where a total-coverage smoke detector system is provided within areas served by a heating, ventilation and air-conditioning (HVAC) system, dampers shall be permitted to be controlled by the smoke detection system.

Reason: This is the only section in the 2006 IBC where the term “unducted opening” is used. It is presumed that this applies to a hole in the wall, and the more appropriate term is air transfer opening.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: It is better to use the term Air transfer opening since it is the typically used term in the code instead of the term Aunducted opening.

Analysis: A similar revision will also be made in Section 607.5.4.1 of the International Mechanical Code because it is using the same wording. This section was discussed during the committee discussion and because the section is under the control of this committee and is identical, it will be modified accordingly.

Assembly Action:

None

Final Hearing Results

FS130-06/07

AS

Code Change No: FS135-06/07

Original Proposal

Sections: 716.5.3 (IMC 607.5.5)

Proponent: Michael Perrino, Code Consultants, Inc

Revise as follows:

716.5.3 (IMC 607.5.5) Shaft enclosures. Shaft enclosures that are permitted to be penetrated by ducts and air transfer openings shall be protected with approved fire and smoke dampers installed in accordance with their listing.

Exceptions:

1. Fire dampers are not required at penetrations of shafts where:
 - 1.1. Steel exhaust subducts are extended at least 22 inches (559 mm) vertically in exhaust shafts, provided there is a continuous airflow upward to the outside; or
 - 1.2. Penetrations are tested in accordance with ASTM E119 as part of the rated assembly; or
 - 1.3. Ducts are used as part of an approved smoke control system designed and installed in accordance with Section 909 and where the fire damper will interfere with the operation of the smoke control system; or
 - 1.4. The penetrations are in parking garage exhaust or supply shafts that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.

2. In Group B and R occupancies, equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, smoke dampers are not required at penetrations of shafts where:
 - 2.1. ~~Kitchen, clothes dryer, b~~ Bathroom and toilet room exhaust openings are installed with steel exhaust subducts, having a wall thickness of at least 0.019 inch (0.48 mm); and
 - 2.2. That extend at least 22 inches (559 mm) vertically; and
 - 2.3. An exhaust fan is installed at the upper terminus of the shaft that is, powered continuously in accordance with the provisions of Section 909.11, so as to maintain a continuous upward airflow to the outside.
3. Smoke dampers are not required at penetration of exhaust or supply shafts in parking garages that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
4. Smoke dampers are not required at penetrations of shafts where ducts are used as part of an approved mechanical smoke control system designed in accordance with Section 909 and where the smoke damper will interfere with the operation of the smoke control system.
5. Fire dampers and combination fire/smoke dampers are not required in kitchen and clothes dryer exhaust system when installed in accordance with the *International Mechanical Code*.

Reason: (In regards to the IBC): To coordinate with IMC Sections 504.2 (last sentence) and with my proposed revision to the last sentence of IMC Section 506.3.10.

The IMC addresses protection for specific equipment and such protection should not be regulated by occupancy classification.

Sections 506.3.10 as proposed for change and 504.2 of the International Mechanical Code adequately address the materials, protection and installation of grease ducts and clothes dryer exhaust ducts based on the hazards associated with such systems. There is no reason to require additional occupancy specific protection to systems which function the same in any occupancy. The new exception adds the necessary information so that the reader is directed to the proper code requirements.

(In regards to the IMC): To coordinate with Section 506.3.10 last sentence (per the proposed code change) and Section 504.2 last sentence.

The last sentence of current section 506.3.10, Grease duct enclosure, provides duct enclosure requirements which states "The duct enclosure shall serve a single grease exhaust duct system and shall not contain any other ducts, piping, wiring, or systems."

The proposed code change to Section 607.5.5, Exception 2 is meant to coordinate with our companion change to Section 506.3.10, which will state "The duct enclosure shall serve a single grease exhaust duct system and shall not contain any other ducts, piping, wiring, fire dampers, combination fire/smoke dampers and any similar devices that will obstruct the exhaust flow."

Also the last sentence of current Section 504.2, Exhaust penetrations, states "Fire dampers, combination fire/smoke dampers and any similar devices that will obstruct the exhaust flow, shall be prohibited in clothes dryer exhaust ducts."

The provisions in Sections 506.3.10 and 504.2 are provided for the specific equipment and should not be regulated by occupancy classification.

Sections 506.3.10 as proposed for change and 504.2 of the International Mechanical Code adequately address the materials, protection and installation of grease ducts and clothes dryer exhaust ducts based on the hazards associated with such systems. There is no reason to require additional occupancy specific protection to systems which function the same in any occupancy.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Replace original proposal with the following:

716.5.3 (IMC 607.5.5) Shaft enclosures. Shaft enclosures that are permitted to be penetrated by ducts and air transfer openings shall be protected with approved fire and smoke dampers installed in accordance with their listing.

Exceptions:

1. Fire dampers are not required at penetrations of shafts where:
 - 1.1. Steel exhaust subducts are extended at least 22 inches (559 mm) vertically in exhaust shafts, provided there is a continuous airflow upward to the outside; or
 - 1.2. Penetrations are tested in accordance with ASTM E119 as part of the rated assembly; or
 - 1.3. Ducts are used as part of an approved smoke control system designed and installed in accordance with Section 909 and where the fire damper will interfere with the operation of the smoke control system; or
 - 1.4. The penetrations are in parking garage exhaust or supply shafts that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
2. In Group B and R occupancies, equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, smoke dampers are not required at penetrations of shafts where:
 - 2.1. Kitchen, clothes dryer, bathroom and toilet room exhaust openings are installed with steel exhaust subducts, having a wall thickness of at least 0.019 inch (0.48 mm); and
 - 2.2. That extend at least 22 inches (559 mm) vertically; and
 - 2.3. An exhaust fan is installed at the upper terminus of the shaft that is, powered continuously in accordance with the provisions of Section 909.11, so as to maintain a continuous upward airflow to the outside.
3. Smoke dampers are not required at penetration of exhaust or supply shafts in parking garages that are separated from other building shafts by not less than 2-hour fire-resistance-rated construction.
4. Smoke dampers are not required at penetrations of shafts where ducts are used as part of an approved mechanical smoke control system designed in accordance with Section 909 and where the smoke damper will interfere with the operation of the smoke control system.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

5. Fire dampers and combination fire/smoke dampers are not required in kitchen and clothes dryer exhaust system when installed in accordance with the *International Mechanical Code*.

Committee Reason: The committee modified the proposal to be consistent with the action taken previously on FS134-06/07. Therefore the proposal is modified so that no changes will be made to item 2.1 and only the new item 5 will move forward. The addition of exception 5 will be applicable to all occupancies and is not limited to the B and R occupancies as exception 2 is. This exception will basically serve as a cross-reference to the IMC and could be used to address items such as an industrial clothes dryer in a hospital. The IMC will prohibit the installation of dampers within these types of exhaust ducts.

Assembly Action:

None

Final Hearing Results

FS135-06/07

AM

Code Change No: **FS139-06/07**

Original Proposal

Sections: 716.5.6 (New) [IMC 607.5.6 (New)]

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

Add new text as follows:

716.5.6 (IMC 607.5.6) Exterior walls. Ducts and air transfer openings in fire-resistance rated exterior walls in accordance with Section 704.14 shall be protected with listed fire dampers installed in accordance with their listing.

Reason: Although Section 704.14 contains very explicit requirements for protection of duct and air transfer openings in fire-resistance rated exterior walls required to have protected openings, the cross referenced Section 716 contains no duct and air transfer opening protection requirements specifically applicable to exterior walls. Section 716.5 provides general charging language while the following subsections state specific requirements for the various fire-resistance rated assemblies. This proposal provides necessary charging language in Section 716 that responds to the requirement in Section 704.14. A basic fire damper requirement consistent with the protection of exterior wall openings has been provided. It is recommended that this fundamental charging language be approved in this code development cycle. This will allow interested parties the opportunity to modify the technical requirement as they feel necessary. Approval of this proposal will provide necessary charging language that currently does not exist in the *International Building Code*.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This helps to create a section to place these requirements in so that they are addressed and can be regulated. There is currently no section that picks up the protection requirements for ducts and air transfer openings through an exterior wall even though it is implied. Code users starting in Section 704.14 are referenced to Section 716.5 to determine where dampers are required. By placing this into the general "where required" section it provides clarity and gets to the damper listing provisions. In addition, it also provides consistency with fire walls, fire barriers and fire partitions. The intent is not to override Table 704.8 and permit openings in the 0 to 3 foot range even if they are protected with a damper.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Lawrence G. Perry, representing BOMA International, requests Approval as Modified by this public comment.

Modify proposal as follows:

716.5.6 (IMC 607.5.6) Exterior Walls. Ducts and air transfer openings in fire-resistance rated exterior walls required to have protected openings in accordance with Section 704.14 shall be protected with listed fire dampers in accordance with their listing.

Commenter's Reason: Without the addition of 'required to have protected openings' it is not clear whether this 'pointer' is requiring dampers on all ducts and air-transfer openings in rated exterior walls, or only those specifically required to have protected openings. Although it might be argued that this is covered by the reference to 704.14, it isn't clear, and it doesn't make much sense to make someone go digging through the book to find 5 extra words.

An additional question, not addressed by this comment, is whether the existing text at 704.14 and this new text could be read to imply that a fire damper is required on the exhaust duct for an emergency generator, which would be problematic.

Final Hearing Results

Code Change No: FS140-06/07

Original Proposal

Sections: 716.5.6 (New), 716.5; IMC 607.5.6 (New), IMC 607.5

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

1. Add new text as follows:

716.5.6 (IMC 607.5.6) Smoke partitions. A listed smoke damper designed to resist the passage of smoke shall be provided at each point that an air transfer opening penetrates a smoke partition. Smoke dampers and smoke damper actuation methods shall comply with Section 716.3.2.1.

Exception: Smoke dampers are not required where the openings in ducts are limited to a single smoke compartment and the ducts are constructed of steel.

2. Revise as follows:

716.5 (IMC 607.5) Where required. Fire dampers, smoke dampers, combination fire/smoke dampers and ceiling radiation dampers shall be provided at the locations prescribed in Sections 716.5.1 through ~~716.5.5~~ 716.5.6. Where an assembly is required to have both fire dampers and smoke dampers, combination fire/smoke dampers or a fire damper and smoke damper shall be required.

Reason: Presently, Section 716.5 has no smoke damper charging language provisions specific to smoke partitions although Section 710.7 requires smoke dampers at air transfer openings. The language proposed for Section 716.5.6 is consistent with the technical requirements of Section 710.7. It is also consistent with the detailed installation requirements for smoke dampers in smoke barriers in accordance with Section 716.5.5. It is only reasonable that an exception to more stringent smoke barrier requirements should also apply to smoke partitions. Approval of this proposal will assist in the proper determination of smoke damper requirements in smoke partitions.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Disapproved**

Committee Reason: While the intent is to provide a section for the reference from Section 710.7 to send the users to, this proposal and some of the potential modifications that were discussed during the testimony created confusion. The concern with this proposal is that while the base paragraph addresses air transfer openings, the exception deals with ducts. If the word duct is added into the base paragraph, it would then conflict with Section 710.7 which does not require a damper in a ducted system.

Assembly Action:**None**

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Gregory R. Keith, Professional heuristic Development, representing The Boeing Company, requests Approval as Modified by this public comment.

Modify proposal as follows:

716.5.6 Smoke partitions. A listed smoke damper designed to resist the passage of smoke shall be provided at each point that an air transfer opening penetrates a smoke partition. Smoke dampers and smoke damper actuation methods shall comply with Section 716.3.2.1.

~~Exception: Smoke dampers are not required where the openings in ducts are limited to a single smoke compartment and the ducts are constructed of steel. Where the installation of a smoke damper will interfere with the operation of a required smoke control system in accordance with Section 909, approved alternate protection shall be utilized.~~

716.5 Where required. Fire dampers, smoke dampers, combination fire/smoke dampers and ceiling radiation dampers shall be provided at the locations prescribed in Sections 716.5.1 through 716.5.6. Where an assembly is required to have both fire dampers and smoke dampers, combination fire/smoke dampers shall be required.

Commenter's Reason: Presently, Section 716.5 has no smoke damper charging language provisions specific to smoke partitions although Section 710.7 requires smoke dampers at air transfer openings. The language proposed for Section 716.5.6 is consistent with the detailed installation requirements for smoke dampers in smoke barriers in accordance with Section 716.5.5. It was pointed out during discussion of the item in Orlando, and as noted in the published reason for disapproval, that a proposed exception addressing smoke dampers in ducts was inappropriate in that Section 710.7 only requires smoke dampers at air transfer openings. That exception has been deleted from the proposal. Approval of this proposal will assist in the proper determination of smoke damper requirements in smoke partitions.

Final Hearing Results

AMPC1

Code Change No: **FS143-06/07**

Original Proposal

Sections: 716.6.2.1 (IMC 607.6.2.1), Chapter 35

Proponent: Bob Eugene, Underwriters Laboratories Inc.

1. Revise as follows:

716.6.2.1 (IMC 607.6.2.1) Ceiling radiation dampers. Ceiling radiation dampers shall be tested either in accordance with UL 555C or as part of a fire-resistance rated floor-ceiling or roof/ceiling assembly in accordance with ASTM E 119 or UL 263. ~~and~~ Ceiling radiation damper shall be installed in accordance with the details listed in the fire-resistance-rated assembly and the manufacturer's installation instructions and the listing. Ceiling radiation dampers are not required where either of the following applies:

1. Tests in accordance with ASTM E119 or UL 263 have shown that ceiling radiation dampers are not necessary in order to maintain the fire-resistance rating of the assembly.
2. Where exhaust duct penetrations are protected in accordance with Section 712.4.1.2, are located within the cavity of a wall and do not pass through another dwelling unit or tenant space.

2. Add standard to Chapter 35 as follows:

UL
263-03 Standard for Fire Test of Building Construction and Materials

Reason: The purpose of this proposed code change is to provide an additional option for the evaluation of ceiling radiation dampers.

Section 703 of the IBC requires the fire performance of horizontal fire-resistance-rated assemblies to be evaluated in accordance with ASTM E 119 or UL 263 (ASTM E 119 and UL 263 describe the same test method). However, current code language does not specifically permit the evaluation of a ceiling radiation damper as part of the horizontal fire-resistance-rated assembly. This proposal is intended to provide that option.

Section 716.6.2.1 of the IBC currently specifies ceiling radiation dampers are to be evaluated in accordance with UL 555C. UL 555C describes a comparative fire test procedure whereby the fire performance of a candidate ceiling radiation damper is compared to the performance of the hinged door type damper specified in many fire-resistance-rated assemblies published in the UL Fire Resistance Directory. UL 555C requires the ceiling radiation damper to perform equal or better than the hinged door type damper. The resulting listing of the ceiling radiation damper specifies the limitations under which the ceiling radiation damper may be used in a fire-resistance-rated assembly in lieu of the hinged door type damper.

Sub-Section 1 under Section 716.6.2.1 already states ceiling radiation dampers are not required at all when tests conducted to ASTM E 119 have shown that ceiling radiation dampers are not necessary to maintain the fire-resistance rating of the assembly. This proposal is simply a variation of this same logic. If an assembly incorporating a ceiling radiation damper provides the required fire-resistance rating, then that ceiling radiation damper should be permitted in the specific fire-resistance-rated assembly.

When a ceiling radiation damper is evaluated as part of a fire-resistance-rated floor-ceiling or roof-ceiling assembly, the description of the tested fire-resistance-rated assembly will include a description of the ceiling radiation damper and its installation.

ASTM E119 is the prescribed test for fire resistive assemblies. When duct outlets are included in the tested assembly, the duct outlet protective system in accordance with the tested assembly will be just as effective as one that uses a Listed ceiling radiation damper. UL 263 is an ANSI approved standard. Results of the review of the proposed standard(s) will be posted on the ICC website by August 20, 2006.

Bibliography: IBC Section 703

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Note: The following analysis was not in the Code Change Proposal book but was published in the AErrata to the 2006/2007 Proposed Changes to the International Codes and Analysis of Proposed Referenced Standards® provided at the code development hearings:

Analysis: Review of proposed new standard indicated that, in the opinion of staff, the standard did comply with ICC standards criteria.

Committee Action:

Approved as Submitted

Committee Reason: The discussion of FS142 and FS143 were taken together. The committee action on this item is taken based on the broader support for code change FS143-06/07. Because FS143 includes the UL standard as a reference, it provides an additional design option. Adding additional standards as design options coordinates with actions taken earlier at this hearing by the committee.

Assembly Action:

None

Code Change No: **FS145-06/07**

Original Proposal

Sections: 717.2.1; IRC R602.8.1

Proponent: Brian Scot Tollisen, P.E., New York Department of State Division of Code Enforcement and Administration

THIS PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC FIRE SAFETY

Revise as follows:

717.2.1 Fireblocking materials. Fireblocking or fill shall not be of any flammable material which can be shaped, fitted and permanently secured in position. Fireblocking shall consist of 2-inch (51 mm) nominal lumber or two thicknesses of 1-inch (25 mm) nominal lumber with broken lap joints or one thickness of 0.719-inch (18.3 mm) wood structural panel with joints backed by 0.719-inch (18.3 mm) wood structural panel or one thickness of 0.75-inch (19

mm) particleboard with joints backed by 0.75-inch (19 mm) particleboard. Gypsum board, cement fiber board, batts or blankets of mineral wool, glass fiber or other approved materials installed in such a manner as to be securely retained in place shall be permitted as an acceptable fireblock. Battis or blankets of mineral wool or glass fiber or other approved nonrigid materials shall be permitted for compliance with the 10-foot (3048 mm) horizontal fireblocking in walls constructed using parallel rows of studs or staggered studs. Loose-fill insulation material, insulating foam sealants and caulk materials shall not be used as a fireblock unless specifically tested in the form and manner intended for use to demonstrate its ability to remain in place and to retard the spread of fire and hot gases. The integrity of fireblocks shall be maintained.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R602.8.1 Materials. Fireblocking or fill shall not be of any flammable material which can be shaped, fitted and permanently secured in position. Except as provided in Section R602.8, Item 4, fireblocking shall consist of 2-inch (51 mm) nominal lumber, or two thicknesses of 1-inch (25.4 mm) nominal lumber with broken lap joints, or one thickness of 23/32-inch (19.8 mm) wood structural panels with joints backed by 23/32-inch (19.8 mm) wood structural panels or one thickness of 3/4-inch (19.1 mm) particleboard with joints backed by 3/4-inch (19.1 mm) particleboard, 1/2-inch (12.7 mm) gypsum board, or 1/4-inch (6.4 mm) cement-based millboard. Battis or blankets of mineral wool or glass fiber or other approved materials installed in such a manner as to be securely retained in place shall be permitted as an acceptable fire block. Battis or blankets of mineral or glass fiber or other approved nonrigid materials shall be permitted for compliance with the 10 foot horizontal fireblocking in walls constructed using parallel rows of studs or staggered studs.

Loose-fill insulation material, insulating foam sealants and caulk materials shall not be used as a fire block unless specifically tested in the form and manner intended for use to demonstrate its ability to remain in place and to retard the spread of fire and hot gases.

Reason: (Part I) To ensure that flammable materials will not be allowed for use as fireblocking in combustible construction.

Currently, IBC Section 717.2.1, as written, appears to allow the use of flammable insulating foam sealants as a fireblocking material. Evaluation service legacy reports recognize flammable insulating foam sealant products as an alternative to the fireblocking materials prescribed in the IBC. The ability to use flammable materials as a fireblocking material does not appear to be consistent with the intent of the fireblocking requirements of the IBC as the materials specified in IBC Section 717.2.1 are not flammable.

IBC Section 717.2.1 requires the integrity of all fireblocks to be maintained. Breaching a fireblock assembly comprised of 2 inch nominal lumber with a conduit and sealing the remaining penetration opening with a flammable material is not consistent with the intent of the requirement to maintain the integrity of the fireblock.

A portion of IBC Section 717.2.1 states “Loose-fill insulation material shall not be used as a fire block unless specifically tested in the form and manner intended for use to demonstrate its ability to remain in place and to retard the spread of fire and hot gases.” It is unclear if the phrase “loose-fill insulation” applies to insulating foam sealants however it does not seem plausible that foam sealants could be considered an alternative to loose-fill insulation unless the material were proven to retard the spread of fire and hot gases.

(Part II) Currently, IRC Section 602.8 as written appears to allow the use of flammable insulating foam sealants as a fireblocking material. Evaluation service legacy reports recognize flammable insulating foam sealant products as an alternative to the fireblocking materials prescribed in the IRC. The ability to use flammable materials as a fireblocking material does not appear to be consistent with the intent of the fireblocking requirements of the IRC as the materials specified in IRC Section R602.8.1 are not flammable.

IRC Section R602.8.1.2 requires the integrity of all fireblocks to be maintained. Breaching a fireblock assembly comprised of 2 inch nominal lumber with a conduit and sealing the remaining penetration opening with a flammable material is not consistent with the intent of the requirement to maintain the integrity of the fireblock..

The last sentence in IRC Section R602.8.1 states “Loose-fill insulation material shall not be used as a fire block unless specifically tested in the form and manner intended for use to demonstrate its ability to remain in place and to retard the spread of fire and hot gases.” It is unclear if the phrase “loose-fill insulation” applies to insulating foam sealants however it does not seem plausible that foam sealants could be considered an alternative to loose-fill insulation unless the material were proven to retard the spread of fire and hot gases.

The language proposed above is consistent with the previous Uniform Code of New York State. For example:

1. Uniform Fire Prevention and Building Code, NYCRR 9B, Section 717.4 (b)(1) “Firestopping or fill shall be of nonflammable material which can be shaped, fitted and permanently secured in position.
2. Uniform Fire Prevention and Building Code, NYCRR 9B, Section 717.4(b)(4) “Flammable materials shall not be permitted as insulation or fill in concealed or attic spaces.”

Cost: The code change proposal will not increase the cost of construction.

Analysis: Since the term “flammable material” is defined in Section 307.2, it is assumed that definition would be applicable to this proposed requirement.

Public Hearing Results

**PART I C IBC FIRE SAFETY
Committee Action:**

Approved as Modified

Modify the proposal as follows:

717.2.1 Fireblocking materials. ~~Fireblocking or fill shall not be of any flammable material which can be shaped, fitted and permanently secured in position.~~ Fireblocking shall consist of 2-inch (51 mm) nominal lumber or two thicknesses of 1-inch (25 mm) nominal lumber with broken lap joints or one thickness of 0.719-inch (18.3 mm) wood structural panel with joints backed by 0.719-inch (18.3 mm) wood structural panel or one thickness of 0.75-inch (19 mm) particleboard with joints backed by 0.75-inch (19 mm) particleboard. Gypsum board, cement fiber board, batts or blankets of mineral wool, ~~glass mineral~~ fiber or other approved materials installed in such a manner as to be securely retained in place shall be permitted as an acceptable fireblock. Batts or blankets of mineral wool ~~or glass, mineral~~ fiber or other approved nonrigid materials shall be permitted for compliance with the 10-foot (3048 mm) horizontal fireblocking in walls constructed using parallel rows of studs or staggered studs. Loose-fill insulation material, insulating foam sealants and caulk materials shall not be used as a fireblock unless specifically tested in the form and manner intended for use to demonstrate its ability to remain in place and to retard the spread of fire and hot gases. The integrity of fireblocks shall be maintained.

Committee Reason: This proposal attempts to help to clarify what fireblocking is and it is attempting to stop the use of flammable materials which may reduce the effectiveness of the fireblocking. While the intent of the proposal is good, the language of the first sentence of the proposal does create a difficulty with certain products which may be used or around which the fireblocking is placed. The modifications help to address the concerns discussed during the testimony by eliminating the first sentence but accepting the added text regarding foam sealants which were the primary concern of this proposal. Additional changes were made to include Amineral fiber® instead of Aglass fiber® which was an issue of discussion during previous code change cycles and resulted in changes in the definitions found in the 2006 IBC. Some brands of caulk have been tested and have been shown to be as effective as the prescribed material or fireblocking.

Assembly Action:

None

PART II C IRC

Committee Action:

Disapproved

Committee Reason: The proposed first sentence, for Section R602.8.1, is inappropriate for use in the IRC.

Assembly Action:

None

Final Hearing Results

FS145-06/07, Part I	AM
FS145-06/07, Part II	D

Code Change No: FS146-06/07

Original Proposal

Sections: 717.2.1, 717.2.1.1, 717.2.1.2 (New), 717.2.1.3, 717.2.1.4

Proponent: Lawrence Brown, CBO, National Association of Home Builders (NAHB)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY AND THE IRC BUILDING/SAFETY CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC FIRE SAFETY

Revise as follows:

717.2.1 Fireblocking materials. Fireblocking shall consist of the following materials:

1. 2-inch (51 mm) nominal lumber, ~~or~~
2. Two thicknesses of 1-inch (25 mm) nominal lumber with broken lap joints, ~~or~~
3. One thickness of 0.719-inch (18.3 mm) wood structural panels with joints backed by 0.719-inch (18.3 mm) wood structural panels ~~or~~
4. One thickness of 0.75-inch (19.1 mm) particleboard with joints backed by 0.75-inch (19 mm) particleboard,
5. ½-inch (12.7 mm) Gypsum board, ~~or~~
6. ¼-inch (6.4 mm) Cement-based millboard
7. Batts or blankets of mineral wool or glass fiber or other approved materials installed in such a manner as to be securely retained in place ~~shall be permitted as an acceptable fire block~~

717.2.1.1 Batts or blankets of mineral or glass fiber. Batts or blankets of mineral or glass fiber or other approved nonrigid materials shall be permitted for compliance with the 10-foot (3048 mm) horizontal fireblocking in walls constructed using parallel rows of studs or staggered studs.

717.2.1.2 Unfaced fiberglass. Unfaced fiberglass batt insulation used as fireblocking shall fill the entire cross section of the wall cavity to a minimum height of 16 inches (406 mm) measured vertically. When piping, conduit or similar obstructions are encountered, the insulation shall be packed tightly around the obstruction.

717.2.1.3 Loose-fill insulation material. Loose-fill insulation material shall not be used as a fireblock unless specifically tested in the form and manner intended for use to demonstrate its ability to remain in place and to retard the spread of fire and hot gases.

717.2.1.4 Fireblocking integrity. The integrity of fireblocks shall be maintained.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R602.8.1 Fireblocking materials. Except as provided in Section R602.8, Item 4, fireblocking shall consist of the following materials:

1. 2-inch (51 mm) nominal lumber, ~~or~~
2. Two thicknesses of 1-inch (25.4 mm) nominal lumber with broken lap joints, ~~or~~
3. One thickness of 23/32-inch (19.8 mm) wood structural panels with joints backed by 23/32-inch (19.8 mm) wood structural panels ~~or~~
4. One thickness of 3/4-inch (19.1 mm) particleboard with joints backed by 3/4-inch (19.1 mm) particleboard, ~~or~~
5. 1/2-inch (12.7 mm) gypsum board, ~~or~~
6. 1/4-inch (6.4 mm) cement-based millboard
7. Batts or blankets of mineral wool or glass fiber or other approved materials installed in such a manner as to be securely retained in place ~~shall be permitted as an acceptable fire block~~

R602.8.1.1 Batts or blankets of mineral or glass fiber. Batts or blankets of mineral or glass fiber or other approved nonrigid materials shall be permitted for compliance with the 10 foot horizontal fireblocking in walls constructed using parallel rows of studs or staggered studs.

R602.8.1.2 4 Unfaced fiberglass. Unfaced fiberglass batt insulation used as fireblocking shall fill the entire cross section of the wall cavity to a minimum height of 16 inches (406 mm) measured vertically. When piping, conduit or similar obstructions are encountered, the insulation shall be packed tightly around the obstruction.

R602.8.1.3 Loose-fill insulation material. Loose-fill insulation material shall not be used as a fire block unless specifically tested in the form and manner intended for use to demonstrate its ability to remain in place and to retard the spread of fire and hot gases.

R602.8.1.4 2 Fireblocking integrity. The integrity of all fireblocks shall be maintained.

Reason: (IBC) This is primarily an editorial change. This proposal takes the 7 (seven) fireblocking materials, and the 3 (three) additional sub-provisions located in the current, very lengthy paragraph and separates them into a more user-friendly format. All of the new text (underlined) is the text of the IRC for this same provision, including the 1/2-inch dimension for gypsum board, and the 1/4-inch dimension for Cement fiber board, that are an appropriate minimum thickness for these materials used as fireblocking. The new modifying provision for “unfaced fiberglass” (as an allowed fireblocking material in “(g)”) is also from the IRC and provides the direction needed to install this material to be an effective fireblock. The text shown as stricken in “(g)” above is not needed – because, if the material is allowed as a fireblocking material it is already “acceptable”. All other provisions remain unchanged.

Reason: (IRC) This is primarily an editorial change. This proposal takes the 7 (seven) fireblocking materials, and the 4 (four) sub-provisions located in the current, very lengthy paragraph and separates them into a more user-friendly format. The text shown as stricken in “(g)” above is not needed – because, if the material is allowed as a fireblocking material it is already “acceptable”. All other provisions remain unchanged.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

**PART I C IBC FIRE SAFETY
Committee Action:**

Approved as Submitted

Committee Reason: The editorial style makes it easier to read and see the options that are available for use as a fireblock. The loss of the word *Aor*® after each of the items helps make it clear that any of them are acceptable for use. Dividing the long paragraph into smaller pieces makes the provisions easier to understand and find.

Assembly Action:

None

PART II C IRC

Committee Action:

Approved as Submitted

Committee Reason: This change reformats the requirements into a list. This clarifies the code and makes it more user friendly.

Assembly Action:

None

Final Hearing Results

FS146-06/07, Part I	AS
FS146-06/07, Part II	AS

Code Change No: FS148-06/07

Original Proposal

Section: 719.4

Proponent: Rick Thornberry, P.E., The Code Consortium, Inc., representing Cellulose Insulation Manufacturers Association (CIMA)

Revise as follows:

719.4 Loose-fill insulation. Loose-fill insulation materials that cannot be mounted in the ASTM E 84 apparatus without a screen or artificial supports shall comply with the flame spread and smoke-developed limits of Sections 719.2 and 719.3 when tested in accordance with CAN/ULC S102.2.

Exception: Cellulose loose-fill insulation shall not be required to comply with ~~the flame spread index requirement~~ of CAN/ULC S102.2, provided such insulation complies with the requirements of Section 719.6.

Reason: This code change proposal deletes the requirement that cellulose loose-fill insulation be tested in accordance with CAN/ULC S102.2 for smoke-developed. It should be noted that testing cellulose loose-fill insulation per CAN/ULC S102.2 for flame spread is already preempted by federal regulations promulgated by the Consumer Product Safety Commission (CPSC). However, those regulations do not specifically preempt it from being tested for smoke development. That is why the code currently requires cellulose loose-fill insulation to be tested per ASTM E84 for smoke developed. See the exceptions to Section 719.2 and 719.3.

CAN/ULC S102.2 was originally developed in Canada for testing attic insulation but it never caught on, primarily because of ASTM E970, the critical radiant flux test for attic floor insulation. ASTM E970 is required by both the IRC and IBC and it is specified throughout the world simply because it is a better test for attic insulation. Another major drawback to the CAN/ULC S102.2 test is that it requires major modifications to the ASTM E84 test apparatus. In fact, there are only a couple of Canadian laboratories that can do this test because they made the modifications but there are no US laboratories that can. Furthermore, a Health Canada Laboratories representative who conducts this test publicly stated it is "unreliable and inconsistent". And, the standard hasn't had a consensus revision in more than 18 years.

Several member companies of CIMA have conducted significant numbers of both the ASTM E84 and the CAN/ULC S102.2 tests on cellulose insulation at considerable expense and noted that they get virtually the same "smoke-developed" numbers from both tests. The cost to comply with the current requirement will likely run in the tens of thousands of dollars for the cellulose insulation industry. Thus, we believe there is no technical basis or benefit for testing cellulose loose-fill insulation to CAN/ULC for the sole purpose of obtaining a smoke developed number.

Finally, due to a lack of interest in Canada, CAN/ULC S102.2 has been earmarked by Health Canada for removal from the Canadian government's Product Safety Act.

For all of the above reasons, we respectfully urge the committee to approve this code change proposal which deletes the requirement for testing cellulose loose-fill insulation in accordance with CAN/ULC S102.2 to determine a smoke-developed number.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The ASTM E 84 is not appropriate for the testing of the loose fill insulation. There are testing agencies within the states that do conduct testing to the Canadian standard. The committee discussion focused on the issue of an inconsistency that the proposal would create between Sections 719.3 and 719.4. The proposal would effectively eliminate the smoke-development testing requirement for cellulose loose-fill insulation.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Rick Thornberry, P.E., The Code Consortium, Inc., representing Cellulose Insulation Manufacturers Association (CIMA), requests Approval as Modified by this public comment.

Replace proposal as follows:

719.4 Loose-fill insulation. Loose-fill insulation materials that cannot be mounted in the ASTM E84 apparatus without a screen or artificial supports shall comply with the flame spread and smoke-developed limits of Sections 719.2 and 719.3 when tested in accordance with CAN/ULC S102.2.

Exception: Cellulose loose-fill insulation shall not be required to ~~comply with the flame spread index requirements of~~ be tested in accordance with CAN/ULC S102.2, provided such insulation complies with the requirements of Section 719.2 or 719.3, as applicable, and Section 719.6.

Commenter's Reason: The Cellulose Insulation Manufacturers Association (CIMA) has filed this Public Comment to request the ICC voting membership to approve this code change proposal based on the substitute proposal contained in this Public Comment to revise the Exception to Section 719.4 regarding the fire and smoke testing of cellulose loose-fill insulation. We believe, the proposed revisions will better clarify the intent of the original code change proposal to exempt cellulose loose-fill insulation from being tested to two separate fire tests for determination of the smoke developed index (rating). We would also like to respond to some of the statements made in the Committee Reason for recommending disapproval of our original code change proposal.

The Committee states that the ASTM E84 test is not an appropriate test for loose-fill insulation. In general, we agree, certainly from the perspective of determining a flame spread index. However, the way the present code is structured for testing of cellulose loose-fill insulation, the ASTM E84 test is only used to determine the smoke developed index. That index is allowed to be as high as 450, whereas the flame spread index could not be greater than 25. Since there is more than an order of magnitude difference in the required limits, the accuracy of the ASTM E84 test method is not nearly as critical for determining the smoke developed index of a material as it is for determining the flame spread index. Furthermore, cellulose loose-fill insulation tested to ASTM E84 generally results in smoke developed indexes of less than 50. So even if there was a significant error in the test results, there would be no jeopardy of approaching the 450 limit specified in the code.

The Committee has also indicated that testing agencies in the United States do test to the CAN/ULC S102.2. However, it should be clarified that there are testing agencies in the United States that are qualified to test to this standard but they must modify their typical ASTM E84 test apparatus to accomplish that. Currently, there are no such testing labs in the United States that have modified their equipment for this testing. Therefore, any manufacturer wishing to test to the Canadian standard must go to Canada. We do not believe that such a hardship which involves significant additional costs and time is justified for determining a smoke developed rating which by ASTM E84 testing has been shown to be very low. In fact, several cellulose insulation manufacturers who do sell their insulation in Canada or who manufacture their materials in Canada have tested to the CAN/ULC S102.2 test and have shown that the smoke developed ratings are even lower than those determined by the ASTM E84 test method for the same materials. Therefore, the ASTM E84 test method should be adequate for determining the smoke developed index of cellulose loose-fill insulation.

The Committee is also concerned that there is an inconsistency between Sections 719.3 and 719.4. We would also point out that Section 719.2 has a similar exception to that in Section 719.3 that allows the cellulose loose-fill insulation tested in accordance with ASTM E84 to not have to be tested for a flame spread index but only for a smoke developed index. This is not an inconsistency in that the original code requirements incorporated into the International Building Code (IBC) were structured in such a manner as to recognize the unique characteristics of cellulose loose-fill insulation and the Federal preemption on many of the requirements for limiting its combustibility. We have clarified this issue to eliminate what may appear to be an inconsistency by clearly stating in the Exception to Section 719.3 that the cellulose loose-fill insulation is required to comply with Section 719.2 or 719.3, as appropriate, as well as with Section 719.6 which prescribes the Federal preemptive regulations for fire testing of cellulose loose-fill insulation. Under these conditions there is no need to require the cellulose loose-fill insulation to be tested to CAN/ULC S102.2 to determine a smoke developed limit. However, the current code does require cellulose loose-fill insulation to be tested in accordance with ASTM E84 to determine a smoke developed index.

The Committee Reason also indicates that the originally proposed revision to the Exception to Section 719.4 would virtually eliminate smoke developed testing for cellulose loose-fill insulation. We believe this is based on an incorrect interpretation of the code requirements which we have corrected with the above mentioned revisions proposed in this Public Comment. It has always been the intent, as well as the requirement, of the IBC to specify smoke developed index testing in accordance with ASTM E84 for cellulose loose-fill insulation. Furthermore, because of the combustibility test requirements specified by the Federal government through the CPSC that preempt the application of any other fire test requirements, the cellulose loose-fill insulation cannot be mandated to be tested to the Canadian standard for determining a flame spread limitation. Therefore, if the CAN/ULC S102.2 standard cannot be mandated for determining a flame spread limitation for cellulose loose-fill insulation, why should it be invoked for testing to determine a smoke developed limitation when testing that insulation in accordance with ASTM E84 will provide suitable test results for determining a smoke developed index to satisfy compliance with the 450 limitation presently prescribed in the code for all insulation materials?

In conclusion, we believe that the proposed revisions contained in this Public Comment should satisfy the Committee's concerns about the application of the appropriate test methods to cellulose loose-fill insulation. Therefore, we sincerely request that the Committee recommendation for disapproval be overturned and this Public Comment be approved with the modifications shown to the Exception to Section 719.4.

Final Hearing Results

FS148-06/07

AMPC1

Code Change No: FS149-06/07

Original Proposal

Table 720.1(2)

Proponent: Sam Francis, American Forest & Paper Association

Revise table as follows:

TABLE 720.1(2)
RATED FIRE-RESISTANCE PERIODS FOR VARIOUS WALLS AND PARTITIONS ^{a,o,p}

MATERIAL	ITEM NUMBER	CONSTRUCTION	MINIMUM FINISHED THICKNESS FACE-TO-FACE ^b (Inches)			
			4 hour	3 hour	2 hour	1 hour
15. Exterior or interior walls	15-1.12q	2"x6"wood studs at 16"with double top plates, single bottom plate; interior and exterior sides covered with 5/8 "Type X gypsum wallboard, 4'wide, applied horizontally or vertically with vertical joints over studs, and fastened with 21/4 " Type S drywall screws, spaced 12"on center. Cavity to be filled with 5-1/2mineral wool insulation.	—	—	—	6¾
	45-1.16q	2" x 4" wood studs at 16" with double top plates, single bottom plate; interior sides covered with 5/8 " Type X gypsum wallboard, 4' wide, applied horizontally unblocked, and fastened with 21/4 " Type S drywall screws, spaced 12" on center, wallboard joints covered with paper tape and joint compound, fastener heads covered with joint compound. Exterior covered with 3/8 " wood structural panels applied vertically, horizontal joints blocked and fastened with 6d common nails (bright) — 12" on center in the field, 6" on center panel edges. Cavity to be filled with 2 1/2 " mineral wool insulation. Rating established for exposure from interior side only.	—	—	—	4½
	45-1.17 15-1.16g	2"x6"wood studs at 24"centers with double top plates, single bottom plate; interior and exterior side covered with two layers of 5/8 " Type X gypsum wallboard, 4'wide, applied horizontally with vertical joints over studs. Base layer fastened with 21/4 " Type S drywall screws, spaced 24"on center, and face layer fastened with Type S drywall screws, spaced 8"on center, wallboard joints covered with paper tape and joint compound, fastened heads covered with joint compound. Cavity to be filled with 5 1/2 "mineral wool insulation.	=	=	7¾	=
16. Exterior walls rated for fire resistance from the inside only in accordance with Section 704-5.	16-1.1q	2" x 4" wood studs at 16" centers with double top plates, single bottom plate; interior side covered with 5/8 " Type X gypsum wallboard, 4' wide, applied horizontally unblocked, and fastened with 2-1/4 " Type S drywall screws, spaced 12" on center, wallboard joints covered with paper tape and joint compound, fastener heads covered with joint compound. Exterior covered with 3/8 " wood structural panels (oriented strand board), applied vertically, horizontal joints blocked and fastened with 6d common nails (bright) — 12" on center in the field, and 6" on center panel edges. Cavity to be filled with 3-1/2 " mineral wool insulation. Rating established for exposure from interior side only.	—	—	—	4½

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

MATERIAL	ITEM NUMBER	CONSTRUCTION	MINIMUM FINISHED THICKNESS FACE-TO-FACE ^b (Inches)			
			4 hour	3 hour	2 hour	1 hour
	16-1.2q	2"x 6" (51mm x 152 mm) wood studs at 16 " centers with double top plates, single bottom plate; interior side covered with 5/8 " Type X gypsum wallboard, 4' wide, applied horizontally or vertically with vertical joints over studs and fastened with 21/4 " Type S drywall screws, spaced 12" on center, wallboard joints covered with paper tape and joint compound, fastener heads covered with joint compound, exterior side covered with 7/16 " wood structural panels (oriented strand board) fastened with 6d common nails (bright) spaced 12" on center in the field and 6" on center along the panel edges. Cavity to be filled with 5 1/2 " mineral wool insulation. Rating established from the gypsum-covered side only.	—	—	—	6 ⁹ / ₁₆
	16-1.3	2"x6"wood studs at 16"centers with double top plates, single bottom plates; interior side covered with 5/8 " Type X gypsum wallboard, 4' 4' 4' wide, applied vertically with all joints over framing or blocking and fastened with 21/4 "Type S drywall screws spaced 7"on center. Joints to be covered with tape and joint compound. Exterior covered with 3/8 "wood structural panels (oriented strand board), applied vertically with edges over framing or blocking and fastened with 6d common nails (bright) at 12"on center in the field and 6"on center on panel edges. R-19 fiberglass insulation installed in stud cavity. <u>Rating established from the gypsum-covered side only.</u>	—	—	—	6½

(Portions of table not shown do not change.)

Reason: Item 1: (15-1.12q) This item was among several to be 'corrected' by the new definition of mineral wool. Instead, the printed code lacked the insulation requirement in its entirety. This will correct an editorial/printing error in the 2006 edition.

Item 2: (~~15-1.16q~~ & 16-1.1q) This item was 15-1.16 in the 2003 edition. In an AF&PA code change, a separate group, 16-x.xx was created for assemblies which are asymmetric (16 is for tested for exposure from the inside only which is a condition permitted by the IBC). In addition, a change last year was approved to delete the parenthetical notation of OSB. The purpose of this change is to correct the editorial/printing errors. Item 15-1.16 was moved in a previous code cycle to 16-1.1. It should have been deleted here. This will correct an editorial/printing error in the 2006 edition.

Item 3: (~~15-1.17~~ 15-1.16g) Incorrectly deleted in 2006 edition. No proposal ever took this action. It is intended to keep a two hour assembly in the code table. This will correct an editorial/printing error in the 2006 edition by restoring an item incorrectly deleted during the editing/printing of the 2006 edition.

Item 4: (16-1.2q) This item was moved in the same approved code change as the item above. In addition, a change last year was approved to delete the parenthetical notation of OSB. The purpose of this change is to correct the editorial/printing errors. This will correct an editorial/printing error in the 2006 edition.

Item 5: (16-1.3) This change will correct the editorial/printing errors in the 2006 edition. It also adds the last sentence, present in each of the other assemblies in 16-x.xx, which will require that the rating is asymmetric and is only established for the gypsum side of the assembly.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: As stated in the proponents reason statement, the revisions address items that are currently missing in the code but which were a part of the testing or needed for clarification. Specifically, the revision in item 15-1.12 was a part of the original test and should be included to assure the assembly is properly constructed. The change to item 16-1.3 clarifies that this is a non-symmetrical assembly and it only has a fire-resistance rating from the one side. This also coordinates with the other items in section 16 of the table.

Analysis: The majority of the items shown in the monograph have been previously addressed and accepted as errata to the 2006 edition of the code. The following are considered as errata and will not be acted on by the committee: (1) deletion of existing item 15-1.16; (2) addition of the new item 15-1.16; (3) revisions in item 16-1.1; (4) revisions in item 16.1.2; and (5) the first two revisions shown in item 16-1.3 (the revision to 4 feet and deletion of ~~oriented strand board~~). Therefore, the only changes which are being acted on by the committee are (1) the addition of text into item 15-1.12, and (2) the addition in the last line of item 16.1.3.

Assembly Action:

None

Final Hearing Results

FS149-06/07

AS

Code Change No: **FS150-06/07**

Original Proposal

Table 720.1(2)

Proponent: James Shriver, Thermafiber Inc.

Revise table as follows:

TABLE 720.1(2)
RATED FIRE-RESISTANCE PERIODS FOR VARIOUS WALLS AND PARTITIONS ^{a,o,p}

MATERIAL	ITEM NUMBER	CONSTRUCTION
15. Exterior or interior walls	15-1.13q	2" x 6" wood studs at 16" with double top plates, single bottom plate; interior and exterior sides covered with 5/8" Type X gypsum wallboard, 4' wide, applied vertically with all joints over framing or blocking and fastened with 2 1/4" Type S drywall screws, spaced 12" on center. R-19 fiberglass mineral fiber insulation installed in stud cavity.

(Portions of table not shown do not change)

Reason: Changing the language to mineral fiber will allow either fiberglass or mineral wool insulation in the stud cavity.

Mineral wool insulation is a well known and proven fire resistance material that has been tested, and approved numerous times for all types of fire resistive assemblies. In this type of a wall assembly, the Underwriters Laboratory Fire Resistance Directory lists mineral wool and fiberglass insulations as alternate materials in numerous design listings. Reference UL designs U305, U309, U311, U317, U327, U334, U338, U356 and U359. Specifically, U305 covers this design and lists the insulation as glass fiber or mineral wool with a rating of 1 hr. The same rating as listed in table 720.1(2) item number 15-1.13.

The UL Fire resistance directory also lists all of these designs as 2" x 4" wood studs versus this design with 2" x 6" wood studs. The UL Fire Resistive rating – ANSI/UL 263 (BXUV) design information section VI wall and partition assemblies states the size of the studs are minimum unless otherwise stated. . Therefore the referenced UL designs apply to 2" x 6" construction as well.

By changing the language to mineral fiber as defined in ASTM C168, Standard Terminology Relating to Thermal Insulation, both mineral wool and fiberglass insulation will be allowed in this wall assembly that has been tested and proven to be effective with either materials. Providing this construction with an alternate product also allows the end user more flexibility in their overall building needs.

Mineral wool has been tested in numerous assemblies as noted in the UL listed designs for wood studs – U305, U309, U311, U317 etc. There are also numerous examples in the metal studs listed designs U400 – 499. Specifically U305 is the same design as this construction (15-1.13). UL design listing U305 (attached), line item 5 Batt and Blankets, list glass fiber or mineral wool insulation in the assembly with the same hourly rating. Therefore using mineral wool as an alternant to fiberglass in this assembly will not effect the constructions hourly rating.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A copy of UL design number BXUV.U305 was submitted but has not been printed here.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This revision provides consistency with the definition and also with the UL fire-resistance directory. The term A mineral fiber® will pick up both the glass and wool insulation products. Making this revision will allow for the inclusion of additional types of insulating materials other than fiberglass.

Assembly Action:

None

Interior side covered with two layers of 5/8" thick Type X gypsum wallboard. Bottom layer attached to studs with 1" long No. 6 drywall screws at 24" on center. Top layer attached to studs with 1 5/8" long No. 6 drywall screws at 12" on center.</u>			7 7/8	

(Portions of table not shown do not change)

Reason: The purpose of this code change is to incorporate generic exterior/interior wall constructions into Table 720.1(2) for 1-hour and 2-hour walls constructed utilizing thin veneer brick units or brick units in conjunction with 5/8 inch thick Type X gypsum wallboard. These wall assemblies are currently contained in the ICBO Evaluation Service, Inc. Evaluation Report ER-5058. The basis for their evaluation and listing in the evaluation report as complying 1-hour and 2-hour fire-resistance rated exterior/interior wall assemblies is fire test data developed in 1993 by Walter Dickey, Consulting Engineer, who conducted a series of fire tests at Warnock Hersey at their fire testing lab in Pittsburg, CA.

We have reviewed the ICBO Evaluation Service, Inc. Evaluation Report, as well as the fire test data, to verify that it will demonstrate compliance with the 2006 International Building Code (IBC). The result is the text contained in the proposed revisions to Table 720.1(2) for the various wall assemblies of 1-hour and 2-hour fire-resistance ratings utilizing either thin veneer brick units or standard brick units attached as adhered veneer or anchored veneer. Copies of the Evaluation Service Report and the fire test reports are available upon request.

Cost Impact: This proposal will not increase the cost of construction.

Analysis: To view or download copies of ICBO Evaluation Service, Inc. Evaluation Report ER-5058 go to <http://www.icc-es.org> and then select the "Evaluation Reports" link in the left margin.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

**TABLE 720.1(2)
RATED FIRE-RESISTANCE PERIODS FOR VARIOUS WALLS AND PARTITIONS^{a,o,p}**

MATERIAL	ITEM NUMBER	CONSTRUCTION	MINIMUM FINISHED THICKNESS FACE-TO-FACE ^b (inches)			
			4 hour	3 hour	2 hour	1 hour
15. Exterior or interior walls	15-2.1	3 5/8" No. 16 gage steel studs at 24" on center or 2" x 4" wood studs at 24" on center. Metal lath attached to the exterior side of studs with minimum 1" long No. 6 drywall screws at 6" on center and covered with minimum 3/4" thick portland cement plaster. Thin veneer brick units of clay or shale complying with ASTM C1088, Grade TBS or better, installed in running bond in accordance with Section 1405.9. Combined total thickness of the portland cement plaster, mortar, and thin veneer brick units shall be not less than 1 3/4". (Portions of table not shown remain unchanged)

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

Committee Reason: The proposal adds additional prescriptive assemblies which use a clay brick veneer. The modifications provide more information within the code rather than relying upon the reference standard to find this requirement. The standard is currently referenced and used in the IBC. The second change that the modification makes is to add the 1-inch air gap. The code currently has this requirement in other sections due to the code’s reference to ACI 530.1. The modification simply adds the air gap requirement and dimension into the assembly so that it is clearly seen and not inadvertently constructed in violation of the standard.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Maureen Traxler, City of Seattle Department of Planning and Development, requests Approval as Modified by this public comment.

Modify proposal as follows:

**TABLE 720.1(2)
RATED FIRE-RESISTANCE PERIODS FOR VARIOUS WALLS AND PARTITIONS^{a,o,p}**

MATERIAL	ITEM NUMBER	CONSTRUCTION	MINIMUM FINISHED THICKNESS FACE-TO-FACE ^b (inches)			
			4 hour	3 hour	2 hour	1 hour
15. Exterior or interior walls	15-2.1 ^d	3 5/8" No. 16 gage steel studs at 24" on center or 2" x 4" wood studs at 24" on center. Metal lath attached to the exterior side of studs with minimum 1" long No. 6 drywall screws at 6" on center and covered with minimum 3/4" thick portland cement plaster. Thin veneer brick units of clay or shale complying with ASTM C1088, Grade TBS or better, installed in running bond in accordance with Section 1405.9. Combined total thickness of the portland cement plaster, mortar, and thin veneer brick units shall be not less than 1 3/4". Brick units of clay or shale not less than 2 5/8" thick complying with ASTM C 216 installed in accordance with Section 1405.5 with a minimum 1" air space. Interior side covered with two layers of 5/8" thick Type X gypsum wallboard. Bottom layer attached to studs with 1" long No. 6 drywall screws at 24" on center. Top layer attached to studs with 1 5/8" long No. 6 drywall screws at 12" on center.			8 1/2	

(Portions of proposed changes to table not shown do not change)

For SI: 1 inch = 25.4 mm, 1 square inch = 645.2 mm², 1 cubic foot = 0.0283 m³.

- a. Staples with equivalent holding power and penetration shall be permitted to be used as alternate fasteners to nails for attachment to wood framing.
- b. Thickness shown for brick and clay tile is nominal thicknesses unless plastered, in which case thicknesses are net. Thickness shown for concrete masonry and clay masonry is equivalent thickness defined in Section 721.3.1 for concrete masonry and Section 721.4.1.1 for clay masonry. Where all cells are solid grouted or filled with silicone-treated perlite loose-fill insulation; vermiculite loose-fill insulation; or expanded clay, shale or slate lightweight aggregate, the equivalent thickness shall be the thickness of the block or brick using specified dimensions as defined in Chapter 21. Equivalent thickness may also include the thickness of applied plaster and lath or gypsum wallboard, where specified.

- c. For units in which the net cross-sectional area of cored brick in any plane parallel to the surface containing the cores is at least 75 percent of the gross cross-sectional area measured in the same plane.
- d. Shall be used for nonbearing purposes only.
- e. For all of the construction with gypsum wallboard described in this table, gypsum base for veneer plaster of the same size, thickness and core type shall be permitted to be substituted for gypsum wallboard, provided attachment is identical to that specified for the wallboard, and the joints on the face layer are reinforced and the entire surface is covered with a minimum of 1/16-inch gypsum veneer plaster.
- f. The fire-resistance time period for concrete masonry units meeting the equivalent thicknesses required for a 2-hour fire-resistance rating in Item 3, and having a thickness of not less than 7 5/8 inches is 4 hours when cores which are not grouted are filled with silicone-treated perlite loose-fill insulation; vermiculite loose-fill insulation; or expanded clay, shale or slate lightweight aggregate, sand or slag having a maximum particle size of 3/8 inch.
- g. The fire-resistance rating of concrete masonry units composed of a combination of aggregate types or where plaster is applied directly to the concrete masonry shall be determined in accordance with ACI 216.1/TMS 0216. Lightweight aggregates shall have a maximum combined density of 65 pounds per cubic foot.
- h. See also Note b. The equivalent thickness shall be permitted to include the thickness of cement plaster or 1.5 times the thickness of gypsum plaster applied in accordance with the requirements of Chapter 25.
- i. Concrete walls shall be reinforced with horizontal and vertical temperature reinforcement as required by Chapter 19.
- j. Studs are welded truss wire studs with 0.18 inch (No. 7 B.W. gage) flange wire and 0.18 inch (No. 7 B.W. gage) truss wires.
- k. Nailable metal studs consist of two channel studs spot welded back to back with a crimped web forming a nailing groove.
- l. Wood structural panels shall be permitted to be installed between the fire protection and the wood studs on either the interior or exterior side of the wood frame assemblies in this table, provided the length of the fasteners used to attach the fire protection is increased by an amount at least equal to the thickness of the wood structural panel.
- m. The design stress of studs shall be reduced to 78 percent of allowable F_c with the maximum not greater than 78 percent of the calculated stress with studs having a slenderness ratio l_e/d of 33.
- n. For properties of cooler or wallboard nails, see ASTM C 514, ASTM C 547 or ASTM F 1667.
- o. Generic fire-resistance ratings (those not designated as PROPRIETARY* in the listing) in the GA 600 shall be accepted as if herein listed.
- p. NCMA TEK 5-8A shall be permitted for the design of fire walls.
- q. The design stress of studs shall be equal to a maximum of 100 percent of the allowable F_c calculated in accordance with Section 2306.

Commenter's Reason: A condition of the test used to justify the assemblies added to the table in FS151-06/07 is that the assembly was used for non-bearing walls only.

Editor's note: The only change that is being proposed by this public comment is the insertion of the reference to footnote "d" at each of the four new item numbers.

Final Hearing Results

FS151-06/07

AMPC1

Code Change No: **FS152-06/07**

Original Proposal

Table 720.1(2)

Proponent: Shriver, Thermafiber Inc.

Revise table as follows:

TABLE 720.1(2)
RATED FIRE-RESISTANCE PERIODS FOR VARIOUS WALLS AND PARTITIONS ^{a,o,p}

MATERIAL	ITEM NUMBER	CONSTRUCTION
16. Exterior walls rated for fire resistance from the inside only in accordance with Section 704.5.	16-1.3	2" x 6" wood studs at 16" centers with double top plates, single bottom plates; interior side covered with 5/8" Type X gypsum wallboard, 4" wide, applied vertically with all joints over framing or blocking and fastened with 21/4" Type S drywall screws spaced 7" on center. Joints to be covered with tape and joint compound. Exterior covered with 3/8" wood structural panels (oriented strand board), applied vertically with edges over framing or blocking and fastened with 6d common nails (bright) at 12" on center in the field and 6" on center on panel edges. R-19 fiberglass mineral fiber insulation installed in stud cavity.

(Portions of table not shown do not change)

Reason: Changing the language to mineral fiber will allow either fiberglass or mineral wool insulation in the stud cavity.

Mineral wool insulation is a well known and proven fire resistance material that has been tested, and approved numerous times for all types of fire resistive assemblies. In this type of a wall assembly, the Underwriters Laboratory Fire Resistance Directory lists mineral wool and fiberglass insulations as alternate materials in numerous design listings. Reference UL designs U305, U309, U311, U317, U327, U334, U338, U356 and U359. Specifically, U356 covers this design and lists the insulation as glass fiber or mineral wool with a rating of 1 hr. The same rating as listed in table 720.1(2) item number 16-1.3.

The UL Fire resistance directory also lists all of these designs as 2" x 4" wood studs versus this design with 2" x 6" wood studs. The UL Fire Resistive rating – ANSI/UL 263 (BXUV) design information section VI wall and partition assemblies states the size of the studs are minimum unless otherwise stated. Therefore the referenced UL designs apply to 2" x 6" construction as well.

By changing the language to mineral fiber as defined in ASTM C168, Standard Terminology Relating to Thermal Insulation, both mineral wool and fiberglass insulation will be allowed in this wall assembly that has been tested and proven to be effective with either materials. Providing this construction with an alternate product also allows the end user more flexibility in their overall building needs.

Mineral wool has been tested in numerous assemblies as noted in the UL listed designs for wood studs – U305, U309, U311, U317 etc. There are also numerous examples in the metal studs listed designs U400 – 499. Specifically U356 is the same design as this construction (16-1.3). UL design listing U356 (attached), line item 4 Batt and Blankets, list glass fiber or mineral wool insulation in the assembly with the same hourly rating. Therefore using mineral wool as an alternant to fiberglass in this assembly will not effect the constructions hourly rating.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A copy of UL design BXUV.U356 was submitted but has not been printed here.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This revision provides consistency with the definition and also with the UL fire-resistance directory. The term A mineral fiber® will pick up both the glass and wool insulation products. Making this revision will allow for the inclusion of additional types of insulating materials other than fiberglass. This is also consistent with the action taken on FS150-06/07 previously.

Assembly Action:

None

Final Hearing Results

FS152-06/07

AS

Code Change No: FS153-06/07

Original Proposal

Sections: 721.1, 721.6, 721.6.1, 721.6.1.1

Proponent: Sam Francis, American Forest & Paper Association

Revise as follows:

721.1 General. The provisions of this section contain procedures by which the fire resistance of specific materials or combinations of materials is established by calculations. These procedures apply only to the information contained in this section and shall not be otherwise used. The calculated fire resistance of concrete, concrete masonry, and clay masonry assemblies shall be permitted in accordance with ACI 216.1/TMS 0216. The calculated fire resistance of steel assemblies shall be permitted in accordance with Chapter 5 of ASCE 29. The calculated fire resistance of exposed wood members and wood decking shall be permitted in accordance with Chapter 16 of ANSI/AF&PA National Design Specification for Wood Construction (NDS) ©.

721.6 Wood assemblies. The provisions of this section contain procedures by which the fire-resistance ratings of wood assemblies are established by calculations.

721.6.1 General. This section contains procedures for calculating the fire-resistance ratings of walls, floor/ceiling and roof/ceiling assemblies based in part on the standard method of testing referenced in Section 703.2.

721.6.1.1 Maximum fire-resistance rating. ~~Fire resistance ratings calculated using the procedures in this section shall be used only for 1-hour rated assemblies.~~ Fire resistance ratings calculated for assemblies using the methods in Section 721.6 shall be limited to a maximum of 1 hour.

Reason: This section is being revised to include reference to the most recent consensus standards for wood structural design for fire resistance. The document referenced in this proposal, the AF&PA NDS, is currently referenced in the IBC. The proposed revision is intended to make it clear that Chapter 16 of the NDS is a separate methodology developed under ANSI procedures in a consensus process. It is a mechanics-based procedure with fire science underpinnings. The procedures previously published by AF&PA and transcribed in Section 721.6 are derived from work by Lei and by NRC. This procedure is developed using work by White, Sumathipala and others.

This methodology affords the designer a way to develop a fire resistance of up to 2 hours at full design load. The calculation procedure accounts for the effects of increasing cross-section to provide increased fire resistance ensuring that sufficient unaffected section remains to resist the loads. This method uses engineering mechanics rather than the empirical calculations found in the current IBC text (Section 721.6). Because the method is soundly based in research, has a mechanics basis, and was developed using a national consensus process, the reference is placed in the general paragraph with the other material standards. Furthermore, the fire resistance calculation procedures in the reference are not limited to 1 hour.

The revision to Section 721.6.1.1 is an editorial change. The sentence was reordered to clearly indicate that 1 hr. fire resistance rating limits of this section only apply to provisions of Section 721.6.

The supporting information for the addition of these design provisions in the NDS, an ANSI consensus standard, are contained in AF&PA *Technical Report 10: Calculating the Fire Resistance of Exposed Wood Members* available as a free download at www.awc.org/pdf/tr10.pdf.

Bibliography:

NDS
TR10

Cost Impact: This proposal offers a new calculation methodology to address numerous design issues previously unavailable using the provisions of Section 721.6. More options traditionally have reduced costs by allowing the most appropriate and effective strategy to be applied to a problem.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The provisions of Section 721.6 are intended to be limited to 1-hour assemblies. The revision to Section 721.6.1.1 are editorial improvements by referring to the specific code section. The change to Section 721.1 adds an additional reference to an existing standard which will permit assemblies to use this method and be able to achieve a fire-resistance rating of greater than 1-hour. The inclusion of this reference provides additional design options and flexibility in calculating fire-resistance ratings.

Assembly Action:

None

Final Hearing Results

FS153-06/07

AS

Code Change No: FS154-06/07

Original Proposal

Section: 721.4.1.1.1

Proponent: Charles Clark, Brick Industry Association (BIA), representing Masonry Alliance for Codes and Standards (MACS)

Revise as follows:

721.4.1.1.1 Hollow clay units. The equivalent thickness, T_e , shall be the value obtained for hollow clay units as determined in accordance with Equation 7-8. The net volume, V_n , of the units shall be determined using the gross volume and percentage of void area determined in accordance with ASTM C 67.

Reason: To clarify that the equivalent thickness of hollow clay units must be calculated according to Equation 7-8 using the gross volume and percentage of void area determined according to ASTM C 67.

The existing provision 721.4.1.1.1 directs the user to determine the equivalent thickness in accordance with ASTM C 67. However, this standard contains no method to calculate equivalent thickness, which should be determined using Equation 7-8 for equivalent thickness. Rather, the gross volume and percentage of void area from ASTM C 67 should be used to determine the net volume of the hollow clay units. This code change clarifies these issues.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal will assist the code users by telling them what equation to use and how to calculate the factors which are needed for it.

Assembly Action:

None

Original Proposal

Sections: 721.5.1.3, Figure 721.5.1(5), 721.5.1.3.2, 721.5.2.2, 721.5.2.3, 1702.1

Proponent: Philip Brazil, P.E, Reid Middleton, Inc., representing himself

THIS PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY AND THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES. PART I – IBC FIRE SAFETY

Revise as follows:

721.5.1.3 ~~Spray-applied~~ Sprayed fire-resistant materials. The fire resistance of wide-flange structural steel columns protected with ~~spray-applied~~ sprayed fire-resistant materials, as illustrated in Figure 721.5.1(5), shall be permitted to be determined from the following expression:

$$R = [C_1 (W/D) + C_2] h \quad \text{(Equation 7-13)}$$

Where:

R = Fire resistance (minutes).

h = Thickness of ~~spray-applied~~ sprayed fire-resistant material (inches).

D = Heated perimeter of the structural steel column (inches).

C_1 and C_2 = Material-dependent constants.

W = Weight of structural steel columns (pounds per linear foot).

The fire resistance of structural steel columns protected with intumescent or mastic fire-resistant coatings shall be determined on the basis of fire-resistance tests in accordance with Section 703.2.

**FIGURE 721.5.1(5)
WIDE FLANGE STRUCTURAL STEEL COLUMNS WITH
~~SPRAY-APPLIED~~ SPRAYED FIRE-RESISTANT MATERIALS**

[No additional changes to Figure 721.5.1(5)]

721.5.1.3.2 ~~Spray-applied~~ Identification. ~~Spray-applied~~ Sprayed fire-resistant materials shall be identified by density and thickness required for a given fire-resistance rating.

721.5.2.2 ~~Spray-applied~~ Sprayed fire-resistant materials. The provisions in this section apply to structural steel beams and girders protected with ~~spray-applied~~ sprayed fire-resistant materials. Larger or smaller beam and girder shapes shall be permitted to be substituted for beams specified in approved unrestrained or restrained fire-resistance-rated assemblies, provided that the thickness of the fire-resistant material is adjusted in accordance with the following expression:

$$h_2 = h_1 [(W_1/D_1) + 0.60] / [(W_2/D_2) + 0.60] \quad \text{(Equation 7-17)}$$

where:

- h = Thickness of ~~spray-applied~~ sprayed fire-resistant material in inches.
 W = Weight of the structural steel beam or girder in pounds per linear foot.
 D = Heated perimeter of the structural steel beam in inches.

Subscript 1 refers to the beam and fire-resistant material thickness in the approved assembly.

Subscript 2 refers to the substitute beam or girder and the required thickness of fire-resistant material.

The fire resistance of structural steel beams and girders protected with intumescent or mastic fire-resistant coatings shall be determined on the basis of fire-resistance tests in accordance with Section 703.2.

721.5.2.3 Structural steel trusses. The fire resistance of structural steel trusses protected with fire-resistant materials ~~spray-applied~~ sprayed to each of the individual truss elements shall be permitted to be determined in accordance with this section. The thickness of the fire-resistant material shall be determined in accordance with Section 721.5.1.3. The weight-to-heated-perimeter ratio (W/D) of truss elements that can be simultaneously exposed to fire on all sides shall be determined on the same basis as columns, as specified in Section 721.5.1.1. The weight-to-heated-perimeter ratio (W/D) of truss elements that directly support floor or roof construction shall be determined on the same basis as beams and girders, as specified in Section 721.5.2.1.

The fire resistance of structural steel trusses protected with intumescent or mastic fire-resistant coatings shall be determined on the basis of fire-resistance tests in accordance with Section 703.2.

PART II – IBC STRUCTURAL

Revise definition as follows:

1702.1 General. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

SPRAYED FIRE-RESISTANT MATERIALS. Cementitious or fibrous materials that are ~~spray-applied~~ sprayed to provide fire-resistant protection of the substrates.

Reason: The purpose for the proposal is editorial: to use the term “sprayed fire-resistant material” consistently throughout the IBC. Currently, “spray-applied fire-resistant material” is also used in places. All instances of the latter term in the IBC are included in this proposal. Use of the term “sprayed fire-resistant material” is currently found in IBC Sections 603.1 (21), 1702.1 (“sprayed fire-resistant material”), and 1704.10 through 1704.10.5.2.

The proposal will also align the IBC with the ASTM standards applicable to sprayed fire-resistant materials. ASTM E 605 and E 736 are referenced standards of the IBC. ASTM E 759, E 760 and E 761 also apply to sprayed fire-resistant materials. All of these standards consistently refer to the materials as “sprayed” materials.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I C IBC FIRE SAFETY

Committee Action:

Approved as Submitted

Committee Reason: This proposal is truly an editorial change that provides clarification by being used consistently throughout the code and by matching up with the term used in the ASTM standards which the code references for these materials. This proposal switches to the term Asprayed® versus Aspray-applied® wherever that term was used in the code. This will make the IBC terminology consistent so that only one term is used. This does coordinate with the intent of a previous code change from the last cycle.

Assembly Action:

None

PART II C IBC STRUCTURAL

Committee Action:

Approved as Submitted

Committee Reason: This proposal makes the code provisions for sprayed fire-resistant materials easier to apply by providing consistent terminology throughout the IBC.

Assembly Action:

None

FS156-06/07, Part II	AS

Code Change No: **FS157-06/07**

Original Proposal

Sections: 803.1, 803.2, 803.5

Proponent: Marcelo M. Hirschler, GBH International, representing American Fire Safety Council

Revise as follows:

803.1 General. Interior wall and ceiling finishes shall be classified in accordance with ASTM E 84. Such interior finish materials shall be grouped in the following classes in accordance with their flame spread and smoke-developed indexes.

- Class A: Flame spread index 0-25; smoke-developed index 0-450.
- Class B: Flame spread index 26-75; smoke-developed index 0-450.
- Class C: Flame spread index 76-200; smoke-developed index 0-450.

Exception: Materials, ~~other than textiles~~, tested in accordance with Section 803.2.

803.2. Interior wall or ceiling finishes ~~other than textiles~~. Interior wall or ceiling finishes, ~~other than textiles~~, shall be permitted to be tested in accordance with NFPA 286. Finishes tested in accordance with NFPA 286 shall comply with Section 803.2.1.

803.5 Interior finish requirements based on group. Interior wall and ceiling finish shall have a flame spread index not greater than that specified in Table 803.5 for the group and location designated. Interior wall and ceiling finish materials, ~~other than textiles~~, tested in accordance with NFPA 286 and meeting the acceptance criteria of Section 803.2.1, shall be permitted to be used where a Class A classification in accordance with ASTM E 84 is required.

Reason: Section 803.6.3, as modified in the last cycle, permits textile wall and ceiling coverings to be tested in accordance with NFPA 286. Therefore the clause referring to "other than textiles" in the exception to 803.1, in the text and title of 803.2 and in 803.5, now creates an unnecessary conflict. Eliminating the clause "other than textiles" eliminates the conflict. This proposal does not provide new requirements since testing of textile wall and ceiling coverings by NFPA 286 is allowed but not required.

This proposal also replaces the nouns "flame spread" and "smoke developed" by "flame spread index" and "smoke developed index", since that is the correct terminology used in ASTM E 84.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal is primarily going to help coordinate these sections with changes which were made in the last cycle and that appear in the 2006 edition of the code. Textile materials are permitted to be tested in accordance with the NFPA 286 room corner test and therefore should not be excluded in these sections. The inclusion of the term index® makes the provisions consistent with the terminology and reporting from ASTM E 84.

Assembly Action:

None

Final Hearing Results

FS157-06/07

AS

Code Change No: **FS158-06/07**

Original Proposal

Section: 803.2

Proponent: Marcelo M. Hirschler, GBH International, representing American Fire Safety Council

Revise as follows:

803.2. Interior wall or ceiling finishes ~~other than textiles~~. Interior wall or ceiling finishes, ~~other than textiles~~, shall be permitted to be tested in accordance with NFPA 286. Finishes tested in accordance with NFPA286 shall comply with Section 803.2.1.

Reason: Section 803.6.3, as modified in the last cycle, permits textile wall coverings to be tested in accordance with NFPA 286. Therefore this clause in the text and title of 803.2 now creates an unnecessary conflict.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This is consistent with the action taken on FS157-06/07 which made the same proposal. Under the 2006 edition of the code, textiles are permitted to be tested using the NFPA 286 room corner test. Therefore, the language which prohibited this needs to be removed for consistency with Section 803.6 and 803.6.3.

Assembly Action:

None

Final Hearing Results

FS158-06/07

AS

Code Change No: **FS160-06/07**

Original Proposal

Sections: 801.1, 801.2 (New), 801.3 (New), 801.1.1, 801.1.2, 801.1.3, 801.2, 801.2.1, 801.2.2, 803.1, 803.1.1, 803.2, 803.2.1, 803.1.3 (New), 803.1.3.1 (New), 803.1.4 (New), 803.2 (New), 803.3 (New), 803.4 (New), 803.5 (New), 803.6 (New), 803.7 (New), 803.8 (New)

Proponent: Marcelo M. Hirschler, GBH International, representing American Fire Safety Council

Revise as follows:

801.1 Scope. Provisions of this chapter shall govern the use of materials used as interior finishes, trim and decorative materials.

801.2 Interior wall and ceiling finish. The provisions of 803 shall limit the allowable fire performance and smoke development of interior wall and ceiling finish materials based on occupancy classification.

801.3 Interior floor finish. The provisions of 804 shall limit the allowable fire performance of interior floor finish materials based on occupancy classification

~~801.1.1 Interior finishes.~~ These provisions shall limit the allowable flame spread and smoke development based on location and occupancy classification.

Exceptions:

1. ~~Materials having a thickness less than 0.036 inch (0.9 mm) applied directly to the surface of walls or ceilings.~~
2. ~~Exposed portions of structural members complying with the requirements for buildings of Type IV construction in Section 602.4 shall not be subject to interior finish requirements.~~

[F] 801.1.2 801.4 Decorative materials and trim. Decorative materials and trim shall be restricted by combustibility and flame resistance in accordance with Section 806.

~~801.1.3 801.5 Applicability.~~ For buildings in flood hazard areas as established in Section 1612.3, interior finishes, trim and decorative materials below the design flood elevation shall be flood-damage-resistant materials.

801.2 801.6 Application. Combustible materials shall be permitted to be used as finish for walls, ceilings, floors and other interior surfaces of buildings.

~~801.2.1 801.7 Windows.~~ Show windows in the first story of buildings shall be permitted to be of wood or of unprotected metal framing.

~~801.2.2 801.8 Foam plastics.~~ Foam plastics shall not be used as interior finish or trim except as provided in Section 803.4. Foam plastics shall not be used as interior trim except as provided in Section 806.3 or Section 2604.2 2603.9 or 2604. This section shall apply both to exposed foam plastics and to foam plastics used in conjunction with a textile or vinyl facing or cover.

SECTION 802: (No change to current text)

**SECTION 803
WALL AND CEILING FINISHES**

803.1 General. Interior wall and ceiling finish materials shall be classified for fire performance and smoke development in accordance with 803.1.1 or 803.1.2, except as shown in 803.2 through 803.8. Materials tested in accordance with 803.1.2 shall not be required to be tested in accordance with 803.1.1.

803.1.1 Interior wall and ceiling finish materials. Interior wall and ceiling finish materials finishes shall be classified in accordance with ASTM E 84. Such interior finish materials shall be grouped in the following classes in accordance with their flame spread and smoke-developed indexes.

- Class A: Flame spread index 0-25; smoke-developed index 0-450.
- Class B: Flame spread index 26-75; smoke-developed index 0-450.
- Class C: Flame spread index 76-200; smoke-developed index 0-450.

Exception: ~~Materials, other than textiles,~~ tested in accordance with Section 803.1.2 803-2.

803.2 803.1.2 . Room corner test for interior ~~Interior wall or ceiling finish materials finishes other than textiles.~~ Interior wall or ceiling finish materials finishes, ~~other than textiles,~~ shall be permitted to be tested in accordance with NFPA 286. Interior wall or ceiling finish materials ~~Finishes~~ tested in accordance with NFPA 286 shall comply with Section ~~803.2.4~~ 803.1.2.1.

~~803.2.1 803.1.2.1 Acceptance criteria for NFPA 286.~~ During the 40 kW exposure, the interior finish shall comply with Item 1. During the 160 kW exposure, the interior finish shall comply with Item 2. During the entire test, the interior finish shall comply with Items 3 and 4.

1. During the 40kW exposure, flames shall not spread to the ceiling.
2. During the 160 kW exposure, the interior finish shall comply with the following:
 - 2.1. Flame shall not spread to the outer extremity of the sample on any wall or ceiling.
 - 2.2. Flashover, as defined in NFPA 286, shall not occur.
3. The peak rate of heat release throughout the NFPA 286 test shall not exceed 800 kW.
4. The total smoke released throughout the NFPA 286 test shall not exceed 1,000 m².

803.1.3 Room corner test for textile wall coverings and expanded vinyl wall coverings. Textile wall coverings and expanded vinyl wall coverings shall meet the criteria of Section 803.1.3.1 when tested in the manner intended for use in accordance with the Method B protocol of NFPA 265 using the product mounting system, including adhesive.

803.1.3.1 Acceptance criteria for NFPA 265. During the 40 kW exposure the interior finish shall comply with item 1. During the 150 kW exposure, the interior finish shall comply with item 2. During the entire test, the interior finish shall comply with item 3.

1. During the 40 kW exposure, flames shall not spread to the ceiling.
2. During the 150 kW exposure, the interior finish shall comply with the following:
 - 2.1. Flame shall not spread to the outer extremities of the samples on the 8-foot by 12-foot (203 mm by 305 mm) walls.
 - 2.2. Flashover, as described in NFPA 265, shall not occur.
3. The total smoke released throughout the NFPA 265 test shall not exceed 1,000 m².

803.1.4 Acceptance criteria for textile and expanded vinyl wall or ceiling coverings tested to ASTM E 84. Textile wall and ceiling coverings and expanded wall and ceiling coverings shall have a Class A flame spread index in accordance with ASTM E 84 and be protected by automatic sprinklers installed in accordance with Section 903.3.1.1 or 903.3.1.2.

803.2 Thickness exemption Materials having a thickness less than 0.036 inch (0.9 mm) applied directly to the surface of walls or ceilings shall not be required to be tested.

803.3 Heavy time exemption. Exposed portions of structural members complying with the requirements for buildings of Type IV construction in Section 602.4 shall not be subject to interior finish requirements.

803.4 Foam plastics. Foam plastics shall not be used as interior finish except as provided in Section 2603.9. This section shall apply both to exposed foam plastics and to foam plastics used in conjunction with a textile or vinyl facing or cover. Foam plastics shall be permitted to be tested in accordance with Section 803.1.2, in the manner intended for use, and meet the criteria of 803.1.2.1.

803.5 Textile wall Coverings. Where used as interior wall finish materials, textile wall coverings, including materials having woven or nonwoven, napped, tufted, looped or similar surface and carpet and similar textile materials, shall be tested in the manner intended for use, using the product mounting system, including adhesive, and shall comply with the requirements of section 803.1.2, 803.1.3 or 803.1.4.

803.6 Textile ceiling coverings. Where used as interior ceiling finish materials, textile ceiling coverings, including materials having woven or nonwoven, napped, tufted, looped or similar surface and carpet and similar textile materials, shall be tested in the manner intended for use, using the product mounting system, including adhesive, and shall comply with the requirements of section 803.1.2 or 803.1.4.

803.7 Expanded vinyl wall coverings. Where used as interior wall finish materials, expanded vinyl wall coverings shall be tested in the manner intended for use, using the product mounting system, including adhesive, and shall comply with the requirements of section 803.1.2, 803.1.3 or 803.1.4.

803.8 Expanded vinyl ceiling coverings. Where used as interior ceiling finish materials, expanded vinyl ceiling coverings shall be tested in the manner intended for use, using the product mounting system, including adhesive, and shall comply with the requirements of section 803.1.2, or 803.1.4.

(Delete and relocate to 803.10; See below)

803.3 Stability. Interior finish materials regulated by this chapter shall be applied or otherwise fastened in such a manner that such materials will not readily become detached where subjected to room temperatures of 200°F (93°C) for not less than 30 minutes.

(Delete and relocate to 803.11; See below)

803.4 Application. Where these materials are applied on walls, ceilings or structural elements required to have a fire-resistance rating or to be of noncombustible construction, they shall comply with the provisions of this section.

(Delete and relocate to 803.11.1; See below)

803.4.1 Direct attachment and furred construction. Where walls and ceilings are required by any provision in this code to be of fire-resistance-rated or noncombustible construction, the interior finish material shall be applied directly against such construction or to furring strips not exceeding 1.75 inches (44 mm) applied directly against such surfaces. The intervening spaces between such furring strips shall be filled with inorganic or Class A material or shall be fireblocked at a maximum of 8 feet (2438 mm) in any direction in accordance with Section 717.

(Delete and relocate to 803.11.2; See below)

~~**803.4.2 Set-out construction.** Where walls and ceilings are required to be of fire-resistance-rated or noncombustible construction and walls are set out or ceilings are dropped distances greater than specified in Section 803.4.1, Class A finish materials shall be used except where interior finish materials are protected on both sides by an automatic sprinkler system or attached to noncombustible backing or furring strips installed as specified in Section 803.4.1. The hangers and assembly members of such dropped ceilings that are below the main ceiling line shall be of noncombustible materials, except that in Type III and V construction, fire-retardant-treated wood shall be permitted. The construction of each set-out wall shall be of fire-resistance-rated construction as required elsewhere in this code.~~

(Delete and relocate to 803.11.3; See below)

~~**803.4.3 Heavy timber construction.** Wall and ceiling finishes of all classes as permitted in this chapter that are installed directly against the wood decking or planking of Type IV construction or to wood furring strips applied directly to the wood decking or planking shall be fireblocked as specified in Section 803.4.1.~~

(Delete and relocate to 803.11.4; See below)

~~**803.4.4 Materials.** An interior wall or ceiling finish that is not more than 0.25 inch (6.4 mm) thick shall be applied directly against a noncombustible backing.~~

Exceptions:

1. Class A materials.
2. Materials where the qualifying tests were made with the material suspended or furred out from the noncombustible backing.

~~**803.5**~~ **803.9 Interior finish requirements based on group.** Interior wall and ceiling finish shall have a flame spread index not greater than that specified in Table 803.9 for the group and location designated. Interior wall and ceiling finish materials, ~~other than textiles,~~ tested in accordance with NFPA 286 and meeting the acceptance criteria of Section ~~803.1.2.1~~ 803.2.1, shall be permitted to be used where a Class A classification in accordance with ASTM E 84 is required.

(Renumber Table 803.5 as Table 803.9 without any other changes)

~~**803.6 Textiles.** Where used as interior wall or ceiling finish materials, textiles, including materials having woven or nonwoven, napped, tufted, looped or similar surface and carpet and similar textile materials, shall comply with the requirements of section 803.6.1, 803.6.2 or 803.6.3.~~

~~**803.6.1 Surface Burning Characteristic Test.** Textile wall and ceiling coverings shall have a Class A flame spread index in accordance with ASTM E 84 and be protected by automatic sprinklers installed in accordance with Section 903.3.1.1 or 903.3.1.2.~~

~~**803.6.2 Room corner test, textiles.** Textile wall coverings shall meet the criteria of Section 803.6.2.1 when tested in the manner intended for use in accordance with the Method B protocol of NFPA 265 using the product mounting system, including adhesive.~~

~~**803.6.2.1 Method B test protocol.** During the 40 kW exposure the interior finish shall comply with item 1. During the 150 kW exposure, the interior finish shall comply with item 2. During the entire test, the interior finish shall comply with item 3.~~

1. During the 40 kW exposure, flames shall not spread to the ceiling.
2. During the 150 kW exposure, the interior finish shall comply with the following:
 - 2.1. Flame shall not spread to the outer extremities of the samples on the 8-foot by 12-foot (203 mm by 305 mm) walls.
 - 2.2. Flashover, as described in NFPA 265, shall not occur.
3. The total smoke released throughout the NFPA 265 test shall not exceed 1,000 m².

~~**803.6.3 Room corner test, ceiling and wall finish.** Textile wall and ceiling coverings shall meet the criteria of 803.2.1 when tested in the manner intended for use in accordance with NFPA 286 using the product mounting system, including adhesive.~~

~~**803.7 Expanded vinyl wall coverings.** Expanded vinyl wall coverings shall comply with the requirements for textile wall and ceiling materials and their use shall comply with Section 803.5.~~

~~**Exception:** Expanded vinyl wall or ceiling coverings complying with Section 803.2 shall not be required to comply with Section 803.1 or 803.5.~~

803-3 803.10 Stability. Interior finish materials regulated by this chapter shall be applied or otherwise fastened in such a manner that such materials will not readily become detached where subjected to room temperatures of 200°F (93°C) for not less than 30 minutes.

803-4 803.11 Application of interior finish materials to fire-resistance rated structural elements. Where these interior finish materials are applied on walls, ceilings or structural elements required to have a fire-resistance rating or to be of noncombustible construction, they shall comply with the provisions of this section.

803-4.1 803.11.1 Direct attachment and furred construction. Where walls and ceilings are required by any provision in this code to be of fire-resistance-rated or noncombustible construction, the interior finish material shall be applied directly against such construction or to furring strips not exceeding 1.75 inches (44 mm) applied directly against such surfaces. The intervening spaces between such furring strips shall comply with one of the following:

1. be filled with material that is inorganic or non combustible, 2. be filled with material that meets the requirements of a Class A material in accordance with Section 803.1.1 or 803.1.2 or
2. shall be fireblocked at a maximum of 8 feet (2438 mm) in any direction in accordance with Section 717.

803-4.2 803.11.2 Set-out construction. Where walls and ceilings are required to be of fire-resistance-rated or noncombustible construction and walls are set out or ceilings are dropped distances greater than specified in Section 803.11.1 803-4.1, Class A finish materials, in accordance with Section 803.1.1 or 803.1.2, shall be used except where interior finish materials are protected on both sides by an automatic sprinkler system or attached to noncombustible backing or furring strips installed as specified in Section 803.11.1 803-4.1. The hangers and assembly members of such dropped ceilings that are below the main ceiling line shall be of noncombustible materials, except that in Type III and V construction, fire-retardant-treated wood shall be permitted. The construction of each set-out wall shall be of fire-resistance-rated construction as required elsewhere in this code.

803-4.3 803.11.3 Heavy timber construction. Wall and ceiling finishes of all classes as permitted in this chapter that are installed directly against the wood decking or planking of Type IV construction or to wood furring strips applied directly to the wood decking or planking shall be fireblocked as specified in Section 803-4.4 803.11.1.

803-4.4 803.11.4 Materials. An interior wall or ceiling finish that is not more than 0.25 inch (6.4 mm) thick shall be applied directly against a noncombustible backing.

Exceptions:

1. Class A materials, in accordance with Section 803.1.1 or 803.1.2.
2. Materials where the qualifying tests were made with the material suspended or furred out from the noncombustible backing.

SECTION 804 (No change to current text)

SECTION 805: (No change to current text)

SECTION 806: (No change to current text)

803-8 807 Insulation. Thermal and acoustical insulation shall comply with Section 719.

803-9 808 Acoustical ceiling systems. The quality, design, fabrication and erection of metal suspension systems for acoustical tile and lay-in panel ceilings in buildings or structures shall conform with generally accepted engineering practice, the provisions of this chapter and other applicable requirements of this code.

803-9.1 808.1 Materials and installation. Acoustical materials complying with the interior finish requirements of Section 803 shall be installed in accordance with the manufacturer's recommendations and applicable provisions for applying interior finish.

803-9.1.1 808.1.1 Suspended acoustical ceilings. Suspended acoustical ceiling systems shall be installed in accordance with the provisions of ASTM C 635 and ASTM C 636.

803-9.1.2 808.1.2 Fire-resistance-rated construction. Acoustical ceiling systems that are part of fire-resistance-rated construction shall be installed in the same manner used in the assembly tested and shall comply with the provisions of Chapter 7.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

Reason: This proposal makes no changes to any requirements but reorganizes the sections so as to create a more logical sequence and to avoid confusion. The rewrite shows all three tests used for interior wall and ceiling finish materials, and their criteria (ASTM E 84, NFPA 286 and NFPA 265). These are in 803.1.1, 803.1.2 and 803.1.3, while 803.1.4 shows the requirements for sprinklers when textile or vinyl coverings are tested via ASTM E 84. Sections 803.2 through 803.8 set out the requirements for all interior finish materials that are tested differently from the norm. The section on stability has been moved to appear after all of the fire test requirements, followed by the sections on application of interior finish to fire resistance-rated structural elements. The sections on insulation and acoustical ceiling systems have been moved to the end of the chapter. The proposal makes it clear that everywhere that a Class A material is required, a material that has passed NFPA 286 (per 803.1.2.1) is also permitted.

The proposal also eliminates a contradiction in the code, because there are several areas where the code at present says “other than textiles” when referring to NFPA 286. These sections are: the exception in 803.1, section 803.2 and section 803.5. However, sections 803.6 and 803.6.3 already permit textiles to be tested with NFPA 286. Therefore, the proposal just cleans up a problem without changing requirements. The following chart will help track the reformatting done by this code change proposal.

2006 IBC	Code Change for 2009 IBC
Section 801 General	
801.1 Scope	Same
801.1.1 Interior finishes	Delete
	801.2 Interior wall and ceiling finish
	801.3 Interior floor finish
801.1.2 Decorative materials and trim	801.4 Decorative materials and trim
801.1.3 Applicability	801.5 Applicability
801.2 Application	801.6 Application
801.2.1 Windows	801.7 Windows
801.2.2 Foam plastics	801.8 Foam plastics
Section 802 No Change	
Section 803 Wall and Ceiling Finishes	
803.1 General	803.1 General
	803.1.1 Interior wall and ceiling finish materials
803.2 Interior wall or ceiling finishes other than textiles	803.1.2 Room corner test for interior wall or ceiling finish materials
803.2.1 Acceptance criteria	803.1.2.1 Acceptance criteria for NFPA 286
	803.1.3 Room corner test for textile wall coverings and expanded vinyl wall coverings
	803.1.3.1 Acceptance criteria for NFPA 265
	803.1.4 Acceptance criteria for textile and expanded vinyl wall or ceiling coverings tested to ASTM E 84
	803.2 Thickness exemption
	803.3 Heavy timber exemption
	803.4 Foam plastics
	803.5 Textile Wall Coverings
	803.6 Textile Ceiling Coverings
	803.7 Expanded Vinyl Wall Coverings
	803.8 Expanded Vinyl Ceiling Coverings
803.3 Stability	803.10 Stability
803.4 Application	803.11 Application of interior finish materials to fire-resistance rated structural elements
803.4.1 Direct attachment and furred construction	803.11.1 Direct attachment and furred construction
803.4.2 Set-out construction	803.11.2 Set-out construction
803.4.3 Heavy timber construction	803.11.3 Heavy timber construction
803.4.4 Materials	803.11.4 Materials
803.5 Interior finish requirements based on group	803.9 Interior finish requirements based on group
803.6 Textiles	
803.6.1 Surface burning characteristic test	
803.6.2 Room corner test, textiles	
803.6.2.1 Method B test protocol	
803.6.3 Room corner test, ceiling and wall finish	
803.7 Expanded vinyl wall coverings	
Section 804 No Change	
Section 805 No Change	
Section 806 No Change	
803.8 Insulation	807 Insulation
803.9 Acoustical ceiling systems	808 Acoustical ceiling systems
803.9.1 Materials and installation	808.1 Materials and installation
803.9.1.1 Suspended acoustical ceilings	808.1.1 Suspended acoustical ceilings
803.9.1.2 Fire-resistance-rated construction	808.1.2 Fire-resistance-rated construction

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

803.4 Foam plastics. Foam plastics shall not be used as interior finish except as provided in Section 2603.9. This section shall apply both to exposed foam plastics and to foam plastics used in conjunction with a textile or vinyl facing or cover. ~~Foam plastics shall be permitted to be tested in accordance with Section 803.1.2, in the manner intended for use, and meet the criteria of 803.1.2.1.~~

(Portions of proposal not shown remain unchanged)

Committee Reason: This is essentially an editorial change that helps to put the requirements of Chapter 8 into a more logical order. This type of rewrite has been discussed for several years in both the IBC Fire Safety committee hearings and also in front of the IFC committee. This should make the code more usable. The modification made by the committee was simply done to delete what was viewed as repetitive language. The first sentence of the new Section 803.4 indicates that foam plastics are to be regulated by the provisions in Chapter 26. That sentence is appropriate and is all that is needed. The remainder of the proposal is approved as submitted.

Assembly Action:

None

Final Hearing Results

FS160-06/07

AM

Code Change No: **FS163-06/07**

Original Proposal

Section: 901.6.2

Proponent: Robert J Davidson, Davidson Code Concepts, Tinton Falls, NJ, representing himself

Revise as follows:

901.6.2 Fire alarm systems. Fire alarm systems required by the provisions of Section 907.2 of this code and Sections 907.2 and 907.3 of the *International Fire Code* shall be monitored by an approved supervising station in accordance with Section 907.14.

Exceptions:

1. Single- and multiple-station smoke alarms required by Section 907.2.10.
2. Smoke detectors in Group I-3 occupancies.
3. Supervisory service is not required for automatic sprinkler systems in one- and two-family dwellings.

Reason: Whether the required fire alarm system is being installed in new construction pursuant to Section 907.2 of the IBC and Section 907.2 of the IFC, or is being installed in an existing building or structure pursuant to Section 907.3 of the IFC, the need for alarm system supervision is the same.

This proposal adds Section 907.3 of the IFC to the existing language of Section 901.6.2 of the IBC to ensure these required fire alarm systems have the same level of supervisory service.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: IFC Section 907.3 addresses where fire alarm and detection systems are required to be installed in existing buildings on a retroactive basis.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal provides needed correlation between the IBC and IFC with respect to alarm system supervision in both new and retroactively required systems.

Assembly Action:

None

Original Proposal

Sections: 906.1 (New), Table 906.1 (New), 906.2 (New), 906.3 (New), 906.3(1) (New), 906.3(2) (New), 906.4 (New), 906.5 (New), 906.6 (New), 906.7 (New), 906.8 (New), 906.9 (New), 906.10 (New)

Proponent: Jerry R. Tepe, JRT-AIA Architect, Hopkinton, NH

Delete and substitute as follows:

[F] 906.1 General. Portable fire extinguishers shall be provided in occupancies and locations as required by the *International Fire Code*.

**SECTION 906
PORTABLE FIRE EXTINGUISHERS**

[F] 906.1 Where required. Portable fire extinguishers shall be installed in the following locations.

1. In new and existing Group A, B, E, F, H, I, M, R-1, R-2, R-4 and S occupancies.

Exception: In new and existing Group A, B and E occupancies equipped throughout with quick response sprinklers, portable fire extinguishers shall be required only in locations specified in Items 2 through 6.

2. Within 30 feet (9144 mm) of commercial cooking equipment.
3. In areas where flammable or combustible liquids are stored, used or dispensed.
4. On each floor of structures under construction, except Group R-3 occupancies, in accordance with Section 1415.1 of the *International Fire Code*.
5. Where required by the *International Fire Code* sections indicated in Table 906.1.
6. Special-hazard areas, including but not limited to laboratories, computer rooms and generator rooms, where required by the fire code official.

[F] 906.2 General requirements. Portable fire extinguishers shall be selected, installed and maintained in accordance with this section and NFPA 10.

Exceptions:

1. The travel distance to reach an extinguisher shall not apply to the spectator seating portions of Group A-5 occupancies.

2. Thirty-day inspections shall not be required and maintenance shall be allowed to be once every three years for dry-chemical or halogenated agent portable fire extinguishers that are supervised by a listed and approved electronic monitoring device, provided that all of the following conditions are met:
 - 2.1. Electronic monitoring shall confirm that extinguishers are properly positioned, properly charged and unobstructed.
 - 2.2. Loss of power or circuit continuity to the electronic monitoring device shall initiate a trouble signal.
 - 2.3. The extinguishers shall be installed inside of a building or cabinet in a noncorrosive environment.
 - 2.4. Electronic monitoring devices and supervisory circuits shall be tested every three years when extinguisher maintenance is performed.
 - 2.5. A written log of required hydrostatic test dates for extinguishers shall be maintained by the owner to ensure that hydrostatic tests are conducted at the frequency required by NFPA 10.

[F] 906.3 Size and distribution. For occupancies that involve primarily Class A fire hazards, the minimum sizes and distribution shall comply with Table 906.3(1). Fire extinguishers for occupancies involving flammable or combustible liquids with depths of less than or equal to 0.25-inch (6.35 mm) shall be selected and placed in accordance with Table 906.3(2). Fire extinguishers for occupancies involving flammable or combustible liquids with a depth of greater than 0.25-inch (6.35 mm) or involving combustible metals shall be selected and placed in accordance with NFPA 10. Extinguishers for Class C fire hazards shall be selected and placed on the basis of the anticipated Class A or Class B hazard.

**[F] TABLE 906.3(1)
FIRE EXTINGUISHERS FOR CLASS A FIRE HAZARDS**

	<u>LIGHT (Low) HAZARD OCCUPANCY</u>	<u>ORDINARY (Moderate) HAZARD OCCUPANCY</u>	<u>EXTRA (High) HAZARD OCCUPANCY</u>
<u>Minimum Rated Single Extinguisher</u>	<u>2-A^c</u>	<u>2-A</u>	<u>4-Aa</u>
<u>Maximum Floor Area Per Unit of A</u>	<u>3,000 square feet</u>	<u>1,500 square feet</u>	<u>1,000 square feet</u>
<u>Maximum Floor Area For Extinguisher^b</u>	<u>11,250 square feet</u>	<u>11,250 square feet</u>	<u>11,250 square feet</u>
<u>Maximum Travel Distance to Extinguisher</u>	<u>75 feet</u>	<u>75 feet</u>	<u>75 feet</u>

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929m², 1 gallon = 3.785 L.

- a. Two 2.5-gallon water-type extinguishers shall be deemed the equivalent of one 4-A rated extinguisher.
- b. Annex E.3.3 of NFPA 10 provides more details concerning application of the maximum floor area criteria.
- c. Two water-type extinguishers each with a 1-A rating shall be deemed the equivalent of one 2-A rated extinguisher for Light (Low) Hazard Occupancies.

**[F] TABLE 906.3(2)
FLAMMABLE OR COMBUSTIBLE LIQUIDS WITH DEPTHS
OF LESS THAN OR EQUAL TO 0.25-INCH**

<u>TYPE OF HAZARD</u>	<u>BASIC MINIMUM EXTINGUISHER RATING</u>	<u>MAXIMUM TRAVEL DISTANCE TO EXTINGUISHERS (feet)</u>
<u>Light (Low)</u>	<u>5-B</u>	<u>30</u>
	<u>10-B</u>	<u>50</u>
<u>Ordinary (Moderate)</u>	<u>10-B</u>	<u>30</u>
	<u>20-B</u>	<u>50</u>
<u>Extra (High)</u>	<u>40-B</u>	<u>30</u>
	<u>80-B</u>	<u>50</u>

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm.

NOTE. For requirements on water-soluble flammable liquids and alternative sizing criteria, see Section 4.3 of NFPA 10.

[F] 906.4 Cooking grease fires. Fire extinguishers provided for the protection of cooking grease fires shall be of an approved type compatible with the automatic fire-extinguishing system agent and in accordance with Section 904.11.5 of the *International Fire Code*.

[F] 906.5 Conspicuous location. Portable fire extinguishers shall be located in conspicuous locations where they will be readily accessible and immediately available for use. These locations shall be along normal paths of travel, unless the fire code official determines that the hazard posed indicates the need for placement away from normal paths of travel.

[F] 906.6 Unobstructed and unobscured. Portable fire extinguishers shall not be obstructed or obscured from view. In rooms or areas in which visual obstruction cannot be completely avoided, means shall be provided to indicate the locations of extinguishers.

[F] 906.7 Hangers and brackets. Hand-held portable fire extinguishers, not housed in cabinets, shall be installed on the hangers or brackets supplied. Hangers or brackets shall be securely anchored to the mounting surface in accordance with the manufacturer's installation instructions.

[F] 906.8 Cabinets. Cabinets used to house portable fire extinguishers shall not be locked.

Exceptions:

1. Where portable fire extinguishers subject to malicious use or damage are provided with a means of ready access.
2. In Group I-3 occupancies and in mental health areas in Group I-2 occupancies, access to portable fire extinguishers shall be permitted to be locked or to be located in staff locations provided the staff has keys.

[F] 906.9 Height above floor. Portable fire extinguishers having a gross weight not exceeding 40 pounds (18 kg) shall be installed so that its top is not more than 5 feet (1524 mm) above the floor. Hand-held portable fire extinguishers having a gross weight exceeding 40 pounds (18 kg) shall be installed so that its top is not more than 3.5 feet (1067 mm) above the floor. The clearance between the floor and the bottom of installed hand-held extinguishers shall not be less than 4 inches (102 mm).

[F] 906.10 Wheeled units. Wheeled fire extinguishers shall be conspicuously located in a designated location.

Reason: To ensure a method of requiring portable fire extinguishers. The *International Building Code* already includes verbatim the text from the *International Fire Code* for sprinkler systems, standpipes, fire alarm systems, etc. Portable fire extinguishers seem to be the only exception. Some jurisdictions do not adopt the *International Fire Code* and cannot get to other codes by reference. Without this change there is no method to require portable fire extinguishers in those jurisdictions without amending the *International Building Code* locally. If it has been deemed necessary to include the other systems, portable fire extinguishers should also be included. There is no intent to make any technical changes with this proposal and code development would remain with the Fire Code Committee.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The maintenance of the technical content of Section 906 rests with the IFC Code Development Committee. The need for and suitability of duplicating the entire text of the IFC Section 906 into the IBC is a matter to be determined by the IBC-Fire Safety Code Development Committee. Note that this proposal does not include any technical modifications to the content of IFC Section 906.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: Inclusion of these provisions into the IBC will allow the extinguishers to be required in jurisdictions which do not adopt the IFC. If a jurisdiction has not adopted the IFC they would miss this important requirement which is needed for protecting the building. This will also help designers determine the location and requirements for extinguishers so that cabinets and other mounting locations can be determined and installed as a part of the initial building construction. This helps when recessed cabinets are used or if the cabinets are installed within a wall with rated construction.

Assembly Action:

None

Final Hearing Results

FS165-06/07

AS

Code Change No: **FS166-06/07**

Original Proposal

Section: 913 (New)

Proponent: Robert J Davidson, Davidson Code Concepts, representing himself

1. Add new text as follows:

SECTION 913 FIRE PUMPS

913.1 General. Where provided, fire pumps shall be installed in accordance with this section and NFPA 20.

913.2 Protection against interruption of service. The fire pump, driver, and controller shall be protected in accordance with NFPA 20 against possible interruption of service through damage caused by explosion, fire, flood, earthquake, rodents, insects, windstorm, freezing, vandalism and other adverse conditions.

913.3 Temperature of pump room. Suitable means shall be provided for maintaining the temperature of a pump room or pump house, where required, above 40°F (5°C).

913.3.1 Engine manufacturer's recommendation. Temperature of the pump room, pump house or area where engines are installed shall never be less than the minimum recommended by the engine manufacturer. The engine manufacturer's recommendations for oil heaters shall be followed.

913.4 Valve supervision. Where provided, the fire pump suction, discharge and bypass valves, and the isolation valves on the backflow prevention device or assembly shall be supervised open by one of the following methods.

1. Central-station, proprietary, or remote-station signaling service.
2. Local signaling service that will cause the sounding of an audible signal at a constantly attended location.
3. Locking valves open.
4. Sealing of valves and approved weekly recorded inspection where valves are located within fenced enclosures under the control of the owner.

913.4.1 Test outlet valve supervision. Fire pump test outlet valves shall be supervised in the closed position.

913.5. Acceptance test. Acceptance testing shall be done in accordance with the requirements of NFPA 20.

2. Add standard to Chapter 35 as follows:

NFPA

20—03 Installation of Stationary Pumps for Fire Protection

Reason: This proposal provides correlation between the *International Building Code* and the *International Fire Code* by copying existing language from the IFC into the IBC.

Since the standards for the installation of the water based fire protection systems are already in the IBC, the requirements for fire pumps currently in the IFC should also be located in the IBC for ease of use when the installation of fire pumps is required.

This addition to the IBC will also solve a problem that is occurring in jurisdictions that adopt the IBC as the only construction document and adopt the IFC or another code as a maintenance document. In some cases the plan reviewers and inspectors performing the construction related duties are not referring to the requirements found in the IFC at the time of construction.

Recognizing the multitude of different ways that the IBC, the IFC, or both are adopted and enforced, these codes must work either together or separately to accomplish the desired result.

This effort was initiated by an action item from ICC's Federal Agency Codes and Standards Forum. There is a need for this in jurisdictions without the IFC, and this change will streamline the design process in jurisdictions where both codes were in effect.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The maintenance of the technical contents of IFC Section 913 (source of this proposal) rests with the IFC Code Development Committee. The need for and suitability of duplicating the text of these sections into the IBC is a matter to be determined by the IBC-Fire Safety Code Development Committee. Note that this proposed code change does not include any technical modifications to the content of IFC Section 913 but that the testing and maintenance issues are not being brought into the IBC. This proposal does not include the following items from the IFC: the testing and maintenance issues of IFC 913.5; the testing of generator sets in IFC 913.5.2; the testing of transfer switches in IFC 913.5.3 and the pump room environmental conditions of IFC 913.5.4. Results of the review of the proposed standard(s) will be posted on the ICC website by August 20, 2006.

Public Hearing Results

Committee Action:**Approved as Submitted**

Committee Reason: This brings the water supply requirements into the code which is important. The IBC currently does not even contain a reference to the fire pump requirements of the IFC. The inclusion of a fire pump is a design issue related to a piece of equipment which does affect the layout and construction of the building. Including these provisions within the construction code reminds the designer that the pump location, protection and connections be dealt with as a part of the initial design.

Assembly Action:**None**

Code Change No: FS168-06/07

Original Proposal

Section: 915 (New)**Proponent:** Robert J Davidson, Davidson Code Concepts, Tinton Falls, NJ, representing himself**Add new text as follows:**

SECTION 915
EMERGENCY RESPONDER SAFETY FEATURES

915.1 Shaftway markings. Vertical shafts shall be identified as required by this section.

915.1.1 Exterior access to shaftways. Outside openings accessible to the fire department and which open directly on a hoistway or shaftway communicating between two or more floors in a building shall be plainly marked with the word SHAFTWAY in red letters at least 6 inches (152 mm) high on a white background. Such warning signs shall be placed so as to be readily discernible from the outside of the building.

915.1.2 Interior access to shaftways. Door or window openings to a hoistway or shaftway from the interior of the building shall be plainly marked with the word SHAFTWAY in red letters at least 6 inches (152 mm) high on a white background. Such warning signs shall be placed so as to be readily discernible.

Exception: Marking shall not be required on shaftway openings which are readily discernible as openings onto a shaftway by the construction or arrangement.

915.2 Pitfalls. The intentional design or alteration of buildings to disable, injure, maim or kill intruders is prohibited. No person shall install and use firearms, sharp or pointed objects, razor wire, explosives, flammable or combustible liquid containers, or dispensers containing highly toxic, toxic, irritant or other hazardous materials in a manner which may passively or actively disable, injure, maim or kill an emergency responder who forcibly enters a building for the purpose of controlling or extinguishing a fire, rescuing trapped occupants or rendering other emergency assistance

915.3 Equipment room identification. Fire protection equipment shall be identified in an approved manner. Rooms containing controls for air-conditioning systems, sprinkler risers and valves, or other fire detection, suppression or control elements shall be identified for the use of the fire department. Approved signs required to identify fire protection equipment and equipment location, shall be constructed of durable materials, permanently installed and readily visible.

Reason: This proposal provides correlation between the International Building Code and the International Fire Code by copying existing language from the IFC into the IBC.

The IBC's stated intent in Section 101.3 includes the safety of emergency responders when operating in buildings and structures. Recognizing the multitude of different ways that the IBC, the IFC, or both are adopted and enforced, these codes must work either together or separately to accomplish the desired result. There are a number of construction (brick & mortar) provisions related to emergency responder safety which appear in the IFC but not the IBC. This potentially results in a gap in certain scenarios, especially jurisdictions which adopt the IBC but not the IFC, or where the IFC is enforced by a fire code official outside the building permitting and inspection process.

The labeling of shaft hazards, prohibition of pitfalls and the marking of equipment doors for identification of controls are important at all times and should be addressed by the IBC at the time of construction in addition to be identified and maintained during maintenance inspections under the IFC.

Certainly it is not the intent to build a structure without critical safety features necessary for Emergency responder activities that routinely occur before a maintenance inspection is scheduled at newly constructed buildings and structures.

Recognizing the multitude of different ways that the IBC, the IFC, or both are adopted and enforced, these codes must work either together or separately to accomplish the desired result.

This effort was initiated by an action item from ICC's Federal Agency Codes and Standards Forum. There is a need for this in jurisdictions without the IFC, and this change will streamline the design process in jurisdictions where both codes were in effect.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The maintenance of the technical contents of IFC Sections 507.2, 507.3 and 510.1 (source of this proposal) rests with the IFC Code Development Committee. The need for and suitability of duplicating the text of these sections into the IBC is a matter to be determined by the IBC-Fire Safety Code Development Committee. Note that this proposed code change does not include any technical modifications to the content of IFC Sections 507.2, 507.3 and 510.1.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

**SECTION 915
EMERGENCY RESPONDER SAFETY FEATURES**

915.1 Shaftway markings. Vertical shafts shall be identified as required by this section.

915.1.1 Exterior access to shaftways. Outside openings accessible to the fire department and which open directly on a hoistway or shaftway communicating between two or more floors in a building shall be plainly marked with the word SHAFTWAY in red letters at least 6 inches (152 mm) high on a white background. Such warning signs shall be placed so as to be readily discernible from the outside of the building.

915.1.2 Interior access to shaftways. Door or window openings to a hoistway or shaftway from the interior of the building shall be plainly marked with the word SHAFTWAY in red letters at least 6 inches (152 mm) high on a white background. Such warning signs shall be placed so as to be readily discernible.

Exception: Marking shall not be required on shaftway openings which are readily discernible as openings onto a shaftway by the construction or arrangement.

~~**915.2 Pitfalls.** The intentional design or alteration of buildings to disable, injure, maim or kill intruders is prohibited. No person shall install and use firearms, sharp or pointed objects, razor wire, explosives, flammable or combustible liquid containers, or dispensers containing highly toxic, toxic, irritant or other hazardous materials in a manner which may passively or actively disable, injure, maim or kill an emergency responder who forcibly enters a building for the purpose of controlling or extinguishing a fire, rescuing trapped occupants or rendering other emergency assistance~~

915.3 Equipment room identification. Fire protection equipment shall be identified in an approved manner. Rooms containing controls for air-conditioning systems, sprinkler risers and valves, or other fire detection, suppression or control elements shall be identified for the use of the fire department. Approved signs required to identify fire protection equipment and equipment location, shall be constructed of durable materials, permanently installed and readily visible.

Committee Reason: The items such as shaftway markings do address hazards which affect the safety of the fire fighters from the first day of occupancy and therefore need to be included within the building code so that the protection is there whenever it is first needed. The committee did feel that these items are related to the building construction, relate to the scope of the document found in IBC Section 101.3 since they are related to fire fighter safety. The committee did modify the proposal by deleting Section 915.2 believing that this element does not belong in the building code but is more of an operational and maintenance issue which should remain in the IFC.

Assembly Action:

Disapproved

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because an assembly action was successful.

Final Hearing Results

FS168-06/07

AM

Code Change No: **FS170-06/07**

Original Proposal

Sections: 1402.1; IRC R202

Proponent: John Mulder, James Hardie Building Products, Inc.

THIS PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY AND THE IRC CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Revise as follows:

PART I – IBC FIRE SAFETY

1402.1 General. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

FIBER-CEMENT SIDING. A manufactured, fiber-reinforcing product made with an inorganic hydraulic or calcium silicate binder formed by chemical reaction and reinforced with discrete organic or inorganic nonasbestos fibers, or both. Additives that enhance manufacturing or product performance are permitted. Fiber-cement siding products have either smooth or textured faces and are intended for exterior wall and related applications.

PART II – IRC BUILDING/ENERGY

Revise as follows:

SECTION R202 DEFINITIONS

FIBER-CEMENT SIDING. A manufactured, fiber-reinforcing product made with an inorganic hydraulic or calcium silicate binder formed by chemical reaction and reinforced with discrete organic or inorganic non-asbestos fibers, or both. Additives which enhance manufacturing or product performance are permitted. Fiber-cement siding products have either smooth or textured faces and are intended for exterior wall and related applications.

Reason: The purpose of this proposed code change is to clarify the definition of “fiber-cement” to be consistent with the current National Standard ASTM C 1154-02: “fiber-cement products, n – manufactured thin section composites of hydraulic matrices and discrete non-asbestos fibers.”

The current Code language fails to discriminate between “fiber-cement products” (see published definition above); “fiber-mat reinforced products, n – manufactured thin section composites of hydraulic cementitious matrices and non-asbestos fibers in two-dimensional scrim(s)” (published definition in C 1154-02); and “cement-bonded particle board, n – manufactured flat sheets of hydraulic cementitious matrices and fibrous wood particles” (published definition in C 1154-02). This change will clarify existing confusion in the marketplace by clearly describing the nature of the fiber.

ASTM C 1154-02, Standard Terminology for Non-Asbestos Fiber-Reinforced Cement Products.

Bibliography: ASTM International, C 1154-02, Standard Terminology for Non-Asbestos Fiber-Reinforced Cement Products.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A copy of ASTM C 1154-02 was submitted as a supporting document for this proposal but has not been printed here. A copy of ASTM C 1154-02 is available for purchase directly from ASTM International at <http://www.astm.org>.

Public Hearing Results

PART I C IBC FIRE SAFETY

Committee Action:

Approved as Submitted

Committee Reason: This revision makes the definition consistent with the ASTM standard and helps clarify the products and what the appropriate code requirements are. This will help eliminate confusion which is occurring in the marketplace.

Assembly Action:

None

PART II C IRC

Committee Action:

Approved as Submitted

Committee Reason: This new language in the definition for Fiber-Cement Siding helps to clarify the term and provides a clear means of defining this building product. The definition is now consistent with the language in ASTM C 1154-02.

Assembly Action:

None

Final Hearing Results

FS170-06/07, Part I
FS170-06/07, Part II

AS
AS

Code Change No: FS172-06/07

Original Proposal

Section: 1404.10

Proponent: John Mulder, James Hardie Building Products, Inc.

Revise as follows:

1404.10 Fiber_cement siding. Fiber_cement siding shall conform to the requirements of ASTM C 1186, Type A, and shall be so identified on labeling listing an approved quality control agency.

Reason: The purpose of this proposed Code change is to clarify and correct errors and omissions in the current language describing the recognized products.

Revision of Section 1404.10

The current Code language fails to specify the product "classification type"; either "Type A – Sheets are intended for exterior applications, subject to the direct action of sun, rain or snow" or "Type B – Sheets are intended for exterior application, not subjected to the direct action of sun, rain, or snow" (see ASTM C1186-02, Sections 4.1 and 4.2). Exterior sidings must be suitable for use in exterior applications subject to the direct action of sun, rain or snow. "Type A" should be included in the material description

ICC-ES Acceptance Criteria (AC-90), Section 3.1 supports the proposal for "Type A" sheets (See also evaluation reports for James Hardie Building Products NER-405, Section 3.1; Mexalit Industrial ER-5139, Section 3; and Certaineed Corporation ESR-1668, Section 6.1.

Bibliography:

ASTM C1186-02, Standard Specification for Flat Non-Asbestos Fiber-Cement Sheets.
ICC-ES (AC90) Acceptance Criteria for Fiber Cement Siding used as Exterior Wall Siding.
Certaineed Corporation ES Report ESR-1668
James Hardie Building Products Legacy Report NER-405
Mexalit Industrial Legacy Report ER-5139

Analysis: Copies of all items listed in the bibliography were submitted with this proposal but have not been printed here. To view or download copies of ICC-ES (AC90) Acceptance Criteria for Fiber Cement Siding used as Exterior Wall Siding; Certaineed Corporation ES Report ESR-1668; James Hardie Building Products Legacy Report NER-405; or Mexalit Industrial Legacy Report ER-5139 go to <http://www.icc-es.org> and then select either the "Evaluation Reports" or "Criteria/Guideline" links in the left margin. A copy of ASTM C 1186 is available for purchase directly from ASTM International at <http://www.astm.org>.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The ASTM standard does have distinctions between the type of siding. It is appropriate that the code requires the correct type so that there is no question regarding the appropriateness of a product. This will make determining compliance easier for both the designer and the code official.

Assembly Action:

None

Final Hearing Results

FS172-06/07

AS

Code Change No: FS173-06/07

Original Proposal

Section: 1405.3.2

Proponent: Charles Clark, Brick Industry Association (BIA), representing Masonry Alliance for Codes and Standards (MACS)

Revise as follows:

1405.3 Flashing. Flashing shall be installed in such a manner so as to prevent moisture from entering the wall or to redirect it to the exterior. Flashing shall be installed at the perimeters of exterior door and window assemblies, penetrations and terminations of exterior wall assemblies, exterior wall intersections with roofs, chimneys, porches, decks, balconies and similar projections and at built-in gutters and similar locations where moisture could enter the wall. Flashing with projecting flanges shall be installed on both sides and the ends of copings, under sills and continuously above projecting trim.

1405.3.1 Exterior wall pockets. In exterior walls of buildings or structures, wall pockets or crevices in which moisture can accumulate shall be avoided or protected with caps or drips, or other approved means shall be provided to prevent water damage.

1405.3.2 Masonry. Flashing and weep holes in anchored veneer shall be located in the first course of masonry above finished ground level above the foundation wall or slab, and other points of support, including structural floors, shelf angles and lintels where anchored veneers are designed in accordance with Section 1405.5.

Reason: To clarify the Code. This section has been incorrectly applied to masonry walls with anchored veneer. The intent of the section is to have the flashing and weep holes in the veneer, not in the masonry backup wall. This code change, although minor and editorial, provided the necessary clarification.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Approved as Submitted**

Committee Reason: The provisions are not applicable to adhered veneer. Because there are differences between adhered and anchored veneer, it is important that the code distinguish its requirements when the provisions are not applicable to both of the veneer types. This will also coordinate with some other changes that are being heard by other committees this week which will help to clarify the distinction between the veneer types.

Assembly Action:**None**

Final Hearing Results

FS173-06/07

AS

Code Change No: **FS176-06/07**

Original Proposal

Section: 1405.5.2

Proponent: Martin W. Johnson, ABS Consulting, representing NCSEA Seismic Code Advisory Committee

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Revise as follows:

1405.5.2 Seismic requirements. Anchored masonry veneer located in Seismic Design Category C, D, E or F shall conform to the requirements of Section 6.2.2.10 of ACI530/ASCE5/ TMS 402. Anchored masonry veneer located in Seismic Design Category D shall also conform to the requirements ~~for Seismic Design Category E or F of Section 6.2.2.10.3.3 of ACI530/ ASCE5/ TMS 402.~~

Reason: To clarify the intent of the code.

In the last code change cycle, a floor modification and testimony was offered to S130-04/05 regarding the need to provide wire reinforcement in Seismic Design Category (SDC) D and above, and the need to tie this reinforcement to the anchor. The modified language however went beyond this reinforcement requirement. By requiring that all masonry veneer in SDC D conform to the requirements of SDC E or F, the gravity support of masonry veneer at every floor was triggered per 6.2.2.10.3.2 ACI530/ ASCE5/ TMS 402. Extensive testimony was offered at the Code Change Hearings and at the Public comment Hearings regarding the wire reinforcement and tie requirements, however, no testimony was offered about the gravity support of masonry veneer at every floor. This code change proposal clarifies the code by implementing the intent of the floor modification to S130-04/05.

The proponent shall substantiate the proposed code change based on technical information and substantiation. Substantiation provided which is reviewed in accordance with Section 4.2 and determined as not germane to the technical issues addressed in the proposed code change shall be identified as such. The proponent shall be notified that the proposal is considered an incomplete proposal in accordance with Section 4.3, and the proposal shall be held until the deficiencies are corrected. The proponent shall have the right to appeal this action in accordance with the policy of the ICC Board. The burden of providing substantiating material lies with the proponent of the code change proposal. A minimum of two copies of all substantiating information shall be submitted.

Bibliography: The proponent shall submit a bibliography of any substantiating material submitted with the code change proposal. The bibliography shall be published with the code change and the proponent shall make the substantiating materials available for review at the appropriate ICC office and during the public hearing.

Cost Impact: The code change proposal will not increase the cost of construction. This code change will help reduce the increased cost of construction that resulted from the unintended consequence of the floor modification of S130-04/05.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal corrects the seismic requirements for anchored masonry veneer by referencing specific requirements in ACI530/ASCE5/TMS402 regarding wire reinforcement and ties.

Assembly Action:

None

Final Hearing Results

FS176-06/07

AS

Code Change No: **FS180-06/07**

Original Proposal

Section: 1405.15

Proponent: Rick Curkeet, PE, Intertek Testing Services NA, Inc.

Revise as follows:

1405.15 Fiber_cement siding. Fiber_cement siding complying with Section 1404.10 shall be permitted on exterior walls of Type I, II, III, IV and V construction for wind pressure resistance or wind speed exposures as indicated in by the manufacturer's compliance report listing and label and approved installation instructions. Where specified, the siding shall be installed over sheathing or materials listed in Section 2304.6 and shall be installed to conform to the water-resistive barrier requirements in Section 1403. Siding and accessories shall be installed in accordance with approved manufacturer's instructions. Unless otherwise specified in the approved manufacturer's instructions, nails used to fasten the siding to wood studs shall be corrosion-resistant round head smooth shank and shall be long enough to penetrate the studs at least 1 inch (25 mm). For metal framing, all-weather screws shall be used and shall penetrate the metal framing at least three full threads.

Reason: The purpose of this proposed Code change is to clarify and define agencies recognized to label and list compliant products for installation in accordance with applicable sections of this Code.

"Compliance Report" is not defined in the Code.

"Label" (IBC Section 1702.1) is defined as: "An identification applied to a product by the manufacturer that contains the name of the manufacturer, the function and performance characteristics of the product or material, and the name and identification of the approved agency and that indicates that the representative sample of the product or material has been tested and evaluated by an approved agency (see Section 1703.5 and "Inspection certificate", "Manufacturer's designation" and "Mark")."

"Listed" (IBC Section 902.1) is defined as: "Equipment, materials or services included in a list published by an organization acceptable to the building official and concerned with evaluation of products or services that maintains periodic inspection of production or listed equipment or materials or periodic evaluation services and whose listing states either that the equipment, material or service meets identified standards or has been tested and found suitable for a specific purpose."

The proposed wording could include, but is not limited to, a "compliance report".

Since there is no definition for "compliance report" in the current IBC. The existing definitions for "label" and "listed" in IBC Sections 1702.1 and 902.1 should be referenced. The existing definitions for "label" and "listed" adequately describe both the intent of and the requirements for an approved agency capable of substantiating the performance of construction as indicated in a manufacturer's approved installation instructions that are also acceptable to the building official. It should not be necessary for a building products manufacturer whose products are already under a third-party "labeling and listing" program (that includes both product type and system testing as well as product and manufacturing facility quality assurance inspections) to also maintain an additional "compliance report" from another vendor. The comprehensive labeling and listing documentation makes a "compliance report" redundant.

Bibliography:

IBC Section 1702.1, "label"

IBC Section 902.1, "listed"

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: As discussed in the proponent's reason statement, the term *A*compliance report® is not defined and is not clear as to what is required. Using the term *A*listing and label® will provide the clarification by using terms which are used and defined within the code. This also assures that because the item is listed, that it has been tested by an approved agency and deemed to comply with the appropriate standard.

Assembly Action:

None

Final Hearing Results

FS180-06/07

AS

Code Change No: FS182-06/07

Original Proposal

Section: 1406.2.2

Proponent: Gene Boecker, Code Consultants, Inc.

Revise as follows:

1406.2.2 Architectural trim. In buildings of Type I, II, III and IV construction ~~that do not exceed three stories or 40 feet (12 192 mm) in height above grade plane~~, exterior wall coverings shall be permitted to be constructed of wood where permitted by Section 1405.4 or other equivalent combustible material. Combustible exterior wall coverings, other than fire-retardant-treated wood complying with Section 2303.2 for exterior installation, shall not exceed 10 percent of an exterior wall surface area where the fire separation distance is 5 feet (1524 mm) or less. ~~Architectural trim that exceeds 40 feet (12 192 mm) in height above grade plane shall be constructed of approved noncombustible materials and shall be secured to the wall with metal or other approved noncombustible brackets.~~ Combustible architectural trim shall be limited to three stories or 40 feet (12 192 mm) above grade plane.

Exceptions:

1. Combustible architectural trim of fire-retardant treated wood shall be permitted up to four stories or 60 feet in height above grade plane.
2. Noncombustible materials shall be permitted to be of any height provided the materials are secured to the wall with metal or other approved noncombustible brackets.

Reason: This proposed change coordinates language and requirements between Section 1405.4 (FS174-06/07) and this section for consistency. A companion change to Section 1405.4 will add text that addresses the height in feet in addition to stories. Because Section 1406.2.2 uses both feet and stories, this section has a height representative of that for the added story increase. The exceptions are extracted from the code text and set out as such for clarity. Because of the limits which have existed in Section 1405.4, no technical change will result from this code change, but the change is needed to bring consistency and clarity to these requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This is a nice clean up which makes the provisions easier to understand and determine what the section is requiring and accepting. It appropriately limits the height of the trim instead of addressing it based on the height of the building that the trim is applied to.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Maureen Traxler, City of Seattle Department of Planning and Development, requests Approval as Modified by the public comment.

Modify proposal as follows:

1406.2.2 Architectural trim. In buildings of Type I, II, III and IV construction, exterior wall coverings shall be permitted to be constructed of wood where permitted by Section 1405.4 or other equivalent combustible material. Combustible exterior wall coverings, other than fire-retardant-treated wood complying with Section 2303.2 for exterior installation, shall not exceed 10 percent of an exterior wall surface area where the fire separation

distance is 5 feet (1524 mm) or less. Combustible architectural trim shall be limited to three stories or 40 feet (12 192 mm) above grade plane. Noncombustible materials shall be permitted to be of any height provided the materials are secured to the wall with metal or other approved noncombustible brackets.

Exceptions:

- 4- Combustible architectural trim of fire-retardant treated wood shall be permitted up to four stories or 60 feet in height above grade plane.
- 2- ~~Noncombustible materials shall be permitted to be of any height provided the materials are secured to the wall with metal or other approved noncombustible brackets.~~

Commenter's Reason: This modification is an editorial change that relocates the proposed exception 2 into the body of the section. Since the charging paragraph doesn't mention noncombustible materials, it is inappropriate to address them in the exception—there is nothing in the charging paragraph to which the exception applies.

Final Hearing Results

FS182-06/07

AMPC1

Code Change No: FS183-06/07

Original Proposal

Section: 1407.2.4

Proponent: Rick Thornberry, P.E., The Code Consortium, Inc., representing Alcan Composites USA, Inc

Revise as follows:

1406.2.4 Fireblocking. Where the combustible exterior wall covering is furred from the wall and forms a solid surface, the distance between the back of the covering and the wall shall not exceed 1.625 inches (41 mm) ~~and~~ Where required by Section 717, the space thereby created shall be fireblocked ~~in accordance with Section 717.~~

Reason: This is a clarification of the code requirements regarding fireblocking for combustible exterior wall coverings. During the previous code development cycles this section was revised and simplified and the exceptions deleted since the exceptions were already contained in Section 717 Concealed Spaces. They were considered superfluous since Section 717 was referenced in this section that we're proposing to revise. The purpose of this code change is to clearly indicate that the concealed space need only be fireblocked in the combustible exterior wall where Section 717 actually requires it to be so, since there are several cases which are exempt from the requirement based on the exceptions to Section 717.2.6 Architectural Trim. As currently worded, this Section 1406.2.4 could be interpreted to say that regardless of the type of combustible exterior wall covering used, the fireblocking would be required without regard to the exceptions. By restructuring the last part of this section, we believe it makes it much more clear that the concealed space in the combustible exterior wall covering is only required to be fireblocked where specifically required by Section 717. Because 717.2.6 contains exceptions to the fireblocking requirement for concealed spaces of exterior wall finish, then for those conditions fireblocking would not be triggered by Section 1406.2.4. That was certainly the intent of the rewrite of the section during the last set of code development cycles between the 2003 International Building Code (IBC) and the 2006 IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal provides for a clarification of the code requirements. Because Section 717 does contain exceptions which may be applicable to this situation, it does seem to be better to state ~~Where required by~~ ^{as} as this proposal does.

Assembly Action:

None

Final Hearing Results

FS183-06/07

AS

Code Change No: **FS185-06/07**

Original Proposal

Section: 1502.1

Proponent: Mark S. Graham, James R. Kirby, National Roofing Contractors Association

Add new definition as follows:

1502.1 General. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

AGGREGATE: In roofing, crushed stone, crushed slag or water-worn gravel used for surfacing a built-up roof covering or modified bitumen roof covering.

Reason: This proposed code change adds a new definition to the code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

AGGREGATE: In roofing, crushed stone, crushed slag or water-worn gravel used for surfacing a built-up for roof coverings or modified bitumen roof covering.

Committee Reason: The definition will provide a concise explanation of the term aggregate. The modification removed references to specific types of roof coverings to address the concern that, as written, the definition would not apply to single ply roof coverings.

Assembly Action:

None

Final Hearing Results

FS185-06/07

AM

Code Change No: **FS186-06/07**

Original Proposal

Section: 1502 (New), Chapter 35

Proponent: David L. Roodvoets, DLR Consultants, representing Single-ply Roofing Institute, Inc. (SPRI)

1. Add new definition as follows:

BALLAST: Ballast is any item having weight that is used to hold or steady an object. In roofing, ballast comes in the form of Large Stones (ASTM D448 #4 or larger) or paver systems or light-weight interlocking paver systems and is used to provide uplift resistance for roofing systems that are not adhered or mechanically attached to the roof deck.

2. Add standard to Chapter 35 as follows:**ASTM**D448-03a Standard Classification for Sizes of Aggregate for Road and Bridge Construction

Reason: This addition to the code provides a definition that segregates ballast materials used for wind uplift resistance from other aggregates used on roofs.

There is no definition given for ballast in the standard therefore causing confusion for users of the code between the materials used to provide wind uplift on roofs and smaller aggregate that is used on adhered roofing systems to add fire and weather protection.

The term ballasted was adopted by the roofing industry in the 1970's to describe the use of large stones or pavers to provide wind resistance for roofing systems that were not adhered to the deck. These systems have had extensive use for over 25 years, and have had extensive wind tunnel testing and field evaluations, as well as an excellent track record for performance in high winds.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Note: The following analysis was not in the Code Change Proposal book but was published in the "Errata to the 2006/2007 Proposed Changes to the International Codes and Analysis of Proposed Referenced Standards" provided at the code development hearing.

Analysis: Review of proposed new standard indicated that, in the opinion of staff, the standard did comply with ICC standards criteria

Committee Action:**Approved as Modified****Modify proposal as follows:**

BALLAST: Ballast is any item having weight that is used to hold or steady an object. In roofing, ballast comes in the form of Large aggregate Stones (ASTM D448 #4 or larger) or paver systems or light-weight interlocking paver systems and is used to provide uplift resistance for roofing systems that are not adhered or mechanically attached to the roof deck.

Chapter 35:**ASTM**~~D448-03a Standard Classification for Sizes of Aggregate for Road and Bridge Construction~~

Committee Reason: The definition of ballast will help code users differentiate between aggregate used for wind uplift resistance versus other aggregate roofs. The modification changes "stone" to aggregate for consistency with the changes made in FS186-06/07.

Assembly Action:**None**

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

David L. Roodvoets, DLR Consultants, representing Single-ply Roofing Institute, Inc. (SPRI), requests Approval as Modified by this public comment.

Further modify proposal as follows:

BALLAST: Ballast is any item having weight that is used to hold or steady an object. In roofing, ballast comes in the form of large stones aggregate or paver systems or light-weight interlocking paver systems, and is used to provide uplift resistance for roofing systems that are not adhered or mechanically attached to the roof deck.

Commenter's Reason: The wording as modified by the committee could allow the use of aggregate which can be as small as ¼" in diameter. Although the very small stone is not likely to be dangerous in itself it can be blown off the roof and be a source of debris in windstorms. The proposed modification is a more precise definition and the minimum size stone can be easily observed by an inspector.

Final Hearing Results

FS186-06/07

AMPC1

Code Change No: FS187-06/07**Original Proposal**

Sections: 1503.4, 1503.4.1 (New), 1503.4.2 (New), 1503.4.3 (New), 1611.1

Proponent: Daniel J. Walker, P.E., Metal Building Manufacturers Association, Inc. (MBMA)

1. Revise as follows:

[P] 1503.4 Roof drainage. Design and installation of roof drainage systems shall comply with Section 1503 and the International Plumbing Code.

1503.4.1 Roof design. Roofs shall be designed for the maximum possible depth of water that will pond thereon as determined by the relative levels of roof deck and overflow weirs, scuppers, edges or serviceable drains in combination with the deflected structural elements. In determining the maximum possible depth of water, all primary roof drainage means shall be assumed to be blocked.

1503.4.2 Secondary drainage required. Secondary (emergency) roof drains or scuppers shall be provided where the roof perimeter construction extends above the roof in such a manner that water will be entrapped if the primary drains allow buildup for any reason.

1503.4.3 Scuppers. When scuppers are used for secondary (emergency overflow) roof drainage, the quantity, size, location and inlet elevation of the scuppers shall be sized to prevent the depth of ponding water from exceeding that for which the roof was designed as determined by Section 1503.4.1. Scuppers shall not have an opening dimension of less than 4 inches (102 mm). The flow through the primary system shall not be considered when locating and sizing scuppers.

(Renumber subsequent sections)

2. Revise as follows:

1611.1 Design rain loads. Each portion of a roof shall be designed to sustain the load of rainwater that will accumulate on it if the primary drainage system for that portion is blocked plus the uniform load caused by water that rises above the inlet of the secondary drainage system at its design flow. The design rainfall shall be based on the 100-year hourly rainfall rate indicated in Figure 1611.1 or on other rainfall rates determined from approved local weather data.

3. Insert figure as shown:

Insert all of IPC Figure 1106.1 and renumber as shown

FIGURE 1611.1 IPC-1106.1
100-YEAR, 1-HOUR RAINFALL (INCHES) EASTERN UNITED STATES

For SI: 1 inch = 25.4 mm.

Source: National Weather Service, National Oceanic and Atmospheric Administration, Washington D.C.

Reason: To make the code more user friendly and to make sure that the structural designer is aware of these design requirements that currently only reside in the IPC.

This code change proposal copies the pertinent roof drainage requirements contained in International Plumbing Code (IPC) Chapter 11 into Chapter 15 of the International Building Code (IBC) to make it more readily available to designers who are responsible for the structural load carrying capacity of roofs. This code change also adds verbiage from the IPC to IBC Section 1611.1 for determining the design rainfall, and copies the rainfall intensity map found in the IPC (Figure 1106.1). Currently this information is only available in the International Plumbing Code.

Section 8.3 of ASCE 7 and IBC Section 1611.1 both state that "Each portion of a roof shall be designed to sustain the load of all rainwater that will accumulate on it if the primary drainage system for that portion is blocked plus the uniform load caused by water that rises above the inlet of the secondary drainage system at its design flow". This code change proposal copies the applicable sections of the IPC into the IBC and puts the information into the hands of those who are responsible for the structural adequacy of the roof for these loads. The design of scuppers as the only secondary roof overflow mechanism is typically the responsibility of the design professional of record, and this information should be copied from the IPC into the IBC to make this information more available. All of the provisions of the IPC will remain, as this proposal suggests only copying the applicable ones into the IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The text proposed for inclusion into Section 1503.4.1 is from IPC Section 1101.7 and is identical to it. The text proposed for Section 1503.4.2 is from IPC 1107.1 and is identical to it. The text proposed for Section 1503.4.3 is from IPC 1107.3 with modifications since this proposed section only addresses scuppers. The changes that are being made to IPC 1107.3 for the new IBC Section 1503.4.3 are:

IPC 1107.3 Sizing of secondary drains. 1503.4.3 Scuppers. ~~Secondary (emergency) roof drain systems shall be sized in accordance with Section 1106 based on the rainfall rate for which the primary system is sized in Tables 1106.2, 1106.3 and 1106.6. Where scuppers are used for secondary (emergency overflow) roof drainage, the quantity, size, location and inlet elevation of the S scuppers shall be sized to prevent the depth of ponding water from exceeding that for which the roof was designed as determined by Section 1101.7. Scuppers shall not have an opening dimension of less than 4 inches (102 mm). The flow through the primary system shall not be considered when locating and sizing the scuppers secondary roof drain system.~~

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal provides guidance on roof drainage systems that will benefit designers, particularly if the IPC is not adopted.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Daniel J. Walker, P.E., Metal Building Manufacturers Association, Inc. (MBMA), requests Approval as Modified by this public comment.

Modify proposal as follows:

~~1503.4.1 Roof design. Roofs shall be designed for the maximum possible depth of water that will pond thereon as determined by the relative levels of roof deck and overflow weirs, scuppers, edges or serviceable drains in combination with the deflected structural elements. In determining the maximum possible depth of water, all primary roof drainage means shall be assumed to be blocked.~~

(Renumber subsequent sections)

(Portions of proposal not shown remain unchanged)

Commenter's Reason: The purpose for the modification is to remove the language for roof design from the original proposal. This specific language is already addressed in both ASCE 7 (Section 8.1) and IBC Chapter 16, Section 1611.1. What we had originally proposed for 1503.4.1 was taken from the International Plumbing Code, but is in conflict with ASCE 7 and IBC. Both ASCE and IBC direct the designer to calculate the rain load using the undeflected shape of the roof, where the plumbing code directs designers to use the deflected shape of the roof. We therefore request that the proposal be modified to be in sync with ASCE 7 Section 8.1 and IBC Section 1611.1 since those are the authoritative source for design information.

Final Hearing Results

FS187-06/07

AMPC1

Code Change No: **FS188-06/07**

Original Proposal

Sections: 1503.6 (New), 1507.2.9.4; IRC R905.2.8.3, R903.2.2 (New)

Proponent: David Fizzell, City of Prescott, Arizona, representing Arizona Building Officials

THIS PROPOSAL IS ON THE AGENDA OF THE IBC-FIRE SAFETY AND THE IRC-BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC FIRE SAFETY

1. Delete without substitution:

~~**1507.2.9.4 Crickets and saddles.** A cricket or saddle shall be installed on the ridge side of any chimney or penetration greater than 30 inches (762 mm) wide as measured perpendicular to the slope. Cricket or saddle coverings shall be sheet metal or of the same material as the roof covering.~~

2. Add new text as follows:

1503.6 Crickets and saddles. A cricket or saddle shall be installed on the ridge side of any chimney or penetration greater than 30 inches (762 mm) wide as measured perpendicular to the slope. Cricket or saddle coverings shall be sheet metal or of the same material as the roof covering.

PART II S IRC-BUILDING/ENERGY**1. Delete without substitution:**

~~**R905.2.8.3 Crickets and saddles.** A cricket or saddle shall be installed on the ridge side of any chimney or penetration more than 30 inches (762 mm) wide as measured perpendicular to the slope. Cricket or saddle coverings shall be sheet metal or of the same material as the roof covering.~~

2. Add new text as follows:

R903.2.2 Crickets and saddles. A cricket or saddle shall be installed on the ridge side of any chimney or penetration greater than 30 inches (762 mm) wide as measured perpendicular to the slope. Cricket or saddle coverings shall be sheet metal or of the same material as the roof covering.

Reason: Currently this language is located under the requirements for asphalt shingle drip edge. The requirement should not be limited only to asphalt shingle roof coverings. Crickets and saddles are not related to drip edge. These requirements can be applied to all types of roof coverings and need to be located in a section that can be applied to all roofs. An identical code proposal is being presented to the IRC code change committee.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I C IBC FIRE SAFETY**Committee Action:****Approved as Submitted**

Committee Reason: This restores a provision which was accidentally dropped in the last code change cycle. This proposal provides clarification by restoring the provision and moving it to the right section. The provision was previously in the asphalt roofing section and the code concern is a general item which is not material specific.

Assembly Action:**None****PART II C IRC****Committee Action:****Approved as Submitted**

Committee Reason: Appropriately relocates the crickets and saddles requirements to the proper code section to apply to all roof coverings.

Assembly Action:**None**

Final Hearing Results

Original Proposal

Sections: 1504.1.1, 1507.2.7 (New), 1507.2.7.1 (New), Table 1507.2.7.1 (New), 1609.5.2, Chapter 35; IRC R905.2.4.1 (New), Table R905.2.4.1 (New), R905.2.6, Chapter 43

Proponent: Michael D. Fischer, The Kellen Company, representing the Asphalt Roofing Manufacturers Association

THIS PROPOSAL IS ON THE AGENDA OF THE IBC-STRUCTURAL AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

1. Revise as follows.

1504.1.1 Wind resistance of asphalt shingles. Asphalt shingles shall be installed in accordance with Section 1507.2.7. ~~For roofs located where the basic wind speed in accordance with Figure 1609 is 110 mph or greater, asphalt shingles shall be tested in accordance with ASTM D 3161, Class F. As an alternative, load and wind resistance of asphalt shingle roof coverings shall be determined in accordance with Section 1609.5.2.~~

2. Delete and substitute as follows.

~~**1507.2.7 Attachment.** Asphalt shingles shall have the minimum number of fasteners required by the manufacturer and Section 1504.1. Asphalt shingles shall be secured to the roof with not less than four fasteners per strip shingle or two fasteners per individual shingle. Where the roof slope exceeds 20 units vertical in 12 units horizontal (166-percent slope), asphalt shingles shall be installed in accordance with the manufacturer's printed installation instructions for steep-slope roof applications.~~

1507.2.7 Attachment. Asphalt shingles shall have the minimum number of fasteners required by the manufacturer, but not less than four fasteners per strip shingle or two fasteners per individual shingle. Where the roof slope, exceeds 21 units vertical in 12 units horizontal (21:12), shingles shall be installed as required by the manufacturer.

1507.2.7.1 Wind Resistance. Asphalt shingles shall be tested in accordance with either ASTM D3161 or ASTM D7158 for wind resistance. Asphalt shingles shall meet the classification requirements of Table 1507.2.7 for the appropriate Maximum Basic Wind Speed. Asphalt shingle packaging shall indicate compliance with the required classification in Table 1507.2.7.

3. Add new table as follows:

**TABLE 1507.2.7
CLASSIFICATION OF ASPHALT ROOF SHINGLES ^a**

<u>MAXIMUM BASIC WIND SPEED FROM FIGURE 1609</u>	<u>ASTM D 3161</u>	<u>ASTM D 7158 b</u>
<u>85</u>	<u>A,D, or F</u>	<u>D,G or H</u>
<u>90</u>	<u>A,D, or F</u>	<u>D,G or H</u>
<u>100</u>	<u>A,D, or F</u>	<u>G or H</u>
<u>110</u>	<u>F</u>	<u>G or H</u>
<u>120</u>	<u>F</u>	<u>G or H</u>
<u>130</u>	<u>F</u>	<u>H</u>
<u>140</u>	<u>F</u>	<u>H</u>
<u>150</u>	<u>F</u>	<u>H</u>

- a. Asphalt Shingles shall be tested in accordance with ASTM D 3161 or ASTM D 7158. Refer to this table for selection of the appropriate product classification(s).
- b. The standard calculations contained in ASTM D 7158 assume exposure category B or C and building height of 60 feet or less. Additional calculations are required for conditions outside of these assumptions.

4. Revise as follows:

1609.5 Roof systems.

1609.5.1 Roof deck. The roof deck shall be designed to withstand the wind pressures determined in accordance with ASCE 7.

1609.5.2 Roof coverings. Roof coverings shall comply with Section 1609.5.1.

Exception: Rigid tile roof coverings that are air permeable and installed over a roof deck complying with Section 1609.5.1 are permitted to be designed in accordance with Section 1609.5.3.

~~Asphalt shingles installed over a roof deck complying with Section 1609.5.1 shall be tested to determine the resistance of the sealant to uplift forces using ASTM D 6381.~~

~~Asphalt shingles installed over a roof deck complying with Section 1609.5.1 are permitted to be designed using UL 2390 to determine appropriate uplift and force coefficients applied to the shingle.~~

Asphalt Shingles installed over a roof deck complying with 1609.5.1 shall be permitted to be designed using ASTM D 7158 to determine wind resistance.

5. Add standard to Chapter 35 as follows:

ASTM

D7158-05 Standard Test Method for Wind Resistance of Sealed Asphalt Shingles (Uplift Force/Uplift Resistance Method)

PART II – IRC BUILDING/ENERGY

1. Revise as follows:

R905.2.4.1 Wind resistance of asphalt shingles. Asphalt shingles shall be installed in accordance with Section R905.2.6. ~~Shingles classified using ASTM D 3161 are acceptable for use in wind zones less than 110 mph (49 m/s). Shingles classified using ASTM D 3161, Class F, are acceptable for use in all cases where special fastening is required.~~ Asphalt shingles shall be tested for wind resistance in accordance with one of the following test standards:

1. ASTM D 3161
2. ASTM D 7158

Asphalt shingles shall meet the classification requirement of Table 905.2.4.1 for the applicable maximum basic wind speed. Asphalt shingle packaging shall bear a label to indicate compliance with one of the above ASTM test standards and the appropriate classification from Table 905.2.4.1.

2. Add new table as follows:

**TABLE R905.2.4.1
CLASSIFICATION OF ASPHALT ROOF SHINGLES ^a**

<u>MAXIMUM BASIC WIND SPEED FROM TABLE R301.2(1)</u>	<u>ASTM D 3161</u>	<u>ASTM D 7158 b</u>
<u>85</u>	<u>A,D, or F</u>	<u>D,G or H</u>
<u>90</u>	<u>A,D, or F</u>	<u>D,G or H</u>
<u>100</u>	<u>A,D, or F</u>	<u>G or H</u>
<u>110</u>	<u>F</u>	<u>G or H</u>
<u>120</u>	<u>F</u>	<u>G or H</u>
<u>130</u>	<u>F</u>	<u>H</u>
<u>140</u>	<u>F</u>	<u>H</u>
<u>150</u>	<u>F</u>	<u>H</u>

- a. Asphalt Shingles shall be tested in accordance with ASTM D 3161 or ASTM D 7158. Refer to this table for selection of the appropriate product classification(s).
- b. The standard calculations contained in ASTM D 7158 assume exposure category B or C and building height of 60 feet or less. Additional calculations are required for conditions outside of these assumptions.

3. Revise as follows.

R905.2.6 Attachment. ~~Asphalt shingles shall have the minimum number of fasteners required by the manufacturer, but not less than four fasteners per strip shingle or two fasteners per individual shingle. For normal application, asphalt shingles shall be secured to the roof with not less than four fasteners per strip shingle or two fasteners per individual shingle. Where the roof slope exceeds 20 21 units vertical in 12 units horizontal (467 21:12, 175 percent slope), shingles shall be installed as required by the manufacturer. special methods of fastening are required. For roofs located where the basic wind speed per Figure 301.2(4) is 110 mph (49 m/s) or higher, special methods of fastening are required. Special fastening methods shall be tested in accordance with ASTM D 3161 Class F. Asphalt shingle wrappers shall bear a label indicating compliance with ASTM D 3161 Class F.~~

4. Add standard to Chapter 43 as follows:

ASTM

D7158-05 Standard Test Method for Wind Resistance of Sealed Asphalt Shingles (Uplift Force/Uplift Resistance Method)

Reason: This proposal will revise requirements for the testing of asphalt shingles to demonstrate resistance to wind forces, and provide clarifications to the attachment requirements for steep slope conditions. The IBC and IRC lack a reference to ASTM D 7158, which provides a method of testing that is appropriate for sealed asphalt shingles. The current reference to ASTM D 3161 is necessary for unsealed shingles, so that reference remains in this proposal. In order to clearly communicate the proper application of the two standards, the proponent is adding Table 1507.2.7 (IRC Table 905.2.4.1). The table will assist in the proper selection of asphalt shingles based upon the appropriate basic wind speed and the applicable standard.

Changes in the attachment section provide consistency with the industry installation guidelines, but continue to provide minimum fastener quantities. Reformatting the code sections provides a clear line of compliance. The shingle shall be tested, labeled, selected, and attached, and the code will now follow that sequence in the requirements.

The referenced standard has been accepted by the Florida Building Commission Structural TAC, for adoption into the Florida Building Code and Florida Building Code Residential. The clarification to Section 1609.5.2 provides consistency to the reference of ASTM D 7158.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Note: The following analysis was not in the Code Change Proposal book but was published in the AErrata to the 2006/2007 Proposed Changes to the International Codes and Analysis of Proposed Referenced Standards® provided at the code development hearings:

Analysis: Review of proposed new standard indicated that, in the opinion of staff, the standard did comply with ICC standards criteria. (Reviewed 2006 year date)

PART I C IBC STRUCTURAL**Committee Action:****Approved as Modified**

Modify the proposal as follows:

Chapter 35**ASTM**D7158- ~~05~~ 06 Standard Test Method for Wind Resistance of Sealed Asphalt Shingles (Uplift Force/Uplift Resistance Method)

Committee Reason: This proposal clarifies the attachment and determination of wind resistance of asphalt shingles. The added standard provides for testing of sealed asphalt shingles. The modification merely changes the edition of the standard to agree with what was submitted for committee review.

Assembly Action:**None****PART II C IRC****Committee Action:****Approved as Modified**

Modify the proposal as follows:

4. Add standard to Chapter 43 as follows:**ASTM**D7158-~~05~~ 06 Standard Test Method for Wind Resistance of Sealed Asphalt Shingles (Uplift Force/Uplift Resistance Method)

(Portions of proposal not shown remain unchanged)

Committee Reason: Based on proponent's published reason. The modification updates the reference standard to the current edition.

Assembly Action:**None**

Final Hearing Results

FS191-06/07, Part I	AM
FS191-06/07, Part II	AM

Code Change No: FS192-06/07

Original Proposal

Sections: 1504.2, 1504.3, 1504.8 and Table 1508.4**Proponent:** Philip Brazil, P.E., Reid Middleton, Inc., representing himself

THIS PROPOSAL IS ON THE AGENDA OF THE STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

Revise as follows:

1504.2 Wind resistance of clay and concrete tile. Wind loads on G clay and concrete tile roof coverings shall be ~~connected to the roof deck~~ in accordance with ~~Chapter 16~~ Section 1609.5.

1504.3 Wind resistance of nonballasted roofs. Roof coverings installed on roofs in accordance with Section 1507 that are mechanically attached or adhered to the roof deck shall be designed to resist the design wind load pressures for components and cladding in ~~Chapter 16~~ accordance with Section 1609.

1504.8 Gravel and stone. Gravel or stone shall not be used on the roof of a building located in a hurricane-prone region as defined in Section 1609.2, or on any other building with a mean roof height exceeding that permitted by Table 1504.8 based on the exposure category and basic wind speed at the ~~building~~ site.

**TABLE 1504.8
MAXIMUM ALLOWABLE MEAN ROOF HEIGHT PERMITTED FOR BUILDINGS
WITH GRAVEL OR STONE ON THE ROOF IN AREAS OUTSIDE A HURRICANE-PRONE REGION**

BASIC WIND SPEED FROM FIGURE 1609 (mph) ^b	MAXIMUM MEAN ROOF HEIGHT (ft) ^{a,c}		
	Exposure category		
	B	C	D
85	170	60	30
90	110	35	15
95	75	20	NP
100	55	15	NP
105	40	NP	NP
110	30	NP	NP
115	20	NP	NP
120	15	NP	NP
Greater than 120	NP	NP	NP

For SI: 1 foot = 304.8 mm; 1 mile per hour = 0.447 m/s.

- a. Mean roof height in accordance with Section 1609.2 as defined in ASCE 7.
- b. For intermediate values of basic wind speed, the height associated with the next higher value of wind speed shall be used, or direct interpolation is permitted.
- c. NP = gravel and stone not permitted for any roof height.

Reason: The purpose for the proposal is to update the provisions of Section 1504 on performance requirements for roof decks and roof covering to be more consistent with current structural provisions in Chapter 16. Section 1504.2 on clay and concrete tile roof coverings is revised from a requirement to be connected in accordance with Chapter 16 to a determination of wind loads in accordance with Section 1609.5 because the only identified reference to clay and concrete tile roof coverings in Chapter 16 is in Section 1609.5, which specifies how to determine wind loads (Section 1609.5.3) and wind pressures (Section 1609.5.1) but does not specify required connections.

Section 1609.5.1 requires the roof deck to be designed to withstand the wind pressures determined in accordance with ASCE 7. Section 1609.5.2 requires roof coverings to comply with Section 1609.5.1 except for rigid tile roof coverings that are air permeable and installed over a roof deck complying with Section 1609.5.1, which are permitted to comply with Section 1609.5.3.

A change to the title of Section 1504.2 is not proposed in order to maintain consistency with the titles to Sections 1504.1 (wind resistance of roofs) and 1504.3 (wind resistance of ballasted roofs), and with the subject of Section 1504.2.1, which refers to the resistance of shingles to uplift forces.

The proposed changes to Section 1504.3 are editorial. The deletion of “building” from Section 1504.8 is being done because the provisions of the IBC apply to structures as well as buildings. The revision to Footnote (a) of Table 1504.8 is being done because Section 1609.2 does not define mean roof height but that definition is found in Section 6.2 of ASCE 7-05.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal provides better coordination between the roof covering wind requirements in Section 1504 and Chapter 16 wind load requirements.

Assembly Action:

None

Final Hearing Results

FS192-06/07

AS

Code Change No: **FS196-06/07**

Original Proposal

Section: 1504.4

Proponent: David L. Roodvoets, DLR Consultants, representing Single-ply Roofing Institute, Inc. (SPRI)

Revise as follows:

1504.4 Ballasted low-slope roof systems. Ballasted low-slope (roof slope < 2:12) single-ply roof system coverings installed in accordance with Sections ~~4507~~ 1507.12 and 1507.13 shall be designed in accordance with ~~Section 1504.8 and~~ ANSI/SPRI RP-4.

Reason: Clarify which specific sections in 1507 - Requirements for Roof Coverings, involve low slope Ballasted systems and that the ballast used is large stone.

There is confusion by users of the code between the materials used to provide wind uplift on roofs and smaller aggregate that is used on adhered roofing systems to add fire and weather protection.

Ballasted single ply membranes performed very well in the recent hurricanes, see examples from the RICOWI report, again verifying that ANSI/SPRI RP-4 provides the design tools to install roofing systems that meet the required design. This change clearly separates the requirements for systems that use ballast for wind resistance from those systems that use smaller aggregate for fire and weather protection.

2.02 West Florida Hospital, East Patient Hospital, 8383 N. Davis Highway, Pensacola

TYPE OF STRUCTURE—Hospital
EXPOSURE—B
WALL CONSTRUCTION—Concrete with EIFS cladding
ROOF TYPE—Single-ply membrane
ROOF PITCH—¼ " : 12
ROOF DECK—Cast-in-place concrete

CONSTRUCTION—The building is one of many on the site and is constructed mostly of substantial steel frame construction with original rock aggregate precast concrete exterior panels that had been retrofitted with an EIFS exterior cladding system. The roof deck, which is about 30 ft above grade, appears to be cast-in-place concrete. This roof has a gravel stop edge.

The Escambia inlet bay could be seen to the east and south from the roofs, yet the surrounding terrain would qualify as Exposure B, according to ASCE 7-02, with a height of surface roughness of about 25 to 30 ft above grade. Streets and parking lots create open areas on the east, northeast, south, and southeast side of the structure across the street, as well as adjacent to the structure.

ROOF MEMBRANE SYSTEM—The membrane was a loose-laid ballasted white reinforced elastomeric sheet single-ply membrane (Hypalon), The ballast was similar to ASTM 448 #4 or larger (average 1.5-in. with stones up to 2 in.) The membrane was installed over tapered Isocyanurate insulation.

DAMAGE CONDITIONS—No membrane damage was noted. There was a small amount of gravel scour at the windward side, at corners, and around penthouses. There were no signs that gravel had left the roof. Ballast scour may occur, based on previous wind studies, for winds over 115 mph at this building height. Some of the partially adhered, 1/2-in.-thick rubber walk pads had become loose from the membrane; some may have blown off the roof. A 30 to 40 ft segment of the snap on fascia edge metal cover become disengaged from its cleat and had blown off. An exhaust fan had also blown off the roof.

DAMAGE INITIATION—The shop-fabricated metal edge was clamped over an existing gravel stop. The cleat, although continuous, was thin and could not resist the bending forces of the fascia.

OTHER COMMENTS —This roof was a survivor. There were no known leaks, and the ballast remained on the roof. The damage to the edge was repairable. The section of the hospital had been closed because the windows in the east-facing wall leaked so badly that water was blowing into the patient rooms. They expected to have the area back in operation as soon as the rooms were dried out.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1504.4 Ballasted low-slope roof systems. Ballasted low-slope (roof slope < 2:12) single-ply roof system coverings installed in accordance with Sections 1507.12 and 1507.13 shall be designed in accordance with Section 1504.8 and ANSI/SPRI RP-4.

Committee Reason: The proposal clarifies the installation of ballasted low-slope roof systems by providing more specific section references. The modification retains the reference to Section 1504.8 for design because no reason was given to justify removing it.

Assembly Action:

None

Final Hearing Results

Code Change No: **FS198-06/07**

Original Proposal

Section: 1504.8, Table 1504.8

Proponent: Mark S. Graham, James R. Kirby, National Roofing Contractors Association

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

Revise as follows:

1504.8 Gravel and stone. Aggregate. ~~Gravel or stone~~ Aggregate shall not be used on the roof of a building located in a hurricane-prone region as defined in Section 1609.2, or on any other building with a mean roof height exceeding that permitted by Table 1504.8 based on the exposure category and basic wind speed at the building site.

**TABLE 1504.8
MAXIMUM ALLOWABLE MEAN ROOF HEIGHT PERMITTED FOR
BUILDINGS WITH ~~GRAVEL OR STONE~~ AGGREGATE ON THE ROOF IN AREAS
OUTSIDE A HURRICANE-PRONE REGION**

(No changes to table text)

Reason: This proposed code change is intended to clarify the intent of Section 1504.8. The terms "gravel and stone" are not used elsewhere in Chapter 15. The term "aggregate" is already used in Table 1507.10.2.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: Substituting the term Aggregate® for Agravel and stone® clarifies these roof covering provisions.

Assembly Action:

None

Final Hearing Results

Original Proposal

Sections: 1505.2, 1505.3; IRC R902.1

Proponent: John C. Dean, The National Association of State Fire Marshals

THIS PROPOSAL IS ON THE AGENDA OF THE IBC-FS AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC FIRE SAFETY

Revise as follows:

1505.2 Class A roof assemblies. Class A roof assemblies are those that are effective against severe fire test exposure. Class A roof assemblies and roof coverings shall be listed and identified as Class A by an approved testing agency. Class A roof assemblies shall be permitted for use in buildings or structures of all types of construction.

Exception: Class A roof assemblies include those with coverings of brick, masonry, slate, clay or concrete roof tile, or exposed concrete roof deck, ~~ferrous or copper shingles or sheets.~~

1505.3 Class B roof assemblies. Class B roof assemblies are those that are effective against moderate fire-test exposure. Class B roof assemblies and roof coverings shall be listed and identified as Class B by an approved testing agency.

~~**Exception:** Class B roof assemblies include those with coverings of metal sheets and shingles.~~

PART II – IRC BUILDING/ENERGY

Revise as follows:

R902.1 Roofing covering materials. Roofs shall be covered with materials as set forth in Sections R904 and R905. Class A, B or C roofing shall be installed in areas designated by law as requiring their use or when the edge of the roof is less than 3 feet (914 mm) from a property line. Classes A, B and C roofing required to be listed by this section shall be tested in accordance with UL 790 or ASTM E 108. Roof assemblies with coverings of brick, masonry, slate, clay or concrete roof tile, or exposed concrete roof deck, ~~ferrous or copper shingles or sheets, and metal sheets and shingles,~~ shall be considered Class A roof coverings.

Reason: All roof assemblies with metal roof covering should be tested in accordance with ASTM E 108 or UL 790. The increasingly wide range of materials and configurations used as metal roofing now available in the market can no longer support a general exemption from fire testing these assemblies.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing Results

PART I C IBC FIRE SAFETY

Committee Action:

Disapproved

Committee Reason: This would be a substantial change which would remove a provision which was permitted by all three legacy codes. This issue was debated during the IBC development and since then and has been disapproved because structures with steel roofs do have a good fire history. While there are new materials being introduced, they still are required to meet the material standards of Section 1507.4.3 and Table 1507.3(1). If there is a problem with a new material then those products should be addressed without creating a prohibition against a product without a history of problems. The proposal lacked technical support.

Assembly Action:

None

PART II C IRC

Committee Action:

Disapproved

Committee Reason: There was no technical data submitted to show that the current code language is inadequate.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

John C. Dean, The National Association of State Fire Marshals, requests Approval as Modified by this public comment for Part I.

Modify proposal as follows:

1505.2 Class A roof assemblies. Class A roof assemblies are those that are effective against severe fire test exposure. Class A roof assemblies and roof coverings shall be listed and identified as Class A by any approved testing agency. Class A roof assemblies shall be permitted for use in buildings or structures of all types of construction.

Exceptions:

1. Class A roof assemblies include those with coverings of brick, masonry, slate, clay or concrete roof tile, or and exposed concrete roof deck.
2. Class A roof assemblies also include ferrous or copper shingles or sheets, installed on non-combustible decks.

1505.3 Class B roof assemblies. Class B roof assemblies are those that are effective against moderate fire-test exposure. Class B roof assemblies and roof coverings shall be listed and identified as Class B by an approved testing agency.

Commenter's Reason: These proposals were mischaracterized by the committee as eliminating the use of products that have previously been acceptable. In fact, the proposal makes no such assertion. The proposals only seek to remove language and exceptions that automatically confer Class A or Class B status to certain materials. The increasingly wide range of materials and configurations used as metal roofing now available in the market can no longer support a general exemption from fire testing these assemblies. All roof assemblies with metal roof covering should be tested in accordance with ASTM E108 or UL 790. The modification recognizes that metal roof coverings on non-combustible decks do not constitute a hazard.

In addition, these proposals will remove discrepancies between the IBC and IRC. In Section 902.1 of the IRC it confers Class A status to metal and copper materials. Section 1505.2 and 1505.3 of the IBC, copper is considered Class A, and metal is considered Class B. The same roofing material would have a different rating in each code. Revising the language and exceptions will provide clarification and consistency throughout the ICC documents.

The committee also indicated that they were unaware of data that suggests the exceptions are not warranted. Representative roofing material was tested on January 10, 2007i. These materials were subjected to the Burning Brand test in accordance with the ANSI/UL790 (Eighth Edition) standard. The test decks were constructed in accordance with paragraph 4.2, roof covering material applied in accordance with paragraph 4.4, and test samples conditioned in accordance with paragraph 4.5. The test decks were constructed using 15/32 seconds plywood in accordance with UL790. Testing was conducted in the UL lab and photo and video documentation were recorded. All tests were conducted using ASTM D226 Type 1 underlayment. Sustained flaming of the underside of the deck, indicating test FAILURE, occurred as follows:

- 30 gauge steel shingle – Class A test: Failed in 3 minutes 9 seconds.
- 0.040 Aluminum panel – Class B test: Failed in 7 minutes 39 seconds
- 24 gauge steel sheet – Class A test: Failed in 10 minutes 25 seconds
- Slate shingle 14X10 - Class A test: Failed 14 minutes 29 seconds.

These results are significant for several reasons. 1. The representative tests substantiate the original proposals as they certainly create a doubt that the automatic classification afforded by the codes is appropriate, 2. The tests indicate that sustained burning would occur in the attic space of buildings, in many cases before local fire departments could respond, and 3. Roof covering systems should be rated, not just the covering material.

In the document entitled *Roofing Materials & Systems Directory*, 2006 Edition, UL defines the roof system requirements for the various classifications. Most Class A ratings require the use of an additional layer of protection. With the automatic classifications now allowed by the code, it is creating a false sense of safety.

i "Report on Fact-Finding Investigation of Metal and Slate Prepared Roof Coverings". UL Report: Project 07CA03538/ File SV16680. January 2007.

Public Comment:

John C. Dean, The National Association of State Fire Marshals , requests Approval as Modified by this public comment for Part II.

Modify proposal as follows:

R902.1 Roofing covering materials. Roofs shall be covered with materials as set forth in Sections R904 and R905. Class A, B or C roofing shall be installed in areas designated by law as requiring their use or when the edge of the roof is less than 3 feet (914 mm) from a property line. Classes A, B and C roofing required to be listed by this section shall be tested in accordance with UL790 or ASTM E 108. ~~Roof assemblies with coverings of brick, masonry, slate, clay or concrete roof tile, or exposed concrete roof deck shall be considered Class A roof coverings.~~

Exceptions:

1. Class A roof assemblies include those with coverings of brick, masonry, slate, clay or concrete roof tile, and exposed concrete roof deck.
2. Class A roof assemblies also include ferrous or copper shingles or sheets, metal sheets and shingles, installed on noncombustible decks.

Commenter's Reason: These proposals were mischaracterized by the committee as eliminating the use of products that have previously been acceptable. In fact, the proposal makes no such assertion. The proposals only seek to remove language and exceptions that automatically confer Class A or Class B status to certain materials. The increasingly wide range of materials and configurations used as metal roofing now available in the market can no longer support a general exemption from fire testing these assemblies. All roof assemblies with metal roof covering should be tested in accordance with ASTM E108 or UL 790. The modification recognizes that metal roof coverings on non-combustible decks do not constitute a hazard.

In addition, these proposals will remove discrepancies between the IBC and IRC. In Section 902.1 of the IRC it confers Class A status to metal and copper materials. Section 1505.2 and 1505.3 of the IBC, copper is considered Class A, and metal is considered Class B. The same roofing material would have a different rating in each code. Revising the language and exceptions will provide clarification and consistency throughout the ICC documents.

The committee also indicated that they were unaware of data that suggests the exceptions are not warranted. Representative roofing material was tested on January 10, 2007ⁱ. These materials were subjected to the Burning Brand test in accordance with the ANSI/UL790 (Eighth Edition) standard. The test decks were constructed in accordance with paragraph 4.2, roof covering material applied in accordance with paragraph 4.4, and test samples conditioned in accordance with paragraph 4.5. The test decks were constructed using 15/32 seconds plywood in accordance with UL790. Testing was conducted in the UL lab and photo and video documentation were recorded. All tests were conducted using ASTM D226 Type 1 underlayment. Sustained flaming of the underside of the deck, indicating test FAILURE, occurred as follows:

30 gauge steel shingle – Class A test: Failed in 3 minutes 9 seconds.
 0.040 Aluminum panel – Class B test: Failed in 7 minutes 39 seconds
 24 gauge steel sheet – Class A test: Failed in 10 minutes 25 seconds
 Slate shingle 14X10 - Class A test: Failed 14 minutes 29 seconds.

These results are significant for several reasons. 1. The representative tests substantiate the original proposals as they certainly create a doubt that the automatic classification afforded by the codes is appropriate, 2. The tests indicate that sustained burning would occur in the attic space of buildings, in many cases before local fire departments could respond, and 3. Roof covering systems should be rated, not just the covering material.

In the document entitled *Roofing Materials & Systems Directory*, 2006 Edition, UL defines the roof system requirements for the various classifications. Most Class A ratings require the use of an additional layer of protection. With the automatic classifications now allowed by the code, it is creating a false sense of safety.

FS199-06/07, Part II	AMPC1

Code Change No: FS200-06/07

Original Proposal

Sections: 1507.2.8.2, 1507.5.3, 1507.6.3, 1507.7.3, Table 1507.8, 1507.8.3 and 1507.9.3

Proponent: Lawrence Brown, CBO, National Association of Home Builders (NAHB)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

Revise as follows:

1507.2.8.2 Ice dam membrane barrier. In areas where there has been a history of ice forming along the eaves causing a backup of water, ~~a membrane~~ an ice barrier that consists of at least two layers of underlayment cemented together or of a self-adhering polymer modified bitumen sheet shall be used in lieu of normal underlayment and extend from the ~~eave's edge~~ lowest edges of all roof surfaces to a point at least 24 inches (610 mm) inside the exterior wall line of the building.

Exception: Detached accessory structures that contain no conditioned floor area.

1507.5.3 Underlayment. Underlayment shall comply with ASTM D226, Type I or ASTM D4869.

1507.5.4 Ice barrier. In areas where there has been a history of ice forming along the eaves causing a backup of water, an ice barrier that consists of at least two layers of underlayment cemented together or of a self-adhering polymer-modified bitumen sheet shall be used in lieu of normal underlayment and extend from the ~~eave's edge~~ lowest edges of all roof surfaces to a point at least 24 inches (610 mm) inside the exterior wall line of the building.

Exception: Detached accessory structures that contain no conditioned floor area.

(Renumber subsequent sections)

1507.6.3 Underlayment. Underlayment shall comply with ASTM D226, Type I or ASTM D4869.

1507.6.4 Ice barrier. In areas where there has been a history of ice forming along the eaves causing a backup of water, an ice barrier that consists of at least two layers of underlayment cemented together or of a self-adhering polymer-modified bitumen sheet shall be used in lieu of normal underlayment and extend from the ~~eave's edge~~ lowest edges of all roof surfaces to a point at least 24 inches (610 mm) inside the exterior wall line of the building.

Exception: Detached accessory structures that contain no conditioned floor area.

(Renumber subsequent sections)

1507.7.3 Underlayment. Underlayment shall comply with ASTM D 226, Type I or ASTM D 4869.

1507.7.4 Ice barrier. In areas where the average daily temperature in January is 25 °F (-4 °C) or less or where there is a possibility of ice forming along the eaves causing a backup of water, an ice barrier that consists of at least two layers of underlayment cemented together or of a self-adhering polymer-modified bitumen sheet shall extend from the ~~eave's edge~~ lowest edges of all roof surfaces to a point at least 24 inches (610 mm) inside the exterior wall line of the building.

Exception: Detached accessory structures that contain no conditioned floor area.

(Renumber subsequent sections)

1507.8.3 Underlayment. Underlayment shall comply with ASTM D226, Type I or ASTM D4869.

1507.8.4 Ice barrier. In areas where there has been a history of ice forming along the eaves causing a backup of water, an ice barrier that consists of at least two layers of underlayment cemented together or of a self-adhering polymer-modified bitumen sheet shall be used in lieu of normal underlayment and extend from the ~~eave's edge~~ lowest edges of all roof surfaces to a point at least 24 inches (610 mm) inside the exterior wall line of the building.

Exception: Detached accessory structures that contain no conditioned floor area.

(Renumber subsequent sections)

1507.9.3 Underlayment. Underlayment shall comply with ASTM D226, Type I or ASTM D4869.

1507.9.4 Ice barrier. In areas where there has been a history of ice forming along the eaves causing a backup of water, an ice barrier that consists of at least two layers of underlayment cemented together or of a self-adhering polymer-modified bitumen sheet shall be used in lieu of normal underlayment and extend from the ~~eave's edge~~ lowest edges of all roof surfaces to a point at least 24 inches (610 mm) inside the exterior wall line of the building.

Exception: Detached accessory structures that contain no conditioned floor area.

(Renumber subsequent sections)

**TABLE 1507.8
WOOD SHINGLE AND SHAKE INSTALLATION**

ROOF ITEM	WOOD SHINGLES	WOOD SHAKES
4. Underlayment	—	—
Temperate climate	Underlayment shall comply with ASTM D 226, Type 1.	Underlayment shall comply with ASTM D 226, Type 1.
In areas where there is a possibility of ice forming along the eaves causing a backup of water.	An ice shield <u>barrier</u> that consists of at least two layers of underlayment cemented together or of a self-adhering polymer-modified bitumen sheet shall extend from the eave's edge to a point at least 24 inches inside the exterior wall line of the building.	An ice shield <u>barrier</u> that consists of at least two layers of underlayment cemented together or of a self-adhering polymer-modified bitumen sheet shall extend from the eave's edge <u>lowest edges of all roof surfaces</u> to a point at least 24 inches inside the exterior wall line of the building.

(Portions of table not shown do not change)

Reason: The intent of this Proposal is to coordinate the different Sections of IBC to consistently use the same terminology that most accurately describes this building element. The terms "ice shield", "ice dam membrane", and "ice barrier" are used in different Sections throughout both the IBC and IRC to describe the same element, that of a barrier to prevent damage from ice damming occurring under roof coverings. IBC Section 1507.2.8.2 uses the term "ice dam membrane", Table 1507.8 "ice shield", and Sections 1507.5.3, 1507.6.3, 1507.7.3, 1507.8.3 and 1507.9.3 all use the term "ice barrier". The change to the sections already containing the term "ice shield" is to only separate the text relating to the underlayment needing to comply with ASTM, and moving the text relating to the ice shield of that same section to a new subsection as these are two separate aspects of materials and construction. These Sections are already separated in Section 1507.2 for asphalt shingles.

The term "eave's edge" is changed to "lowest edges of all roof surfaces" due to the misapplication of this provision. It is the lowest edges of a roof where, due to the influence of gravity, melting snow and ice will refreeze and cause a back-up of ice. A few construction dictionaries define an "eave" as "the part of a roof that projects beyond the exterior wall". This would imply any exterior wall. Though, some dictionaries do go on to also state the eave is the "lower edge of a sloped roof". Technically, the extension over the roof on a gable end is a "rake", not an eave. This change correctly addresses the aspect that it is the lowest edges of a roof where there is a possibility of an ice dam occurring, not the rake or ridge of a roof. In its' application, it is the lowest edge of the roof where the underlayment is installed. This same change reflects the text of the 2006 IRC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This change makes the ice barrier requirements more uniform using consistent terminology that more accurately describes the applicable building elements.

Assembly Action:

None

Original Proposal

Sections: Proponent: Michael D. Fischer, The Kellen Company, representing the Asphalt Roofing Manufacturers Association

THIS PROPOSAL IS ON THE AGENDA OF THE IBC-STRUCTURAL AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Revise as follows:

1507.2.9.2 Valleys. Valley linings shall be installed in accordance with the manufacturer's instructions before applying shingles. Valley linings of the following types shall be permitted:

1. For open valleys (valley lining exposed) lined with metal, the valley lining shall be at least 16 inches (406 mm) wide and of any of the corrosion-resistant metals in Table 1507.2.9.2.
2. For open valleys, valley lining of two plies of mineral-surfaced roll roofing complying with ASTM D 3909 or ASTM D 6380 shall be permitted. The bottom layer shall be 18 inches (457 mm) and the top layer a minimum of 36 inches (914 mm) wide.
3. For closed valleys (valleys covered with shingles), valley lining of one ply of smooth roll roofing complying with ASTM D 6380, ~~Class S Type III, Class M Type II or ASTM D 3909~~ and at least 36 inches (914 mm) wide or types as described in Items 1 ~~and or~~ 2 above shall be permitted. Specialty Self-adhering polymer modified bitumen underlayment shall comply with complying with ASTM D 1970 shall be permitted in lieu of the lining material.

PART II – IRC BUILDING/ENERGY

Revise as follows:

R905.2.8.2 Valleys. Valley linings shall be installed in accordance with the manufacturer’s installation instructions before applying shingles. Valley linings of the following types shall be permitted:

1. For open valleys (valley lining exposed) lined with metal, the valley lining shall be at least 24 inches (610 mm) wide and of any of the corrosion-resistant metals in Table R905.2.8.2.
2. For open valleys, valley lining of two plies of mineral surfaced roll roofing, complying with ASTM D3909 or ASTM D6380 Class M, shall be permitted. The bottom layer shall be 18 inches (457mm) and the top layer a minimum of 36 inches (914 mm) wide.
3. For closed valleys (valley covered with shingles), valley lining of one ply of smooth roll roofing complying with ASTM D6380 ~~Class S Type III, Class M Type II, or ASTM D3909~~ and at least 36 inches wide (914 mm) or valley lining as described in Items 1 ~~and or~~ 2 above shall be permitted. Specialty Self-adhering polymer modified bitumen underlayment complying with ASTM D1970 may be used shall be permitted in lieu of the lining material.

Reason: (IBC and IRC) This proposal clarifies the requirements for valley linings and properly references ASTM D1970 for self-adhering modified bitumen underlayment. The IRC and IBC currently allow materials complying with ASTM D3909, normally used as cap sheets, to be used as valley lining in closed applications, but that reference is more appropriate for open conditions. This proposal appropriately provides for the addition of materials complying with ASTM D 1970 to be used in closed valley linings- consistent with the current underlayment requirements. Additionally, a grammatical error in item number 1 is fixed, non-mandatory language in number 3 is corrected, and the self-adhering polymer modified bitumen underlayment reference is corrected for consistency with the referenced standard.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I C IBC STRUCTURAL

Committee Action:

Approved as Submitted

Committee Reason: The proposal clarifies valley lining requirements.

Assembly Action:

None

PART II C IRC

Committee Action:

Approved as Submitted

Committee Reason: This change clarifies the code, properly references ASTM D 1970 for closed valleys, and eliminates non-mandatory language.

Original Proposal

Table 1507.8; IRC R905.7.5, R905.8.6

Proponent: Steven William Harris, Quality Auditing Institute, representing Cedar Shake and Shingle Bureau

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC STRUCTURAL

Revise table as follows:

**TABLE 1507.8
WOOD SHINGLE AND SHAKE INSTALLATION**

ROOF ITEM	WOOD SHINGLES	WOOD SHAKES
5. Application	—	—
Attachment	Fasteners for wood shingles shall be corrosion-resistant hot dipped <u>galvanized or type 304 (type 316 for coastal areas) stainless steel</u> with a minimum penetration of 0.75 inch into the sheathing. For sheathing less than 0.5 inch thick, the fasteners shall extend through the sheathing.	Fasteners for wood shakes shall be corrosion-resistant hot dipped <u>galvanized or type 304 (type 316 for coastal areas)</u> with a minimum penetration of 0.75 inch into the sheathing. For sheathing less than 0.5 inch thick, the fasteners shall extend through the sheathing.
No. of fasteners	Two per shingle.	Two per shake.
Exposure	Weather exposures shall not forth in Table 1507.8.6	Weather exposures shall not exceed those set forth in Table 1507.9.7
Method	Shingles shall be laid with a side lap of not less than 1.5 inches between joints in courses, and no two joints in any three adjacent courses shall be in direct alignment. Spacing between shingles shall be 0.25 to 0.375 inch.	Shakes shall be laid with a side lap of not less than 1.5 inches between joints in adjacent courses. Spacing between shakes shall not be less than 0.375 inch or more than 0.625 inch for shakes and tapered shakes of naturally durable wood and shall be 0.25 to 0.375 inch for preservative tapered shakes.

(Portions of table not shown do not change)

PART II – IRC BUILDING/ENERGY

Revise as follows:

R905.7.5 Application. Wood shingles shall be installed according to this chapter and the manufacturer's installation instructions. Wood shingles shall be laid with a side lap not less than 1½ inches (38 mm) between joints in courses, and no two joints in any three adjacent courses shall be in direct alignment. Spacing between shingles shall not be less than ¼ inch to 3/8 inch (6 mm to 10 mm). Weather exposure for wood shingles shall not exceed those set in Table R905.7.5. Fasteners for wood shingles shall be ~~corrosion-resistant hot dipped~~ galvanized or type 304 (type 316 for coastal areas) stainless steel, with a minimum penetration of ½ inch (13 mm) into the sheathing. For sheathing less than ½ inch (13 mm) in thickness, the fasteners shall extend through the sheathing. Wood shingles shall be attached to the roof with two fasteners per shingle, positioned no more than ¾ inch (19 mm) from each edge and no more than 1 inch (25 mm) above the exposure line.

R905.8.6 Application. Wood shakes shall be installed according to this chapter and the manufacturer's installation instructions. Wood shakes shall be laid with a side lap not less than 1½ inches (38 mm) between joints in adjacent courses. Spacing between shakes in the same course shall be 1/8 inch to 5/8 inch (3 mm to 16 mm) for shakes and

tapersawn shakes of naturally durable wood and shall be ¼ inch to 3/8 inch (6mm to 10 mm) for preservative treated taper sawn shakes. Weather exposure for wood shakes shall not exceed those set forth in Table R905.8.6. Fasteners for wood shakes shall be ~~corrosion-resistant~~ hot dipped galvanized or type 304 (type 316 for coastal areas) stainless steel, with a minimum penetration of ½ inch (12.7 mm) into the sheathing. For sheathing less than ½ inch (12.7 mm) in thickness, the fasteners shall extend through the sheathing. Wood shakes shall be attached to the roof with two fasteners per shake, positioned no more than 1 inch (25 mm) from each edge and no more than 2 inches (51 mm) above the exposure line.

Reason: This code change will eliminate the use of electro galvanized fasteners which have been shown to fail prematurely causing shakes or shingles to lose their attachment to the deck.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing Results

**PART I C IBC STRUCTURAL
Committee Action:**

Approved as Submitted

Committee Reason: The corrosion-resistant fasteners this code change requires have a useful life commensurate with cedar shingles and shakes and thus protect against premature failure of the attachment to the deck.

Assembly Action:

None

**PART II C IRC
Committee Action:**

Disapproved

Committee Reason: This proposal lacks a definition of Acoastal areas®. No technical data was submitted to document premature failure of electro-galvanized fasteners.

Assembly Action:

None

Proponent: David L. Roodvoets, DLR Consultants, representing Single-ply Roofing Institute, Inc. (SPRI)

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

Add new text as follows:

1507.13.3 Ballasted thermoplastic low slope roofs (<2:12) shall be installed in accordance with this section and section 1504.4

(Renumber subsequent sections)

Reason: This change clarifies the requirements for thermoplastic ballasted roofs. It is proposed to be added so that uses can refer directly to section requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Approved as Submitted**

Committee Reason: The proposal clarifies requirements for ballasted thermoplastic roofs by inserting a cross reference to an applicable requirement.

Assembly Action:**None**

Final Hearing Results

FS209-06/07

AS

Code Change No: **FS210-06/07**

Original Proposal

Section: 1507.16 (New)

Proponent: Mark S. Graham, James R. Kirby, National Roofing Contractors Association

Add new text as follows:

1507.16 Roof gardens and landscaped roofs. Roof gardens and landscaped roof shall comply with the requirements of this Chapter, Section 1607.11.2.2 and Section 1607.11.2.3.

Reason: This proposed code change adds new requirements and clarifies existing requirements in the code. This proposed code language requires roof gardens and landscaped roofs to equivalently meet the same requirements as all other roof systems. Additionally, this proposed code language ties the existing requirements for special purpose roofs (e.g., garden roofs) and landscaped roofs in Chapter 16 to Chapter 15.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Is this provision better located in 1504 or 1509?

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This code change provides cross references to Chapter 16 that assure loading requirements for landscaped roofs are included by the designer.

Original Proposal

Section: 1509.2.1

Proponent: Joe Holland, Hoover Treated Wood Products, Inc.

THIS PROPOSAL IS ON THE AGENDA OF THE IBC GENERAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

Revise as follows:

1509.2.1 Type of construction. Penthouses shall be constructed with walls, floors and roof as required for the building.

Exceptions:

1. On buildings of Type I ~~and II~~ construction, the exterior walls and roofs of penthouses with a fire separation distance of more than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be of at least 1-hour fire-resistance-rated noncombustible construction. Walls and roofs with a fire separation distance of 20 feet (6096 mm) or greater shall be of noncombustible construction. Interior framing and walls shall be of noncombustible construction.
2. On buildings of Type I two stories or less in height and Type II construction, the exterior walls and roofs of penthouses with a fire separation distance of more than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be of at least 1-hour fire-resistance-rated noncombustible or fire-retardant-treated wood construction. Walls and roofs with a fire separation distance of 20 feet (6096 mm) or greater shall be of noncombustible or fire-retardant-treated wood construction. Interior framing and walls shall be of noncombustible or fire-retardant-treated wood construction.
- ~~2.~~ 3. On buildings of Type III, IV and V construction, the exterior walls of penthouses with a fire separation distance of more than 5 feet (1524 mm) and less than 20 feet (6096 mm) shall be at least 1-hour fire-resistance-rated construction. Walls with a fire separation distance of 20 feet (6096 mm) or greater from a common property line shall be of Type IV, ~~or noncombustible, or fire-retardant-treated wood~~ construction. Roofs shall be constructed of materials and fire-resistance rated as required in Table 601 ~~and Section 601 item 1.3.~~ Interior framing and walls shall be Type IV, ~~or noncombustible, or fire-retardant-treated wood~~ construction.
- ~~3.~~ 4. On buildings of Type I ~~II~~ unprotected noncombustible enclosures housing only mechanical equipment and located with a minimum fire separation distance of 20 feet (6096 mm) shall be permitted.
5. On buildings of Type I two stories or less, II, III, IV, and V unprotected noncombustible or fire-retardant-treated wood enclosures housing only mechanical equipment and located with a minimum fire separation distance of 20 feet (6096 mm) shall be permitted.
- ~~4.~~ 6. On one-story buildings, combustible unroofed mechanical equipment screens, fences or similar enclosures are permitted where located with a fire separation distance of at least 20 feet (6096 mm) from adjacent property lines and where not exceeding 4 feet (1219 mm) in height above the roof surface.
- ~~5.~~ 7. Dormers shall be of the same type of construction as the roof on which they are placed, or of the exterior walls of the building.

Reason: The roof structure on all types of construction can be constructed using fire-retardant-treated wood. This change clarifies that a roof top structure can be FRTW as well.

With the limitation and size restrictions contained within the exceptions for rooftop structures it's inconsistent to not allow materials used in the construction of the roof structure to be used for a fence on a roof, or a penthouse.

Section 603.1.3 allows the roof structure to be FRTW in Type I two stories or less and Type II.

Cost Impact: The code change proposal will not increase the cost of construction and may save in construction costs and time.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal provides clarity with construction types and coordination with other allowances for fire-retardant-treated wood such as that allowed for roofs in Section 603.1.3.

Assembly Action:

None

Code Change No: FS212-06/07

Original Proposal

Section: 1510.3

Proponents: Mark S. Graham, James R. Kirby, National Roofing Contractors Association

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

Revise as follows:

1510.3 Recovering versus replacement. New roof coverings shall not be installed without first removing all existing layers of roof coverings down to the roof deck where any of the following conditions occur:

1. Where the existing roof or roof covering is water soaked or has deteriorated to the point that the existing roof or roof covering is not adequate as a base for additional roofing.
2. Where the existing roof covering is wood shake, slate, clay, cement or asbestos-cement tile.
3. Where the existing roof has two or more applications of any type of roof covering.

Exceptions:

1. Complete and separate roofing systems, such as standing-seam metal roof systems, that are designed to transmit the roof loads directly to the building's structural system and that do not rely on existing roofs and roof coverings for support, shall not require the removal of existing roof coverings.
2. Metal panel, metal shingle and concrete and clay tile roof coverings shall be permitted to be installed over existing wood shake roofs when applied in accordance with Section 1510.4.
3. The application of a new protective coating over an existing spray polyurethane foam roofing system shall be permitted without tear-off of existing roof coverings.

Reason: The proposed code change clarifies the intent of the code by specifically indicating that when roof removal is necessary removal of all roof coverings down to the roof is required.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal clarifies the current requirement for removing roof coverings by indicating the removal is to be down to the roof deck.

Assembly Action:

None

AS

Code Change No: **FS216-06/07**

Original Proposal

Section: 2606.4

Proponent: William E. Koffel, P.E., Koffel Associates, Inc.

Revise as follows:

2606.4 Specifications. Light-transmitting plastics, including thermoplastic, thermosetting or reinforced thermosetting plastic material, shall have a self-ignition temperature of 650°F (343°C) or greater where tested in accordance with ASTM D 1929; a smoke-developed index not greater than 450 where tested in the manner intended for use in accordance with ASTM E84, or an average smoke density rating not greater than 75 where tested in the thickness intended for use in accordance with ASTM D 2843 and shall conform to one of the following combustibility classifications:

Class CC1: Plastic materials that have a burning extent of 1 inch (25 mm) or less where tested at a nominal thickness of 0.060 inch (1.5 mm), or in the thickness intended for use, in accordance with ASTM D 635,

Class CC2: Plastic materials that have a burning rate of 2.5 inches per minute (1.06 mm/s) or less where tested at a nominal thickness of 0.060 inch (1.5 mm), or in the thickness intended for use, in accordance with ASTM D 635.

Reason: ASTM D 2843 required that a smoke density rating be obtained for three specimens and that an average smoke density rating for the three specimens be reported. The proposed change clarifies the original intent of the code which was that the average smoke density rating of the three specimens does not exceed 75. Without the clarification, one could interpret the Code to say that the smoke density of all three specimens shall not exceed 75.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

2606.4 Specifications. Light-transmitting plastics, including thermoplastic, thermosetting or reinforced thermosetting plastic material, shall have a self-ignition temperature of 650°F (343°C) or greater where tested in accordance with ASTM D 1929; a smoke-developed index not greater than 450 where tested in the manner intended for use in accordance with ASTM E84, or an maximum average smoke density rating not greater than 75 where tested in the thickness intended for use in accordance with ASTM D 2843 and shall conform to one of the following combustibility classifications:

Class CC1: Plastic materials that have a burning extent of 1 inch (25 mm) or less where tested at a nominal thickness of 0.060 inch (1.5 mm), or in the thickness intended for use, in accordance with ASTM D 635,

Class CC2: Plastic materials that have a burning rate of 2.5 inches per minute (1.06 mm/s) or less where tested at a nominal thickness of 0.060 inch (1.5 mm), or in the thickness intended for use, in accordance with ASTM D 635.

Committee Reason: This makes the code technically correct. The reported results are an average of the three tests. The committee did modify the proposal by inserting the word maximum since it is the highest smoke density rating during the test which is of concern and should be reported.

Assembly Action:

None

Final Hearing Results

Reason: The *ICC Code Development Process for the International Codes (Procedures)* Section 4.5* requires the updating of referenced standards to be accomplished administratively, and be processed as a Code Proposal. In May 2005, a letter was sent to each developer of standards that are referenced in the I-Codes, asking them to provide ICC with a list of their standards in order to update to the current edition. Above is the list received of the referenced standards under the maintenance responsibility of the IBC Fire Safety Committee.

***4.5 Updating Standards:** The updating of standards referenced by the Codes shall be accomplished administratively by the appropriate code development committee in accordance with these full procedures except that multiple standards to be updated may be included in a single proposal.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: It is important to keep the standards updated to the current editions of the standards. This assures that the most up-to-date information is included and also that the standards are available for both the designers and code enforcement agencies.

Assembly Action:

None

Final Hearing Results

FS217-06/07

AS

IBC – GENERAL

Code Change No: **G4-06/07**

Original Proposal

Sections: 112.1, 1612.3, 3109.4.1.8, 3202.1.2, 3202.3.4, 3202.4, 3303.6, 3306.2 (IEBC [B] 1401.6.1), 3308.1(IEBC [B] 1403.1), 3409.9 (IEBC [B] 308.9), G102.2

Proponent: Philip Brazil, P.E., Reid Middleton, Inc., representing the Washington Association of Building Officials

Revise as follows:

112.1 General. In order to hear and decide appeals of orders, decisions or determinations made by the building official relative to the application and interpretation of this code, there shall be and is hereby created a board of appeals. The board of appeals shall be appointed by the applicable governing body authority and shall hold office at its pleasure. The board shall adopt rules of procedure for conducting its business.

1612.3 Establishment of flood hazard areas. To establish flood hazard areas, the applicable governing body authority shall adopt a flood hazard map and supporting data. The flood hazard map shall include, at a minimum, areas of special flood hazard as identified by the Federal Emergency Management Agency in an engineering report entitled "The Flood Insurance Study for [INSERT NAME OF JURISDICTION]," dated [INSERT DATE OF ISSUANCE], as amended or revised with the accompanying Flood Insurance Rate Map (FIRM) and Flood Boundary and Floodway Map (FBFM) and related supporting data along with any revisions thereto. The adopted flood hazard map and supporting data are hereby adopted by reference and declared to be part of this section.

3109.4.1.8 Dwelling wall as a barrier. Where a wall of a dwelling serves as part of the barrier, one of the following shall apply:

1. Doors with direct access to the pool through that wall shall be equipped with an alarm that produces an audible warning when the door and/or its screen, if present, are opened. The alarm shall be listed in accordance with UL 2017. The audible alarm shall activate within 7 seconds and sound continuously for a minimum of 30 seconds after the door and/or its screen, if present, are opened and be capable of being heard throughout the house during normal household activities. The alarm shall automatically reset under all conditions. The alarm shall be equipped with a manual means, such as touchpad or switch, to temporarily deactivate the alarm for a single opening. Such deactivation shall last for not more than 15 seconds. In dwellings not required to be Accessible, Type A or Type B units, the deactivation switch shall be located 54 inches (1372 mm) or more above the threshold of the door. In dwellings required to be Accessible, Type A or Type B units, the deactivation switch(es) shall be located at 54 inches (1372 mm) maximum and 48 inches minimum above the threshold of the door.
2. The pool shall be equipped with a power safety cover that complies with ASTM F 1346.
3. Other means of protection, such as self-closing doors with self-latching devices, which are approved by the administrative authority building official, shall be accepted so long as the degree of protection afforded is not less than the protection afforded by Section 3109.4.1.8, Item 1 or 2.

3202.1.2 Vaults and other enclosed spaces. The construction and utilization of vaults and other enclosed space below grade shall be subject to the terms and conditions of the applicable governing authority ~~or legislative body having jurisdiction~~.

3202.3.4 Pedestrian walkways. The installation of a pedestrian walkway over a public right-of-way shall be subject to the approval of ~~local~~ the applicable governing authority having jurisdiction. The vertical clearance from the public right-of-way to the lowest part of a pedestrian walkway shall be 15 feet (4572 mm) minimum.

3202.4 Temporary encroachments. Where allowed by the ~~local~~ applicable governing authority having jurisdiction, vestibules and storm enclosures shall not be erected for a period of time exceeding 7 months in any one year and shall not encroach more than 3 feet (914 mm) nor more than one-fourth of the width of the sidewalk beyond the

street lot line. Temporary entrance awnings shall be erected with a minimum clearance of 7 feet (2134 mm) to the lowest portion of the hood or awning where supported on removable steel or other approved noncombustible support.

3303.6 Utility connections. Service utility connections shall be discontinued and capped in accordance with the approved rules and the requirements of the applicable governing authority having jurisdiction.

3306.2 (IEBC 1401.6.1) Walkways. A walkway shall be provided for pedestrian travel in front of every construction and demolition site unless the applicable governing authority having jurisdiction authorizes the sidewalk to be fenced or closed. Walkways shall be of sufficient width to accommodate the pedestrian traffic, but in no case shall they be less than 4 feet (1219 mm) in width. Walkways shall be provided with a durable walking surface. Walkways shall be accessible in accordance with Chapter 11 and shall be designed to support all imposed loads and in no case shall the design live load be less than 150 pounds per square foot (psf) (7.2 kN/m²).

3308.1 (IEBC 1403.1) Storage and handling of materials. The temporary use of streets or public property for the storage or handling of materials or of equipment required for construction or demolition, and the protection provided to the public shall comply with the provisions of the applicable governing authority having jurisdiction and this chapter.

3409.9 (IEBC 308.9) Historic buildings. These provisions shall apply to buildings and facilities designated as historic structures that undergo alterations or a change of occupancy, unless technically infeasible. Where compliance with the requirements for accessible routes, entrances or toilet facilities would threaten or destroy the historic significance of the building or facility, as determined by the applicable governing authority having jurisdiction, the alternative requirements of Sections 3409.9.1 through 3409.9.4 for that element shall be permitted.

G102.2 Establishment of flood hazard areas. Flood hazard areas are established in Section 1612.3 of the *International Building Code*, adopted by the applicable governing body authority on [INSERT DATE].

Reason: The purpose of this proposal is to make more consistent references to the regulatory authorities responsible for enforcement of the IBC in their jurisdictions. Typically, the building official is responsible for day-to-day enforcement. The IBC refers to the building official consistently throughout the IBC except for the definition of “immediately dangerous to life and health,” which refers to the code official, and Sections 903.6, 903.3.7 and 903.3.7.1 on hose threads and fire department connections, which refer to the “fire code official.”

In many jurisdictions there is a committee or other body, typically appointed by the local elected officials, with the authority to oversee the performance of building officials in their duties and to perform other regulatory functions (i.e., board of appeals). The IBC makes frequent references to such a body but it does not do so in a consistent manner. The most prevalent term for this body currently in the IBC is “applicable governing authority.” This proposal will make the references consistent.

Authority having jurisdiction. IRC (Def – permit, potable water, approved, code, labeled and listed, N1107.7) IPC (Def – approved, code, potable water, 302.2, 602.3.3, C101.1), IMC (Def approved, code, listed, approved), IFGC (Def – code, listed), IECC (101.2.2.4, Approved), ICCEC (Approved, Listed and listing), IPMC (106.3, 109.3, 302.4), IEBC (116.3, 1105.15, A505).

Governing Body. Ordinances, IRC (112.1, AG105.2 (Item 9.3)), IFC (106.2, 108.1, A101.2, A101.3.3), ICCEC (701.1, 1101.1), IPMC (110.4), IEBC (112.1, 117.4).

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis. The IBC also includes these terms in the example of the Adoption Ordinance, the definition of ‘permit’ and Section 3303.4.

While some sections listed are typically the purview of other committees, for consistency, the General Committee will make the determination for this entire proposal.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

3109.4.1.8 Dwelling wall as a barrier. Where a wall of a dwelling serves as part of the barrier, one of the following shall apply:

1. Doors with direct access to the pool through that wall shall be equipped with an alarm that produces an audible warning when the door and/or its screen, if present, are opened. The alarm shall be listed in accordance with UL 2017. The audible alarm shall activate within 7 seconds and sound continuously for a minimum of 30 seconds after the door and/or its screen, if present, are opened and be capable of being heard throughout the house during normal household activities. The alarm shall automatically reset under all conditions. The alarm shall be equipped with a manual means, such as touchpad or switch, to temporarily deactivate the alarm for a single opening. Such deactivation shall last for not more than 15 seconds. In dwellings not required to be Accessible, Type A or Type B units, the deactivation switch shall be located 54 inches (1372 mm) or more above the threshold of the door. In dwellings required to be Accessible, Type A or Type B units, the deactivation switch(es) shall be located at 54 inches (1372 mm) maximum and 48 inches minimum above the threshold of the door.
2. The pool shall be equipped with a power safety cover that complies with ASTM F 1346.

3. Other means of protection, such as self-closing doors with self-latching devices, which are approved by the building official shall be accepted so long as the degree of protection afforded is not less than the protection afforded by Section 3109.4.1.8, Item 1 or 2.

(Portions of proposal not shown remain unchanged)

Committee Reason: The proposal was approved based upon the need to use consistent language to refer to the regulatory authorities responsible for enforcement of the IBC. See proponents reason. The committee agreed that within Section 3109.4.1.8 the appropriate authority is the building official but that it was not necessary to explicitly state as the definition of approved would include the building official.

Code Change No: **G6-06/07**

Original Proposal

Sections: 402.6, 414.2.4, 603.1, 704.9, 708.4, 717.4.2, Table 803.5, 1206.2, 1206.3, 1405.4, 1406.2.2, 1406.3, Table 1505.1, 1808.2.5, 1915.5, 2606.12, 3306.7, Table 3410.6.11 (IEBC [B] Table 1301.6.11); IFC Table 803.3, IFC 907.2.4 (IBC [F] 907.2.4), IFC 907.2.8.1 (IBC [F] 907.2.8.1), 907.2.9 (IBC [F] 907.2.9)

Proponent: Philip Brazil, PE, Reid Middleton, Inc., representing himself

THIS PROPOSAL IS ON THE AGENDA OF THE IBC GENERAL AND IFC CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES

PART I – IBC

Revise as follows:

402.6 Types of construction. The area of any covered mall building, including anchor buildings, of Type I, II, III and IV construction, shall not be limited provided the covered mall building and attached anchor buildings and parking garages are surrounded on all sides by a permanent open space of not less than 60 feet (18 288 mm) and the anchor buildings do not exceed three stories ~~in height above grade plane~~. The allowable height and area of anchor buildings greater than three stores ~~in height above grade plane~~ shall comply with Section 503, as modified by Sections 504 and 506. The construction type of open parking garages and enclosed parking garages shall comply with Sections 406.3 and 406.4, respectively.

414.2.4 Fire-resistance-rating requirements. The required fire-resistance rating for fire barriers shall be in accordance with Table 414.2.2. The floor construction of the control area and the construction supporting the floor of the control area shall have a minimum 2-hour fire-resistance rating.

Exception: The floor construction of the control area and the construction supporting the floor of the control area is allowed to be 1-hour fire-resistance rated in buildings of Type IIA, IIIA and VA construction, provided that both of the following conditions exist:

1. The building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, and
2. The building is three stories or less ~~in height above grade plane~~.

603.1 Allowable materials. Combustible materials shall be permitted in buildings of Type I or Type II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:

1. Fire-retardant-treated wood shall be permitted in:

- 1.1. Nonbearing partitions where the required fire-resistance rating is 2 hours or less.
- 1.2. Nonbearing exterior walls where no fire rating is required.
- 1.3. Roof construction, including girders, trusses, framing and decking.

Exception: In buildings of Type I construction exceeding two stories ~~in height~~ above grade plane, fire-retardant-treated wood is not permitted in roof construction when the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).

(Items 2 through 22 of section to remain unchanged)

704.9 Vertical separation of openings. Openings in exterior walls in adjacent stories shall be separated vertically to protect against fire spread on the exterior of the buildings where the openings are within 5 feet (1524 mm) of each other horizontally and the opening in the lower story is not a protected opening with a fire protection rating of not less than $\frac{3}{4}$ hour. Such openings shall be separated vertically at least 3 feet (914 mm) by spandrel girders, exterior walls or other similar assemblies that have a fire-resistance rating of at least 1 hour or by flame barriers that extend horizontally at least 30 inches (762 mm) beyond the exterior wall. Flame barriers shall also have a fire-resistance rating of at least 1 hour. The unexposed surface temperature limitations specified in ASTM E 119 shall not apply to the flame barriers or vertical separation unless otherwise required by the provisions of this code.

Exceptions:

1. This section shall not apply to buildings that are three stories or less ~~in height~~ above grade plane.
2. This section shall not apply to buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.
3. Open parking garages.

708.4 Continuity. Fire partitions shall extend from the top of the foundation or floor/ceiling assembly below to the underside of the floor or roof sheathing, slab or deck above or to the fire-resistance-rated floor/ceiling or roof/ceiling assembly above, and shall be securely attached thereto. If the partitions are not continuous to the sheathing, deck or slab, and where constructed of combustible construction, the space between the ceiling and the sheathing, deck or slab above shall be fireblocked or draftstopped in accordance with Sections 717.2 and 717.3 at the partition line. The supporting construction shall be protected to afford the required fire-resistance rating of the wall supported, except for tenant and sleeping unit separation walls and corridor walls in buildings of Types IIB, IIIB and VB construction.

Exceptions:

1. The wall need not be extended into the crawl space below where the floor above the crawl space has a minimum 1-hour fire-resistance rating.
2. Where the room-side fire-resistance-rated membrane of the corridor is carried through to the underside of the floor or roof sheathing, deck or slab of a fire-resistance-rated floor or roof above, the ceiling of the corridor shall be permitted to be protected by the use of ceiling materials as required for a 1-hour fire-resistance-rated floor or roof system.
3. Where the corridor ceiling is constructed as required for the corridor walls, the walls shall be permitted to terminate at the upper membrane of such ceiling assembly.
4. The fire partition separating tenant spaces in a mall, complying with Section 402.7.2, are not required to extend beyond the underside of a ceiling that is not part of a fire-resistance-rated assembly. A wall is not required in attic or ceiling spaces above tenant separation walls.
5. Fireblocking or draftstopping is not required at the partition line in Group R-2 buildings that do not exceed four stories ~~in height~~ above grade plane, provided the attic space is subdivided by draftstopping into areas not exceeding 3,000 square feet (279 m²) or above every two dwelling units, whichever is smaller.
6. Fireblocking or draftstopping is not required at the partition line in buildings equipped with an automatic sprinkler system installed throughout in accordance with Section 903.3.1.1 or 903.3.1.2, provided that automatic sprinklers are installed in combustible floor/ceiling and roof/ceiling spaces.

717.4.2 Groups R-1 and R-2. Draftstopping shall be provided in attics, mansards, overhangs or other concealed roof spaces of Group R-2 buildings with three or more dwelling units and in all Group R-1 buildings. Draftstopping shall be installed above, and in line with, sleeping unit and dwelling unit separation walls that do not extend to the underside of the roof sheathing above.

Exceptions:

1. Where corridor walls provide a sleeping unit or dwelling unit separation, draftstopping shall only be required above one of the corridor walls.
2. Draftstopping is not required in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.
3. In occupancies in Group R-2 that do not exceed four stories ~~in height~~ above grade plane, the attic space shall be subdivided by draftstops into areas not exceeding 3,000 square feet (279 m²) or above every two dwelling units, whichever is smaller.
4. Draftstopping is not required in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.2, provided that automatic sprinklers are also installed in the combustible concealed spaces.

**TABLE 803.5
INTERIOR WALL AND CEILING FINISH REQUIREMENTS BY OCCUPANCY^k**

(No changes to table text)

For SI: 1 inch = 25.4 mm, 1 square foot = 0.0929 m².

- a. Class C interior finish materials shall be permitted for wainscoting or paneling of not more than 1,000 square feet of applied surface area in the grade lobby where applied directly to a noncombustible base or over furring strips applied to a noncombustible base and fireblocked as required by Section 803.4.1.
- b. In exit enclosures of buildings less than three stories ~~in height~~ above grade plane of other than Group I-3, Class B interior finish for nonsprinklered buildings and Class C interior finish for sprinklered buildings shall be permitted.
- c. Requirements for rooms and enclosed spaces shall be based upon spaces enclosed by partitions. Where a fire-resistance rating is required for structural elements, the enclosing partitions shall extend from the floor to the ceiling. Partitions that do not comply with this shall be considered enclosing spaces and the rooms or spaces on both sides shall be considered one. In determining the applicable requirements for rooms and enclosed spaces, the specific occupancy thereof shall be the governing factor regardless of the group classification of the building or structure.
- d. Lobby areas in Group A-1, A-2 and A-3 occupancies shall not be less than Class B materials.
- e. Class C interior finish materials shall be permitted in places of assembly with an occupant load of 300 persons or less.
- f. For places of religious worship, wood used for ornamental purposes, trusses, paneling or chancel furnishing shall be permitted.
- g. Class B material is required where the building exceeds two stories.
- h. Class C interior finish materials shall be permitted in administrative spaces.
- i. Class C interior finish materials shall be permitted in rooms with a capacity of four persons or less.
- j. Class B materials shall be permitted as wainscoting extending not more than 48 inches above the finished floor in corridors.
- k. Finish materials as provided for in other sections of this code.
- l. Applies when the exit enclosures, exit passageways, corridors or rooms and enclosed spaces are protected by a sprinkler system installed in accordance with Section

1206.2 Yards. Yards shall not be less than 3 feet (914 mm) in width for ~~one- and two-story~~ two stories or less above grade plane. For buildings more than two stories ~~in height~~ above grade plane, the minimum width of the yard shall be increased at the rate of 1 foot (305 mm) for each additional story. For buildings exceeding 14 stories ~~in height~~ above grade plane, the required width of the yard shall be computed on the basis of 14 stories above grade plane.

1206.3 Courts. Courts shall not be less than 3 feet (914 mm) in width. Courts having windows opening on opposite sides shall not be less than 6 feet (1829 mm) in width. Courts shall not be less than 10 feet (3048 mm) in length unless bounded on one end by a public way or yard. For buildings more than two stories ~~in height~~ above grade plane, the court shall be increased 1 foot (305 mm) in width and 2 feet (310 mm) in length for each additional story. For buildings exceeding 14 stories ~~in height~~ above grade plane, the required dimensions shall be computed on the basis of 14 stories above grade plane.

1405.4 Wood veneers. Wood veneers on exterior walls of buildings of Type I, II, III and IV construction shall be not less than 1 inch (25 mm) nominal thickness, 0.438-inch (11.1 mm) exterior hardboard siding or 0.375-inch (9.5 mm) exterior-type wood structural panels or particleboard and shall conform to the following:

1. The veneer shall not exceed three stories ~~in height, measured from above~~ the grade plane. Where fire-retardant-treated wood is used, the height shall not exceed four stories.
2. The veneer is attached to or furred from a noncombustible backing that is fire-resistance rated as required by other provisions of this code.
3. Where open or spaced wood veneers (without concealed spaces) are used, they shall not project more than 24 inches (610 mm) from the building wall.

1406.2.2 Architectural trim. In buildings of Type I, II, III and IV construction that do not exceed three stories above grade plane or 40 feet (12 192 mm) in height ~~above grade plane~~, exterior wall coverings shall be permitted to be constructed of wood where permitted by Section 1405.4 or other equivalent combustible material. Combustible exterior wall coverings, other than fire-retardant-treated wood complying with Section 2303.2 for exterior installation, shall not exceed 10 percent of an exterior wall surface area where the fire separation distance is 5 feet (1524 mm) or less. Architectural trim that exceeds 40 feet (12 192 mm) in height above grade plane shall be constructed of approved noncombustible materials and shall be secured to the wall with metal or other approved noncombustible brackets.

1406.3 Balconies and similar projections. Balconies and similar projections of combustible construction other than fire-retardant-treated wood shall be fire-resistance rated in accordance with Table 601 for floor construction or shall be of Type IV construction in accordance with Section 602.4. The aggregate length shall not exceed 50 percent of the building's perimeter on each floor.

Exceptions:

1. On buildings of Type I and II construction, three stories or less ~~in height above grade plane~~, fire-retardant-treated wood shall be permitted for balconies, porches, decks and exterior stairways not used as required exits.
2. Untreated wood is permitted for pickets and rails or similar guardrail devices that are limited to 42 inches (1067 mm) in height.
3. Balconies and similar projections on buildings of Type III, IV and V construction shall be permitted to be of Type V construction, and shall not be required to have a fire-resistance rating where sprinkler protection is extended to these areas.
4. Where sprinkler protection is extended to the balcony areas, the aggregate length of the balcony on each floor shall not be limited.

TABLE 1505.1^{a, b}

MINIMUM ROOF COVERING CLASSIFICATION FOR TYPES OF CONSTRUCTION

IA	IB	IIA	IIB	IIIA	IIIB	IV	VA	VB
B	B	B	C ^c	B	C ^c	B	B	C ^c

For SI: 1 foot = 304.8 mm, 1 square foot = 0.0929m².

- a. Unless otherwise required in accordance with the *International Wildland-Urban Interface Code* or due to the location of the building within a fire district in accordance with Appendix D.
- b. Nonclassified roof coverings shall be permitted on buildings of Group R-3 and Group U occupancies, where there is a minimum fire-separation distance of 6 feet measured from the leading edge of the roof.
- c. Buildings that are not more than two stories ~~in height above grade plane~~ and having not more than 6,000 square feet of projected roof area and where there is a minimum 10-foot fire-separation distance from the leading edge of the roof to a lot line on all sides of the building, except for street fronts or public ways, shall be permitted to have roofs of No. 1 cedar or redwood shakes and No. 1 shingles.

1808.2.5 Stability. Piers or piles shall be braced to provide lateral stability in all directions. Three or more piles connected by a rigid cap shall be considered braced, provided that the piles are located in radial directions from the centroid of the group not less than 60 degrees (1 rad) apart. A two-pile group in a rigid cap shall be considered to be braced along the axis connecting the two piles. Methods used to brace piers or piles shall be subject to the approval of the building official.

Piles supporting walls shall be driven alternately in lines spaced at least 1 foot (305 mm) apart and located symmetrically under the center of gravity of the wall load carried, unless effective measures are taken to provide for eccentricity and lateral forces, or the wall piles are adequately braced to provide for lateral stability. A single row of piles without lateral bracing is permitted for one- and two-family dwellings and lightweight construction not exceeding two stories above grade plane or 35 feet (10 668 mm) in height, provided the centers of the piles are located within the width of the foundation wall.

1915.5 Fire-resistance-rating protection. Pipe columns shall be of such size or so protected as to develop the required fire-resistance ratings specified in Table 601. Where an outer steel shell is used to enclose the fire-protective covering, the shell shall not be included in the calculations for strength of the column section. The minimum diameter of pipe columns shall be 4 inches (102 mm) except that in structures of Type V construction not exceeding three stories above grade plane or 40 feet (12 192 mm) in height, pipe columns used in the basement and as secondary steel members shall have a minimum diameter of 3 inches (76 mm).

2606.12 Solar collectors. Light-transmitting plastic covers on solar collectors having noncombustible sides and bottoms shall be permitted on buildings not over three stories ~~in height~~ above grade plane or 9,000 square feet (836.1 m²) in total floor area, provided the light-transmitting plastic cover does not exceed 33.33 percent of the roof area for CC1 materials or 25 percent of the roof area for CC2 materials.

Exception: Light-transmitting plastic covers having a thickness of 0.010 inch (0.3 mm) or less or shall be permitted to be of any plastic material provided the area of the solar collectors does not exceed 33.33 percent of the roof area.

3306.7 Covered walkways. Covered walkways shall have a minimum clear height of 8 feet (2438 mm) as measured from the floor surface to the canopy overhead. Adequate lighting shall be provided at all times. Covered walkways shall be designed to support all imposed loads. In no case shall the design live load be less than 150 psf (7.2 kN/m²) for the entire structure.

Exception: Roofs and supporting structures of covered walkways for new, light-frame construction not exceeding two stories ~~in height~~ above grade plane are permitted to be designed for a live load of 75 psf (3.6kN/m²) or the loads imposed on them, whichever is greater. In lieu of such designs, the roof and supporting structure of a covered walkway are permitted to be constructed as follows:

1. Footings shall be continuous 2-inch by 6-inch (51mm by 152 mm) members.
2. Posts not less than 4 inches by 6 inches (102 mm by 152 mm) shall be provided on both sides of the roof and spaced not more than 12 feet (3658 mm) o.c.
3. Stringers not less than 4 inches by 12 inches (102 mm by 305 mm) shall be placed on edge upon the posts.
4. Joists resting on the stringers shall be at least 2 inches by 8 inches (51 mm by 203 mm) and shall be spaced not more than 2 feet (610 mm) o.c.
5. The deck shall be planks at least 2 inches (51 mm) thick or wood structural panels with an exterior exposure durability classification at least ²³/₃₂ inch (18.3 mm) thick nailed to the joists.
6. Each post shall be knee braced to joists and stringers by 2-inch by 4-inch (51 mm by 102 mm) minimum members 4 feet (1219 mm) long.
7. A 2-inch by 4-inch (51 mm by 102 mm) minimum curb shall be set on edge along the outside edge of the deck.

**TABLE 3410.6.11 (IEBC [B] Table 1301.6.11)
MEANS OF EGRESS VALUES
(No changes to table text)**

- a. The values indicated are for buildings six stories or less in height. For buildings over six stories ~~in height~~ above grade plane, add an additional -10 points.

PART II – IFC

Revise as follows:

**TABLE 803.3
INTERIOR WALL AND CEILING FINISH REQUIREMENTS BY OCCUPANCY^k**

(No changes to table text)

- a. Class C interior finish materials shall be allowed for wainscotting or paneling of not more than 1,000 square feet of applied surface area in the grade lobby where applied directly to a noncombustible base or over furring strips applied to a noncombustible base and fireblocked as required by Section 803.4 of the *International Building Code*.
- b. In exit enclosures of buildings less than three stories ~~in height~~ above grade plane of other than Group I-3, Class B interior finish for nonsprinklered buildings and Class C for sprinklered buildings shall be permitted.

- c. Requirements for rooms and enclosed spaces shall be based upon spaces enclosed by partitions. Where a fire-resistance rating is required for structural elements, the enclosing partitions shall extend from the floor to the ceiling. Partitions that do not comply with this shall be considered as enclosing spaces and the rooms or spaces on both sides shall be considered as one. In determining the applicable requirements for rooms and enclosed spaces, the specific occupancy thereof shall be the governing factor regardless of the group classification of the building or structure.
- d. Lobby areas in Group A-1, A-2 and A-3 occupancies shall not be less than Class B materials.
- e. Class C interior finish materials shall be allowed in Group A occupancies with an occupant load of 300 persons or less.
- f. In places of religious worship, wood used for ornamental purposes, trusses, paneling or chancel furnishing shall be allowed.
- g. Class B material is required where the building exceeds two stories.
- h. Class C interior finish materials shall be allowed in administrative spaces.
- i. Class C interior finish materials shall be allowed in rooms with a capacity of four persons or less.
- j. Class B materials shall be allowed as wainscoting extending not more than 48 inches above the finished floor in corridors.
- k. Finish materials as provided for in other sections of this code.
- l. Applies when the vertical exits, exit passageways, corridors or rooms and spaces are protected by an approved automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

907.2.4 Group F. A manual fire alarm system shall be installed in Group F occupancies that are two or more stories ~~in height above grade plane~~ and have an occupant load of 500 or more above or below the lowest level of exit discharge.

Exception: Manual fire alarm boxes are not required when the building is equipped throughout with an automatic sprinkler system and the notification appliances will activate upon sprinkler water flow.

907.2.8.1 Manual fire alarm system. A manual fire alarm system shall be installed in Group R-1 occupancies.

Exceptions:

- 1. A manual fire alarm system is not required in buildings not more than two stories ~~in height above grade plane~~ where all individual sleeping units and contiguous attic and crawl spaces are separated from each other and public or common areas by at least 1-hour fire partitions and each individual sleeping unit has an exit directly to a public way, exit court or yard.
- 2. Manual fire alarm boxes are not required throughout the building when the following conditions are met:
 - 2.1. The building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2;
 - 2.2. The notification appliances will activate upon sprinkler water flow; and
 - 2.3. At least one manual fire alarm box is installed at an approved location.

907.2.9 Group R-2. A manual fire alarm system shall be installed in Group R-2 occupancies where:

- 1. Any dwelling unit or sleeping unit is located three or more stories above the lowest level of exit discharge;
- 2. Any dwelling unit or sleeping unit is located more than one story below the highest level of exit discharge of exits serving the dwelling unit or sleeping unit; or
- 3. The building contains more than 16 dwelling units or sleeping units.

Exceptions:

- 1. A fire alarm system is not required in buildings not more than two stories ~~in height above grade plane~~ where all dwelling units or sleeping units and contiguous attic and crawl spaces are separated from each other and public or common areas by at least 1-hour fire partitions and each dwelling unit or sleeping unit has an exit directly to a public way, exit court or yard.
- 2. Manual fire alarm boxes are not required throughout the building when the following conditions are met:
 - 2.1. The building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or Section 903.3.1.2; and
 - 2.2. The notification appliances will activate upon sprinkler flow.
- 3. A fire alarm system is not required in buildings that do not have interior corridors serving dwelling units and are protected by an approved automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2, provided that dwelling units either have a means of egress door opening directly to an exterior exit access that leads directly to the exits or are served by open-ended corridors designed in accordance with Section 1023.6, Exception 4.

Reason: All of the code sections in this proposal have one thing in common. They specify requirements for a building based on its number of stories. A story is defined in Sections 202 and 502.1 as “that portion of a building included between the upper surface of a floor and the upper surface of the floor or roof next above,” which includes portions of a building below grade plane (i.e., basements). Consequently, the number of stories specified in of these code sections would be determined beginning at the bottommost level in the building, which could be several levels (stories) below grade plane. The proposal will establish that the determination begins at the first story above grade plane, which is the probable intent in each case.

This proposal does not include each code section in the IBC that specifies requirements for a building based on its number of stories. There are cases where the determination of the number of stories in a building beginning at the bottommost level is warranted. Please refer to Sections 406.1.1, 415.4, 415.5, 415.7.3.3, 903.2.8.1(1), 903.3.1.2, 1015.2, 1206.3.2, 2305.1.5, 2305.2.5, 2603.5, 3310.1 and 3311.1.

There are also several code sections in the IBC that currently specify requirements for a building based on its number of stories above grade plane. Please refer to Sections 101.2 (Exception 1), 402.1, 402.7.3, 415.7.3.5, 415.9.2.3, 903.2.3(2), 903.2.6(2), 903.2.8(2), 1009.12, 1002.6 (Exception 1), 1018.2 (Item 1), 1025.1, 1407.11.1, 1407.11.2, 1705.1 (Exceptions 1 and 2), 1509.5, 1807.1.1, 2308.2(1), 2308.2.2 (Exception 2), 2308.11.2 (Exception 1), 2308.12.2 (Exception 1), 2607.3, 2608.2 (Item 1) and 3002.4. See code change proposal G44-04/05 (AM) for further information.

This proposal is partly a continuation of code change proposal G44-04/05 (AM), which successfully distinguished between requirements based on the height or number of stories of a building by measuring from grade plane versus the height of a component of a building by measuring from grade. There is also a similar proposal before the IBC Structural Committee.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis. While some sections listed are typically the purview of other committees, for consistency, the General Committee will make the determination for the entire Part I of this proposal.

Public Hearing Results

PART I C IBC

Committee Action:

Approved as Submitted

Committee Reason: Clarified specific cases within the code where stories below grade plane are not intended to be included when determining applicability of a requirement. See also the proponent’s reason.

Assembly Action:

None

PART II C IFC

Committee Action:

Disapproved

Committee Reason: Approval of the proposal could result in the installation of fewer fire alarm systems in the Section 907 items.

Assembly Action:

None

Original Proposal

Sections: [F] 415.6.2.1.1, 505.4, 506.1.1, 507.2, 507.3, 507.4, 507.6, 507.7, 507.8, 507.9, 507.10, 509.3, 509.8, [F] 903.2.8.1 (IFC 903.2.8.1), [F] 903.2.10.1 (IFC 903.2.10), 1009.11 (IFC [B] 1009.11), 1020.1 (IFC [B] 1020.1), 502.1, 202

Proponent: Maureen Traxler, City of Seattle, WA, Department of Planning and Development

Revise as follows:

[F] 415.6.2.1.1 Height exception. Where storage tanks are located within only a ~~single-story~~ building no more than one story in height, the height limitation of Section 503 shall not apply for Group H.

505.4 Openness. A mezzanine shall be open and unobstructed to the room in which such mezzanine is located except for walls not more than 42 inches (1067 mm) high, columns and posts.

Exceptions:

1. Mezzanines or portions thereof are not required to be open to the room in which the mezzanines are located, provided that the occupant load of the aggregate area of the enclosed space does not exceed 10.
2. A mezzanine having two or more means of egress is not required to be open to the room in which the mezzanine is located if at least one of the means of egress provides direct access to an exit from the mezzanine level.
3. Mezzanines or portions thereof are not required to be open to the room in which the mezzanines are located, provided that the aggregate floor area of the enclosed space does not exceed 10 percent of the mezzanine area.
4. In industrial facilities, mezzanines used for control equipment are permitted to be glazed on all sides.
5. In other than Groups H and I occupancies no more than two stories in height ~~above grade plane~~ and equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, a mezzanine having two or more means of egress shall not be required to be open to the room in which the mezzanine is located.

506.1.1 Basements. A single basement ~~that is not a story above grade plane~~ need not be included in the total allowable area, provided such basement does not exceed the area permitted for a building with no more than one story above grade plane.

507.2 Nonsprinklered, one story. The area of a Group F-2 or S-2 building no more than one-story in height, ~~Group F-2 or S-2 building~~ shall not be limited when the building is surrounded and adjoined by public ways or yards not less than 60 feet (18 288 mm) in width.

507.3 Sprinklered, one story. The area of a Group B, F, M or S building no more than one-story in height, ~~Group B, F, M or S building~~ or a Group A-4 building no more than one-story in height ~~Group A-4 building~~, of other than Type V construction, shall not be limited when the building is provided with an automatic sprinkler system throughout in accordance with Section 903.3.1.1 and is surrounded and adjoined by public ways or yards not less than 60 feet (18 288 mm) in width.

Exceptions:

1. Buildings and structures of Type I and II construction for rack storage facilities that do not have access by the public shall not be limited in height, provided that such buildings conform to the requirements of Sections 507.2 and 903.3.1.1 and NFPA 230.
2. The automatic sprinkler system shall not be required in areas occupied for indoor participant sports, such as tennis, skating, swimming and equestrian activities in occupancies in Group A-4, provided that:
 - 2.1. Exit doors directly to the outside are provided for occupants of the participant sports areas; and
 - 2.2. The building is equipped with a fire alarm system with manual fire alarm boxes installed in accordance with Section 907.
3. Group A-1 and A-2 occupancies of other than Type V construction shall be permitted, provided:
 - 3.1. All assembly occupancies are separated from other spaces as required for separated uses in Section 508.3.3.4 with no reduction allowed in the fire-resistance rating of the separation based upon the installation of an automatic sprinkler system;
 - 3.2. Each Group A occupancy shall not exceed the maximum allowable area permitted in Section 503.1; and
 - 3.3. All required exits shall discharge directly to the exterior.

507.4 Two story. The area of a Group B, F, M or S building no more than two stories in height ~~two-story, Group B, F, M or S building~~ shall not be limited when the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, and is surrounded and adjoined by public ways or yards not less than 60 feet (18 288 mm) in width.

507.6 Group A-3 buildings. The area of a Group A-3 building no more than one-story in height, ~~Group A-3 building~~ used as a place of religious worship, community hall, dance hall, exhibition hall, gymnasium, lecture hall, indoor swimming pool or tennis court of Type II construction shall not be limited when all of the following criteria are met:

1. The building shall not have a stage other than a platform.
2. The building shall be equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.
3. The assembly floor shall be located at or within 21 inches (533 mm) of street or grade level and all exits are provided with ramps complying with Section 1010.1 to the street or grade level.
4. The building shall be surrounded and adjoined by public ways or yards not less than 60 feet (18 288 mm) in width.

507.7 Group H occupancies. Group H-2, H-3 and H-4 occupancies shall be permitted in unlimited area buildings containing Group F and S occupancies, in accordance with Sections 507.3 and 507.4 and the limitations of this section. The aggregate floor area of the Group H occupancies located at the perimeter of the unlimited area building shall not exceed 10 percent of the area of the building nor the area limitations for the Group H occupancies as specified in Table 503 as modified by Section 506.2, based upon the percentage of the perimeter of each Group H fire area that fronts on a street or other unoccupied space. The aggregate floor area of Group H occupancies not located at the perimeter of the building shall not exceed 25 percent of the area limitations for the Group H occupancies as specified in Table 503. Group H fire areas shall be separated from the rest of the unlimited area building and from each other in accordance with Table 508.3.3 For two-story unlimited area buildings, the Group H fire areas shall not be located ~~above the first~~ more than one story above grade plane unless permitted by the allowable height in stories and feet as set forth in Table 503 based on the type of construction of the unlimited area building.

507.8 Aircraft paint hangar. The area of a Group H-2 aircraft paint hangar no more than one-story in height, ~~Group H-2 aircraft paint hangar~~ shall not be limited where such aircraft paint hangar complies with the provisions of Section 412.4 and is entirely surrounded by public ways or yards not less in width than one and one-half times the height of the building.

507.9 Group E buildings. The area of a Group E building no more than one-story in height, ~~Group E building~~ of Type II, IIIA or IV construction shall not be limited when the following criteria are met:

1. Each classroom shall have not less than two means of egress, with one of the means of egress being a direct exit to the outside of the building complying with Section 1018.
2. The building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.
3. The building is surrounded and adjoined by public ways or yards not less than 60 feet (18 288 mm) in width.

507.10 Motion picture theaters. In buildings of Type II construction, the area of a ~~one-story~~ motion picture theater located on the first story above grade plane shall not be limited when the building is provided with an automatic sprinkler system throughout in accordance with Section 903.3.1.1 and is surrounded and adjoined by public ways or yards not less than 60 feet (18 288 mm) in width.

509.3 Group S-2 enclosed parking garage with Group S-2 open parking garage above. A Group S-2 enclosed parking garage located ~~in the basement or first~~ no more than one story above grade plane, and located below a Group S-2 open parking garage shall be classified as a separate and distinct building for the purpose of determining the type of construction when the following conditions are met:

1. The allowable area of the structure shall be such that the sum of the ratios of the actual area divided by the allowable area for each separate occupancy shall not exceed 1.0.
2. The Group S-2 enclosed parking garage is of Type I or II construction and is at least equal to the fire-resistance requirements of the Group S-2 open parking garage.
3. The height and the number of the floors above the basement shall be limited as specified in Table 406.3.5.
4. The floor assembly separating the Group S-2 enclosed parking garage and Group S-2 open parking garage shall be protected as required for the floor assembly of the Group S-2 enclosed parking garage. Openings between the Group S-2 enclosed parking garage and Group S-2 open parking garage, except exit openings, shall not be required to be protected.
5. The Group S-2 enclosed parking garage is used exclusively for the parking or storage of private motor vehicles, but shall be permitted to contain an office, waiting room and toilet room having a total area of not more than 1,000 square feet (93 m²), and mechanical equipment rooms incidental to the operation of the building.

509.8 Group B or M with Group S-2 open parking garage above. Group B or M uses located in the basement or first story above grade plane below a Group S-2 open parking garage shall be classified as a separate and distinct building for the purpose of determining the type of construction when all of the following conditions are met:

1. The basement or first story above grade plane shall be Type I or II construction, but not less than the type of construction required for the open parking garage above. The height and area of the basement or first story shall not exceed the limitations in Section 503 for the Group B or M uses.
2. The height and area of the open parking garage shall not exceed the limitations permitted under Section 406.3. The height, in both feet and stories, of the open parking garage shall be measured from grade plane and include both the open parking garage and the basement or first story above grade plane.
3. Fire separation assemblies between the open parking garage and the basement or first story above grade plane use group occupancy shall correspond to the required fire-resistance rating prescribed by Table 508.3.3
4. Exits serving the open parking garage shall discharge directly to a street or public way and shall be separated from the basement or first story above grade plane use group occupancy by not less than 2-hour fire barriers constructed in accordance with Section 706 or 2-hour horizontal assemblies constructed in accordance with Section 711, or both, with opening protectives in accordance with Table 715.4.

[F] 903.2.8.1 Repair garages. An automatic sprinkler system shall be provided throughout all buildings used as repair garages in accordance with Section 406, as shown:

1. Buildings having two or more stories in height, including basements, with a fire area containing a repair garage exceeding 10,000 square feet (929 m²).
2. ~~One-story buildings~~ Buildings no more than one story in height, with a fire area containing a repair garage exceeding 12,000 square feet (1115 m²).
3. Buildings with a repair garage servicing vehicles parked in the basement.

[F] 903.2.10.1 Stories and basements without openings. An automatic sprinkler system shall be installed throughout all stories, including basements, ~~every story or basement~~ of all buildings where the floor area exceeds 1,500 square feet (139.4m²) and where there is not provided at least one of the following types of exterior wall openings:

1. Openings below grade that lead directly to ground level by an exterior stairway complying with Section 1009 or an outside ramp complying with Section 1010. Openings shall be located in each 50 linear feet (15 240 mm), or fraction thereof, of exterior wall in the story on at least one side.
2. Openings entirely above the adjoining ground level totaling at least 20 square feet (1.86 m²) in each 50 linear feet (15 240 mm), or fraction thereof, of exterior wall in the story on at least one side.

1009.11 Stairway to roof. In buildings ~~located~~ four or more stories in height ~~above grade plane~~, one stairway shall extend to the roof surface, unless the roof has a slope steeper than four units vertical in 12 units horizontal (33-percent slope). In buildings without an occupied roof, access to the roof from the top story shall be permitted to be by an alternating tread device.

1020.1 Enclosures required. Interior exit stairways and interior exit ramps shall be enclosed with fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both. Exit enclosures shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories. The number of stories connected by the exit enclosure shall include any basements but not any mezzanines. An exit enclosure shall not be used for any purpose other than means of egress.

Exceptions:

1. In all occupancies, other than Group H and I occupancies, a stairway is not required to be enclosed when the stairway serves an occupant load of less than 10 and the stairway complies with either Item 1.1 or 1.2. In all cases, the maximum number of connecting open stories shall not exceed two.
 - 1.1. The stairway is open to not more than one story above the story at the level of exit discharge; or
 - 1.2. The stairway is open to not more than one story below the story at the level of exit discharge.
2. Exits in buildings of Group A-5 where all portions of the means of egress are essentially open to the outside need not be enclosed.
3. Stairways serving and contained within a single residential dwelling unit or sleeping unit in Group R-1, R-2 or R-3 occupancies are not required to be enclosed.

4. Stairways that are not a required means of egress element are not required to be enclosed where such stairways comply with Section 707.2.
5. Stairways in open parking structures that serve only the parking structure are not required to be enclosed.
6. Stairways in Group I-3 occupancies, as provided for in Section 408.3.6, are not required to be enclosed.
7. Means of egress stairways as required by Section 410.5.3 are not required to be enclosed.
8. In other than Group H and I occupancies, a maximum of 50 percent of egress stairways serving one adjacent floor are not required to be enclosed, provided at least two means of egress are provided from both floors served by the unenclosed stairways. Any two such interconnected floors shall not be open to other floors. Unenclosed exit stairways shall be remotely located as required in Section 1015.2.
9. In other than Group H and I occupancies, interior egress stairways serving only the first and second stories above grade plane of a building equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 are not required to be enclosed, provided at least two means of egress are provided from both floors served by the unenclosed stairways. Such interconnected stories shall not be open to other stories. Unenclosed exit stairways shall be remotely located as required in Section 1015.2.

502.1 Definitions.

BASEMENT. ~~That portion of a building that is partly or completely below grade plane (see “Story above grade plane” in Section 202). A basement shall be considered as~~ A story that is not a story above grade plane (See “Story above grade plane” in Section 202) ~~where the finished surface of the floor above the basement is:~~

- ~~1. More than 6 feet (1829 mm) above grade plane; or~~
- ~~2. More than 12 feet (3658 mm) above the finished ground level at any point.~~

SECTION 202 DEFINITIONS

STORY. That portion of a building included between the upper surface of a floor and the upper surface of the floor or roof next above (also see “Basement”, “Mezzanine” and Section 502.1). It is measured as the vertical distance from top to top of two successive tiers of beams or finished floor surfaces and, for the topmost story, from the top of the floor finish to the top of the ceiling joists or, where there is not a ceiling, to the top of the roof rafters.

STORY ABOVE GRADE PLANE. Any story having its finished floor surface entirely above grade plane, ~~except that a basement shall be considered as a story above grade plane or in which~~ where the finished surface of the floor above the basement is:

1. More than 6 feet (1829 mm) above grade plane; or
2. More than 12 feet (3658 mm) above the finished ground level at any point.

Reason: The purpose of this proposal is to clarify the use of the term “basement” in the IBC.

Part 1 of the proposal makes several corrections to the use of terms.

It clarifies what is meant when the code uses “one-story building”, “two-story building”, “first story”, and similar phrases. “Story” is defined as “That portion of a building included between the upper surface of a floor and the upper surface of the floor or roof next above”. According to this definition, basements are stories. This proposal revises several code sections to clarify that, when the codes uses ‘buildings with one (or two) stories in height’, or similar term, only stories above grade plane are counted. According to the current code language, a building with one basement and one story above grade plane would be considered a two-story building; according to this proposal, it would be a single-story building.

In Part 1 of this proposal, we have chosen to use the term “stories in height” instead of “stories above grade plane”. “Stories in height” is less awkward, and it is currently used many places in the code. “Stories in height” conveys the same meaning as “stories above grade plane”. It refers to the number of stories allowed by Table 503, which is measured in stories above grade plane. If “stories above grade plane” were to be used instead, many more code sections would require revisions. The important issue is to use one term consistently throughout the code.

Unnecessary language is removed from Section 506.1.1, since Part 1 clarified that basements are not stories above grade plane.

Note that this proposal deals only with Chapters 1 through 10. Changes to other chapters can be proposed in the next code cycle.

Part 2 of the proposal revises the definitions of “basement” and “story above grade plane”. Section 202 defines the term “basement” as a portion of a building that is at least partly below grade plane. The definition doesn’t specify a minimum amount of the portion that’s below grade plane, or how far below grade plane. A portion of a building that has one corner located one foot below grade plane is, therefore, a basement according to the current definition. The definition contains a discussion of when a basement is considered a story above grade plane, but that discussion doesn’t affect the determination of whether a portion of a building is a basement. A portion of a building can be both a basement and a story above grade plane. This proposal makes “basement” and “story above grade plane” mutually-exclusive terms.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: For consistency in the code, the General Committee will make the determination for entire proposal.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

507.3 Sprinklered, one story. The area of a Group B, F, M or S building no more than one-story in height, or a Group A-4 building no more than one-story in height, of other than Type V construction, shall not be limited when the building is provided with an automatic sprinkler system throughout in accordance with Section 903.3.1.1 and is surrounded and adjoined by public ways or yards not less than 60 feet (18 288 mm) in width.

Exceptions:

- 1. Buildings and structures of Type I and II construction for rack storage facilities that do not have access by the public shall not be limited in height, provided that such buildings conform to the requirements of Sections 507.2 and 903.3.1.1 and NFPA 230.
- 2. The automatic sprinkler system shall not be required in areas occupied for indoor participant sports, such as tennis, skating, swimming and equestrian activities in occupancies in Group A-4, provided that:
 - 2.1. Exit doors directly to the outside are provided for occupants of the participant sports areas; and
 - 2.2. The building is equipped with a fire alarm system with manual fire alarm boxes installed in accordance with Section 907.
- 3. Group A-1 and A-2 occupancies of other than Type V construction shall be permitted, provided:
 - 3.1. All assembly occupancies are separated from other spaces as required for separated uses in Section 508.3.3.4 with no reduction allowed in the fire-resistance rating of the separation based upon the installation of an automatic sprinkler system;
 - 3.2. Each Group A occupancy shall not exceed the maximum allowable area permitted in Section 503.1; and
 - 3.3. All required exits shall discharge directly to the exterior.

STORY ABOVE GRADE PLANE. Any story having its finished floor surface entirely above grade plane, or in which the finished surface of the floor above is:

- 1. More than 6 feet (1829 mm) above grade plane; or
- 2. More than 12 feet (3658 mm) above the finished ground level at any point.

(Portions of proposal not shown remain unchanged)

Committee Reason: This proposal clarified the use of the term basement throughout the code. See also the proponents reason. The first amendment to Section 507.3 was based upon a concern with grammar. The modification retains commas that were initially struck out. The second amendment places the term above back in the definition of story above grade plane to retain the intent of the definition.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Maureen Traxler, City of Seattle, WA, Department of Planning and Development, requests Approval as Modified by this public comment.

Further modify proposal as follows:

[F] 415.6.2.1.1 Height exception. Where storage tanks are located within ~~only~~ a building no more than one story ~~in height~~ above grade plane, the height limitation of Section 503 shall not apply for Group H.

505.4 Openness. A mezzanine shall be open and unobstructed to the room in which such mezzanine is located except for walls not more than 42 inches (1067 mm) high, columns and posts.

Exceptions:

- 1. Mezzanines or portions thereof are not required to be open to the room in which the mezzanines are located, provided that the occupant load of the aggregate area of the enclosed space does not exceed 10.
- 2. A mezzanine having two or more means of egress is not required to be open to the room in which the mezzanine is located if at least one of the means of egress provides direct access to an exit from the mezzanine level.
- 3. Mezzanines or portions thereof are not required to be open to the room in which the mezzanines are located, provided that the aggregate floor area of the enclosed space does not exceed 10 percent of the mezzanine area.
- 4. In industrial facilities, mezzanines used for control equipment are permitted to be glazed on all sides.
- 5. In other than Groups H and I occupancies no more than two stories ~~in height~~ above grade plane and equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, a mezzanine having two or more means of egress shall not be required to be open to the room in which the mezzanine is located.

507.3 Sprinklered, one story. The area of a Group B, F, M or S building no more than one-story ~~in height~~ above grade plane or a Group A-4 building no more than one-story ~~in height~~ above grade plane of other than Type V construction, shall not be limited when the building is provided with an automatic sprinkler system throughout in accordance with Section 903.3.1.1 and is surrounded and adjoined by public ways or yards not less than 60 feet (18 288 mm) in width.

Exceptions:

1. Buildings and structures of Type I and II construction for rack storage facilities that do not have access by the public shall not be limited in height, provided that such buildings conform to the requirements of Sections 507.2 and 903.3.1.1 and NFPA 230.
2. The automatic sprinkler system shall not be required in areas occupied for indoor participant sports, such as tennis, skating, swimming and equestrian activities in occupancies in Group A-4, provided that:
 - 2.1. Exit doors directly to the outside are provided for occupants of the participant sports areas; and
 - 2.2. The building is equipped with a fire alarm system with manual fire alarm boxes installed in accordance with Section 907.
3. Group A-1 and A-2 occupancies of other than Type V construction shall be permitted, provided:
 - 3.1. All assembly occupancies are separated from other spaces as required for separated uses in Section 508.3.3.4 with no reduction allowed in the fire-resistance rating of the separation based upon the installation of an automatic sprinkler system;
 - 3.2. Each Group A occupancy shall not exceed the maximum allowable area permitted in Section 503.1; and
 - 3.3. All required exits shall discharge directly to the exterior.

507.4 Two story. The area of a Group B, F, M or S building no more than two stories in height above grade plane shall not be limited when the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, and is surrounded and adjoined by public ways or yards not less than 60 feet (18 288 mm) in width.

507.6 Group A-3 buildings. The area of a Group A-3 building no more than one-story in height above grade plane used as a place of religious worship, community hall, dance hall, exhibition hall, gymnasium, lecture hall, indoor swimming pool or tennis court of Type II construction shall not be limited when all of the following criteria are met:

1. The building shall not have a stage other than a platform.
2. The building shall be equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.
3. The assembly floor shall be located at or within 21 inches (533 mm) of street or grade level and all exits are provided with ramps complying with Section 1010.1 to the street or grade level.
4. The building shall be surrounded and adjoined by public ways or yards not less than 60 feet (18 288 mm) in width.

507.8 Aircraft paint hangar. The area of a Group H-2 aircraft paint hangar no more than one-story in height above grade plane, shall not be limited where such aircraft paint hangar complies with the provisions of Section 412.4 and is entirely surrounded by public ways or yards not less in width than one and one-half times the height of the building.

507.9 Group E buildings. The area of a Group E building no more than one-story in height above grade plane, of Type II, IIIA or IV construction shall not be limited when the following criteria are met:

1. Each classroom shall have not less than two means of egress, with one of the means of egress being a direct exit to the outside of the building complying with Section 1018.
2. The building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.
3. The building is surrounded and adjoined by public ways or yards not less than 60 feet (18 288 mm) in width.

509.8 Group B or M with Group S-2 open parking garage above. Group B or M uses located in the basement or first story above grade plane below a Group S-2 open parking garage shall be classified as a separate and distinct building for the purpose of determining the type of construction when all of the following conditions are met:

1. The basement or first story above grade plane shall be Type I or II construction, but not less than the type of construction required for the open parking garage above. The height and area of the basement or first story shall not exceed the limitations in Section 503 for the Group B or M uses.
2. The height and area of the open parking garage shall not exceed the limitations permitted under Section 406.3. The height, in both feet and stories, of the open parking garage shall be measured from grade plane and include both the open parking garage and the basement or first story above grade plane.
3. Fire separation assemblies between the open parking garage and the occupancy located in the basement or on the first story above grade plane shall correspond to the required fire-resistance rating prescribed by Table 508.3.3.
4. Exits serving the open parking garage shall discharge directly to a street or public way and shall be separated from the occupancy located in the basement or on the first story above grade plane by not less than 2-hour fire barriers constructed in accordance with Section 706 or 2-hour horizontal assemblies constructed in accordance with Section 711, or both, with opening protectives in accordance with Table 715.4.

[F] 903.2.8.1 Repair garages. An automatic sprinkler system shall be provided throughout all buildings used as repair garages in accordance with Section 406, as shown:

1. Buildings having two or more stories above grade plane, including basements, with a fire area containing a repair garage exceeding 10,000 square feet (929 m²).
2. Buildings no more than one story in height above grade plane, with a fire area containing a repair garage exceeding 12,000 square feet (1115 m²).
3. Buildings with a repair garage servicing vehicles parked in the basement.

1009.11 Stairway to roof. In buildings four or more stories in height above grade plane, one stairway shall extend to the roof surface, unless the roof has a slope steeper than four units vertical in 12 units horizontal (33-percent slope). In buildings without an occupied roof, access to the roof from the top story shall be permitted to be by an alternating tread device.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: These modifications are proposed for the sake of consistency with the Code Development Committee action on G6-06/07. G6-06/07 changed several code sections from "...stories in height" to "...stories above grade plane". Together, G6-06/07 and G8-06/07 clarify that when the number of stories is used to trigger a code requirement in the affected sections, the code is referring to the number of stories above grade plane.

Final Hearing Results

G8-06/07

AMPC1

Code Change No: **G9-06/07**

Original Proposal

Sections: [F] 415.6.2.1, 505.5, 507.7, 508.3.3.3, 706.7, 3410.6.1.1 (IEBC [B] 1301.6.1.1), 3410.6.2.2 (IEBC [B] 1301.6.2.2), 3410.6.4.1 (IEBC [B] 1301.6.4.1), 3410.6.8.1 (IEBC [B] 1301.6.8.1), 3410.6.10.1 (IEBC [B] 1301.6.10.1), 3410.6.18 (IEBC [B] 1301.6.19), 702.1, 902.1

Proponent: Gregory R. Keith, Professional heuristic Development, representing the Boeing Company

Revise as follows:

[F] 415.6.2.1 Mixed occupancies. Where the storage tank area is located in a building of two or more occupancies, and the quantity of liquid exceeds the maximum allowable quantity for one control area, the use shall be completely separated from adjacent ~~fire areas~~ occupancies in accordance with the requirements of Section 508.3.3.

504.2 Automatic sprinkler system increase. Where a building is equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1, the value specified in Table 503 for maximum height is increased by 20 feet (6096 mm) and the maximum number of stories is increased by one. These increases are permitted in addition to the area increase in accordance with Sections 506.2 and 506.3. For Group R buildings equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.2, the value specified in Table 503 for maximum height is increased by 20 feet (6096 mm) and the maximum number of stories is increased by one, but shall not exceed 60 feet (18 288 mm) or four stories, respectively.

Exceptions:

1. ~~Fire areas~~ Buildings with an occupancy in Group I-2 occupancy of Type IIB, III, IV or V construction.
2. ~~Fire areas~~ Buildings with an occupancy in Group H-1, H-2, H-3 or H-5 occupancy.
3. Fire-resistance rating substitution in accordance with Table 601, Note e.

505.5 Equipment platforms. Equipment platforms in buildings shall not be considered as a portion of the floor below. Such equipment platforms shall not contribute to either the building area or the number of stories as regulated by Section 503.1. The area of the equipment platform shall not be included in determining the fire area in accordance with Section 903. Equipment platforms shall not be a part of any mezzanine and such platforms and the walkways, stairs and ladders providing access to an equipment platform shall not serve as a part of the means of egress from the building.

507.7 Group H occupancies. Group H-2, H-3 and H-4 occupancies shall be permitted in unlimited area buildings containing Group F and S occupancies, in accordance with Sections 507.3 and 507.4 and the limitations of this section. The aggregate floor area of the Group H occupancies located at the perimeter of the unlimited area building shall not exceed 10 percent of the area of the building nor the area limitations for the Group H occupancies as specified in Table 503 as modified by Section 506.2, based upon the percentage of the perimeter of each Group H ~~fire floor~~ area that fronts on a street or other unoccupied space. The aggregate floor area of Group H occupancies not located at the perimeter of the building shall not exceed 25 percent of the area limitations for the Group H occupancies as specified in Table 503. Group H ~~fire areas~~ occupancies shall be separated from the rest of the unlimited area building and from each other in accordance with Table 508.3.3 For two-story unlimited area buildings, the Group H ~~fire areas~~ occupancies shall not be located above the first story unless permitted by the allowable height in stories and feet as set forth in Table 503 based on the type of construction of the unlimited area building.

508.3.3.3 Allowable height. Each occupancy shall comply with the height limitations based on the type of construction of the building in accordance with Section 503.1. The height, in both feet and stories, of each ~~fire floor~~ area shall be measured from grade plane. This measurement shall include the height, in both feet and stories, of intervening ~~fire floor~~ areas.

Exception: Special provisions permitted by Section 509.

706.6 Openings. Openings in a fire barrier shall be protected in accordance with Section 715. Openings shall be limited to a maximum aggregate width of 25 percent of the length of the wall, and the maximum area of any single opening shall not exceed 156 square feet (15m²). Openings in exit enclosures and exit passageways shall also comply with Sections 1020.1.1 and 1021.4, respectively.

Exceptions:

1. Openings shall not be limited to 156 square feet (15 m²) where adjoining ~~fire~~ floor areas are equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.
2. Fire doors serving an exit enclosure.
3. Openings shall not be limited to 156 square feet (15m²) or an aggregate width of 25 percent of the length of the wall where the opening protective assembly has been tested in accordance with ASTM E119 and has a minimum fire-resistance rating not less than the fire-resistance rating of the wall.
4. Fire windows permitted in atrium separation walls shall not be limited to a maximum aggregate width of 25 percent of length of the wall.

3410.6.1.1 (IEBC 1301.6.1.1) Height formula. The following formulas shall be used in computing the building height value.

$$\text{Height value, feet} = \frac{(AH) - (EBH)}{12.5} \sim xCF$$

$$\text{Height, value, stories} = (AS - EBS) \times CF$$

(Equation 34-1)

where:

AH = Allowable height in feet from Table 503.

EBH = Existing building height in feet.

AS = Allowable height in stories from Table 503.

EBS = Existing building height in stories.

CF = 1 if *(AH) - (EBH)* is positive.

CF = Construction-type factor shown in Table 3410.6.6(2) if *(AH) - (EBH)* is negative.

Note: Where mixed occupancies are separated and individually evaluated as indicated in Section 3410.6, the values *AH*, *AS*, *EBH* and *EBS* shall be based on the height of the ~~fire area of the~~ occupancy being evaluated.

3410.6.2.2 (IEBC 1301.6.2.2) Area formula. The following formula shall be used in computing the area value. Determine the area value for each occupancy ~~fire~~ floor area on a floor-by-floor basis. For each occupancy, choose the minimum area value of the set of values obtained for the particular occupancy.

(Equation 34-3 does not change)

3410.6.4.1 (IEBC 1301.6.4.1) Categories. The categories for tenant and dwelling unit separations are:

1. Category a — No fire partitions; incomplete fire partitions; no doors; doors not self-closing or automatic closing.
2. Category b—Fire partitions or floor assembly less than 1-hour fire-resistance rating or not constructed in accordance with Sections 708 or 711, respectively.
3. Category c—Fire partitions with 1 hour or greater fire-resistance rating constructed in accordance with Section 708 and floor assemblies with 1-hour but less than 2-hour fire-resistance rating constructed in accordance with Section 711, or with only one tenant within the ~~fire~~ floor area.
4. Category d — Fire barriers with 1-hour but less than 2-hour fire-resistance rating constructed in accordance with Section 706 and floor assemblies with 2-hour or greater fire-resistance rating constructed in accordance with Section 711.
5. Category e — Fire barriers and floor assemblies with 2-hour or greater fire-resistance rating and constructed in accordance with Sections 706 and 711, respectively.

3410.6.8.1 (IEBC 1301.6.8.1) Categories. The categories for automatic fire detection are:

1. Category a — None.
2. Category b— Existing smoke detectors in HVAC systems and maintained in accordance with the *International Fire Code*.

3. Category c—Smoke detectors in HVAC systems. The detectors are installed in accordance with the requirements for new buildings in the *International Mechanical Code*.
4. Category d — Smoke detectors throughout all floor areas other than individual sleeping units, tenant spaces and dwelling units.
5. Category e—Smoke detectors installed throughout the ~~fire~~ floor area.

3410.6.10.1 (IEBC 1301.6.10.1) Categories. The categories for smoke control are:

1. Category a — None.
2. Category b — The building is equipped throughout with an automatic sprinkler system. Openings are provided in exterior walls at the rate of 20 square feet (1.86 m²) per 50 linear feet (15 240 mm) of exterior wall in each story and distributed around the building perimeter at intervals not exceeding 50 feet (15 240 mm). Such openings shall be readily openable from the inside without a key or separate tool and shall be provided with ready access thereto. In lieu of operable openings, clearly and permanently marked tempered glass panels shall be used.
3. Category c — One enclosed exit stairway, with ready access thereto, from each occupied floor of the building. The stairway has operable exterior windows and the building has openings in accordance with Category b.
4. Category d—One smokeproof enclosure and the building has openings in accordance with Category b.
5. Category e — The building is equipped throughout with an automatic sprinkler system. Each ~~fire~~ floor area is provided with a mechanical air-handling system designed to accomplish smoke containment. Return and exhaust air shall be moved directly to the outside without recirculation to other ~~fire~~ floor areas of the building under fire conditions. The system shall exhaust not less than six air changes per hour from the ~~fire~~ floor area. Supply air by mechanical means to the ~~fire~~ floor area is not required. Containment of smoke shall be considered as confining smoke to the fire area involved without migration to other ~~fire~~ floor areas. Any other tested and approved design which will adequately accomplish smoke containment is permitted.
6. Category f—Each stairway shall be one of the following: a smokeproof enclosure in accordance with Section 1020.1.7; pressurized in accordance with Section 909.20.5; or shall have operable exterior windows.

3410.6.18 (IEBC 1301.6.19) Incidental use. Evaluate the protection of incidental use areas in accordance with Section 508.2. Do not include those where this code requires suppression throughout the building including covered mall buildings, high-rise buildings, public garages and unlimited area buildings. Assign the lowest score from Table 3410.6.18 for the building or ~~fire~~ floor area being evaluated. If there are no specific occupancy areas in the building or ~~fire~~ floor area being evaluated, the value shall be zero.

2. Delete without substitution:

702.1 Definitions. The following words and terms shall, for the purposes of this chapter, and as used elsewhere in this code, have the meanings shown herein.

~~**FIRE AREA.** The aggregate floor area enclosed and bounded by fire walls, fire barriers, exterior walls or fire-resistance-rated horizontal assemblies of a building.~~

3. Add new text as follows:

902.1 Definitions. The following words and terms shall, for the purposes of this chapter, and as used elsewhere in this code, have the meanings shown herein.

FIRE AREA. The aggregate floor area enclosed and bounded by fire walls, fire barriers, exterior walls or fire-resistance-rated horizontal assemblies of a building.

Reason: The term “fire area” has a very specific purpose with respect to the application of IBC provisions. In proper context, the term fire area serves to define the spatial boundaries for automatic sprinkler system and other active fire protection requirement threshold determination purposes in Chapter 9. The term also occurs in several chapters other than Chapter 9 in the IBC. Unfortunately, most of those references are out of context; and therefore, tend to be confusing to code users.

To clarify the matter, it is proposed to move the definition of fire area from Chapter 7 to Chapter 9. Speaking against the current location in Chapter 7, those provisions applicable to fire areas in Chapter 7 only deal with construction details for fire barriers and horizontal assemblies separating fire areas and have nothing to do with their actual purpose or function. Please note that the definition for “control area” is not located in Chapter 7; but rather, located in context at Chapter 3.

Most of the erroneous fire area provisions outside of Chapter 9 are building or floor area references. Those provisions have been identified and corrected. This clarification will benefit those attempting to correctly identify code requirements. An example occurs at Section 3410.6.8.1. In that section, Category e identifies, “Smoke detectors installed throughout the fire area.” Meanwhile, Category d states, “Smoke detectors throughout all floor areas other than individual sleeping units, tenant spaces and dwelling units.” Category e should also reference floor area.

Certain interpreters may react to an incorrect fire area reference by requiring a fire barrier or horizontal assembly to surround an ordinary floor area in a sprinklered building only because those assemblies are contained in the definition of fire area. This proposed code change will clarify the code and eliminate the possibility of such confusing and inappropriate interpretations.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Approved as Modified****Modify the proposal as follows:**

504.2 Automatic sprinkler system increase. Where a building is equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1, the value specified in Table 503 for maximum height is increased by 20 feet (6096 mm) and the maximum number of stories is increased by one. These increases are permitted in addition to the area increase in accordance with Sections 506.2 and 506.3. For Group R buildings equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.2, the value specified in Table 503 for maximum height is increased by 20 feet (6096 mm) and the maximum number of stories is increased by one, but shall not exceed 60 feet (18 288 mm) or four stories, respectively.

Exceptions:

1. Buildings ~~with, or portions of buildings, classified as a~~ Group I-2 occupancy of Type IIB, III, IV or V construction.
2. Buildings ~~with, or portions of buildings, classified as a~~ Group H-1, H-2, H-3 or H-5 occupancy.
3. Fire-resistance rating substitution in accordance with Table 601, Note e.

(Portions of proposal not shown remain unchanged)

Committee Reason: The code change cleans up the code to correlate with the changes in the mixed occupancy requirements. More specifically separating the concept of fire areas from determination of allowable height and area. The modification was to clarify within the exception that it may be an entire building or only a portion of a building with an occupancy classification that are prohibited from increasing building height. The original proposal would have limited any building containing such occupancies to the heights indicated in Table 503.

Assembly Action:**None**

Final Hearing Results

G9-06/07**AM**

Code Change No: G25-06/07

Original Proposal

Section: 110.1

Proponent: Rebecca Baker, Jefferson County, CO, Chair, ICC Ad Hoc Committee on the Administrative Provisions in the I-Codes (AHC-Admin)

Revise as follows:

110.1 Use and occupancy. No building or structure shall be used or occupied, and no change in the existing occupancy classification of a building or structure or portion thereof shall be made until the building official has issued a certificate of occupancy therefor as provided herein. Issuance of a certificate of occupancy shall not be construed as an approval of a violation of the provisions of this code or of other ordinances of the jurisdiction. Certificates presuming to give authority to violate or cancel the provisions of this code or other ordinances of the jurisdiction shall not be valid.

Exceptions:

1. Certificates of occupancy are not required for work exempt from permits under Section 105.2.
2. Accessory buildings or structures.

Reason: Consistency and coordination among the I-Codes is one of the cornerstones of the ICC Code Development Process. This holds true for not only the technical code provisions but also for the administrative code provisions as contained in Chapter 1 of all the I-Codes.

In response to concerns raised by the ICC membership since publication of the first editions of the I-Codes, the ICC Board established the Ad Hoc Committee on the Administrative Provisions in the I-Codes (AHC-Admin) to review Chapter 1 administrative provisions in each code in the International Codes family, improve their correlation among the I-Codes through the code development process and recommend to the ICC Board the mechanism by which code development maintenance of the continuing coordination of administrative provisions can best be achieved.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

The AHC-Admin is submitting a series of code change proposals designed to provide consistent and correlated administrative provisions among the I-Codes using existing I-Code texts, as noted. While some proposed text may be “new” to this code, it is not new to the I-Code family, since it already exists in one or more of the International Codes, unless otherwise noted. A comparative matrix of current I-Codes Chapter 1 text may be found on the ICC website at www.iccsafe.org/cs/cc/admin/index.html.

The purpose of this proposed change is to provide correlation with Section 110.1 of the *International Residential Code*. The added text in this section will make it clear that though the certificate of occupancy is the legal notification from the department that the building may be occupied for its intended purpose the granting of a certificate of occupancy may not be construed as indicating that no violations of the code or other jurisdictional laws exist if, in fact they do. Any certificate that would imply such approval would be considered void. The added exceptions make it clear that certain work and structures do not need a certificate.

A similar proposal has also been submitted to Section 110.1 of the *International Existing Building Code*.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

110.1 Use and occupancy. No building or structure shall be used or occupied, and no change in the existing occupancy classification of a building or structure or portion thereof shall be made until the building official has issued a certificate of occupancy therefor as provided herein. Issuance of a certificate of occupancy shall not be construed as an approval of a violation of the provisions of this code or of other ordinances of the jurisdiction. ~~Certificates presuming to give authority to violate or cancel the provisions of this code or other ordinances of the jurisdiction shall not be valid.~~

Exceptions:

1. Certificates of occupancy are not required for work exempt from permits under Section 105.2.
- ~~2. Accessory buildings or structures.~~

Committee Reason: The language was felt to be an improvement to the code to clarify that certificates of occupancy are not required in some cases. The modification deleted wording that is addressed elsewhere in the code and to delete the 2nd exception as the term Accessory® is not defined and could potentially cause confusion.

Assembly Action:

None

AM

Code Change No: G26-06/07

Original Proposal

Section 111.3

Proponent: Rebecca Baker, Jefferson County, CO, Chair, ICC Ad Hoc Committee on the Administrative Provisions in the I-Codes (AHC-Admin)

Revise as follows:

111.3 Authority to disconnect service utilities. The building official shall have the authority to authorize disconnection of utility service to the building, structure or system regulated by this code and ~~the codes referenced~~ the referenced codes and standards set forth in Section 102.4 in case of emergency where necessary to eliminate an immediate hazard to life or property or when such utility connection has been made without the approval required by Section 111.1 or 111.2. The building official shall notify the serving utility, and wherever possible the owner and occupant of the building, structure or service system of the decision to disconnect prior to taking such action. If not notified prior to disconnecting, the owner or occupant of the building, structure or service system shall be notified in writing, as soon as practical thereafter.

Reason: Consistency and coordination among the I-Codes is one of the cornerstones of the ICC Code Development Process. This holds true for not only the technical code provisions but also for the administrative code provisions as contained in Chapter 1 of all the I-Codes.

In response to concerns raised by the ICC membership since publication of the first editions of the I-Codes, the ICC Board established the Ad Hoc Committee on the Administrative Provisions in the I-Codes (AHC-Admin) to review Chapter 1 administrative provisions in each code in the International Codes family, improve their correlation among the I-Codes through the code development process and recommend to the ICC Board the mechanism by which code development maintenance of the continuing coordination of administrative provisions can best be achieved.

The AHC-Admin is submitting a series of code change proposals designed to provide consistent and correlated administrative provisions among the I-Codes using existing I-Code texts, as noted. While some proposed text may be "new" to this code, it is not new to the I-Code family, since it already exists in one or more of the International Codes, unless otherwise noted. A comparative matrix of current I-Codes Chapter 1 text may be found on the ICC website at www.iccsafe.org/cs/cc/admin/index.html.

The purpose of this proposal is to provide correlation with Section 111.3 of the *International Residential Code*. The added text will provide the code official with the needed authority to order that service utilities be disconnected the utility service has been connected without the necessary approvals required by the code. A similar proposal has been submitted to the *International Existing Building Code*.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

111.3 Authority to disconnect service utilities. The building official shall have the authority to authorize disconnection of utility service to the building, structure or system regulated by this code and the referenced codes and standards set forth in Section ~~402.4-101.4~~ 101.4 in case of emergency where necessary to eliminate an immediate hazard to life or property or when such utility connection has been made without the approval required by Section 111.1 or 111.2. The building official shall notify the serving utility, and wherever possible the owner and occupant of the building, structure or service system of the decision to disconnect prior to taking such action. If not notified prior to disconnecting, the owner or occupant of the building, structure or service system shall be notified in writing, as soon as practical thereafter.

Committee Reason: The proposal was approved as it was felt to give more specific guidance on which standards were referenced. In addition this proposal now gives the building official the authority to disconnect power simply because the connection was made without prior approval. Currently the authority is only available when a hazard exists. The modification simply revises the section reference to 101.4 which gives a specific listing of codes versus a general section addressing referenced codes and standards.

Assembly Action:

None

Final Hearing Results

G26-06/07

AM

Code Change No: G30-06/07

Original Proposal

Section: 202

Proponent: Juli Case, Industrial Fabrics Association International

Revise definition as follows:

SECTION 202 DEFINITIONS

AWNING. An architectural fabric projection that provides weather protection, identity or decoration and is wholly supported by the building to which it is attached. An awning is comprised of a lightweight, ~~rigid skeleton~~ frame structure over which a covering is attached.

Reason: To clarify the code. The addition of the word "fabric" differentiates awnings made from fabrics and other pliable materials from those made of other building materials. The change from "lightweight rigid skeleton" structure to "lightweight frame" structure is a simplification of current verbiage.

Members of the Industrial Fabrics Association International, including the Lightweight Structures Association; the Professional Awning Manufacturers Association; the Tent Rental Division; and the Banner, Flag & Graphics Association, worked jointly on assessing terminology. Participants reflected backgrounds in engineering, architecture, end product manufacturing and component suppliers.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

The change reflected in the proposed definition is already being used in the membrane structure industry, having been published in the *Fabric Architecture* and *Industrial Fabric Products Review* magazines, published on the Professional Awning Manufacturers Association website, and used by the IFAI International Achievement Awards program.

Bibliography:

"By Any Other Name," *Industrial Fabric Products Review*, volume 91, Number 1, January 2006.
"A Defining Moment for Fabric Structures," *InTents*, volume 12, number 1, February/March 2005
"Defining the Basics," *InTents*, Volume 13, Number 1, February/March 2006
Professional Awning Manufacturers Association website, <http://www.awninginfo.com>
IFAI International Achievement Awards 2006 entry brochure

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

AWNING. An architectural ~~fabrie~~ projection that provides weather protection, identity or decoration and is wholly supported by the building to which it is attached. An awning is comprised of a lightweight frame structure over which a covering is attached.

Committee Reason: The term ~~frame~~ which is more consistent with language throughout the code was preferred by the committee over the current terminology ~~Arigid skeleton~~. The committee approved of the modified version of the proposal which removed the term ~~fabric~~ which would have been limiting in application and retained the term ~~covering~~ which was more encompassing.

Assembly Action:

None

G30-06/07

AM

Code Change No: G33-06/07

Original Proposal

Sections: 202; IEBC 202

Proponent: Philip Brazil, PE, Reid Middleton, Inc., representing himself

THIS PROPOSAL IS ON THE AGENDA OF THE IBC GENERAL AND IEBC CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC

Delete and substitute as follows:

**SECTION 202
DEFINITIONS**

~~**REGISTERED DESIGN PROFESSIONAL.** An individual who is registered or licensed to practice their respective design profession as defined by the statutory requirements of the professional registration laws of the state or jurisdiction in which the project is to be constructed.~~

REGISTERED DESIGN PROFESSIONAL IN RESPONSIBLE CHARGE. A registered design professional engaged by the owner to review and coordinate certain aspects of the project, as determined by the building official, for compatibility with the design of the building or structure, including submittal documents prepared by others, deferred submittal documents and phased submittal documents.

PART II – IEBC

Add new text as follows:

**SECTION 202
DEFINITIONS**

REGISTERED DESIGN PROFESSIONAL IN RESPONSIBLE CHARGE. A registered design professional engaged by the owner to review and coordinate certain aspects of the project, as determined by the building official, for compatibility with the design of the building or structure, including submittal documents prepared by others, deferred submittal documents and phased submittal documents.

Reason: This proposal is in response to Recommendation 28 of the “Final Report on the Collapse of the World Trade Center Towers” (NIST NCSTAR 1). The recommendation assumes that the IBC already defines “design professional in responsible charge,” which is not the case. This proposal will provide a definition in the IBC as well as the IEBC. Note that the term “registered design professional in responsible charge” is used throughout the IBC (i.e., Sections 106.3.4.1, 106.3.4.2, 1704.1, 1704.1.1, 1704.1.2, 1704.7, 1704.8, 1704.9, 1705.1, 1708.4, 1708.5, 1709.2 and 1709.3) as well as the IEBC. Note also that the term is typically not used in other codes published by the International Code Council. Specially, there are no instances of the term “registered design professional in responsible charge” in the 2003 IECC, IFC, IFGC, IMC, IPC or IRC.

The proposed definition is consistent with the role the IBC and IEBC currently specify for the registered design professional in responsible charge, which is typically the review and coordination of submittal documents prepared by others, deferred submittal documents and phased submittal documents for compatibility with the design of the building or structure. Refer to Section 106.3.4 in the IBC and IEBC for specific language.

A related proposal before the Structural Committee revises references to “registered design professional in responsible charge” in the structural chapters of the IBC to eliminate conflicts with Section 106.3.4. Sections 1704.7, 1704.8 and 1704.9 use “registered design professional in responsible charge” when referring to the registered design professional responsible for the structural design of a building or structure. Section 1708.5 uses the same term when referring to the registered design professional responsible for the structural design of a designated seismic system in a building or structure. Section 106.3.4.1, however, states that the registered design professional in responsible charge is “responsible for reviewing and coordinating submittal documents prepared by others, including phased and deferred submittal items, for compatibility with the design of the building.” Sections 1704.7, 1704.8, 1704.9 and 1708.5 are in conflict with Section 106.3.4.1 by using the same term for registered design professionals with responsibilities other than as specified in Section 106.3.4.1.

The IBC currently uses the term “registered design professional” in approximately 50 code sections, in addition to the code sections using the term “registered design professional in responsible charge.” “Registered design professional” refers to an individual responsible for an aspect of the design of a building or structure. Typical examples are the architect, structural engineer, mechanical engineer, electrical engineer, civil engineer, fire protection engineer and others. Referring, instead, to such an individual as a registered design professional in responsible charge is an exercise in stating the obvious. Such individuals are in responsible charge of their individual responsibilities in the design of the building or structure. The term “in responsible charge” is implicit in the term “registered design professional.”

The proposal before the Structural Committee will eliminate the conflict between Section 106.3.4, which assigns responsibilities to a registered design professional acting as the registered design professional in responsible charge of a project, and other sections of the IBC, which use the same term but do not intend that the responsibilities in Section 106.3.4 also apply.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The term ‘registered design professional’ is currently in the definition section of the IBC, IRC, IFC, IPC, IMC, IFGC, IPSDC and the IZC. The Existing Building Committee will only hear if they want the definition in the IEBC. The decision for the wording of the definition will be the purview of the General Committee.

The General Committee will determine the wording of the definition. The IEBC committee will only be determining if this definition should also be included in Chapter 2 of the IEBC.

Public Hearing Results

PART I C IBC

Errata: Do not delete definition of registered design professional

Committee Action:

Approved as Submitted

Committee Reason: The committee felt that this definition was needed based upon its use throughout the code.

Assembly Action:

None

PART II C IEBC

Committee Action:

Approved as Submitted

Committee Reason: The definition of Registered Design Professional in Responsible Charge is appropriate for inclusion in the IEBC. Further this action is consistent with the action taken on G33-06/07, Part I.

Assembly Action:

None

G33-06/07, Part II	AS

Code Change No: G36-06/07

Original Proposal

Section: 202

Proponent: Juli Case, Industrial Fabrics Association International

Revise definition as follows:

**SECTION 202
DEFINITIONS**

TENT. Any structure, enclosure or shelter ~~which is~~ constructed of ~~canvas~~ fabric or pliable material supported in any manner except by air or the contents it protects.

Reason: To revise outdated material. "Canvas" is a fabric term that applies to a woven fabric, traditionally of cotton. This material has not been used in tent construction for decades. The phrase "fabric or pliable material" would apply to tents made of either coated fabric or laminated fabric constructions, were dominate this product niche.

Members of the Industrial Fabrics Association International, including the Lightweight Structures Association; the Professional Awning Manufacturers Association; the Tent Rental Division; and the Banner, Flag & Graphics Association, worked jointly on assessing terminology. Participants reflected backgrounds in engineering, architecture, end product manufacturing and component suppliers.

The change reflected in the proposed definition is already being used in the membrane structure industry, having been published in the *Fabric Architecture* and *Industrial Fabric Products Review* magazines and IFAI Procedural Handbook for the Safe Installation and Maintenance of Tentage

Bibliography: "By Any Other Name," *Industrial Fabric Products Review*, volume 91, Number 1, January 2006.

"Standardized Industry Definitions" *Fabric Architecture*, Volume 18, No. 2, March/April 2006

"A Defining Moment for Fabric Structures," *InTents*, volume 12, number 1, February/March 2005

"Defining the Basics," *InTents*, Volume 13, Number 1, February/March 2006

IFAI Procedural Handbook for the Safe Installation and Maintenance of Tentage, IFAI,

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: Revising the language to reflect a more general term fabric versus canvas provides a more encompassing definition.

Assembly Action:

Final Hearing Results

G36-06/07

AS

Code Change No: **G46-06/07**

Original Proposal

Sections: 308.5.1 (IFC [B] 202)

Proponent: Wayne R. Jewell, City of Southfield, MI

Revise as follows:

308.5.1 Adult care facility. A facility that provides accommodations for less than 24 hours for more than five unrelated adults and provides supervision and personal care services shall be classified as Group I-4.

Exception: A facility where occupants are capable of responding to an emergency situation without physical assistance from the staff shall be classified as Group ~~A-3~~ R-3.

Reason: When I had proposed change G-32-00 I had a serious typo an "A" was placed where an "R" should have been. I never intended for these facilities to be considered an Assembly Group and this is a correction of my error. The language in Section 310.1 for R-3 uses does speak to these uses.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal corrects an incorrect occupancy classification. The current Group R-3 occupancy classifications in Section 310 correlates with this proposal.

Analysis: See committee action on G38-06/07.

AS

Code Change No: **G47-06/07**

Original Proposal

Sections: 310.1 (IFC [B] 202)

Proponent: Richard Lyman, Sandy City Fire Department, representing the Utah Chapter

Revise as follows:

310.1 Residential Group R. Residential Group R includes, among others, the use of a building or structure, or a portion thereof, for sleeping purposes when not classified as an Institutional Group I or when not regulated by the *International Residential Residential Code* in accordance with Section 101.2. Residential occupancies shall include the following:

R-1 Residential occupancies containing sleeping units where the occupants are primarily transient in nature, including:

- Boarding houses (transient)
- Hotels (transient)
- Motels (transient)

Congregate living facilities (transient) with 10 or fewer occupants are permitted to comply with the construction requirements for Group R-3.

R-2 Residential occupancies containing sleeping units or more than two dwelling units where the occupants are primarily permanent in nature, including:

- Apartment houses
- Boarding houses (not transient)
- Convents
- Dormitories
- Fraternities and sororities
- Hotels (nontransient)
- Monasteries
- Motels (nontransient)
- Vacation timeshare properties

Congregate living facilities with 16 or fewer occupants are permitted to comply with the construction requirements for Group R-3.

R-3 Residential occupancies where the occupants are primarily permanent in nature and not classified as Group R-1, R-2, R-4 or I, including:

- Buildings that do not contain more than two dwelling units.
- Adult facilities that provide accommodations for five or fewer persons of any age for less than 24 hours.
- Child care facilities that provide accommodations for five or fewer persons of any age for less than 24 hours.
- Congregate living facilities with 16 or fewer persons.
- Adult care and child care facilities that are within a single-family home are permitted to comply with the *International Residential Code*

R-4 Residential occupancies shall include buildings arranged for occupancy as residential care/assisted living facilities including more than five but not more than 16 occupants, excluding staff.

Group R-4 occupancies shall meet the requirements for construction as defined for Group R-3, except as otherwise provided for in this code, or shall comply with the *International Residential Code*.

Reason: This change would establish a threshold of 10 for occupancies such as a bed and breakfast or a ski rental which would otherwise be considered an R-1. If a single family dwelling was converted into a bed and breakfast with two bedrooms accommodating just 4 guests the requirements for an R-1 are triggered. One of the Legacy Codes established a threshold of 10 for congregate residences. This concept was brought back into the IBC in the 2006 Code for an R-2 but not an R-1. Because of the transient nature of these types of occupancies and the lack of familiarity with surroundings a maximum of 10 rather than 16 is proposed.

Utah has a statewide amendment to the 2003 IBC that currently addresses R-1 and R-2 occupancies with a similar exception. This statewide amendment would be eliminated with the approval of the proposed change.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal addresses the need to provide a classification of congregate living facilities that are considered transient in nature under Group R-1. The 2006 IBC contains a classification for more permanent facilities under Group R-2. The classification under Group R-1 is more restrictive and allows a Group R-3 classification only if the number of occupants is 10 or less versus 16 or less under Group R-2.

Assembly Action:

None

Code Change No: **G52-06/07**

Original Proposal

Section: 402.6.1 (New)

Proponent: Daniel E. Nichols, New York State Department of State

Add new text as follows:

402.6.1 Reduced open space. The permanent open space of 60 feet (18 288 mm) shall be permitted to be reduced to not less than 40 feet (12 192 mm), provided the following requirements are met:

1. The reduced open space shall not be allowed for more than 75 percent of the perimeter of the covered mall building and anchor buildings.
2. The exterior wall facing the reduced open space shall have a minimum fire-resistance rating of 3 hours.
3. Openings in the exterior wall facing the reduced open space shall have opening protectives with a minimum fire protection rating of 3 hours
4. Group E, H, I, or R occupancies are not within the covered mall building or anchor stores.

Reason: The purpose of the code change is to allow covered mall buildings and anchor buildings to reduce the required open space around the building as already permitted in buildings with similar fire hazards.

Unlimited area buildings, where permitted in Section 507, all require an open space around the building of 60 feet to prevent exposure fire spread. Section 507.5 permits sprinklered one- and two-story B, M, F, and S buildings, one-story A-4 buildings, and Type II buildings serving as a group A-3 or as a movie theater to reduce the open space requirement to 40 feet. This reduction is permitted in these locations when the exterior wall in the reduced space area is rated for 3 hours and doesn't include more than 75 percent of the building perimeter.

Looking at the definition of a covered mall building, a vast majority of the uses described therein are found within a covered mall building. Therefore, it can be assumed that the fire load within a mall is similar than the fire load permitted in a code compliant unlimited area building. Since the intent of the open space requirement is to prevent fire spread from one building to another and the fire loads are similar, allowing covered mall buildings to be subject to the same separation requirements as other unlimited area buildings does not reduce the level of fire protection afforded.

Exception #4 is not found in Section 507.5 and has been added to keep this code change proposal aligned with the occupancies permitted to use Section 507.5. Group E, H, I, and R occupancies are not prohibited from being within a covered mall building or an anchor store. This exception would prohibit the use of the reduced open space if one of the occupancies was part of the covered mall building or anchor store design.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: Creates a consistency with the allowance of reduced open space for unlimited buildings in Section 507. Covered mall buildings are simply an unique 3 story unlimited building.

Assembly Action:

None

Final Hearing Results

G52-06/07

AS

Code Change No: G53-06/07

Original Proposal

Section: 402.8 (New)

Proponent: Daniel E. Nichols, New York State Department of State

Add new text as follows:

402.8 Interior Finish. Interior wall and ceiling finishes within the mall, exits, and exit passageways shall have a minimum flame spread rating of Class B per Section 803. Interior floor finishes shall meet the requirements of Section 804.

(Renumber subsequent sections)

Reason: The purpose of this code change proposal is to clearly state the interior finish requirements within a covered mall building.

Currently, Sections 402 and 803 do not specifically state the requirements for interior finish within a covered mall building. Since a covered mall building is actually a mixed-use building, the most restrictive occupancy requirements should apply. However, some projects that we have dealt with have stated the mall portion of the covered mall building conforms with Group M requirements since a covered mall building is a Group M with all other uses being accessory.

The use of a mall space has gone beyond its original intent of providing a wide-open walking space to communicate people amongst the various shops and stores within. Mall spaces have become locations to assemble to watch a dance recital, attend a fashion show, or for the local radio station to run a promotion in. It has become clear that mall spaces are assembly spaces themselves, not taking into account the tenant assembly spaces (restaurants, movie theaters, paintball arenas, etc.) that open into them. Therefore, it seems logical to protect the mall space similar to Group A requirements.

The code change proposal adds the performance requirements of interior wall and ceiling finishes into Section 402 and references the code user to Section 803 for specifics. This method of stating performance requirements and referencing to Section 803 is currently found in Section 404 for atriums. Coincidentally, Section 404.7 also requires atrium spaces to have Class B fire spread rating for wall and ceiling finishes. Based on the type of activity occurring in both covered mall buildings and atrium spaces, it is appropriate that these to special use areas correlate with the interior wall and ceiling finish requirements of sprinklered Group A occupancies.

The 1997 Southern Building Code (Section 413.7.1) stated that a covered mall building has a Group M occupancy classification and all other occupancy types, including Group A, were accessory to the Group M. The current definition of a covered mall building has its source from the 1996 BNBC which talks of the components of a covered mall building but doesn't set Group A occupancies accessory to the retail uses. With the recognition of a mall being both a retail and entertainment venue (as specified in the definition), including specific requirements for interior wall and ceiling finishes that mirror the requirements for sprinkler Group A uses is appropriate.

Bibliography: 1997 Southern Building Code, 1996 BOCA *National Building Code*

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

402.8 Interior Finish. Interior wall and ceiling finishes within the mall and, exits, and exit passageways shall have a minimum flame spread rating index of Class B per Section 803. Interior floor finishes shall meet the requirements of Section 804.

Committee Reason: Based upon the proponents reason. The modification recognized that exits include exit passageways and that flame spread index® is more appropriate terminology used throughout the I-Codes than flame spread rating.®

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Marcelo M. Hirschler, GBH International, representing the American Fire Safety Council, requests Approval as Modified by this public comment.

Further modify proposal as follows:

402.8 Interior Finish. Interior wall and ceiling finishes within the mall and exits shall have a minimum flame spread index and smoke developed index of Class B per Chapter 8 Section 803. Interior floor finishes shall meet the requirements of Section 804.

Commenter's Reason: The original proposal correctly pointed out that there is a need to state clearly the interior finish requirements within a covered mall building. Chapter 8 requires that those interior wall and ceiling finishes that are not considered trim (per Section 806) must meet both a flame spread index (in the case of Class B it would be a flame spread index of between 26 and 75) and a smoke developed index (of no more than 450). With the proposed reorganization of Chapter 8 and the option of using NFPA 286 instead of ASTM E 84 for testing interior finishes, the reference to Chapter 8 is better than the reference to section 803.

Final Hearing Results

G53-06/07

AMPC1

Code Change No: G54-06/07

Original Proposal

Section: 402.9

Proponent: Sarah A. Rice, Schirmer Engineering Corporation

Revise as follows:

402.9 Smoke control. Where a covered mall building contains an atrium, a smoke control system shall be provided where required for atriums in accordance with Section 404 404.4.

Exception: A smoke control system is not required in covered mall buildings, when an atrium connects only two stories.

Reason: The issue is - when does a covered mall building require a smoke control system. As currently written the code has been interpreted as always mandating a smoke control system for any covered mall building regardless of configuration. The reference in Section 402.9 for the code user goes to go to the Atrium Section (404) seems to be easily missed.

While some may see the proposed language as redundant we feel it clarifies the intent and application of the smoke control provisions as they apply to covered mall buildings. The proposed language does 2 things:

1. Makes it clear that only when a covered mall building has an atrium a smoke control system might be needed. This language will make it clear that a single story covered mall building will never be required to have a smoke control system, as it won't have an atrium, and
2. For those multi-story covered mall buildings, the inclusion of the exception in Section 402.9 (which is mirrored after the exception in 404.4) allows the code user to know that the smoke control requirements are only for covered mall buildings having 3 stories. This seeks to eliminate the confusion that seems to exist when the user is sent to Section 404.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: Clarifies that smoke control is only required for a covered mall building when it contains an atrium that connects more than 2 stories.

Assembly Action:

None

AS

Code Change No: **G56-06/07**

Original Proposal

Section 402.11.1, Chapter 35

Proponent: Marcelo M. Hirschler, GBH International, representing the American Fire Safety Council

THIS PROPOSAL IS ON THE AGENDA OF THE IBC FIRE SAFETY CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

1. Revise as follows:

402.11.1 Materials. Children's playground structures shall be constructed of noncombustible materials or of combustible materials that comply with the following:

1. Fire-retardant-treated wood.
2. Light-transmitting plastics complying with Section 2606.
3. Foam plastics (including the pipe foam used in soft-contained play equipment structures) having a maximum heat-release rate not greater than 100 kW when tested in accordance with UL 1975.
4. Aluminum composite material (ACM) meeting the requirements of Class A interior finish in accordance with Chapter 8 when tested as an assembly in the maximum thickness intended for use.
5. Textiles and films complying with the flame propagation performance criteria contained in NFPA 701.
6. Plastic materials used to construct rigid components of soft-contained play equipment structures (such as tubes, windows, panels, junction boxes, pipes, slides and decks) meeting the UL 94 V-2 classification when tested in accordance with UL 94 or exhibiting a peak rate of heat release not exceeding 400 kW/m² when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m² in the horizontal orientation at a thickness of 6 mm.
7. Ball pool balls, used in soft-contained play equipment structures, having a maximum heat release rate not greater than 100 kW when tested in accordance with UL 1975. The minimum specimen test size shall be 36 inches by 36 inches (914 mm by 914 mm) by an average of 21 inches (533 mm) deep, and the balls shall be held in a box constructed of galvanized steel poultry netting wire mesh.
8. Foam plastics shall be covered by a fabric, coating or film meeting the flame propagation performance criteria of NFPA 701.
9. The floor covering placed under the children's playground structure shall exhibit a Class I interior floor finish classification, as described in Section 804, when tested in accordance with NFPA 253.

2. Add standard to Chapter 35 as follows:

ASTM E1354-04a Standard Test Method for Heat and Visible Smoke Release Rates for Materials and Products Using an Oxygen Consumption Calorimeter

Reason: The ASTM E 1534 test (cone calorimeter) is known to be a good predictor of full scale fire performance. Recent tests were conducted in which polyethylene materials (typically used for these components) complying with UL 94 V2 and UL 94 V0 classifications were tested using test method ASTM E 1354 in the vertical orientation at 6 mm thickness and the results (in duplicate) showed peak rates of heat release as follows:

Polyethylene UL 94 V2: 356.8 and 357.6 kW/m²
Polyethylene UL 94 V0: 328.8 and 318.1 kW/m²

Earlier data had already shown that non fire retarded pure polyethylene can give peak rates of heat release that exceed 1,000 kW/m², something found in several publications, including the following two: (a) Hirschler, M. M., "Heat release from plastic materials," Chapter 12a, in Babrauskas, V. and Grayson, S. J. (Eds.), Heat Release in Fires, (1992), pp. 375-422, Elsevier, London, UK and (b) Hirschler, M.M., "Flammability and Fire Performance", Chapter 13 in "PVC Handbook", Ed. C.E. Wilkes, J.W. Summers & C.A. Daniels, Carl Hanser, Cincinnati, OH, 2005, pp. 419-481.

The standard referenced has already been approved for use in the IFC (Chapter 8).

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Approved as Modified****Modify the proposal as follows:**

402.11.1 Materials. Children-s playground structures shall be constructed of noncombustible materials or of combustible materials that comply with the following:

1. Fire-retardant-treated wood.
2. Light-transmitting plastics complying with Section 2606.
3. Foam plastics (including the pipe foam used in soft-contained play equipment structures) having a maximum heat-release rate not greater than 100 kW when tested in accordance with UL 1975.
4. Aluminum composite material (ACM) meeting the requirements of Class A interior finish in accordance with Chapter 8 when tested as an assembly in the maximum thickness intended for use.
5. Textiles and films complying with the flame propagation performance criteria contained in NFPA 701.
6. Plastic materials used to construct rigid components of soft-contained play equipment structures (such as tubes, windows, panels, junction boxes, pipes, slides and decks) ~~meeting the UL 94 V-2 classification when tested in accordance with UL 94~~ or exhibiting a peak rate of heat release not exceeding 400 kW/m² when tested in accordance with ASTM E 1354 at an incident heat flux of 50 kW/m² in the horizontal orientation at a thickness of 6 mm.
7. Ball pool balls, used in soft-contained play equipment structures, having a maximum heat release rate not greater than 100 kW when tested in accordance with UL 1975. The minimum specimen test size shall be 36 inches by 36 inches (914 mm by 914 mm) by an average of 21 inches (533 mm) deep, and the balls shall be held in a box constructed of galvanized steel poultry netting wire mesh.
8. Foam plastics shall be covered by a fabric, coating or film meeting the flame propagation performance criteria of NFPA 701.
9. The floor covering placed under the children-s playground structure shall exhibit a Class I interior floor finish classification, as described in Section 804, when tested in accordance with NFPA 253.

(Portions of proposal not shown remain unchanged)

Committee Reason: This action was taken to accept the ASTM E 1354 since it does provide a good indication of the actual performance of the material. The option of using the UL 94 test was deleted since this is a small scale test which was not intended for evaluating the flammability of such plastic play structures.

Assembly Action:**None**

Final Hearing Results

AM

Code Change No: G60-06/07

Original Proposal

Section: 403.3.1

Proponent: Thomas Kinsman, T.A. Kinsman Consulting Company, Bellevue, WA

Revise as follows:

403.3.1 Type of construction. The following reductions in the ~~minimum construction type allowed~~ minimum fire resistive values of the building elements in Table 601 shall be ~~allowed as provided in Section 403.3~~ permitted as follows:

1. For buildings not greater than 420 feet (128 m) in height, the fire resistive values of the building elements in Type IA construction shall be allowed permitted to be reduced to the minimum fire resistive values for the building elements in Type IB.

Exception: The required fire-resistance rating of columns supporting floors shall not be ~~allowed permitted to be reduced~~ to the fire resistive value for columns in Type IB.

2. In other than Groups F-1, M and S-1, the fire resistive values of the building elements in Type IB construction shall be ~~allowed~~ permitted to be reduced to the fire resistive elements for columns in Type IIA.
3. The height and area limitations of ~~the a building containing building elements with reduced construction type~~ fire resistive values shall be ~~allowed~~ permitted to be the same as for ~~the original construction type~~ the building without such reductions.

Reason: The purpose of this code change is to clarify the language and make it consistent with the charging 403.3 section title and paragraph which addresses fire resistive reductions rather than construction type reductions. It is not intended to make any substantive changes to the current code.

The construction types haven't changed as indicated by the fact that these buildings, even with the fire resistive reductions in the building elements, are still permitted to use the unreduced construction type with respect to Table 503. In addition, there is now the anomaly of buildings < 420 feet high with all elements reduced to IB, except for the columns – so in such cases, the reduced building really isn't a IB either.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

403.3.1 Type of construction. The following reductions in the minimum fire ~~resistive values~~ resistance rating of the building elements in Table 601 shall be permitted as follows:

1. For buildings not greater than 420 feet (128 m) in height, the fire ~~resistive values~~ resistance rating of the building elements in Type IA construction shall be permitted to be reduced to the minimum fire ~~resistive values~~ resistance ratings for the building elements in Type IB.

Exception: The required fire-resistance rating of columns supporting floors shall not be permitted to be reduced, ~~to the fire resistive values for columns in Type IB.~~

2. In other than Groups F-1, M and S-1, the fire ~~resistive values~~ resistance rating of the building elements in Type IB construction shall be permitted to be reduced to the fire ~~resistive elements for columns~~ resistance ratings in Type IIA.
3. The height and area limitations of a building containing building elements with reduced fire ~~resistive values~~ resistance ratings shall be permitted to be the same as the building without such reductions.

Committee Reason: Based upon the proponents reason. The modification uses AFire Resistance rating® which is more appropriate terminology than Afire resistive values.® The modification also takes out specific reference to columns with regard to fire resistance ratings since it is superfluous language.

Assembly Action:

None

Final Hearing Results

G60-06/07

AM

Code Change No: G63-06/07

Original Proposal

Sections: 403.10 (New), 3007 (New), Chapter 35 (New)

Proponents: Dave Frable, U.S. General Services Administration; Gerry Jones/Herman Brice, Co-Chairs, NIBS/MMC Committee for Translating the NIST World Trade Center Investigation Recommendations into Building Codes

1. Add new text as follows:

403.10 Fire service access elevator. In buildings with an occupied floor more than 120 feet above the lowest level of fire department vehicle access, a minimum of one fire service access elevator shall be provided in accordance with Section 3007.

(Renumber subsequent sections)

SECTION 3007
FIRE SERVICE ACCESS ELEVATOR

3007.1 General. Where required by Section 403.10, every floor of the building shall be served by a fire service access elevator. Except as modified in this section, the fire service access elevator shall be installed in accordance with this chapter and ASME A17.1.

3007.2 Hoistway enclosures protection. The fire service access elevator shall be located in a shaft enclosure complying with Section 707.

3007.3 Fire service access elevator lobby. The fire service access elevator shall have a door opening into a fire service access elevator lobby complying with Sections 3007.3.1 through 3007.3.3.

Exception: Where fire service access elevators have multiple door openings on a floor, additional door openings shall be permitted to open to lobbies protected in accordance with Section 707.14.1.

3007.3.1 Access. The fire service access elevator lobby shall have direct access to a building stair.

3007.3.2 Lobby enclosure. The fire service access elevator lobby enclosure shall have a minimum 1-hour fire resistance rating.

3007.3.3 Lobby fire door assemblies. Each fire service access elevator lobby fire door shall have a fire protection rating of not less than 1 hour and shall be self closing or automatic closing.

3007.4 Standpipe hose connection. Each building exit stair having direct access to the fire service access elevator lobby shall be provided with a standpipe hose connection in accordance with Section 905.

3007.5 Two-way fire department communication system. The fire service access elevator and every associated fire service access elevator lobby shall be provided with an approved two-way fire department communication system. It shall operate between a fire command center complying with Section 911 and the fire service access elevator and every associated fire service access elevator lobby. The two-way fire department communication system shall be designed and installed in accordance with NFPA 72.

Exception: Fire department radio systems where approved by the fire department.

3007.6 Elevator car size. The elevator car size shall be in accordance with Section 3002.4.

3007.7 Elevator system monitoring. Conditions necessary for the continued safe operation of the fire service access elevator shall be continuously monitored at the fire command center by a *Standard Fire Service Interface* system meeting the requirements of NFPA 72 and NEMA SB30.

3007.8 Electrical power. The following features associated with fire service access elevators shall be supplied by both normal power and Type 60/Class 2/Level 1 standby power:

1. Elevator equipment
2. Elevator machine room ventilation and cooling equipment
3. Elevator controller cooling equipment

3007.8.1 Control wiring The normal and standby power control wiring supplying the fire service access elevators shall be protected by construction having a minimum 1 hour fire resistive rating.

3007.9 Standby power. The fire service access elevator shall be provided with standby power in accordance with Sections 2702 and 3003.

3007.10 Elevator machine rooms and machinery spaces. Automatic fire sprinklers shall not be installed in fire service access elevator machine rooms and machinery spaces.

2. Add new standards organization and standard to Chapter 35 as follows:

National Electrical Manufacturer's Association (NEMA)
1300 N. 17th Street
Suite 1847
Rosslyn, VA 22209

SB30-05 Fire Service Annunciator and Interface

Reason: Following the events of September 11, 2001, the U.S. General Services Administration (GSA) undertook a research initiative for the development of performance requirements for the use of elevators for occupant egress and fire service access in buildings. This research initiative is currently being conducted by the National Institute of Standards and Technology (NIST). The proposed code change is a by-product of the research currently being conducted by NIST as well preliminary information provided by a task group of ASME A17.1 for determining the required system features necessary for safe operation by trained firefighters during a fire emergency.

We feel that the requirements included in this proposal provide a reasonable degree of safety for firefighters operating the fire service access elevator to a location for staging firefighters and equipment one or two floors below the fire. The staging location will have access to a stair and standpipe that will allow for firefighting operations to be conducted from just above the staging area.

Cost Impact: The code change proposal will increase the cost of construction.

Analysis: Results of review of the proposed standard will be posted on the ICC Website by August 20, 2006.

Note: The following analysis was not in the Code Change Proposal book but was published in the "Errata to the 2006/2007 Proposed Changes to the International Codes and Analysis of Proposed Referenced Standards" provided at the code development hearings:

Analysis: Review of the proposed new standard indicated that, in the opinion of ICC Staff, the standard did not comply with ICC standards criteria, Section 3.6.2.1 for mandatory language.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Generally the committee was in favor of the proposal but disapproved the code change based upon a variety of issues that needed to be addressed. For instance there was concern with terminology in proposed section 3007.3.1 which currently references a "building stair" instead of an "exit enclosure." Other concerns related to the standard reference to NEMA SB30 and the size of the elevator lobby.

Assembly Action:

Approved as Submitted

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because an assembly action was successful and public comments were submitted.

Public Comment 1:

Dave Frable, U.S. General Services Administration requests Approval as Modified by this public comment.

1. Modify proposal as follows:

403.10 Fire service access elevator. In buildings with an occupied floor more than 120 feet above the lowest level of fire department vehicle access, a minimum of one fire service access elevator shall be provided in accordance with Section 3007.

(Renumber subsequent sections)

**SECTION 3007
FIRE SERVICE ACCESS ELEVATOR**

3007.1 General. Where required by Section 403.10, every floor of the building shall be served by a fire service access elevator. Except as modified in this section, the fire service access elevator shall be installed in accordance with this chapter and ASME A17.1.

3007.2 Hoistway enclosures protection. The fire service access elevator shall be located in a shaft enclosure complying with Section 707.

3007.3 Fire service access elevator lobby. The fire service access elevator shall ~~have a door opening open~~ open into a fire service access elevator lobby ~~complying in accordance with~~ Sections 3007.3.1 through 3007.3.3.

Exception: Where ~~a~~ fire service access elevators ~~have multiple~~ has two entrances ~~door openings~~ open onto a floor, ~~the second additional entrance~~ door openings shall be permitted to open into an elevator lobby ~~lobbies protected~~ in accordance with Section 707.14.1.

3007.3.1 Access. The fire service access elevator lobby shall have direct access to an exit enclosure ~~building stair~~.

3007.3.2 Lobby enclosure. The fire service access elevator lobby ~~enclosure~~ shall be enclosed with a smoke barrier ~~having~~ have a minimum 1-hour fire resistance rating, except that lobby doorways shall comply with Section 3007.3.3.

Exception: Enclosed fire service access elevator lobbies are not required at the street floor.

~~**3007.3.3 Lobby fire door assemblies doorways.** Each fire service access elevator lobby fire door shall have a fire protection rating of not less than 1 hour and shall be self closing or automatic closing be provided with a doorway that is protected with a ¾ hour fire door assembly complying with Section 715.4.~~

~~**3007.4 Standpipe hose connection.** Each building exit stair having direct access to the fire service access elevator lobby shall be provided with a A Class I standpipe hose connection in accordance with Section 905 shall be provided in the exit enclosure having direct access from the fire service access elevator lobby.~~

~~**3007.5 Two-way fire department communication system.** The fire service access elevator and every associated fire service access elevator lobby shall be provided with an approved two-way fire department communication system. It shall operate between a fire command center complying with Section 911 and the fire service access elevator and every associated fire service access elevator lobby. The two-way fire department communication system shall be designed and installed in accordance with NFPA 72.~~

~~**Exception:** Fire department radio systems where approved by the fire department.~~

~~**3007.6 Elevator car size.** The elevator car size shall be in accordance with Section 3002.4.~~

~~**3007.7 Elevator system monitoring.** The Conditions necessary for the continued safe operation of the fire service access elevator shall be continuously monitored at the fire command center by a *Standard Fire Emergency Service Interface* system meeting the requirements of NFPA 72 and NEMA SB30.~~

~~**3007.8 Electrical power.** The following features associated with serving each fire service access elevators shall be supplied by both normal power and Type 60/Class 2/Level 1 standby power:~~

1. Elevator equipment
2. Elevator machine room ventilation and cooling equipment
3. Elevator controller cooling equipment

~~**3007.8.1 Protection of wiring or cables.** Control wiring. The normal and standby power control wiring supplying the fire service access elevators shall be protected by construction having a minimum 1 hour fire resistive rating. Wires or cables that provide normal and standby power, control signals, communication with the car, lighting, heating, air conditioning, ventilation, and fire detecting systems to fire service access elevators shall be protected by construction having a minimum 1 hour fire resistance rating or shall be circuit integrity cable having a minimum 1 hour fire resistance rating.~~

~~**3007.9 Standby power.** The fire service access elevator shall be provided with standby power in accordance with Sections 2702 and 3003.~~

~~**3007.10 Elevator machine rooms and machinery spaces.** Automatic fire sprinklers shall not be installed in fire service access elevator machine rooms and machinery spaces.~~

2. Revise as follows:

~~**903.3.1.1 NFPA 13 sprinkler systems.** Where the provisions of this code require that a building or portion thereof be equipped throughout with an automatic sprinkler system in accordance with this section, sprinklers shall be installed throughout in accordance with NFPA 13 except as provided in Section 903.3.1.1.1.~~

~~**903.3.1.1.1 Exempt locations.** Automatic sprinklers shall not be required in the following rooms or areas where such rooms or areas are protected with an approved automatic fire detection system in accordance with Section 907.2 that will respond to visible or invisible particles of combustion. Sprinklers shall not be omitted from any room merely because it is damp, of fire-resistance rated construction or contains electrical equipment.~~

1. Any room where the application of water, or flame and water, constitutes a serious life or fire hazard.
2. Any room or space where sprinklers are considered undesirable because of the nature of the contents, when approved by the fire code official.
3. Generator and transformer rooms separated from the remainder of the building by walls and floor/ceiling or roof/ceiling assemblies having a fire-resistance rating of not less than 2 hours.
4. In rooms or areas that are of noncombustible construction with wholly noncombustible contents.
5. In fire service access elevator machine rooms and machinery spaces.

~~**Commenter's Reason:** As the proponent of the original code change proposal, I submit this comment to support the successful Assembly Action in Lake Buena Vista that recommended approval of this code change. The proposed code change is a by-product of research currently being conducted by the National Institute of Standards and Technology (NIST) and funded by the U.S. General Services Administration. Overall, the General Code Committee stated they were in favor of the code change proposal but disapproved the code change proposal based on a number of issues. The purpose of this modified code change is to address the issues raised by the General Code Committee.~~

1. **3007.3 Fire service access elevator lobby.** This paragraph was revised for clarification purposes only. The exception also clarifies that if the fire service access elevator has two entrances, the second entrance is permitted to open into an enclosed or otherwise protected elevator lobby in accordance with 707.14.1.
2. **3007.3.1 Access.** This paragraph was revised for clarification purposes only. This change addresses the concerns of the Code Committee regarding the term "building stair".
3. **3007.3.2 Lobby enclosure.** This paragraph was revised for clarification purposes only. This change addresses concerns that this paragraph was non-specific with regard to the enclosure requirements for the lobby. A smoke barrier is the appropriate reference since it is designed to resist fire and smoke spread and is intended to create an area of refuge. The new exception addresses the need for not requiring an enclosed lobby on the street floor.

4. **3007.3.3 Lobby doorways.** The title and content of this paragraph was revised for clarification purposes only. A horizontal separation is allowed to be protected with a ¾ hour fire door assembly. Clearly a ¾ hour fire rated door provides more protection than a 20 minute fire door typically required by a smoke barrier.
5. **3007.4 Standpipe hose connection.** This paragraph was revised for clarification purposes only. It was felt that since 905.4 is limited to "required" exit stairways; this paragraph will still require a standpipe hose connection in non-required or additional exit stairways.
6. **3007.5 Two-way fire department communication system.** This paragraph was deleted since it is redundant and currently covered in the IBC.
7. **3007.6 Elevator car size.** This paragraph was deleted since it is redundant and currently covered in the IBC.
8. **3007.7 Elevator system monitoring.** This paragraph was revised to delete superfluous text, correct the title of the interface system, and to delete the reference to NEMA SB30.
9. **3007.8 Electrical power.** This paragraph was revised for clarification purposes only.
10. **3007.8.1 Protection of wiring or cables.** The title and content of this paragraph was revised for clarification purposes only.
11. **3007.9 Standby power.** This paragraph was deleted since it is redundant and currently covered in the IBC.
12. **3007.10 Elevator machine rooms and machinery spaces.** This paragraph was relocated to Chapter 9 based on a recommendation from the General Code Committee. See new exemption number 5, 903.3.1.1.1.

903.3.1.1.1 Exempt locations (new exemption 5). Added new exemption number 5. Relocated material from 3007.10. Provides an exemption for providing automatic sprinklers in fire service access elevator machine rooms and machinery spaces. The need for providing sprinkler protection in these areas is questionable based on the lack of fire loss statistics for elevator machine room and machinery space fires and the concerns from ASME regarding disconnecting the main power line to the affected elevators prior to the application of water from the sprinklers.

Final Hearing Results

G63-06/07 AMPC1

Code Change No: G68-06/07

Original Proposal

Section: 403.15 (New), Table 403.15 (New)

Proponent: William M. Connolly, State of New Jersey, Dept. of Community Affairs, Division of Codes and Standards, representing the International Code Council Ad Hoc Committee on Terrorism Resistant Buildings

Add new text as follows:

403.15 Spray-Applied Fire Resistive Materials (SFRM). The bond strength of the SFRM shall be in accordance with Table 403.15.

**TABLE 403.15
MINIMUM BOND STRENGTH**

HEIGHT OF BUILDING	SFRM MINIMUM BOND STRENGTH
More than 75 feet ^a and up to 420 feet	430 psf
More than 420 feet	1,000 psf

a. Above the lowest level of fire department vehicle access

Reason: This code change proposal is one of fourteen proposals being submitted by the International Code Council Ad Hoc Committee on Terrorism Resistant Buildings.

The purpose of this proposal is to increase the required adhesions of Spray Applied Fire Resistant Materials (SFRM).

The National Institute of Standards and Technology's (NIST) investigation into the World Trade Center (WTC) tragedy documented that the proximate cause of the actual collapse was the action of a building contents fire on light steel members in the absence of spray applied fire resistant material, which had been dislodged. Events far less dramatic than an airplane attack have been known to dislodge SFRM. The initiating events can be as simple as elevator movement, building sway or maintenance activities.

Recommendation 6 of the NIST WTC Report calls for improvement of the in-place performance of SFRM. This proposal is one of three that seeks to achieve that objective. The other two are a proposal for a new Section 714.8 dealing with the application of SFRM and a strengthened Section 1704.10 dealing with special inspections of SRFM installations.

The current code specifies a SFRM bond strength of 150 psf when tested in accordance with ASTM E736, no matter how large the building or how high the risk. This proposal requires the use of higher bond strength material for buildings over 75 feet in height and yet again higher strength for those that exceed 420 feet. These higher standards are warranted by the higher risk associated with taller buildings. Products that meet this standard are available in the marketplace.

Bond strength is not the only material characteristic that affects in-place durability. Density does as well. This proposal does not establish a separate density standard because density and bond strength are linked to one another. High bond strength entails high density.

Some might argue that more research is needed to establish appropriate bond strengths for different levels of risk. The proponents agree but believe something needs to be done now to improve the in-place durability of SFRM. This code provision will have that result. It should be recognized as a beginning, not an end.

Bibliography: National Institute of Standards and Technology. Final Report of the National Construction Safety Team on the Collapses of the World Trade Center Towers. United States Government Printing Office: Washington, D.C. September 2005.

Cost Impact: The code change proposal will increase the cost of construction but only marginally so. Many tall buildings already utilize these higher strength materials.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

403.15 Spray-Applied Sprayed Fire Resistive Materials (SFRM). The bond strength of the SFRM shall be in accordance with Table 403.15.

**TABLE 403.15
MINIMUM BOND STRENGTH**

HEIGHT OF BUILDING ^a	SFRM MINIMUM BOND STRENGTH
More than 75 feet ^a and up to 420 feet	430 psf
More than 420 feet	1,000 psf

a. Above the lowest level of fire department vehicle access

Committee Reason: Although the data which provides technical support was not provided within the proposal, this does go along with the NIST recommendations and should provide better safety in high-rise buildings. Using the greater bond strengths will increase the probability that the protection will stay in place and will reduce the likelihood of being dislodged. These factors should provide for a longer time of safety. Placing the requirements in the high-rise provisions of Chapter 4 instead of within Chapter 7 makes sense because they are only applicable to high-rises and will be more likely to be found within that section. The committee did agree with the different bond strength requirements based upon the thought the taller buildings are at a higher risk and that items such as the vibration of tall buildings will affect the long term performance. Based on testimony which was provided, the cost impact of this requirement was considered as being relatively small. The higher density products which are currently available will generally meet these requirements. The modifications included a revision of the terminology Aspray applied® to Asprayed® to be consistent with the action of FS156-06/07 and to create a more global point of reference for building height by moving footnote a to the main title of the first column.

Analysis: Note Section 403.3.1 item 1 states A420 feet (128 m) in height,® relating to building height as defined in Section 502.

Final Hearing Results

G68-06/07

AM

Code Change No: G71-06/07

Original Proposal

Sections: 403.15 (New), 1019.1 (IFC [B] 1019.1)

Proponent: William M. Connolly, State of New Jersey, Dept. of Community Affairs, Division of Codes and Standards, representing the International Code Council Ad Hoc Committee on Terrorism Resistant Buildings

1. Add new text as follows:

403.15 Additional exit stairway. For buildings other than Group R-2 that are more than 420 feet (128 m) in height, one additional exit stairway meeting the requirements of Sections 1009 and 1020 shall be provided in addition to the minimum number of exits required by Section 1019.1. The total width of any combination of remaining stairways with one stairway removed shall not be less than the total width required by Section 1005.1. Scissor stairs shall not be considered the additional exit stair required by this section.

2. Revise as follows:

1019.1 Minimum number of exits. All rooms and spaces within each story shall be provided with and have access to the minimum number of approved independent exits required by Table 1019.1 based on the occupant load of the story, except as modified in Sections 403.15, 1015.1 or 1019.2. For the purposes of this chapter, occupied roofs shall be provided with exits as required for stories. The required number of exits from any story, basement or individual space shall be maintained until arrival at grade or the public way.

Reason: This code change proposal is one of fourteen proposals being submitted by the International Code Council Ad Hoc Committee on Terrorism Resistant Buildings.

This proposed change is intended to enable rapid full evacuation of very tall buildings by ensuring that ongoing and critical firefighting activity does not reduce the total required exit capacity needed to evacuate the remaining occupants of the building. It implements, in part, Recommendation 17 of the National Institute of Standards and Technology (NIST) World Trade Center (WTC) report.

The basic purpose behind the Code's current egress provisions for very tall buildings is to evacuate several floors near the fire floor. The provisions do not contemplate prompt full building evacuation. The NIST WTC report calls for Codes to consider that criterion. It is important to note that the need for full evacuation may be the result of a terrorist event, but that a range of other natural occurrences or man-made failures might also necessitate full building evacuation.

If the need for a full building evacuation occurs because of or at the same time as a fire then there will be very real problems. Necessary firefighting operations will reduce the capacity of the egress system. The extended period of time needed to fully evacuate a very tall building means that people will still be evacuating while full firefighting operations are taking place. Sound high rise fire fighting doctrine provides that the fire department take control of one stair, the one most appropriate to the circumstances of the given fire condition, in order to conduct suppression activities. In a building having two required stairs, each of the same width, this means that one-half of the exit capacity has been lost in a building which is still being evacuated.

This proposal calls for an additional stair so that egress capacity will be maintained through the time that full evacuation is complete. It is important to note that this additional stair is not proposed to be a dedicated fire department stair. The intent of the proposed provision is that the fire department be able to choose the stair which is most appropriate for the actual fire event. The principal purpose of this change is to maintain egress capacity in the case of fire events, but the additional stair will also significantly shorten the time needed for full evacuation in non-fire events.

The proponents recognize that effective use of this feature will require emergency responders to manage evacuation flow to the available stairs. The proponents have submitted proposed changes to Articles 4, 7, and 9 of the IBC that will assist in that management. It should be pointed out, however, that this management problem exists under current code provisions; it is just magnified by the loss of egress capacity for full building evacuation.

The issue of "counter flow" has been much discussed since the WTC tragedy --counter flow meaning the fire fighters going up interfere with occupants moving down. The NIST report suggests that counter flow did not slow evacuation rates, but it did affect firefighter ascent rates. Some have suggested that widening the minimum width of stairs will resolve the counter flow problem.

The proponents disagree and believe that dedicating a stair to the fire service while maintaining necessary egress capacity in the remaining stairs is a better solution. There is a practical limit to how rapidly occupants can descend, no matter how wide the stair. Whether minimum width should be expanded because the practical limit cannot be obtained at the current minimum is a different code issue than the one addressed here. The proponents have not seen data or analysis which suggests that additional minimum width is needed, independent of counter flow considerations.

Really rapid evacuation of all occupants, but especially those with disabilities, depends upon the development of robust and safe evacuation elevators. That is the long term solution. The elevator industry and the ASME A-117.1 Committee are working hard on this important challenge but a lot of work remains to be done. The proponents recognize that evacuation elevators might one day eliminate the need for the extra stair proposed here, but believe that something must be done now to address this very real problem.

The proposal adds a new Section 403.15 which requires one more stair than is otherwise required by Section 1019.1. It requires that the stair meet the minimum width requirements of Section 1009.1. More importantly, it also requires that the additional stair and the two (or more) stairs required by Section 1019.1 be sized, in terms of width, such that any combination of all stairs, less one, will provide for the required total width required by Section 1009.1. This meets the intent of the change that the required egress width be available even with one stair being used for firefighting operations.

It is important to note that the proposal does not require the additional stair to be located in accordance with other applicable requirements such as travel distance and separation. Those provisions of the Code will be met by the other stairs. The proponents believe that those requirements might be very difficult to meet with the additional stair and are not needed given the intent of the change.

Bibliography: National Institute of Standards and Technology. Final Report of the National Construction Safety Team on the Collapses of the World Trade Center Towers. United States Government Printing Office: Washington, D.C. September 2005.

Cost Impact: The code change proposal will increase the cost of construction for very tall buildings.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee felt that review of the NIST report was not yet complete, therefore this proposal was premature. Modeling should be done to show the extent that an additional stair would improve exiting. The logistics of closing off a stairway for fire department staging during an emergency evacuation must be investigated. The calculation method for exit stairway width was confusing, and did not clearly indicate the width required for the extra stairway. The location of the extra stairway in relation to the other exit stairways was not indicated. In a high rise, fire fighters will typically be using the elevator to get near the fire floor and then move to the stairway. A question would be if this stairway should be located near the elevators.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

William M. Connolly, State of New Jersey, Dept. of Community Affairs, Division of Codes and Standards, representing the International Code Council Ad Hoc Committee on Terrorism Resistant Buildings, requests Approval as Submitted.

Commenter's Reason: The Code Development Committee disapproved this change for several reasons. The first was that the "NIST report was not yet complete and the proposal was premature". The NIST report is complete and this proposal addresses Recommendation 17 of the report. The committee also felt that modeling should be done to show the impact of the additional stair. Modeling has been performed by NIST. This model demonstrates that the additional stair improves occupant egress and fire fighter access in all cases. The degree to which the access is improved is directly related to the location of the fire in the building. The committee was also confused with the manner in which the minimum width of the stair is calculated. The code change requires that required egress capacity for the building be determined with one stairway removed from the equation. The committee was also concerned with the lack of guidance regarding the location of the stair. The location of the additional stair is irrelevant. The fire service will commandeer the stair that is closest to the fire location; this code change merely assures that sufficient egress capacity is provided when the fire service does so. It also provides unimpeded access to the fire floor for the fire service. It is for these reasons that the TRB Ad-Hoc Committee requests your support for As Submitted.

G71-06/07

AS

Code Change No: **G77-06/07**

Original Proposal

Section: 405.1

Proponent: Thomas Kinsman, T.A. Kinsman Consulting Company

Revise as follows:

405.1 General. The provisions of this section apply to building spaces having a floor level used for human occupancy more than 30 feet (9144 mm) below the lowest level of exit discharge.

Exceptions:

1. One- and two-family dwellings, sprinklered in accordance with Section 903.3.1.3.
2. Parking garages with automatic sprinkler systems in compliance with Section 405.3.
3. Fixed guideway transit systems.
4. Grandstands, bleachers, stadiums, arenas and similar facilities.
5. Where the lowest story is the only story that would qualify the building as an underground building and has an area not exceeding 1,500 square feet (139 m²) and has an occupant load less than 10.
6. Pumping stations and other similar mechanical spaces where human occupancy involves only intermittent labor relating to maintenance and repair.

Reason: The purpose of this proposal is exempt floor levels containing pumping stations and similar mechanical uses from the requirements of Section 405. The intent of the proposal is to apply this exception to only those pumping stations (water supply, sewage handling, etc.) and other similar mechanical spaces that involve human occupancy only relating maintenance and repairs rather than regular daily use.

The code does not define "human occupancy" found in the charging paragraph. It does define the term "occupiable space" in Section 202 which includes spaces that are used for human labor. Because of its similarity to "human occupancy", this can be, and has been, interpreted broadly to include even labor involving repair and maintenance. Such an interpretation seems beyond the intent of Section 405 given the flavor of the existing exceptions. The safety features required by 405 are overly excessive for such spaces with only intermittent occupancy.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: Section 405 is intended to address concerns with occupants regularly located underground remote from the level of exit discharge, versus spaces which are subject to occasional maintenance. See also the proponent's reason.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jerry J. Barbera, Port of Seattle Airport Building Department, representing himself, requests Approval as Modified by this public comment.

Further modify proposal as follows:

405.1 General. The provisions of this section apply to building spaces having a floor level used for human occupancy more than 30 feet (9144 mm) below the lowest level of exit discharge.

Exceptions:

1. One- and two-family dwellings, sprinklered in accordance with Section 903.3.1.3.
2. Parking garages with automatic sprinkler systems in compliance with Section 405.3.
3. Fixed guideway transit systems.
4. Grandstands, bleachers, stadiums, arenas and similar facilities.
5. Where the lowest story is the only story that would qualify the building as an underground building and has an area not exceeding 1,500 square feet (139 m²) and has an occupant load less than 10.
6. Pumping stations and other similar mechanical spaces ~~where human occupancy involves only intermittent labor relating to maintenance and repair.~~ intended only for limited periodic use by service or maintenance personal.

Commenter's Reason: I agree with the provision provided by the proponent. It is my belief, however, that we should try to have consistent language between the different codes so that the chance of misunderstanding is lessened. Over the 40+ years I have been involved with codes and standards administration, I have found that exceptions without some common set of terms tend to confuse the users and make a proper application of them very difficult.

I surveyed the provisions of IBC Sections Table 307.1(1)-Footnote k, 907.12, 1109.13, 1502.1, and 1607.11.2.1 all relating to mechanical spaces similar to the proposal and found that the common terms were "maintenance", "repair", "limited", "periodic", "service" and "maintenance personal." Therefore, I edited this proposal using these term giving it some of the consistency with the rest of the IBC.

Final Hearing Results

G77-06/07

AMPC1

Code Change No: **G78-06/07**

Original Proposal

Section: 406.2.6

Proponent: David S. Collins, FAIA, The Preview Group, Inc., representing the American Institute of Architects

Revise as follows:

406.2.6 Floor surface. Parking surfaces shall be of concrete or similar noncombustible and nonabsorbent materials.

Exception: ~~Asphalt parking surfaces are permitted at ground level.~~

The area of floor used for parking of automobiles or other vehicles shall be sloped to facilitate the movement of liquids to a drain or toward the main vehicle entry doorway.

Exceptions:

1. Asphalt parking surfaces shall be permitted at ground level.
2. Floors of S-2 parking garages shall not be required to have a sloped surface.

Reason: Many larger parking structures are constructed with prefabricated materials that are difficult if not impossible to design to slope all surfaces. The need to maintain slopes to drains isn't an absolute in such garages.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal solves a problem faced by many jurisdictions with large parking structures. The slope requirement is not necessary in these structures.

Assembly Action:

None

Final Hearing Results

G78-06/07

AS

Code Change No: G80-06/07

Original Proposal

Section: 406.1.5 (New), Chapter 35

Proponent: Bob Eugene, Underwriters Laboratories, Inc.

1. Add new text as follows:

406.1.5 Automatic garage door openers. Automatic garage door openers, if provided, shall be listed in accordance with UL 325.

2. Add standard to Chapter 35 as follows:

UL

325-02 Door, Drapery, Louver and Window Operations and Systems, with revisions through January 2006

Reason: The purpose of this change is to add a new requirement in the IBC, consistent with an existing requirement in Section R309.6 of the IRC.

The reason for this proposal is to assure consistency in the safety requirements for garage door openers, where provided, regardless if whether the IRC or the IBC is the code applied. This proposal does not require automatic garage door openers to be installed, but when a choice is made to install the openers, that the openers comply with ANSI approved safety requirements.

UL 325-02, Door, Drapery, Louver and Window Operations and Systems, with revisions through January 17, 2006 is an ANSI approved standard under continuous maintenance.

Bibliography: IRC R309.6

Cost Impact: The code change proposal will not increase cost of construction.

Public Hearing Results

Errata: Revise standard reference as follows:

325-02 Door, Drapery, Louver and Window Operations and Systems, with revisions through ~~January~~ February 2006

Note: The following analysis was not in the Code Change Proposal book but was published in the AErrata to the 2006/2007 Proposed Changes to the International Codes and Analysis of Proposed Referenced Standards® provided at the code development hearings:

Analysis: Review of the proposed new standard indicated that, in the opinion of ICC Staff, the standard did comply with ICC standards criteria. This standard is already referenced by the IRC.

Committee Action:

Approved as Submitted

Committee Reason: Reference to UL 325 for automatic garage door openers is appropriate and is consistent with the reference in the IRC.

Assembly Action:

None

Final Hearing Results

G80-06/07

AS

Code Change No: G81-06/07

Original Proposal

Sections: 406.3.6, 412.3.1, 412.3.6, [F] 415.6.1.6, Ch. 5, [F] 905.3.1 (IFC 905.3.1), 1406.2.2, 1509.5.1, 1808.2.5, 1915.5

Proponent: Philip Brazil, PE, Reid Middleton, Inc., representing himself

1. Revise as follows:

406.3.6 Area and height increases. The allowable area and height of open parking garages shall be increased in accordance with the provisions of this section. Garages with sides open on three-fourths of the building's perimeter are permitted to be increased by 25 percent in area and one tier in height. Garages with sides open around the entire building's perimeter are permitted to be increased by 50 percent in area and one tier in height. For a side to be considered open under the above provisions, the total area of openings along the side shall not be less than 50 percent of the interior area of the side at each tier and such openings shall be equally distributed along the length of the tier.

Allowable tier areas in Table 406.3.5 shall be increased for open parking garages constructed to heights less than the table maximum. The gross tier area of the garage shall not exceed that permitted for the higher structure. At least three sides of each such larger tier shall have continuous horizontal openings not less than 30 inches (762 mm) in clear height extending for at least 80 percent of the length of the sides and no part of such larger tier shall be more than 200 feet (60 960 mm) horizontally from such an opening. In addition, each such opening shall face a street or yard accessible to a street with a width of at least 30 feet (9144 mm) for the full length of the opening, and standpipes shall be provided in each such tier.

Open parking garages of Type II construction, with all sides open, shall be unlimited in allowable area where the building height does not exceed 75 feet (22 860 mm). For a side to be considered open, the total area of openings along the side shall not be less than 50 percent of the interior area of the side at each tier and such openings shall be equally distributed along the length of the tier. All portions of tiers shall be within 200 feet (60 960 mm) horizontally from such openings or other natural ventilation openings as defined in Section 406.3.3.1. These openings shall be permitted to be provided in courts with a minimum width of 30 feet (9144 mm) for the full width of the openings.

412.3.1 Definition. The following word and term shall, for the purposes of this chapter and as used elsewhere in this code, have the meaning shown herein.

RESIDENTIAL AIRCRAFT HANGAR. An accessory building less than 2,000 square feet (186 m²) and 20 feet (6096 mm) in building height, constructed on a one- or two-family residential property where aircraft are stored. Such use will be considered as a residential accessory use incidental to the dwelling.

412.3.6 Height and area limits. Residential aircraft hangars shall not exceed 2,000 square feet (186 m²) in area and 20 feet (6096 mm) in building height.

[F] 415.6.1.6 Coal pockets. Coal pockets located less than 30 feet (9144 mm) from interior lot lines or from structures on the same lot shall be constructed of not less than Type IB construction. Where more than 30 feet (9144 mm) from interior lot lines, or where erected along a railroad right-of-way, the minimum type of construction of such structures not more than 65 feet (19 812 mm) in building height shall be Type IV.

CHAPTER 5 GENERAL BUILDING HEIGHTS AND BUILDING AREAS

[F] 905.3.1 (IFC 905.3.1) Building hHeight. Class III standpipe systems shall be installed throughout buildings where the floor level of the highest story is located more than 30 feet (9144 mm) above the lowest level of fire department vehicle access, or where the floor level of the lowest story is located more than 30 feet (9144 mm) below the highest level of fire department vehicle access.

Exceptions:

1. Class I standpipes are allowed in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.
2. Class I manual standpipes are allowed in open parking garages where the highest floor is located not more than 150 feet (45 720 mm) above the lowest level of fire department vehicle access.
3. Class I manual dry standpipes are allowed in open parking garages that are subject to freezing temperatures, provided that the hose connections are located as required for Class II standpipes in accordance with Section 905.5.
4. Class I standpipes are allowed in basements equipped throughout with an automatic sprinkler system.
5. In determining the lowest level of fire department vehicle access, it shall not be required to consider:
 - 5.1. Recessed loading docks for four vehicles or less; and
 - 5.2. Conditions where topography makes access from the fire department vehicle to the building impractical or impossible.

1406.2.2 Architectural trim. In buildings of Type I, II, III and IV construction that do not exceed three stories or 40 feet (12 192 mm) in building height ~~above grade plane~~, exterior wall coverings shall be permitted to be constructed of wood where permitted by Section 1405.4 or other equivalent combustible material. Combustible exterior wall coverings, other than fire-retardant-treated wood complying with Section 2303.2 for exterior installation, shall not exceed 10 percent of an exterior wall surface area where the fire separation distance is 5 feet (1524 mm) or less. Architectural trim that exceeds 40 feet (12 192 mm) in height above grade plane shall be constructed of approved noncombustible materials and shall be secured to the wall with metal or other approved noncombustible brackets.

1509.5.1 Noncombustible construction required. Any tower, spire, dome or cupola that exceeds 60 feet (18 288) in height above the highest point at which it comes in contact with the roof, or that exceeds 200 square feet (18.6 m²) in area at any horizontal section, or which is intended to be used for any purpose other than a belfry or architectural embellishment, shall be entirely constructed of and supported by noncombustible materials. Such structures shall be separated from the building below by construction having fire-resistance rating of not less than 1.5 hours with openings protected with a minimum 1.5-hour fire-protection rating. Structures, except aerial supports 12 feet (3658 mm) high or less, flagpoles, water tanks and cooling towers, placed above the roof of any building more than 50 feet (15 240 mm) in building height, shall be of noncombustible material and shall be supported by construction of noncombustible material.

1808.2.5 Stability. Piers or piles shall be braced to provide lateral stability in all directions. Three or more piles connected by a rigid cap shall be considered braced, provided that the piles are located in radial directions from the centroid of the group not less than 60 degrees (1 rad) apart. A two-pile group in a rigid cap shall be considered to be braced along the axis connecting the two piles. Methods used to brace piers or piles shall be subject to the approval of the building official.

Piles supporting walls shall be driven alternately in lines spaced at least 1 foot (305 mm) apart and located symmetrically under the center of gravity of the wall load carried, unless effective measures are taken to provide for eccentricity and lateral forces, or the wall piles are adequately braced to provide for lateral stability. A single row of piles without lateral bracing is permitted for one- and two-family dwellings and lightweight construction not exceeding two stories or 35 feet (10 668 mm) in building height, provided the centers of the piles are located within the width of the foundation

1915.5 Fire-resistance-rating protection. Pipe columns shall be of such size or so protected as to develop the required fire-resistance ratings specified in Table 601. Where an outer steel shell is used to enclose the fire-resistant covering, the shell shall not be included in the calculations for strength of the column section. The minimum diameter

of pipe columns shall be 4 inches (102 mm) except that in structures of Type V construction not exceeding three stories or 40 feet (12 192 mm) in building height, pipe columns used in the basement and as secondary steel members shall have a minimum diameter of 3 inches (76 mm).

Reason: The code sections in this proposal have one thing in common. They specify requirements for a building based on its height. The IBC does not specify how to determine a building's height and the code user is left with a subjective standard for the measurement. Section 502.1, however, defines "building height" as "the vertical distance from grade plane to the average height of the highest roof surface." Grade plane is also defined in Section 502.1. The proposal will change "height" to "building height" so that the determination is an objective one based on the definitions for building height and grade plane.

This proposal does not include each code section in the IBC that specifies requirements for a building or structure based on its height. There are cases where the determination of their height from grade plane to the average height of the highest roof surface is not warranted or not applicable (e.g., towers, spires, domes, cupolas, etc.). Please refer to Sections 412.1.5, 903.2.10.3, 1509.5, 2109.1.1, 3108.3, 3202.2 and 3310.1.

This proposal also does not include references to the height of a building in terms of distance and number of stories. In these cases, the defined term of building height is not appropriate because it is limited to the height of a building in terms of distance. Please refer to Sections 503.1, 508.3.1.2, 508.3.2.2 and 508.3.3.3, and Table 503.

Note that "building height" is currently used in other sections of the IBC. Please refer to Sections 509.2(5) and 1709.3(2).

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis. While some sections listed are typically the purview of other committees, for consistency, the General Committee will make the determination for entire proposal.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: Cleans up code terminology with regard to building height. ABuilding height® is a defined term whereas Aheight® is not specifically defined.

Assembly Action:

None

Original Proposal

Sections: 408.2, 1014.2 (IFC [B] 1014.2)

Proponent: Maureen Traxler, City of Seattle, WA, representing the Washington Association of Building Officials

THIS PROPOSAL IS ON THE AGENDA OF THE IBC GENERAL AND IBC MEANS OF EGRESS CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES

PART I – IBC GENERAL

Revise as follows:

408.2 Mixed occupancies. Portions of buildings with an occupancy in Group I-3 that are classified as a different occupancy shall meet the applicable requirements of this code for such occupancies. Where security operations necessitate the locking of required means of egress, provisions shall be made for the release of occupants at all times.

Means of egress from detention and correctional occupancies that traverse other use areas shall, as a minimum, conform to requirements for detention and correctional occupancies.

Exception: It is permissible to exit through a horizontal exit into other contiguous occupancies that do not conform to detention and correctional occupancy egress provisions but that do comply with requirements set forth in the appropriate occupancy, as long as the occupancy is not a ~~high-hazard~~ Group H use.

PART II – IBC MEANS OF EGRESS

Revise as follows:

1014.2 Egress through intervening spaces. Egress through intervening spaces shall comply with this section.

1. Egress from a room or space shall not pass through adjoining or intervening rooms or areas, except where such adjoining rooms or areas are accessory to the area served, are not a ~~high-hazard~~ Group H occupancy and provide a discernible path of egress travel to an exit.

Exception: Means of egress are not prohibited through adjoining or intervening rooms or spaces in a Group H, S or F occupancy when the adjoining or intervening rooms or spaces are the same or a lesser hazard occupancy group.

2. Egress shall not pass through kitchens, storage rooms, closets or spaces used for similar purposes.

Exceptions:

1. Means of egress are not prohibited through a kitchen area serving adjoining rooms constituting part of the same dwelling unit or sleeping unit.
2. Means of egress are not prohibited through stockrooms in Group M occupancies when all of the following are met:
 - 2.1. The stock is of the same hazard classification as that found in the main retail area;
 - 2.2. Not more than 50 percent of the exit access is through the stockroom;
 - 2.3. The stockroom is not subject to locking from the egress side; and
 - 2.4. There is a demarcated, minimum 44-inch-wide (1118 mm) aisle defined by full or partial height fixed walls or similar construction that will maintain the required width and lead directly from the retail area to the exit without obstructions.
3. An exit access shall not pass through a room that can be locked to prevent egress.
4. Means of egress from dwelling units or sleeping areas shall not lead through other sleeping areas, toilet rooms or bathrooms.

Reason: This proposed change clarifies the application of the code section. “High-hazard occupancy” is a vague, undefined term. “Group H occupancy” is the designation commonly used in the IBC for high hazard occupancies—Section 307 is titled “High-hazard Group H”. The Commentary to the 2003 IBC states “egress paths ... must not pass through an extraordinary fire hazard, such as an area of high-hazard use (Group H).” If these provisions are not intended to apply to Group H occupancies, then what is intended?

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I C IBC GENERAL

Committee Action:

Approved as Submitted

Committee Reason: The terminology Ahigh-hazard® is not defined. Revising the terminology to Group H clarifies which specific use classification is intended.

Assembly Action:

None

PART II C IBC MEANS OF EGRESS

Committee Action:

Approved as Submitted

Committee Reason: The proposal was approved to be consistent with the action taken by the General committee in Part I of the proposal for similar language in Section 408.2. The current use of the term Ahigh hazard® is not defined. The revised language clarifies that the intent is for all Group H occupancies.

Assembly Action:

None

Final Hearing Results

G84-06/07, Part II	AS

Code Change No: **G86-06/07**

Original Proposal

Section: 410.3.5

Proponent: William Conner, ASTC, Bill Conner Associates LLC, representing the American Society of Theatre Consultants

Revise as follows:

410.3.5 Proscenium curtain. Where a proscenium wall is required to have a fire-resistance rating, the stage opening shall be provided with a fire curtain of approved material or an approved water curtain complying with Section 903.3.1.1 or, in facilities not utilizing the provisions of smoke protected assembly seating in accordance with Section 1025.6.2, a smoke control system complying with Section 909 or natural ventilation designed to maintain the smoke level at least 6 feet (1829 mm) above the floor of the means of egress. The fire curtain shall be designed and installed to intercept hot gases, flames and smoke and to prevent a glow from a severe fire on the stage from showing on the auditorium side for a period of 20 minutes. The closing of the fire curtain from the full open position shall be accomplished in less than 30 seconds, with the last 8 feet (2438 mm) of travel requiring 5 or more seconds for full closure.

Reason: The proscenium opening protection is provide to afford occupants more time for egress. This change will permit facilities designed for entertainment better and more options to do this. In many large venues such as arenas where the amount of combustibile materials may exceed that found on stages by an order of magnitude, smoke control is relied upon to protect the audience from burning scenery, curtains, properties, mobile homes, boats, etc. Fire safety curtains don't fit or obstruct the production in many modern theatres. The requirements for m.o.e. today are vastly superior to the era before electricity when stage fires were a hazard; sprinkler technology is well developed and very effective; and the construction type limits combustibles. Together with engineered smoke control systems, the occupants will be much better protected from the hazards of fire than with a proscenium curtain or deluge system. This change would be a move towards a more performance-based design. The cost impact would be no significant change or actually lower cost of construction.

A similar proposal was submitted in the 2002 code change cycle and the reason given for rejection was that combining smoke protected assembly seating with proscenium opening protection was "double dipping". This proposal eliminates that possibility of utilizing smoke control for both proscenium opening protection and increased egress time.

Cost Impact: This code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: Provides additional option to the designer through a direct reference to the smoke control requirements in Section 909 and for the use of natural ventilation as long as the layer is held at 6 feet above the floor of the means of egress.

Assembly Action:

None

Final Hearing Results

G86-06/07

AS

Code Change No: **G87-06/07**

Original Proposal

Sections: 410.3.5, 410.3.5.1, 410.3.5.2, 410.3.5.3, 410.3.5.4, Chapter 35

Proponent: William Conner, ASTC, Bill Conner Associates LLC, representing the American Society of Theatre Consultants

1. Revise as follows:

410.3.5 Proscenium curtain. Where a proscenium wall is required to have a fire-resistance rating, the stage opening shall be provided with a fire curtain of approved material complying with NFPA 80 or an approved water curtain complying with Section 903.3.1.1. ~~The fire curtain shall be designed and installed to intercept hot gases, flames and smoke and to prevent a glow from a severe fire on the stage from showing on the auditorium side for a period of 20 minutes. The closing of the fire curtain from the full open position shall be accomplished in less than 30 seconds, with the last 8 feet (2438 mm) of travel requiring 5 or more seconds for full closure.~~

1. Delete without substitution:

410.3.5.1 Activation. ~~The curtain shall be activated by rate-of-rise heat detection installed in accordance with Section 907.10 operating at a rate of temperature rise of 15 to 20°F per minute (8 to 11°C per minute), and by an auxiliary manual control.~~

410.3.5.2 Fire test. ~~A sample curtain with a minimum of two vertical seams shall be subjected to the standard fire test specified in ASTM E 119 for a period of 30 minutes. The curtain shall overlap the furnace edges by an amount that is appropriate to seal the top and sides. The curtain shall have a bottom pocket containing a minimum of 4 pounds per linear foot (5.9 kg/m) of batten. The exposed surface of the curtain shall not glow, and flame or smoke shall not penetrate the curtain during the test period. Unexposed surface temperature and hose stream test requirements are not applicable to the proscenium fire safety curtain test.~~

410.3.5.3 Smoke test. ~~Curtain fabrics shall have a smoke-developed rating of 25 or less when tested in accordance with ASTM E 84.~~

410.3.5.4 Tests. ~~The completed proscenium curtain shall be subjected to operating tests prior to the issuance of a certificate of occupancy.~~

3. Revise standard in Chapter 35 as follows:

NFPA

80—99-07 Fire Doors and Other Opening Protectives ~~Fire Windows~~

Reason: The existing criteria are outdated and not thorough. The proposed referenced standard began to incorporate requirements for Fire Safety Curtains in 1998 and in this edition for the first time there is an ANSI standard representing a broad consensus of interest and affected parties. It is much more complete, thorough, and performance based than current or previous standards. Unofficial draft is attached.

Cost Impact: The code change proposal will increase the cost of this component for a significant number of stages because it requires motorizing to increase reliability and permit much greater closing forces to overcome the effects of dirt, rust, and age.

Analysis: The edition of the standard proposed was not available for review at the time the monograph was published.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The updated version of the referenced standard was not available for review.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Bill Conner, representing himself, requests Approval as Submitted.

Commenter's Reason: The updated standard, NFPA 80-07 Fire Doors and Other Opening Protectives is now available.

Analysis: Review of the proposed new standards indicated that in the opinion of ICC Staff, the standard complies with ICC Standards criteria.

Final Hearing Results

G87-06/07

AS

Code Change No: **G89-06/07**

Original Proposal

Section: 411.7, Chapter 35

Proponent: Manny Muniz, Manny Muniz Associates, LLC

1. Revise as follows:

411.7 Exit marking. Exit signs shall be installed at the required exit or exit access doorways of amusement buildings. Approved directional exit markings shall also be provided. Where mirrors, mazes or other designs are utilized that disguise the path of egress travel such that they are not apparent, approved and listed low-level exit signs that comply with Section 1011.4, and directional path markings listed in accordance with UL 1994, shall be provided and located not more than 8 inches (203 mm) above the walking surface and on or near the path of egress travel. Such markings shall become visible in an emergency. The directional exit marking shall be activated by the automatic fire detection system and the automatic sprinkler system in accordance with Section 907.2.11.2.

2. Add standard to Chapter 35 as follows:

Underwriters Laboratories

UL 1994-04 Luminous Egress Path Marking Systems, with revisions through February 2005

Reason: To clarify that low-level exit signs and directional path markings shall be listed. Presently, Section 7.10.7.1 requires internally illuminated exit signs be listed. Section 411.7 does not reference this requirement. UL 924, Standard for Safety Emergency Lighting and Power Equipment, has specific electrical and performance test criteria for exit signs in general, and an additional test for impact damage for exit signs installed at floor-level. Without a referenced safety and performance standard, the AHJ must make their own determination as to whether an exit sign is safe to use or that it will perform for 90 minutes in the event of primary power loss.

Likewise, Section 411.7 does not reference a test standard for directional path markings. UL 1994, Standard for Luminous Egress Path Marking Systems, has specific safety and performance test criteria for egress path marking systems. Without a referenced safety and performance standard, the AHJ must make their own determination as to whether a directional path marking system is safe to use or that it will perform for 90 minutes in the event of primary power loss.

The Life Safety Code (NFPA 101), which is used in every state in the US, contains similar requirements in Section 7.10.1.7 and 7.10.7.1 for floor-proximity egress path marking systems and exit signs to be tested and listed. The IBC should not be less stringent.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Code changes being heard by the MOE Development committee deal with similar issues related the photoluminous egress markings. The standard UL 1994-05 has been reviewed for compliance with ICC Council Policy #28, Section 3.6. In the opinion of ICC Staff, the standard complies with ICC Criteria for referenced standards.

Public Hearing Results

Note: The following analysis was not in the Code Change Proposal book but was published in the AErrata to the 2006/2007 Proposed Changes to the International Codes and Analysis of Proposed Referenced Standards® provided at the code development hearings:

Analysis: Review of the proposed new standard indicated that, in the opinion of ICC Staff, the standards did comply with ICC standards criteria.

Committee Action:

Approved as Submitted

Committee Reason: Provides specific direction to jurisdictions as to which standards applies to low level exit signs and directional path markings.

Assembly Action:

None

Code Change No: G92-06/07

Original Proposal

Sections: 419 (New), 310.1, 508.3.1; IRC R101.2

Proponent: David S. Collins, FAIA, The Preview Group, Inc., representing the American Institute of Architects

THIS PROPOSAL IS ON THE AGENDA OF THE IBC GENERAL AND IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES

PART I – IBC

1. Add new text as follows:

SECTION 419
LIVE/WORK UNITS

419.1 General. A live/work unit is a dwelling unit or sleeping unit in which a significant portion of the space includes a non-residential use which is operated by the tenant and shall comply with Section 419.

Exception: Dwelling units or sleeping units which include an office that is less than 10% of the area of the dwelling unit shall not be classified as a live/work unit.

419.1.1 Limitations: The following shall apply to all live/work areas:

1. The live/work unit is permitted to be a maximum of 3,000 sq ft;
2. The non-residential area is permitted to be a maximum 50% of the area of each live/work unit;
3. The non-residential area function shall be limited to the first or main floor only of the live-work unit; and
4. A maximum of 5 non-residential worker or employees are allowed to occupy the non-residential area at any one time.

419.2 Occupancies. Live/work units shall be classified as a Group R-2 occupancy. Separation requirements found in Section 508.3 shall not apply when the live/work unit is in compliance with Section 419. High hazard and storage occupancies shall not be permitted in a live/work unit. The aggregate of storage in the live/work unit shall be limited to 10% of the space dedicated to non-residential activities.

419.3 Means of egress. Except as modified by this section, the provisions for Group R-2 occupancies in Chapter 10 shall apply to the entire live/work unit.

419.3.1 Egress capacity. The egress capacity for each element of the live/work unit shall be based on the occupancy load for the occupancy served in accordance with Table 1004.1.1.

419.3.2 Sliding doors. Where doors in a means of egress are of the horizontal-sliding type, the force to slide the door to its fully open position shall not exceed 50 pounds (220 N) with a perpendicular force against the door of 50 pounds (220 N).

419.3.3 Spiral stairs. Spiral stairs that conform to the requirements of Section 1009.8 shall be permitted.

419.3.4 Locks. Egress doors shall be permitted to be locked in accordance Exception 4 of Section 1008.1.8.3.

419.4 Vertical openings. Floor opening between floor levels of a live/work unit is permitted without enclosure.

419.5 Fire protection. The live-work unit shall be provided with a monitored fire alarm system where required by Section 907.2.9, and a fire sprinkler system in accordance with Section 903.2.7.

419.6 Structural. Floor loading for the areas within a live/work unit shall be designed to conform to Table 1607.1 based on the function within the space.

419.7 Accessibility. The applicable requirements of Chapter 11 shall apply to each area within the live/work unit.

419.8 Ventilation. The applicable requirements of the *International Mechanical Code* shall apply to each area within the live/work unit for the function within that space.

(Renumber subsequent sections)

2. Revise as follows:

310.1 Residential Group R. Residential Group R includes, among others, the use of a building or structure, or a portion thereof, for sleeping purposes when not classified as an Institutional Group I or when not regulated by the *International Residential Code* in accordance with Section 101.2. Residential occupancies shall include the following:

R-1 Residential occupancies containing sleeping units where the occupants are primarily transient in nature, including:

- Boarding houses (transient)
- Hotels (transient)
- Motels (transient)

R-2 Residential occupancies containing sleeping units or more than two dwelling units where the occupants are primarily permanent in nature, including:

- Apartment houses
- Boarding houses (not transient)
- Convents
- Dormitories
- Fraternities and sororities
- Hotels (nontransient)
- Live/work units
- Monasteries
- Motels (nontransient)
- Vacation timeshare properties

Congregate living facilities with 16 or fewer occupants are permitted to comply with the construction requirements for Group R-3.

R-3 Residential occupancies where the occupants are primarily permanent in nature and not classified as Group R-1, R-2, R-4 or I, including:

- Buildings that do not contain more than two dwelling units.
- Adult facilities that provide accommodations for five or fewer persons of any age for less than 24 hours.
- Child care facilities that provide accommodations for five or fewer persons of any age for less than 24 hours.

Congregate living facilities with 16 or fewer persons.
Adult and child care facilities that are within a single-family home are permitted to comply with the *International Residential Code*.

- R-4** Residential occupancies shall include buildings arranged for occupancy as residential care/assisted living facilities including more than five but not more than 16 occupants, excluding staff.
Group R-4 occupancies shall meet the requirements for construction as defined for Group R-3, except as otherwise provided for in this code, or shall comply with the *International Residential Code*.

3. Revise as follows:

508.3.1 Accessory occupancies. Accessory occupancies are those occupancies subsidiary to the main occupancy of the building or portion thereof. Aggregate accessory occupancies shall not occupy more than 10 percent of the area of the story in which they are located and shall not exceed the tabular values in Table 503, without height and area increases in accordance with Sections 504 and 506 for such accessory occupancies.

Exceptions:

1. Accessory assembly areas having a floor area less than 750 square feet (69.7 m²) are not considered separate occupancies.
2. Assembly areas that are accessory to Group E occupancies are not considered separate occupancies except when applying the assembly occupancy requirements of Chapter 11.
3. Accessory religious educational rooms and religious auditoriums with occupant loads of less than 100 are not considered separate occupancies.
4. Live/work units in accordance with Section 419 are not considered separate occupancies.

PART II – IRC

Revise as follows:

R101.2 Scope. The provisions of the *International Residential Code for One- and Two-family Dwellings* shall apply to the construction, alteration, movement, enlargement, replacement, repair, equipment, use and occupancy, location, removal and demolition of detached one- and two-family dwellings and townhouses not more than three stories above-grade in height with a separate means of egress and their accessory structures.

Exception: Live/work units complying with the requirements of Section 419 of the *International Building Code* shall be permitted to be built as one- and two-family dwellings or townhouses. Fire suppression required by Section 419.5 of the *International Building Code* when constructed under the *International Residential Code for One- and Two-family Dwellings* shall conform to Section 903.3.1.3 of the *International Building Code*.

Reason: IBC. This code change creates a live/work unit that is considered to be an R-2 dwelling for application of the code. Several limitations and specific requirements that are to be applied to both the dwelling portion of the unit and the work portion of the unit are itemized. Fire suppression is required throughout a building containing a live/work unit; ventilation and structural requirements must be applied based on the function in the space, and these criteria are applicable whether the unit is in an IBC or IRC building.

The current IBC and IRC do not allow residential live-work units in a form that is typically desirable for community development. This increasingly popular concept of design and construction allows a public service business, with employees working within a residence and allows the public to enter the work area of the unit to acquire service. Some examples of live-work commercial functions are artist's studios, coffee shops and chiropractor's offices. It is important to note that live-work is specifically not to apply to an in home office (architect home office, consultant home office, et al).

These throwbacks to 1900 era planning, created a community where residents could walk to all needed services such as the typical corner commercial store scattered across many old cities. Live-work units began to re-emerge in the 1990's through a development style known as "Traditional Neighborhood Design" (TND). More recently, adaptive reuse of many older urban structures in city centers incorporated the same live-work tools to provide a variety of residential unit types.

Historically, the building codes did not have to deal with the live-work issue by zoning codes which generally precluded a mix of uses within a neighborhood, much less within a building. However, recent planning trends adopted by many jurisdictions, encourage the mixing of commercial and residential uses, not just in neighborhoods, but also in buildings, and even within unit types, such as the live-work unit commonly found in TND projects.

The live-work approach is also driven by the desire to provide affordable housing. Many cities and towns struggle with their revival also driving real estate values up and driving service level citizens out of their community. These jurisdictions want a full range of citizens to be able to both work and live in their community. They aggressively pursue affordable housing, with the *International Residential Code* (IRC) being a key tool in this effort. The IRC allows jurisdictions to produce a range of housing types at competitive market values. Included among these is the live-work unit.

There are no provisions for any use other than residential in the IRC. Since live-work units mix in a commercial use, they are driven out of the IRC, into the IBC. When this happens, the live-work units incur an increase in code related construction requirements (use separation, construction type, egress, fire prevention) far in excess of any risk present in the work function. The added requirements drive the construction cost up, and inevitably drive the units out of the affordable housing range.

The provisions in the IBC are intended to apply to buildings which contain live/work units and would conform in general with the R-2 provisions. In addition, a code change has been proposed to the IRC referencing this section for the criteria that would be appropriate for live/work units built under that code. Obviously, the method by which mixed use unseparated is applied is critical to the usefulness of the live/work concept.

This proposal allows mixed use unseparated occupancies within the dwelling unit or sleeping unit that meets the limits of this section to be classified as an R-2 occupancy. Any occupancy that is not within a dwelling unit would have to be treated as a mixed use condition and would be separated per the IBC. Special features that are common within a dwelling unit and are likely within the live/work unit are addressed in order to clearly delineate the means for designing a live/work unit.

Of concern to many Code Officials and Architects alike is the problem posed by the absence of any live-work provision in the IRC or IBC. Too often, this results in one of two poor choices: a) either the owner misrepresents the proposed "work" use, or b) the Code Officials are encouraged to look the other way, ignoring the "work" use. Consequently, conscientious Code Officials and Architects desire a code compliance tool that addresses their live-work predicament, allowing them to solve this problem as an integral part of a project's code compliance strategy, while still providing affordable residential units.

IRC. This code change creates a live/work unit that is considered to be an R-2 dwelling for application of the code. Several limitations and specific requirements that are to be applied to both the dwelling portion of the unit and the work portion of the unit are itemized. Fire suppression is required throughout a building containing a live/work unit; ventilation and structural requirements must be applied based on the function in the space, and these criteria are applicable whether the unit is in an IBC or IRC building.

The current IBC and IRC do not allow residential live-work units in a form that is typically desirable for community development. This increasingly popular concept of design and construction allows a public service business, with employees working within a residence and allows the public to enter the work area of the unit to acquire service. Some examples of live-work commercial functions are artist's studios, coffee shops and chiropractor's offices. It is important to note that live-work is specifically not to apply to an in home office (architect home office, consultant home office, et al).

These throwbacks to 1900 era planning, created a community where residents could walk to all needed services such as the typical corner commercial store scattered across many old cities. Live-work units began to re-emerge in the 1990's through a development style known as "Traditional Neighborhood Design" (TND). More recently, adaptive reuse of many older urban structures in city centers incorporated the same live-work tools to provide a variety of residential unit types.

Historically, the building codes did not have to deal with the live-work issue by zoning codes which generally precluded a mix of uses within a neighborhood, much less within a building. However, recent planning trends adopted by many jurisdictions, encourage the mixing of commercial and residential uses, not just in neighborhoods, but also in buildings, and even within unit types, such as the live-work unit commonly found in TND projects.

The live-work approach is also driven by the desire to provide affordable housing. Many cities and towns struggle with their revival also driving real estate values up and driving service level citizens out of their community. These jurisdictions want a full range of citizens to be able to both work and live in their community. They aggressively pursue affordable housing, with the *International Residential Code* (IRC) being a key tool in this effort. The IRC allows jurisdictions to produce a range of housing types at competitive market values. Included among these is the live-work unit.

There are no provisions for any use other than residential in the IRC. Since live-work units mix in a commercial use, they are driven out of the IRC, into the IBC. When this happens, the live-work units incur an increase in code related construction requirements (use separation, construction type, egress, fire prevention) far in excess of any risk present in the work function. The added requirements drive the construction cost up, and inevitably drive the units out of the affordable housing range.

The provisions in the IBC are intended to apply to buildings which contain live/work units and would conform in general with the R-2 provisions. In addition, a code change has been proposed to the IRC referencing this section for the criteria that would be appropriate for live/work units built under that code. Obviously, the method by which mixed use unseparated is applied is critical to the usefulness of the live/work concept.

This proposal allows mixed use unseparated occupancies within the dwelling unit or sleeping unit that meets the limits of this section to be classified as an R-2 occupancy. Any occupancy that is not within a dwelling unit would have to be treated as a mixed use condition and would be separated per the IBC. Special features that are common within a dwelling unit and are likely within the live/work unit are addressed in order to clearly delineate the means for designing a live/work unit.

Of concern to many Code Officials and Architects alike is the problem posed by the absence of any live-work provision in the IRC or IBC. Too often, this results in one of two poor choices: a) either the owner misrepresents the proposed "work" use, or b) the Code Officials are encouraged to look the other way, ignoring the "work" use. Consequently, conscientious Code Officials and Architects desire a code compliance tool that addresses their live-work predicament, allowing them to solve this problem as an integral part of a project's code compliance strategy, while still providing affordable residential units.

Cost Impact: The code change proposal will increase the cost of construction. There is no way to calculate the actual impact because this is a design concept that is new to the code, and except when it has been allowed through an appeal or variance process, hasn't been widely used. The criteria are generally limitations that are designed to aid the designer/owner and building official to appropriately use the live/work concept, many of which are already within the code and will have little cost impact (sprinklers/alarms/etc.). The unique feature of this proposal in concert with the proposal to the IRC is the use of the IBC criteria for a building built under the IRC.

Analysis: Regarding the Chapter 11 reference in proposed Section 419.7, would a live/work area be considered part of a dwelling unit in the consideration of the Type A and Type B unit requirements, particularly the multistory dwelling unit exception?

Public Hearing Results

PART I C IBC

Committee Action:

Approved As Submitted

Committee Reason: Though there were several minor concerns with the proposal the need for such provisions was seen as critical and it was pointed out that within the IBC all Group R occupancies will be sprinklered. This proposal will allow the building code to keep pace with development and revisions to zoning laws which allow such development.

Assembly Action:

None

PART II C IRC**Committee Action:****Approved as Submitted**

Committee Reason: The proposed language helps make it clear that live/work units are required to have fire suppression throughout. This additional language provides needed clarity as to the intent and aids the code official.

Assembly Action:**None**

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted for Part I.

Public Comment 1:

Ronald Nickson, National Multi Housing Council, requests Approval as Modified by this public comment for Part I.

Modify proposal as follows:

419.7 Accessibility. ~~Accessibility shall be designed in accordance with Chapter 11. The applicable requirements of Chapter 11 shall apply to each area within the live/work unit.~~

(Portions of proposal not shown remain unchanged)

Commenter's Reason: To clarify the requirements for accessibility. The requirement that each area of the unit meet the accessibility requirements could trigger a requirement for an elevator to the second floor living area of units designed to have the first floor be used as the work area.

Final Hearing Results

G92-06/07, Part I	AMPC1
G92-06/07, Part II	AS

Code Change No: G98-06/07

Original Proposal

Section: 502.1

Proponent: Maureen Traxler, City of Seattle, WA, representing the Washington Association of Building Officials

Delete definition without substitution:

502.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

HEIGHT, STORY. ~~The vertical distance from top to top of two successive finished floor surfaces; and, for the topmost story, from the top of the floor finish to the top of the ceiling joists or, where there is not a ceiling, to the top of the roof rafters.~~

Reason: The purpose of this code change proposal is to delete an unnecessary definition. The definition of "story" contains the same information as the definition of "story height". Furthermore, the term "story height" is used only once in the 2006 IBC. It is used in Section 2106.5.2 in the context of design of masonry shear walls in high Seismic Design Categories. If this definition is needed, it should be moved to Chapter 21.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This definition which is located in Chapter 5 is redundant with the definition of story height in Chapter 2 and is only used in Chapter 21 of the IBC therefore should be deleted from Chapter 5.

Assembly Action:

None

Final Hearing Results

G98-06/07

AS

Code Change No: **G110-06/07**

Original Proposal

Section: 503

Proponent: Philip Brazil, PE, Reid Middleton, Inc., representing himself

Revise as follows:

503.1 General. ~~The height and area for of a buildings of different construction types shall be governed by the intended use of the building and shall not exceed the limits specified in Table 503 based on the type of construction as determined by Section 602 and the occupancies as determined by Section 302 except as modified hereafter. Each part portion of a building included within the exterior walls or the exterior walls and fire walls where provided separated by one or more fire walls complying with Section 705 shall be permitted considered to be a separate building.~~

Reason: The purpose of the proposal is to establish technically sound charging language for the provisions of Section 503. The current language references buildings of different construction types but not buildings of a single construction type. Section 602.1 requires buildings to be classified into a single construction type. Section 503, however, is silent on buildings complying with Section 602.1. Section 705.1 permits portions of a building separated by fire walls to be considered as separate buildings. This, in turn, provides the option of classifying portions of buildings separated by fire walls into different types of construction. Section 503, however, is also silent on buildings complying with Section 705.1. Section 503 limits the height and area of a building with different types of construction by reference to Table 503. Table 503, however, is silent on its application to buildings with different types of construction.

Section 503.1 permits a portion of a building included within the exterior walls or the exterior walls and fire walls to be a separate building. A portion of a building included within the exterior walls is not a portion of a building but is the entire building. Permitting a portion of a building separated by one or more fire walls to be a separate building challenges the laws of physics. A portion of a building separated from the remainder of the building by a fire wall is still a portion of a building but it can be considered as a separate building for the purposes of compliance with the IBC when the fire wall complies with Section 705.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Based upon proponents request. See committee reason for G10-06/07.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Philip Brazil, PE, Reid Middleton, representing himself, requests Approval as Submitted.

Commenter's Reason: At the 2006/2007 ICC code development hearings in Orlando, I agreed to ask for disapproval in conjunction with the initiative by several organizations to pursue resolution to the ongoing differences over the IBC provisions for allowable building heights and building areas, specifically through the efforts of the ICC Code Technology Committee. At the time of the deadline to submit public comments for consideration at the final action hearings in Rochester, that effort was ongoing. Consequently, I am asking for approval as submitted based on the original reason statement.

Final Hearing Results

G110-06/07

AS

Code Change No: G125-06/07

Original Proposal

Sections: 506.4 (New), 506.1.1, 506.4, 506.4.1

Proponent: Philip Brazil, PE, Reid Middleton, Inc., Everett, WA, representing himself

Revise as follows:

506.4 Buildings with more than one story. The total allowable building area of a building with more than one story shall be determined in accordance with Section 506.4. The actual aggregate building area at all stories in the building shall not exceed the total allowable building area.

Exception: Portions of the building not required to be included in the total allowable building area, as specified in Section 506.4.1, shall be permitted to be excluded from the actual aggregate building area.

506.4.1 506.1.1 Basements. A single basement that is not a story above grade plane need not be included in the total allowable building area, provided such basement does not exceed the area permitted for a building with no more than one story above grade plane.

506.4.2 506.4 Area determination. The ~~maximum~~ total allowable building area of a building with more than one story above grade plane shall be determined by multiplying the allowable area ~~of the first per~~ story (A_a), as determined in Section 506.1, by the number of stories above grade plane as listed below:

1. For buildings with two stories above grade plane, multiply by 2;
2. For buildings with three or more stories above grade plane, multiply by 3; and
3. No story shall exceed the allowable area per story (A_a), as determined in Section 506.1, for the occupancies on that story.

Exceptions:

1. Unlimited area buildings in accordance with Section 507.
2. The maximum area of a building equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.2 shall be determined by multiplying the allowable area per story (A_a), as determined in Section 506.1, by the number of stories above grade plane.

506.4.2.1 506.4.1 Mixed occupancies. In buildings with mixed occupancies, the allowable area per story (A_a) shall be based on the most restrictive provisions for each occupancy when the mixed occupancies are treated according to Section 508.3.2. When the occupancies are treated according to Section 508.3.3 as separated occupancies, the maximum total building area shall be such that the sum of the ratios for each such area on all floors as calculated according to Section 508.3.3.2 shall not exceed 2 for two-story buildings and 3 for buildings three stories or higher.

Reason: The purpose of this proposal is to organize the technical provisions for determining the total allowable building area in buildings with more than one story in a more logical manner and provide charging language where needed. Section 503.1 establishes the allowable building height and the allowable area per story (A_a) by reference to Table 503. Section 506.1 determines increases in the allowable building height and allowable area per story (A_a) through application of the provisions in Section 506.2 for frontage and Section 506.3 for automatic fire sprinkler systems.

Section 506.1.1, which is a continuation of Section 506.1, exempts a single basement from being included in the total allowable area. The meaning of “total allowable area” is not clear but, presumably, it is a reference to the total allowable building area in buildings with more than one story. Section 506.1, however, is not applicable to the total allowable area. The provisions for determining the total allowable building area are found in Section 506.4.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

506.4 Buildings with more than one story. The total allowable building area of a building with more than one story shall be determined in accordance with this section. ~~Section 506.4.~~ The actual aggregate building area at all stories in the building shall not exceed the total allowable building area.

Exception: Portions of the building not required to be included in the total allowable building area, as specified in Section 506.4.1, shall be permitted to be excluded from the actual aggregate building area.

(Portions of proposal not shown remain unchanged)

Committee Reason: The proposal clarifies and provides proper structure to the total building area requirements. The modification is simply related to how the applicable provisions are referenced.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Maureen Traxler, City of Seattle Department of Planning and Development requests Approval as Modified by this public comment.

Further modify proposal as follows:

506.4 Buildings with more than one story. The total allowable building area of a building with more than one story shall be determined in accordance with this section. The actual aggregate building area at all stories in the building shall not exceed the total allowable building area.

~~**Exception:** Portions of the building not required to be included in the total allowable building area, as specified in Section 506.4.1, shall be permitted to be excluded from the actual aggregate building area.~~

~~**506.4.1 Basements.** A single basement that is not a story above grade plane need not be included in the total allowable building area, provided such basement does not exceed the area permitted for a building with no more than one story above grade plane.~~

(Portions of proposal not shown remain unchanged)

~~**Commenter's Reason:** This is an editorial comment, intended to simplify Section 506.4. The exception in the original proposal is merely a cross reference to the new Section 506.4.1. It's much simpler to reformat Section 506.4.1 as an exception to 506.4.~~

Final Hearing Results

G125-06/07

AMPC1

Code Change No: **G131-06/07**

Original Proposal

Sections: 508.2, 508.2.1, 508.2.2, 508.2.2.1, 508.2.3, 407.2.1, 407.2.3, 706.3.6, 706.3.8, 706.5, [F] 903.2.13 (IFC 903.2.13), [F] Table 903.2.13 (IFC Table 903.2.13), 3410.6.18 (IEBC [B] 1301.6.19), Table 3410.6.18 (IEBC [B] Table 1301.6.19)

Proponent: Philip Brazil, PE, Reid Middleton, Inc., representing himself

Revise as follows:

508.2 Incidental uses. Incidental ~~use areas~~ uses shall comply with the provisions of this section.

Exception: Incidental ~~use areas~~ uses within and serving a dwelling unit are not required to comply with this section.

508.2.1 Occupancy classification. An incidental use area shall be classified in accordance with the occupancy of that portion of the building in which it is located or the building shall be classified as a mixed occupancy and shall comply with Section 508.3.

508.2.2 Separation. Incidental ~~use areas~~ uses shall be separated or protected, or both, in accordance with Table 508.2.

508.2.2.1 Construction. Where Table 508.2 requires a fire-resistance-rated separation, the incidental ~~use areas~~ use shall be separated from the remainder of the building by a fire barrier constructed in accordance with Section 706 or a horizontal assembly constructed in accordance with Section 711, or both. Where Table 508.2 permits an automatic fire-extinguishing system without a fire barrier, the incidental use area shall be separated from the remainder of the building by construction capable of resisting the passage of smoke. The partitions shall extend from the floor to the underside of the fire-resistance-rated floor/ceiling assembly or fire-resistance-rated roof/ceiling ceiling assembly above or to the underside of the floor or roof sheathing, or sub deck above. Doors shall be self- or automatic closing upon detection of smoke. Doors shall not have air transfer openings and shall not be undercut in excess of the clearance permitted in accordance with NFPA 80.

508.2.3 Protection. Where an automatic fire-extinguishing system or an automatic sprinkler system is provided in accordance with Table 508.2, only the areas of the incidental ~~uses~~ areas need be equipped with such a system.

407.2.1 Spaces of unlimited area. Waiting areas and similar spaces constructed as required for corridors shall be permitted to be open to a corridor, only where all of the following criteria are met:

1. The spaces are not occupied for patient sleeping units, treatment rooms, hazardous or incidental ~~use areas~~ uses as defined in accordance with Section 508.2.
2. The open space is protected by an automatic fire detection system installed in accordance with Section 907.
3. The corridors onto which the spaces open, in the same smoke compartment, are protected by an automatic fire detection system installed in accordance with Section 907, or the smoke compartment in which the spaces are located is equipped throughout with quick-response sprinklers in accordance with Section 903.3.2.
4. The space is arranged so as not to obstruct access to the required exits.

407.2.3 Mental health treatment areas. Areas wherein mental health patients who are not capable of self-preservation are housed, or group meeting or multipurpose therapeutic spaces other than incidental ~~use areas~~ uses as defined in accordance with Section 508.2, under continuous supervision by facility staff, shall be permitted to be open to the corridor, where the following criteria are met:

1. Each area does not exceed 1,500 square feet (140 m²).
2. The area is located to permit supervision by the facility staff.
3. The area is arranged so as not to obstruct any access to the required exits.

4. The area is equipped with an automatic fire detection system installed in accordance with Section 907.2.
5. Not more than one such space is permitted in any one smoke compartment.
6. The walls and ceilings of the space are constructed as required for corridors.

706.3.6 Incidental use areas. The fire barrier separating incidental ~~use areas~~ uses from other spaces in the building shall have a fire-resistance rating of not less than that indicated in Table 508.2.

706.3.8 ~~Separation of mixed~~ Separated occupancies. Where the provisions of Section 508.3.3 are applicable, the fire barrier separating mixed occupancies shall have a fire-resistance rating of not less than that indicated in ~~Section~~ Table 508.3.3 based on the occupancies being separated.

706.5 Continuity. Fire barriers shall extend from the top of the floor/ceiling assembly below to the underside of the floor or roof slab or deck above and shall be securely attached thereto. Such fire barriers shall be continuous through concealed spaces, such as the space above a suspended ceiling. The supporting construction for fire barrier walls shall be protected to afford the required fire-resistance rating of the fire barrier supported, except for 1-hour ~~fire-resistance-rated incidental use area separations as~~ fire barriers required by Table 508.2 in buildings of Type IIB, IIIB and VB construction. Hollow vertical spaces within a fire barrier shall be fireblocked in accordance with Section 717.2 at every floor level.

Exceptions:

1. The maximum required fire-resistance rating for assemblies supporting fire barriers separating tank storage as provided for in Section 415.6.2.1 shall be 2 hours, but not less than required by Table 601 for the building construction type.
2. Shaft enclosures shall be permitted to terminate at a top enclosure complying with Section 707.12.

[F] 903.2.13 (IFC 903.2.13) Other required suppression systems. In addition to the requirements of Section 903.2, the provisions indicated in Table 903.2.13 also require the installation of a suppression system for certain buildings and areas.

**[F] TABLE 903.2.13 (IFC TABLE 903.2.13)
ADDITIONAL REQUIRED SUPPRESSION SYSTEMS**

SECTION	SUBJECT
508.2	Incidental use areas <u>uses</u>

(Portions of table not shown remain unchanged)

3410.6.18 (IEBC 1301.6.19) Incidental use. Evaluate the protection of incidental ~~use areas~~ uses in accordance with Section 508.2. Do not include those where this code requires suppression throughout the building including covered mall buildings, high-rise buildings, public garages and unlimited area buildings. Assign the lowest score from Table 3410.6.18 for the building or fire area being evaluated. If there are no specific occupancy areas in the building or fire area being evaluated, the value shall be zero.

**TABLE 3410.6.18 (IEBC TABLE 1301.6.19)
INCIDENTAL USE AREA VALUES^a**

(No changes to table text)

Reason: The purpose of this proposal is to separate the concept of an incidental use from the area of the building in which it is located. An incidental use is an area of special hazard within a separated occupancy. Its use poses a special hazard to the other uses within the separated occupancy. The provisions for accessory occupancies, nonseparated occupancies and separated occupancies are associated with the provisions for incidental uses. Each set of provisions covers classification of the occupancies, limits on areas and heights, and separations (i.e., fire barriers). Specifying incidental use areas as incidental uses will align them with their associated occupancies each of which has separate requirements applicable to its area.

Section 706.3.6 is being revised because the current language implies that the fire barrier separates incidental use areas from each other not necessarily from other spaces in the building (i.e., main occupancies). Reference to "other spaces" is being done for consistency with the same term in Section 508.3.2.1.

In Section 706.3.8, "mixed occupancies" is changed to "separated occupancies" to recognize that, according to Section 508.3, mixed occupancies consist of accessory occupancies, nonseparated occupancies and separated occupancies.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis. While some sections listed are typically the purview of other committees, for consistency, the General Committee will make the determination for entire proposal.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: Clarifies that the code intends to separate uses not use areas from other activities in the building. The uses are the hazard not the area itself.

Assembly Action:

None

Final Hearing Results

G131-06/07

AS

Code Change No: **G133-06/07**

Original Proposal

Sections: 508.2.1, Table 508.2, 508.3.1

Proponent: Philip Brazil, PE, Reid Middleton, Inc., Everett, WA, representing himself

Revise as follows:

508.2.1 Occupancy classification. An incidental use area shall be classified in accordance with the occupancy of that portion of the building in which it is located ~~or the building shall be classified as a mixed occupancy and shall comply with Section 508.3.~~

**TABLE 508.2
INCIDENTAL USE AREAS**

ROOM OR AREA	SEPARATION AND/OR
Furnace room where any piece of equipment is over 400,000 Btu per hour input	1 hour or provide automatic fire-extinguishing system
Rooms with boilers where the largest piece of equipment is over 15 psi and 10 horsepower	1 hour or provide automatic fire-extinguishing system
Refrigerant machinery room	1 hour or provide automatic sprinkler system
Parking garage (Section 406.2)	2 hours; or 1 hour and provide automatic fire-extinguishing System
Hydrogen cut-off rooms, not classified as Group H	1-hour in Group B, F, M, S and U occupancies. 2-hour in Group A, E, I and R occupancies.
Incinerator rooms	2 hours and automatic sprinkler System
Paint shops, not classified as Group H, located in occupancies other than Group F	2 hours; or 1 hour and provide automatic fire-extinguishing System
Laboratories and vocational shops, not classified as Group H, located in Group E or I-2 occupancies	1 hour or provide automatic fire-extinguishing system
Laundry rooms over 100 square feet	1 hour or provide automatic fire-extinguishing system
Storage rooms over 100 square feet	1 hour or provide automatic fire-extinguishing system
Group I-3 cells equipped with padded surfaces	1 hour
Group I-2 waste and linen collection rooms	1 hour
Waste and linen collection rooms over 100 square feet	1 hour or provide automatic fire-extinguishing system
Stationary storage battery systems having a liquid capacity of more than 100 gallons used for facility standby power, emergency power or uninterrupted power supplies	1-hour in Group B, F, M, S and U occupancies. 2-hour in Group A, E, I and R occupancies.

For SI: 1 square foot = 0.0929 m², 1 pound per square inch = 6.9 kPa,
1 British thermal unit per hour = 0.293 watts, 1 horsepower = 746 watts,
1 gallon = 3.785 L

508.3.1 Accessory occupancies. Accessory occupancies are those occupancies subsidiary to the main occupancy of the building or portion thereof. Aggregate accessory occupancies shall not occupy more than 10 percent of the area of the story in which they are located and shall not exceed the tabular values in Table 503, without height and area increases in accordance with Sections 504 and 506 for such accessory occupancies. The provisions for accessory occupancies shall not reduce the requirements for incidental use areas in Section 508.2.

Exceptions:

1. Accessory assembly areas having a floor area less than 750 square feet (69.7 m²) are not considered separate occupancies.
2. Assembly areas that are accessory to Group E occupancies are not considered separate occupancies except when applying the assembly occupancy requirements of Chapter 11.
3. Accessory religious educational rooms and religious auditoriums with occupant loads of less than 100 are not considered separate occupancies.

Reason: The purpose of this proposal is to reestablish the requirements for incidental use areas by eliminating the option of classifying them as mixed occupancies. Incidental use areas are typically areas of special hazard within occupancies. They are typically not classified as separate occupancies. But a few of the areas listed in Table 508.2 are typically classified as separate occupancies, thus diluting the purpose for the requirements imposed on incidental use areas. The proposal will remove the incidental use areas that are typically classified as separate occupancies (storage rooms and parking garages) and restore the requirements for separation and/or protection specified in Table 508.2 to the remaining incidental use areas. Note that storage rooms are typically classified as Group S-1 or S-2 and parking garages are typically classified as Group S-2.

Section 508.2.1 currently requires an incidental use area to be classified in accordance with the occupancy in which it is located, or to be classified as a mixed occupancy and comply with Section 508.3. Section 508.3 requires each portion of a building to be individually classified in accordance with Section 302.1 on classification of occupancies. When a building contains more than one occupancy group, it is required to comply with the provisions for accessory occupancies (Section 508.3.1), nonseparated occupancies (Section 508.3.2), or separated occupancies (Section 508.3.3). The effect of this is to permit an incidental use area to comply with the provisions for accessory occupancies or nonseparated occupancies. Since incidental use areas are typically not classified as separate occupancies, the separation and/or protection typically required for incidental use areas in the absence of these options is eliminated and the special hazard posed by an incidental use area is not addressed. The other areas within the separated occupancy continue to be exposed to the special hazard but are not protected from it.

Removing storage rooms greater than 100 square feet and parking garages from being classified as incidental uses areas will permit them to qualify as accessory occupancies provided they meet the limitations of Section 508.3.1 for accessory occupancies. But that is the case now. This purpose for this proposal is not to change the provisions of the IBC with respect to storage rooms greater than 100 square feet and parking garages. Rather, it is to change the provisions for incidental use areas other than storage rooms greater than 100 square feet and parking garages by restoring the requirements for separation and/or protection specified in Table 508.2.

A prohibition on applying the provisions of Section 508.3.1 for accessory occupancies in order to reduce the requirements of Section 508.2 for incidental use areas is added to Section 508.3.1. Incidental uses are not occupancies but are areas of special hazard within occupancies. Technically, the prohibition is superfluous but it is proposed to ensure that the provisions for accessory occupancies are not misconstrued as a substitute for the requirements for incidental use areas.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Based upon the request of the proponent. The proponent will come back with a public comment to clean up the proposed language.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 2:

Philip Brazil, PE, Reid Middleton, Inc., Everett, WA, representing himself requests Approval as Modified by this public comment.

Modify proposal to revise Section 508.2.2:

508.2.2 Separation. Incidental use areas shall be separated or protected, or both, in accordance with Table 508.2.

Exception: Incidental uses classified as separated occupancies and complying with Section 508.3.3.

(Portions of proposal not shown remain unchanged)

Commenter's Reason: I asked for disapproval at the 2006/2007 ICC code development hearings in Orlando because of concerns raised by some of my colleagues that incidental uses could also be classified as separate occupancies and be required to comply with the provision of Section 508.2 for incidental uses as well as Section 508.3.3 for separated occupancies. In the proposed exception, "incidental uses" are proposed rather than "incidental use areas" for consistency with similar changes in Proposal G131-06/07 (AS). The proposed exception to Section 508.2.2 is intended to answer those concerns. Note that Section 508.2.1 requires an incidental use to be classified in accordance with the occupancy of that portion of the building in which it is located.

Final Hearing Results

G133-06/07

AMPC2

Code Change No: G134-06/07

Original Proposal

Sections: 508.2.2.1, 508.3 through 508.3.3.3

Proponent: Philip Brazil, PE, Reid Middleton, Inc., representing himself

Revise as follows:

508.2.2 Separation. Incidental use areas shall be separated or protected, or both, in accordance with Table 508.2.

508.2.2.1 Construction. Where Table 508.2 ~~requires~~ specifies a fire-resistance-rated separation, the incidental use area shall be separated from the remainder of the building by a fire barrier constructed in accordance with Section 706 or a horizontal assembly constructed in accordance with Section 711, or both. Where Table 508.2 permits an automatic fire-extinguishing system without a fire barrier, the incidental use area shall be separated from the remainder of the building by construction capable of resisting the passage of smoke. The partitions shall extend from the floor to the underside of the fire-resistance-rated floor/ceiling assembly or fire-resistance-rated roof/ceiling assembly above or to the underside of the floor or roof sheathing, or sub deck above. Doors shall be self- or automatic closing upon detection of smoke. Doors shall not have air transfer openings and shall not be undercut in excess of the clearance permitted in accordance with NFPA 80.

508.3 Mixed occupancies. Each portion of a building shall be individually classified in accordance with Section 302.1.

Where a building contains more than one occupancy group, the building or portion thereof shall comply with Sections 508.3.1, 508.3.2, 508.3.3 or a combination of these sections.

Exceptions:

1. Occupancies separated in accordance with Section 509.
2. Where required by Table 415.3.2, areas of Group H-1, H-2 ~~or~~ and H-3 occupancies shall be located in a separate and detached building or structure.

508.3.1 Accessory occupancies. Accessory occupancies are those occupancies subsidiary to the main occupancy of the building or portion thereof. ~~Aggregate accessory occupancies shall not occupy more than 10 percent of the area of the story in which they are located and shall not exceed the tabular values in Table 503, without height and area increases in accordance with Sections 504 and 506 for such accessory occupancies.~~

Exceptions:

1. Accessory assembly areas having a floor area less than 750 square feet (69.7 m²) are not considered separate occupancies.
2. Assembly areas that are accessory to Group E occupancies are not considered separate occupancies except when applying the assembly occupancy requirements of Chapter 11.

3. Accessory religious educational rooms and religious auditoriums with occupant loads of less than 100 are not considered separate occupancies.

508.3.1.1 Occupancy classification. Accessory occupancies shall be individually classified in accordance with Section 302.1. ~~The Code requirements of this code shall apply to each portion of the building based on the occupancy classification of that the accessory space occupancy,~~ except that the most restrictive applicable provisions of Section 403 and Chapter 9 shall apply to the entire building or portion thereof.

508.3.1.2 Allowable area and height. The allowable area and height of the building shall be based on the allowable area and height for the main occupancy in accordance with Section 503.1. The aggregate area of accessory occupancies shall not occupy more than 10 percent of the area of the story in which they are located and shall not exceed the tabular values in Table 503, without height and area increases in accordance with Sections 504 and 506 for such accessory occupancies. The height of ~~any~~ each accessory occupancy shall not exceed the tabular values in Table 503, without height and area increases in accordance with Sections 504 and 506 for such accessory occupancies occupancy.

508.3.1.3 Separation. No separation is required between accessory occupancies ~~or~~ and the main occupancy.

Exception: Group H-2, H-3, H-4 ~~or~~ and H-5 occupancies shall be separated from all other occupancies in accordance with Section 508.3.3.

508.3.2 Nonseparated occupancies. Buildings or portions of buildings that comply with the provisions of this section shall ~~qualify~~ be considered as nonseparated occupancies.

508.3.2.1 Occupancy classification. Nonseparated occupancies shall be individually classified in accordance with Section 302.1. ~~The Code requirements of this code shall apply to each portion of the building based on the occupancy classification of that space except that the most restrictive applicable provisions of Section 403 and Chapter 9 shall apply to the entire building or portion thereof~~ in which the nonseparated occupancies are located.

508.3.2.2 Allowable area and height. (No change to text)

508.3.2.3 Separation. No separation is required between nonseparated occupancies.

Exception: Group H-2, H-3, H-4 ~~or~~ and H-5 occupancies shall be separated from all other occupancies in accordance with Section 508.3.3.

508.3.3 Separated occupancies. Buildings or portions of buildings that comply with the provisions of this section shall ~~qualify~~ be considered as separated occupancies.

508.3.3.1 Occupancy classification. Separated occupancies shall be individually classified in accordance with Section 302.1. Each ~~fire area~~ separated space shall comply with this code based on the occupancy classification of that portion of the building.

508.3.3.2 Allowable area. In each story, the building area shall be such that the sum of the ratios of the actual ~~floor~~ building area of each separated occupancy divided by the allowable area of each separated occupancy shall not exceed one.

508.3.3.3 Allowable height. Each separated occupancy shall comply with the height limitations based on the type of construction of the building in accordance with Section 503.1. The height, in both feet and stories, of each fire area shall be measured from grade plane. This measurement shall include the height, in both feet and stories, of intervening fire areas.

Exception: Special provisions permitted by Section 509.

Reason: The purpose of this proposal is to make editorial and technical improvements in the provisions of Section 508 for mixed occupancies. In Section 508.2.2.1, "requires" is changed to "specifies" because Table 508.2 doesn't require anything. It does, however, specify fire barriers, construction capable of resisting the passage of smoke or an automatic fire-extinguishing system for areas with specific hazards.

The revision to the second exception to Section 508.3 will avoid the assumption that there is a choice in the requirements for locating Group H-1, H-2 and H-3 occupancies in separate and detached buildings or structures. There is not. The areas of all such occupancies are required to be located in separate and detached buildings or structures to the extent that they are located on a site and Table 415.3.2 requires that they be so located. A similar revision is proposed in the exception to Section 508.3.1.3.

The limit on the aggregate area of accessory occupancies is relocated from Section 508.3.1 to Section 508.3.1.2 on allowable area and height for which it is applicable.

The change from the “entire building or portion thereof” to the “building or portion thereof in which the nonseparated occupancies are located” in Section 508.3.2.1 is being done to recognize that a building could have more than one separated occupancy each of which could have one or more nonseparated occupancies.

The change from “fire area” to “separated space” in Section 508.3.3.1 is being done to recognize that there could be more than one fire area within a separated occupancy and for consistency with the current use of “space” in Section 508.3.2.1. There are approximately 50 code sections in the IBC requiring fire barriers that are not necessarily associated with separated occupancies. Refer to the reason statement with code change proposal FS40-03/04 for further information.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal was approved as it clarifies the language in Section 508. Specifically language such as fire area was removed from Section 508.3.3.1 and the language limiting the area of accessory occupancies to 10 percent was moved from the main section on Accessory occupancies to the area specific to heights and areas for accessory occupancies (Section 508.3.1.2). See also proponents reason.

Assembly Action:

None

Final Hearing Results

G134-06/07

AS

Code Change No: **G137-06/07**

Original Proposal

Section: 508.3.1

Proponent: Gregory R. Keith, Professional heuristic Development, representing the Boeing Company

Revise as follows:

508.3.1 Accessory occupancies. Accessory occupancies are those occupancies subsidiary to the main occupancy of the building or portion thereof. Aggregate accessory occupancies shall not occupy more than 10 percent of the area of the story in which they are located and shall not exceed the tabular values in Table 503, without height and area increases in accordance with Sections 504 and 506 for such accessory occupancies.

Exceptions:

- ~~1. Accessory assembly areas having a floor area less than 750 square feet (69.7 m²) are not considered separate occupancies.~~
- ~~2. Assembly areas that are accessory to Group E occupancies are not considered separate occupancies except when applying the assembly occupancy requirements of Chapter 11.~~
- ~~3. Accessory religious educational rooms and religious auditoriums with occupant loads of less than 100 are not considered separate occupancies.~~

Reason: This proposal is intended to follow up on the reorganization of the mixed occupancy and use provisions introduced in the 2006 Edition of the *International Building Code*. Specifically, it is intended to clarify accessory occupancy provisions. It is proposed to eliminate the three current exceptions. These exceptions are a result of the somewhat vague nature of accessory use areas contained in previous editions of the IBC. As such, they are at odds with the current accessory occupancy provisions. Specifically, Section 508.3.1.1 states, “Accessory occupancies shall be individually classified in accordance with Section 302.1. Code requirements shall apply to each portion of the building based on the occupancy classification of that accessory space, except that the most restrictive applicable provisions of Section 403 and Chapter 9 shall apply to the entire building or portion thereof.” Traditionally, the exceptions have been employed to allow such buildings to have allowable areas based on the main occupancy of the building and to avoid occupancy separations. The reality is that each of these goals can be achieved using current provisions, without the exceptions. The key difference is that if there are any specific requirements that are normally associated with a given occupancy, they must be acknowledged. Exception 1 is almost moot inasmuch as assembly uses (whether they are accessory or not) less than 750 square feet, would seldom be classified as separate occupancies. New Section 303.1, Exceptions 2 and 3 already appropriately address this condition. If it is truly felt that all inclusive educational and religious occupancies be permitted, such provisions should be contained within the specific occupancy

sections in Chapter 3. It should be noted that a similar proposal was defeated during the previous code development cycle. The 2006 IBC accessory occupancy provisions clarify that they are intended only to define a mixed occupancy design option. They are not intended to relieve any pertinent code requirement. Approval of this proposal will clarify accessory occupancy provisions in the IBC and promote needed uniformity in the treatment of these important areas.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Concern that essential exceptions such as item 2 that allows assembly spaces in Group E occupancies to be considered as part of the Group E occupancy would be lost.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Gregory R. Keith, Professional heuristic Development, representing the Boeing Company requests Approval as Modified by this public comment.

Modify proposal as follows:

303.1 Assembly Group A. Assembly Group A occupancy includes, among others, the use of a building or structure, or a portion thereof, for the gathering of persons for purposes such as civic, social or religious functions; recreation, food or drink consumption; or awaiting transportation.

Exceptions:

1. A building or tenant space used for assembly purposes with an occupant load of less than 50 persons shall be classified as a Group B occupancy.
2. A room or space used for assembly purposes with an occupant load of less than 50 persons and accessory to another occupancy shall be classified as a Group B occupancy or as part of that occupancy.
3. A room or space used for assembly purposes that is less than 750 square feet (70 m²) in area and accessory to another occupancy shall be classified as a Group B occupancy or as part of that occupancy.
4. Assembly areas that are accessory to Group E occupancies are not considered separate occupancies except when applying the assembly occupancy requirements of Chapter 11.
5. Accessory religious educational rooms and religious auditoriums with occupant loads of less than 100 are not considered separate occupancies.

(Remainder of section unchanged)

(Portions of proposal not shown remain unchanged)

Commenter's Reason: This proposal is intended to follow up on the reorganization of the mixed occupancy and use provisions introduced in the 2006 Edition of the International Building Code. Specifically, it is intended to clarify accessory occupancy provisions. It is proposed to eliminate the three current exceptions. These exceptions are a result of the somewhat vague nature of accessory use areas contained in previous editions of the IBC. As such, they are at odds with the current accessory occupancy provisions. Specifically, Section 508.3.1.1 states, "Accessory occupancies shall be individually classified in accordance with Section 302.1. Code requirements shall apply to each portion of the building based on the occupancy classification of that accessory space, except that the most restrictive applicable provisions of Section 403 and Chapter 9 shall apply to the entire building or portion thereof." Traditionally, the exceptions have been employed to allow such buildings to have allowable areas based on the main occupancy of the building and to avoid occupancy separations. The reality is that each of these goals can be achieved using current provisions, without the exceptions. The key difference is that if there are any specific requirements that are normally associated with a given occupancy, they must be acknowledged. It was noted during discussion of the item in Orlando that although the provisions were removed from Section 508.3.1, they were not relocated in more appropriate sections. The modification reflected in this public comment corrects that valid observation. Exception 1 is almost moot inasmuch as the matter is already addressed at Section 303.1, Exception 3. Former Exceptions 2 and 3 have been relocated as Exceptions 4 and 5 to Section 303.1. The 2006 IBC accessory occupancy provisions clarify that they are intended only to define a mixed occupancy design option. They are not intended to relieve any pertinent code requirement. Approval of this proposal will clarify accessory occupancy provisions in the IBC and promote needed uniformity in the treatment of these important areas.

Final Hearing Results

G137-06/07

AMPC1

Code Change No: **G140-06/07**

Original Proposal

Sections: 508.3.1.3, 508.3.2.3

Proponents: George Thomas, PE, CBO, Pleasanton, CA, representing the California Fire Chiefs Association and Tri-Chapter Code Committee; Laura Blaul and Lorin Neyer, representing the California Fire Chief's Association

Revise as follows:

508.3.1.3 Separation. No separation is required between accessory occupancies or the main occupancy.

Exceptions:

1. Group H-2, H-3, H-4 or H-5 occupancies shall be separated from all other occupancies in accordance with Section 508.3.3.
2. Group R occupancies shall be separated from other accessory occupancies in accordance with Section 508.3.3.4.

508.3.2.3 Separation. No separation is required between occupancies.

Exceptions:

1. Group H-2, H-3, H-4 or H-5 occupancies shall be separated from all other occupancies in accordance with Section 508.3.3.
2. All Group R occupancies shall be separated from other occupancies in accordance with Section 508.3.3.4

Reason: The 2006 IBC, like the 2000 and 2003 editions, requires that a one-hour fire rated separation be provided between all dwelling units in Group R occupancies. Some interpret that since the code requires a separation between dwelling units it is logical that there also should be a one-hour separation between dwelling units and other use groups within the same building. The code however does not explicitly state that a fire rated separation between that portion of a building used for Group R and any other uses be provided except for Groups H2, H3, H4 and H5. Table 508.3.3 requires occupancy separations with one hour or more fire resistance to be located between Group R and all other occupancies. In multiple family dwellings, Section 419.3 requires that walls separating dwelling units must be constructed as fire partitions having a fire-resistance rating not less than 1-hour. It is logical that where dwelling units are located in mixed use buildings containing other occupancies that the occupancy separations required by Table 508.3.3 should not be eliminated through the use of the non-separated occupancy provisions of Section 508.3.2.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The additional separation requirements were not felt to be justified. In addition the separation being proposed is between Group R and accessory occupancies. This would not require separation from other more significant occupancies. These requirements would also make live/work arrangements more difficult.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Frank Rainone, City of Sunnyvale, requests Approval as Submitted.

Commenter's Reason: Additional reasoning to support G 140, with the new exceptions to sections 508.3.1.3 and 508.3.2.3 are as follows; residential buildings already have the highest fire incidence, higher than any other occupancy and now would be subjected to even higher fire loading. Based on current code 508.3.1.3 and 508.3.2.3 these sections would allow the following occupancies B, F and M to have hazardous materials per tables 307.7 (1) and (2) with no separation to an, R occupancy. Introducing hazardous materials in these occupancies increases the fire loading of the whole building and subject the R occupancy to fire incidence which was not allowed by the previous edition of the IBC. The two exceptions should be included in the sections listed above. Due to the fact that section 419.3 already requires a separation between dwelling units, it would be justified to provide separations between occupancies with potential hazardous materials and all R occupancies, we disagree with the committee's action and wish to support G140 as submitted for approval.

Final Hearing Results

G140-06/07

AS

Code Change No: G142-06/07

Original Proposal

Section: 508.3.3.3

Proponent: Gregory R. Keith, Professional heuristic Development, representing the Boeing Company

Revise as follows:

508.3.3.3 Allowable height. Each occupancy shall comply with the height limitations based on the type of construction of the building in accordance with Section 503.1. ~~The height, in both feet and stories, of each fire area shall be measured from grade plane. This measurement shall include the height, in both feet and stories, of intervening fire areas.~~

Exception: Special provisions permitted by Section 509.

Reason: The stricken language was originally intended to modify the former (2003) separated use provisions. In the context of the new (2006) organization and format, the information is redundant. The basic provision of Section 508.3.3.3 requires the allowable height in feet and stories be determined in accordance with the fundamental provisions of Section 503.1. The concern of the stricken language is currently addressed in the definition of HEIGHT, BUILDING in Section 502.1. The additional language could confuse interpreters by indicating that the height requirements for separated occupancies are determined differently than for individual occupancies. It should be noted that the proposed language is identical to that approved by the membership in Detroit as a portion of the mixed occupancy and use reformatting exercise. Approval of this proposal will clarify the provisions for the determination of allowable height requirements in separated occupancies.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This change removes provisions that were originally intended to work with the former (2003) separated occupancy requirements. Fire area is a separate concept from the separated occupancies in the 2006 IBC.

Code Change No: **G145-06/07**

Original Proposal

Table 508.3.3

Proponents: Don Davies, Salt Lake City Corporation, representing the Utah Chapter; Stephen Thomas, City of Cherry Hills Village, representing the Colorado Chapter

Revise table as follows:

TABLE 508.3.3 REQUIRED SEPARATION OF OCCUPANCIES (HOURS)

(No changes to table text)

For SI: 1 square foot = 0.0929 m².

- S = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
 NS = Buildings not equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
 N = No separation requirement.
 NP = Not permitted.

- a. For Group H-5 occupancies, see Section 903.2.4.2.
~~b. Occupancy separation need not be provided for storage areas within Groups B and M if the:~~
~~1. Area is less than 10 percent of the floor area;~~
~~2. Area is equipped with an automatic fire extinguishing system and is less than 3,000 square feet; or~~
~~3. Area is less than 1,000 square feet.~~
~~c. b.~~ Areas used only for private or pleasure vehicles shall be allowed to reduce separation by 1 hour.
~~d. c.~~ See Section 406.1.4.
~~e. d.~~ Commercial kitchens need not be separated from the restaurant seating areas that they serve.

Reason: Don Davies. These special exceptions are a carryover from a legacy code prior to the creation of the nonseparated use provision in Section 508.3.2 and the incidental use Table 508.2. The separation or nonseparation of storage areas is better addressed under the provisions of the incidental use table where the separation is not required where a fire extinguishing system is provided. Where the building is not sprinkled then the provisions of a nonseparated use could be applied. Exception #2 is especially problematic in that it conflicts with the incidental use table which does not require the one-hour separation of storage areas when automatic fire-extinguishing system is provided. If a storage area exceeding 3,000 square feet is a problem to B and M occupancies then it should pose the same hazard to all occupancies. An additional conflict now occurs in the new occupancy separation table 508.3.3 which does not require any separation of storage areas "S" occupancy from "B" and "M" occupancies. As an exception to the table the exception which originally negated the requirement for a separation would now require the separation which makes no sense. In the context of the I.B.C. these provisions are no longer necessary.

Stephen Thomas. When this table was revised, the separation between a Group B or M occupancy and a Group S-1 occupancy was eliminated. However, footnote b was maintained. Based on this change, the footnote is no longer necessary since storage areas can be classified as a separate occupancy and are no longer required to be separated. Therefore, the footnote is not necessary.

Cost Impact: Don Davies. The code change proposal will not increase the cost of construction. On the surface it appears that the elimination of the exceptions would require the separations and impose a greater cost but since other provisions of the code already eliminate the separations there is no additional cost.

Stephen Thomas. The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The footnote is no longer required as the separation would not be required between Group B and M occupancies and the storage areas contained in these occupancies in Table 508.3.3. This issue would be better addressed simply through incidental and accessory requirements.

Assembly Action:

None

Final Hearing Results

G145-06/07

AS

Code Change No: **G149-06/07**

Original Proposal

Sections: 508.1 through 508.3.1.3

Proponent: Sarah A. Rice, Schirmer Engineering Corporation, Deerfield, IL

Revise as follows:

508.1 General. Each portion of a building shall be individually classified in accordance with Section 302.1. Where a building or portion thereof contains two or more occupancies or uses, the building or portion thereof shall comply with the applicable provisions of this section. Section 508.2, 508.3 or 508.4, or a combination of these sections.

Exceptions:

1. Occupancies separated in accordance with Section 509.
2. Where required by Table 415.3.2, areas of Group H-1, H-2 or H-3 occupancies shall be located in a separate and detached building or structure.

508.2 Ancillary use areas incidental uses. Ancillary use areas are those occupancies that are subordinate or auxiliary to the main occupancy of the building or portion thereof. Ancillary incidental use areas shall comply with the provisions of Section 508.2.1 through 508.2.6.3. this section.

Exceptions:

1. Ancillary incidental use areas within and serving a dwelling unit, are not required to comply with this section.
2. Accessory assembly areas having a floor area less than 750 square feet (69.7 m²) are not considered separate occupancies.
3. Accessory areas that are accessory to Group E occupancies are not considered separate occupancies except when applying the assembly occupancy requirements of Chapter 11.
4. Accessory religious educational rooms and religious auditoriums with occupant loads of less than 100 are not considered separate occupancies.

508.2.1 Area limitations. Ancillary use areas when measured aggregately, shall not occupy more than 10 percent of the area of the story in which they are located and shall not exceed the tabular values in Table 503, without area increases in accordance with Section 506 for the occupancy of the ancillary use or uses.

508.2.1 Occupancy classification. An incidental use area shall be classified in accordance with the occupancy of that portion of the building in which it is located or the building shall be classified as a mixed occupancy and shall comply with Section 508.3.

508.2.2 Occupancy classification. Ancillary use areas shall be individually classified in accordance with Section 302.1.

508.2.3 Applicability of other code requirements. Code requirements shall apply to each portion of the building based on the occupancy classification of that ancillary use area, except that the most restrictive applicable provisions of Section 403 and Chapter 9 shall apply to the entire building or portion thereof.

508.2.4 Allowable area and height. The allowable area and height of the building shall be based on the allowable area and height for the main occupancy in accordance with Section 503.1. The height of any ancillary use areas shall not exceed the tabular values in Table 503, without height increases in accordance with Section 504 for such ancillary occupancies. The area of the ancillary use area shall be in accordance with Section 508.2.1.

508.2.5 Separation of occupancies. Except where required by Section 508.2.6 the walls or floors separating ancillary use areas from other occupancies shall not be required to be fire-resistance rated.

Exception: Group H-2, H-3, H-4 or H-5 occupancies shall be separated from all other occupancies in accordance with Section 508.3.3.

508.2.2 508.2.6 Separation of ancillary use areas. Incidental use areas shall be separated or protected, or both, in accordance with Table 508.2. The ancillary use areas listed in Table 508.2.6 shall be physically separated from the remainder of the building or equipped with an automatic fire-extinguishing system, or both, in accordance with Table 508.2.

508.2.6.1 Fire resistance rated separation. 508.2.2.1 Construction. Where Table 508.2 requires a fire-resistance-rated separation, the incidental ancillary use area shall be separated from the remainder of the building by a fire barrier constructed in accordance with Section 706 or a horizontal assembly constructed in accordance with Section 711, or both.

508.2.6.2 Nonfire-resistance rated separation and protection. Where Table 508.2 permits an automatic fire-extinguishing system without a fire barrier, the incidental ancillary use area shall be separated from the remainder of the building by construction capable of resisting the passage of smoke. The ~~partitions~~ walls shall extend from the floor to the underside of the fire-resistance-rated floor/ceiling assembly or fire-resistance-rated roof/ceiling ceiling assembly above or to the underside of the floor or roof sheathing, or sub deck above. Doors shall be self- or automatic closing upon detection of smoke in accordance with Section 715.4.7.3. Doors shall not have air transfer openings and shall not be undercut in excess of the clearance permitted in accordance with NFPA 80.

TABLE 508.2 INCIDENTAL ANCILLARY USE AREAS

(No changes to current text)

508.2.3 508.2.6.3 Protection. Where an automatic fire-extinguishing system or an automatic sprinkler system is provided in accordance with Table 508.2, only the incidental use areas need be equipped with such a system.

508.3 Mixed occupancies. Each portion of a building shall be individually classified in accordance with Section 302.1. Where a building contains more than one occupancy group, the building or portion thereof shall comply with Sections 508.3.1, 508.3.2, 508.3.3 or a combination of these sections.

Exceptions:

- ~~1. Occupancies separated in accordance with Section 509.~~
- ~~2. Where required by Table 415.3.2, areas of Group H-1, H-2 or H-3 occupancies shall be located in a separate and detached building or structure.~~

508.3.1 Accessory occupancies. Accessory occupancies are those occupancies subsidiary to the main occupancy of the building or portion thereof. Aggregate accessory occupancies shall not occupy more than 10 percent of the area of the story in which they are located and shall not exceed the tabular values in Table 503, without height and area increases in accordance with Sections 504 and 506 for such accessory occupancies.

Exceptions:

- ~~1. Accessory assembly areas having a floor area less than 750 square feet (69.7 m²) are not considered separate occupancies.~~
- ~~2. Assembly areas that are accessory to Group E occupancies are not considered separate occupancies except when applying the assembly occupancy requirements of Chapter 11.~~
- ~~3. Accessory religious educational rooms and religious auditoriums with occupant loads of less than 100 are not considered separate occupancies.~~

~~**508.3.1.1 Occupancy classification.** Accessory occupancies shall be individually classified in accordance with Section 302.1. Code requirements shall apply to each portion of the building based on the occupancy classification of that accessory space, except that the most restrictive applicable provisions of Section 403 and Chapter 9 shall apply to the entire building or portion thereof.~~

~~**508.3.1.2 Allowable area and height.** The allowable area and height of the building shall be based on the allowable area and height for the main occupancy in accordance with Section 503.1. The height of any accessory occupancy shall not exceed the tabular values in Table 503, without height and area increases in accordance with Sections 504 and 506 for such accessory occupancies.~~

~~**508.3.1.3 Separation.** No separation is required between accessory occupancies or the main occupancy.~~

~~**Exception:** Group H-2, H-3, H-4 or H-5 occupancies shall be separated from all other occupancies in accordance with Section 508.3.3.~~

(Renumber subsequent sections)

Reason: There has always been confusion when it comes to determining when a building has mixed occupancies, and if it does what level of protection and/or separation is required, and how ““accessory use areas”” and ““incidental use areas”” are related.

The changes made to Section 302 last cycle made it clear that both accessory use areas and incidental use areas are subsets of a mixed occupancy building, but that really was a beginning of what is needed to make Section 302 ““user friendly.””. This proposal seeks to go to the next level and

- Organize Section 302.3 to be more user-friendly, and
- Make it clear that “incidental use areas” are really only “accessory use areas” that require special protection.

To begin with, the use of two terms to define different aspects (or levels) of the same concept have been the source of confusion. Therefore, to make this cleaner and hopefully add clarity to the entire concept of mixed occupancies, it is proposed that both the term “accessory use area” and “incidental use area” be replaced with a new term - “ancillary use area.” Then the provisions that were attached to each of these organized such that those provisions previously called “incidental use area” are now considered as “ancillary use area” but have special protection and/or separation provisions.

In addition, the text has been arranged such that when a building contains small areas occupied by an occupancy(s) that is different than that of the main occupancy, depending upon the risk of that “ancillary” occupancy it may or may not need to be separated from the main occupancy.

The proposed change is intended to clearly establish the hierarchy of the options available to a designer when a building contains mixed occupancies.

As the designer is fundamentally given the choice of which option they wish to apply when designing a building having mixed occupancies, the proposed code change arranges the code provisions in the order in which most designers are going to look at a mixed occupancy scenario. The order would be:

- 1) identify all of the occupancies in the building (regardless of the amount of area they occupy),
- 2) see if the area occupied by any one occupancy or multiple occupancies,
 - a) occupies < 10% of the aggregate floor area, or
 - b) exceeds the tabular values for either height or area for such occupancy.
- 3) if the occupancy(s) does occupy < 10% of the aggregate floor area nor exceed the tabular values for either height or area for such occupancy. or so, then it is an ““ancillary use area”” and Section 508.2 applies. If an “ancillary use area,” it becomes clear that there are certain cases where it must be separated/protected - Table 508.2
- 4) If > 10% then it is not an ““ancillary use area”” and must comply with either a non separated occupancy or a separated occupancy.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Disapproved with concern that it will undo provisions that were recently implemented into the 2006 code. The incidental use area concept will be lost by this proposal. Suggest a more thorough review of the subject to see how it will affect the new provisions.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Sarah A. Rice, Schirmer Engineering Corporation, Deerfield, IL and Gregory R. Keith, Professional heuristic Development representing the Boeing Company requests Approval as Modified by this public comment.

Modify proposal as follows:

508.1 General. Each portion of a building shall be individually classified in accordance with Section 302.1. Where a building contains more than one occupancy group or portion thereof contains two or more occupancies or uses, the building or portion thereof shall comply with the applicable provisions of Section 508.2, 508.3 or 508.4, or a combination of these sections.

Exceptions:

1. Occupancies separated in accordance with Section 509.
2. Where required by Table 415.3.2, areas of Group H-1, H-2 or H-3 occupancies shall be located in a separate and detached building or structure.

508.2 Accessory occupancies ~~Ancillary use areas~~ ~~Ancillary use areas~~ Accessory occupancies are those occupancies that are ancillary subordinate or auxiliary to the main occupancy of the building or portion thereof. ~~Ancillary use areas~~ Accessory occupancies shall comply with the provisions of Section 508.2.1 through 508.2.6.3.

Exceptions:

- ~~1. Ancillary use areas within and serving a dwelling unit, are not required to comply with this section.~~
- ~~1.~~ ~~2.~~ Accessory assembly areas having a floor area less than 750 square feet (69.7 m²) are not considered separate occupancies.
- ~~2.~~ ~~3.~~ Assembly areas that are accessory to Group E occupancies are not considered separate occupancies except when applying the assembly occupancy requirements of Chapter 11.
- ~~3.~~ ~~4.~~ Accessory religious educational rooms and religious auditoriums with occupant loads of less than 100 are not considered separate occupancies.

508.2.1 Area limitations. ~~Ancillary use areas when measured aggregately.~~ Aggregate accessory occupancies shall not occupy more than 10 percent of the area of the story in which they are located and shall not exceed the tabular values in Table 503, without area increases in accordance with Section 506 for such accessory occupancies ~~the occupancy of the ancillary use or uses.~~

508.2.2 Occupancy classification. ~~Ancillary use areas~~ Accessory occupancies shall be individually classified in accordance with Section 302.1.

508.2.3 Applicability of other code requirements. Code requirements shall apply to each portion of the building based on the occupancy classification of that space ~~Ancillary use areas~~, except that the most restrictive applicable provisions of Section 403 and Chapter 9 shall apply to the entire building or portion thereof.

508.2.3 508.2.4 Allowable area and height. The allowable area and height of the building shall be based on the allowable area and height for the main occupancy in accordance with Section 503.1. The height of any ~~ancillary use areas~~ accessory occupancies shall not exceed the tabular values in Table 503, without height increases in accordance with Section 504 for such ancillary accessory occupancies. The area of the ~~ancillary use areas~~ accessory occupancies shall be in accordance with Section 508.2.1

508.2.4 508.2.5 Separation of occupancies. ~~No separation is required between accessory occupancies or the main occupancy. Except where required by Section 508.2.6, the walls or floors separating ancillary use areas from other occupancies shall not be required to be fire-resistance rated.~~

Exceptions:

- ~~1.~~ Group H-2, H-3, H-4 or H-5 occupancies shall be separated from all other occupancies in accordance with Section 508.4 ~~3.3.~~
- ~~2.~~ Incidental accessory occupancies required to be separated or protected by Section 508.2.5.

508.2.5 508.2.6 Separation of incidental accessory occupancies ~~ancillary use areas~~. The ~~ancillary use areas~~ incidental accessory occupancies listed in Table 508.2.5 shall be physically separated from the remainder of the building or equipped with an automatic fire-extinguishing system, or both, in accordance with Table 508.2.5.

Exception: Incidental accessory use areas within and serving a dwelling unit are not required to comply with this section.

508.2.5.1 508.2.6.1 Fire resistance rated separation. Where Table 508.2.5 requires a fire-resistance rated separation, the ~~ancillary use areas~~ incidental accessory occupancies shall be separated from the remainder of the building by a fire barrier constructed in accordance with Section 706 or a horizontal assembly constructed in accordance with Section 711, or both.

508.2.5.2 508.2.6.2 Nonfire-resistance rated separation and protection. Where Table 508.2.5 permits an automatic fire extinguishing system without a fire barrier, the ~~ancillary use areas~~ incidental accessory occupancies shall be separated from the remainder of the building by construction capable of resisting the passage of smoke. The walls shall extend from the floor to the underside of the fire-resistance-rated floor/ceiling assembly or fire-resistance-rated roof/ceiling assembly above or to the underside of the floor or roof sheathing, or sub deck above. Doors shall be self- or automatic closing upon detection of smoke in accordance with Section 715.4.7.3. Doors shall not have air transfer openings and shall not be undercut in excess of the clearance permitted in accordance with NFPA 80.

508.2.5.3 508.2.6.3 Protection. Where an automatic fire-extinguishing system or an automatic sprinkler system is provided in accordance with Table 508.2.5, only the ~~incidental use area~~ space occupied by the incidental accessory occupancy need be equipped with such a system.

TABLE 508.2.5

Incidental Accessory Occupancies ~~Ancillary-Use Areas~~ (No changes to current text of table)

508.3 508.3.2 Nonseparated occupancies. [No changes to current text but section renumbered accordingly]

508.4 508.3.3 Separated occupancies. [No changes to current text but section renumbered accordingly]

Commenter's Reason: The language proposed above is a result of a collaborative effort of the co-proponents. What is proposed is intended to achieve the intent of the original proposal and resolve the concerns expressed at the hearings regarding the potential adverse affect on the new format of Section 508. This proposal does the following:

- It relocates the content of current Section 508.2; Incidental Use Areas to be part of the mixed use provisions in Section 508.3; Mixed occupancies. More specifically, this proposal relocates the text currently found in Section 508.2 and moves it into current Section 508.3.1 so as to become a subset of the accessory occupancy provisions.
- It fundamentally maintains the terminology currently found in Section 508 (e.g., accessory occupancy and incidental use areas) – with the exception that what were called “incidental use areas” are now called “incidental accessory occupancies.” The terminology change is consistent with the concept that “incidental use areas” are a subset of “accessory occupancies.”
- By “incidental use areas” becoming a subset of “accessory occupancies” it is clear that there is a maximum area limit to those occupancies that are considered currently to be “incidental use areas” - 10% - same as “accessory use areas.”
- The proposed language maintains the format of Section 508
- The language found in current Section 508.3 which gives direction on how the mixed occupancies provisions are to be used has been relocated to be part of the general statement in 508.1.

Final Hearing Results

G149-06/07

AMPC1

Code Change No: G151-06/07

Original Proposal

Section: 509.1

Proponent: John Berry, Cole + Russell Architects, Inc., Cincinnati, OH

Revise as follows:

509.1 General. The provisions in this section shall permit the use of special conditions that are exempt from, or modify, the specific requirements of this chapter regarding the allowable heights and areas of buildings based on the occupancy classification and type of construction, provided the special condition complies with the provisions specified in this section for such condition and other applicable requirements of this code. The provisions of Sections 509.2 through 509.8 are to be considered independent and separate from each other.

Reason: Section 509 is an unusual section that allows special provisions in unique and limited situations. A common point of confusion w/ many code users is assuming that all options allowed in Section 509 are actually required to be met at the same time. This is not the intent of Section 509. Each section within Section 509 is to be considered and applied to a building based upon the specific requirements/allowances specified solely within the specific section. Adding the proposed sentence will clarify the proper application of Section 509.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal clarifies that each of the sections within 509 are independent from one another and should be applied independently.

Assembly Action:

None

AS

Code Change No: **G153-06/07**

Original Proposal

Sections: 509.2, 509.3

Proponent: Philip Brazil, PE, Reid Middleton, Inc., Everett, WA, representing himself

509.2 Group S-2 enclosed or open parking garage with Group A, B, M, R or S above. A ~~basement and/or the first story above grade plane of a building~~ shall be considered as a two separate and distinct buildings for the purpose of determining area limitations, continuity of fire walls, limitation of number of stories and type of construction ~~when~~ where all of the following conditions are met:

1. ~~The basement and/or the first story above grade plane is of Type IA construction and is separated from the buildings are separated above~~ with a horizontal assembly having a minimum 3-hour fire-resistance rating.
2. The building below the horizontal assembly is no more than one story above grade plane.
3. The building below the horizontal assembly is of Type IA construction.
4. Shaft, stairway, ramp ~~or~~ and escalator enclosures through the horizontal assembly shall have not less than a 2-hour fire-resistance rating with opening protectives in accordance with Table 715.4.

Exception: Where the enclosure walls below the horizontal assembly have not less than a 3-hour fire-resistance rating with opening protectives in accordance with Table 715.4, the enclosure walls extending above the horizontal assembly shall be permitted to have a 1-hour fire-resistance rating, provided:

1. The building above the horizontal assembly is not required to be of Type I construction;
 2. The enclosure connects less than four stories; and
 3. The enclosure opening protectives above the horizontal assembly have a minimum 1-hour fire protection rating.
- ~~3.5.~~ The building above the horizontal assembly shall be permitted to have multiple Group A uses, each with an occupant load of less than 300, or Group B, M, R or S uses.
- ~~4.6.~~ The building below the horizontal assembly is a Group S-2 enclosed or open parking garage, used for the parking and storage of private motor vehicles.

Exceptions:

1. Entry lobbies, mechanical rooms and similar uses incidental to the operation of the building shall be permitted.
 2. Multiple Group A uses, each with an occupant load of less than 300, or Group B or M uses shall be permitted, in addition to those uses incidental to the operation of the building (including storage areas), provided that the entire structure below the horizontal assembly is protected throughout by an approved automatic sprinkler system.
- ~~5.7.~~ The maximum building height in feet shall not exceed the limits set forth in Section 503 for the building having the smaller allowable height as measured from the grade plane.

509.3 Group S-2 enclosed parking garage with Group S-2 open parking garage above. A Group S-2 enclosed parking garage with no more than one story above grade plane and located ~~in the basement or first story~~ below a Group S-2 open parking garage shall be classified as a separate and distinct building for the purpose of determining the type of construction ~~when~~ where the following conditions are met:

1. The allowable area of the ~~structure~~ building shall be such that the sum of the ratios of the actual area divided by the allowable area for each separate occupancy shall not exceed 1.0.
2. The Group S-2 enclosed parking garage is of Type I or II construction and is at least equal to the fire-resistance requirements of the Group S-2 open parking garage.

3. The height and the number of ~~the floors above the basement~~ tiers of the Group S-2 open parking garage shall be limited as specified in Table 406.3.5.
4. The floor assembly separating the Group S-2 enclosed parking garage and Group S-2 open parking garage shall be protected as required for the floor assembly of the Group S-2 enclosed parking garage. Openings between the Group S-2 enclosed parking garage and Group S-2 open parking garage, except exit openings, shall not be required to be protected.
5. The Group S-2 enclosed parking garage is used exclusively for the parking or storage of private motor vehicles, but shall be permitted to contain an office, waiting room and toilet room having a total area of not more than 1,000 square feet (93 m²), and mechanical equipment rooms incidental to the operation of the building.

Reason: The purpose of this proposal is to clarify the methods used in Sections 509.2 and 509.3 to establish the equivalent of separate and distinct buildings. Currently, Section 509.2 permits a basement and/or a first story above grade plane, and Section 509.3 permits a Group S-2 enclosed parking garage located in a basement and/or first story below a Group S-2 open parking garage, to be considered a separate and distinct building if certain conditions are met. The height of the first story above grade plane is well established elsewhere in Chapter 5 but that of a basement is not. The question of whether the term “basement” applies to each floor level that is partly or completely below grade or to all floor levels that are partly or completely below grade is addressed by a related code change proposal. Assuming that the term “basement” applies to each floor level that is partly or completely below grade, it is conceivable that more than one basement could qualify as a story above grade plane. The definition of basement in Section 502.1 establishes when a basement is considered a story above grade plane but there is no restriction in the definition or elsewhere in the IBC limiting such a basement to no higher than the first (one) story above grade plane.

Once the location of the basement and/or a first story above grade plane is established, what about the floor levels below the basement and/or a first story above grade plane? Literally, they are currently excluded from the separate and distinct building below the fire-resistance-rated horizontal assembly, which is required between the upper and lower buildings in both cases. The proposed revision establishes a criterion in each case that is more precise and closer to the intent, which is to consider a portion of a building whose topmost floor is no higher than the first story above grade plane to be a separate and distinct building.

The proposed change from “floors” to “tiers” in Item 3 of Section 508.3 is for consistency with the use of “tier” for open parking garages in Section 406.3. “Structure” is revised to “building” in Item #1 of Section 509.3 for consistency with use of the term “building” in the charging statement of Section 509.3.

Cost Impact: The code change proposal will not increase the cost of construction.

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Philip Brazil, PE, Reid Middleton, Inc., Everett, WA, representing himself, requests Approval as Modified by this public comment.

Modify proposal as follows:

509.2 Group S-2 enclosed or open parking garage with Group A, B, M, R or S above. A building shall be considered as ~~two~~ separate and distinct buildings for the purpose of determining area limitations, continuity of fire walls, limitation of number of stories and type of construction where all of the following conditions are met:

1. The buildings are separated with a horizontal assembly having a minimum 3-hour fire-resistance rating.
2. The building below the horizontal assembly is no more than one story above grade plane.
3. The building below the horizontal assembly is of Type IA construction.
4. Shaft, stairway, ramp and escalator enclosures through the horizontal assembly shall have not less than a 2-hour fire-resistance rating with opening protectives in accordance with Table 715.4.

Exception: Where the enclosure walls below the horizontal assembly have not less than a 3-hour fire-resistance rating with opening protectives in accordance with Table 715.4, the enclosure walls extending above the horizontal assembly shall be permitted to have a 1-hour fire-resistance rating, provided:

1. The building above the horizontal assembly is not required to be of Type I construction;
 2. The enclosure connects less than four stories; and
 3. The enclosure opening protectives above the horizontal assembly have a minimum 1-hour fire protection rating.
5. The building or buildings above the horizontal assembly shall be permitted to have multiple Group A uses, each with an occupant load of less than 300, or Group B, M, R or S uses.
 6. The building below the horizontal assembly is a Group S-2 enclosed or open parking garage, used for the parking and storage of private motor vehicles.

Exceptions:

1. Entry lobbies, mechanical rooms and similar uses incidental to the operation of the building shall be permitted.
 2. Multiple Group A uses, each with an occupant load of less than 300, or Group B or M uses shall be permitted, in addition to those uses incidental to the operation of the building (including storage areas), provided that the entire structure below the horizontal assembly is protected throughout by an approved automatic sprinkler system.
7. The maximum building height in feet shall not exceed the limits set forth in Section 503 for the building having the smaller allowable height as measured from the grade plane.

(Portions of the proposal not shown remain unchanged)

Commenter's Reason: The purpose for this public comment is to eliminate an unintended consequence of the originally proposed revisions. Section 509.2, as originally proposed for revision, could be interpreted as limiting the portion of the building above the horizontal assembly to one building. The current language of Section 509.2 does not intend to limit that portion of the building in such a manner and I did not intend to change that in the proposal. As currently intended and as intended by the revised proposal in this public comment, the portion of the building above the horizontal assembly could consist of more than building. Note that this unintended consequence exists with the current language unaffected by the original proposal. In Item #5 of Section 509.2, "building above the horizontal assembly" is changed to "buildings above the horizontal assembly."

Final Hearing Results

G153-06/07

AMPC1

Code Change No: G154-06/07

Original Proposal

Section: 509.2

Proponent: Marshall A. Klein, P.E., Marshall A. Klein and Associates, Inc., representing the Erickson Retirement Communities

Revise as follows:

509.2 Group S-2 enclosed or open parking garage with Group A, B, M, R or S above. A basement and/or the first story above grade plane of a building shall be considered as a separate and distinct building for the purpose of determining area limitations, continuity of fire walls, limitation of number of stories and type of construction when all of the following conditions are met:

1. The basement and/or the first story above grade plane is of Type IA construction and is separated from the building above with a horizontal assembly having a minimum 3-hour fire-resistance rating.
2. Shaft, stairway, ramp or escalator enclosures through the horizontal assembly shall have not less than a 2-hour fire-resistance rating with opening protectives in accordance with Table 715.4.

Exception: Where the enclosure walls below the horizontal assembly have not less than a 3-hour fire-resistance rating with opening protectives in accordance with Table 715.4, the enclosure walls extending above the horizontal assembly shall be permitted to have a 1-hour fire-resistance rating, provided:

1. The building above the horizontal assembly is not required to be of Type I construction;

2. The enclosure connects less than four stories; and
 3. The enclosure opening protectives above the horizontal assembly have a minimum 1-hour fire protection rating.
3. The building above the horizontal assembly shall be permitted to have multiple Group A uses, each with an occupant load of less than 300, or Group B, M, R or S uses.
 4. The building below the horizontal assembly is a Group S-2 enclosed or open parking garage, used for the parking and storage of private motor vehicles.

Exceptions:

1. Entry lobbies, mechanical rooms and similar uses incidental to the operation of the building shall be permitted.
 2. Multiple Group A uses, each with an occupant load of less than 300, or Group B or M, or R uses shall be permitted, in addition to those uses incidental to the operation of the building (including storage areas), provided that the entire structure below the horizontal assembly is protected throughout by an approved automatic sprinkler system.
5. The maximum building height in feet shall not exceed the limits set forth in Section 503 for the building having the smaller allowable height as measured from the grade plane.

Reason: Section 509.2(4) Exception #2 is being proposed to be updated to include the R-use **below** the 3-hour horizontal separation, as is already permitted by Section 508.2(3) for uses **above** the 3-hour horizontal separation.

This section's code requirements were originally from the UBC (Section 702(a)). This section was created to address mixed use construction buildings in urban areas where many cities were trying to promote mixed-use neighborhoods. The concept of these code requirements for "pedestal" buildings was a cost-effective way of allowing housing to be provided in commercial areas without jeopardizing the safety of residents. Since its placement in the UBC, and now under the IBC, it has been used to revitalize urban areas by bringing people back into the cities to live and work.

In the past few years, many projects have been proposed to use work/live units or additional dwelling units on the first floor of mixed-use buildings built under the special requirements of Section 509.2. From a fire protection/life safety standpoint, placing an R use on the first floor, below the 3-hour horizontal separation is not an issue. After all, the entire structure below the 3-hour horizontal separation is already required to be Type 1A (the highest fire resistive construction type in the Code), and is required to be protected throughout by an approved automatic sprinkler system. However, the literal text of the Exception #2 does not address an R use, which is what work/live units would also fall under.

Therefore, this code proposal would address the uses below the 3-hour horizontal separation to be consistent with the same uses above the 3-hour horizontal separation.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal was approved as submitted as it would assist efforts to revitalize urban areas without any increase in hazard. In fact the proposal may increase occupant safety by potentially locating residential occupancies closer to the level of exit discharge.

Assembly Action:

None

Final Hearing Results

G154-06/07

AS

Code Change No: **G155-06/07**

Original Proposal

Section: 509.2

Proponent: Marshall A. Klein, P.E., Marshall A. Klein and Associates, Inc.

Revise as follows:

509.2 Group S-2 enclosed or open parking garage with Group A, B, M, R or S above. A basement and/or the first story above grade plane of a building shall be considered as a separate and distinct building for the purpose of determining area limitations, continuity of fire walls, limitation of number of stories and type of construction when all of the following conditions are met:

1. The basement and/or the first story above grade plane is of Type IA construction and is separated from the building above with a horizontal assembly having a minimum 3-hour fire-resistance rating.
2. Shaft, stairway, ramp or escalator enclosures through the horizontal assembly shall have not less than a 2-hour fire-resistance rating with opening protectives in accordance with Table 715.4.

Exception: Where the enclosure walls below the horizontal assembly have not less than a 3-hour fire-resistance rating with opening protectives in accordance with Table 715.4, the enclosure walls extending above the horizontal assembly shall be permitted to have a 1-hour fire-resistance rating, provided:

1. The building above the horizontal assembly is not required to be of Type I construction;
2. The enclosure connects less than four stories; and
3. The enclosure opening protectives above the horizontal assembly have a minimum 1-hour fire protection rating.
3. The building above the horizontal assembly shall be permitted to have multiple Group A uses, each with an occupant load of less than 300, or Group B, M, R or S uses.
4. The building below the horizontal assembly ~~is shall be permitted to be~~ a Group S-2 enclosed or open parking garage; ~~used for the parking and storage of private motor vehicles.~~

Exceptions:

1. ~~Entry lobbies, mechanical rooms and similar uses incidental to the operation of the building shall be permitted.~~
2. Multiple Group A uses, each with an occupant load of less than 300; ~~or~~ Group B or M uses shall be permitted, in addition to those uses incidental to the operation of the building (including entry lobbies, mechanical rooms, storage areas, and similar uses), provided that the entire structure below the horizontal assembly is protected throughout by an approved automatic sprinkler system.
5. The maximum building height in feet shall not exceed the limits set forth in Section 503 for the building having the smaller allowable height as measured from the grade plane.

Reason: Revisions are intended to be only editorial to make the use and intent of this section of the Code clearer to the user.

The exceptions really are not exceptions, but additional uses permitted below the 3-hour horizontal separation from the building above the 3-hour horizontal separation. Since this section on "pedestal" buildings was from one of the legacy codes (UBC), users of the other two legacy codes (BOCA & SBC) have had problems understanding the intent and application of this section's exceptions. The rewording as proposed will help clear up any confusion on properly applying which uses in the IBC are permitted below the 3-hour horizontal separation.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Replace proposal as follows:

509.2 Horizontal building separation allowance. A basement and/or the first story above grade plane of a building shall be considered as a separate and distinct building for the purpose of determining area limitations, continuity of fire walls, limitation of number of stories and type of construction when all of the following conditions are met:

1. The basement and/or the first story above grade plane is of Type IA construction and is separated from the building above with a horizontal assembly having a minimum 3-hour fire-resistance rating.
2. Shaft, stairway, ramp or escalator enclosures through the horizontal assembly shall have not less than a 2-hour fire-resistance rating with opening protectives in accordance with Table 715.4.

Exception: Where the enclosure walls below the horizontal assembly have not less than a 3-hour fire-resistance rating with opening protectives in accordance with Table 715.4, the enclosure walls extending above the horizontal assembly shall be permitted to have a 1-hour fire-resistance rating, provided:

1. The building above the horizontal assembly is not required to be of Type I construction;
 2. The enclosure connects less than four stories; and
 3. The enclosure opening protectives above the horizontal assembly have a minimum 1-hour fire protection rating.
3. The building above the horizontal assembly shall be permitted to have multiple Group A uses, each with an occupant load of less than 300, or Group B, M, R or S uses.
 4. The building below the horizontal assembly ~~is~~ shall be protected throughout by an approved automatic sprinkler system in accordance with Section 903.3.1.1, and shall be permitted to be any of the following occupancies:

~~1.-a~~ Group S-2 enclosed or open parking garage used for the parking and storage of private motor vehicles. ~~1~~

Exceptions:

- ~~1. Entry lobbies, mechanical rooms and similar uses incidental to the operation of the building shall be permitted.~~
 - ~~2. Multiple Group A uses, each with an occupant load of less than 300; or~~
 - ~~3. Group B or~~
 - ~~4. Group M, and uses shall be permitted, in addition to those~~
 - ~~5. Uses incidental to the operation of the building (including entry lobbies, mechanical rooms, storage areas, and similar uses), provided that the entire structure below the horizontal assembly is protected throughout by an approved automatic sprinkler system.~~
5. The maximum building height in feet shall not exceed the limits set forth in Section 503 for the building having the smaller allowable height as measured from the grade plane.

Committee Reason: Does not change the intent of the section but clarifies that any of the occupancies listed would be allowed regardless of whether or not a Group S-2 parking garage was located in that portion of the building. The modification simply clarified the allowance with the creation of a numbered list. In order to make a numbered list the sprinkler requirements needed to be moved to the main body of item 4.

Analysis: Note that the section title has been revised by staff to coordinate better with the content of the section. Section titles are editorial.

Assembly Action:

None

Final Hearing Results

G155-06/07

AM

Code Change No: G156-06/07

Original Proposal

Sections: 509.5, 509.6

Proponent: Roger R. Evans, Park City Municipal Corporation, representing the Utah Chapter

Revise as follows:

509.5 Group R-2 buildings of Type IIIA construction. The height limitation for buildings of Type IIIA construction in Group R-2 shall be increased to six stories and 75 feet (22 860 mm) where the first-floor construction above the basement has a fire-resistance rating of not less than 3 hours and the floor area is subdivided by 2-hour fire-resistance-rated fire walls into areas of not more than 3,000 square feet (279 m²).

509.6 Group R-2 buildings of Type IIA construction. The height limitation for buildings of Type IIA construction in Group R-2 shall be increased to nine stories and 100 feet (30 480 mm) where the building is separated by not less than 50 feet (15 240 mm) from any other building on the lot and from lot lines, the exits are segregated in an area enclosed by a 2-hour fire-resistance-rated fire wall and the first-floor construction has a fire-resistance rating of not less than 1½ hours.

Reason: When you compare the differences between Group R-1 occupancies and Group R-2 occupancies and look at the fire record information that is published by NFPA, there is no justifiable reason not to extend the special provisions of Section 509 to Group R-1 occupancies.

Cost Impact: The code change proposal will decrease the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: Since fire losses in Group R-1 occupancies have been minimal they should be given the same height increase allowances as Group R-2 as addressed in Sections 509.5 and 509.6.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

William Michael Brady, Ohio Board of Building Standards, representing himself, requests Approval as Modified by this public comment.

Further modify proposal as follows:

509.5 Group R1 and R-2 buildings of Type IIIA construction. The height limitation for buildings of Type IIIA construction in Groups R1 and R-2 shall be increased to six stories and 75 feet (22 860 mm) where the first-floor construction above the basement has a fire-resistance rating of not less than 3 hours and the floor area is subdivided by 2-hour fire resistance-rated fire walls into areas of not more than 3,000 square feet (279 m2).

509.6 Groups R1 and R-2 buildings of Type IIA construction. The height limitation for buildings of Type IIA construction in Groups R1 and R-2 shall be increased to nine stories and 100 feet (30 480 mm) where the building is separated by not less than 50 feet (15 240 mm) from any other building on the lot and from lot lines, the exits are segregated in an area enclosed by a 2-hour fire-resistance-rated fire wall and the first-floor construction has a fire-resistance rating of not less than 1½ hours.

Commenter's Reason: The proponent's reasoning statement and the committee's reason for approving the proposal was based on including R-1 occupancies into section 509.5 and 509.6. The proponent's language, however, inadvertently covered all R occupancies including R-3 and R-4 (assisted living facilities) with no justification. The proposed change returns the text to the proponent's original intent.

AMPC1

Code Change No: **G157-06/07**

Original Proposal

Section: 509.8

Proponent: Philip Brazil, PE, Reid Middleton, Inc., representing himself
Revise as follows:

509.8 Group B or M with Group S-2 open parking garage above. ~~Group B or M uses located in the basement or first story below a Group S-2 open parking garage~~ A building shall be classified considered as a two separate and distinct building for the purpose of determining the type of construction when where all of the following conditions are met:

- ~~1. The basement or first story shall be Type I or II construction, but not less than the type of construction required for the open parking garage above. The height and area of the basement or first story shall not exceed the limitations in Section 503 for the Group B or M uses.~~
 - ~~2. The height and area of the open parking garage shall not exceed the limitations permitted under Section 406.3. The height, in both feet and stories, of the open parking garage shall be measured from grade plane and include both the open parking garage and the basement or first story.~~
 - ~~3. Fire separation assemblies between the open parking garage and the basement or first story use group shall correspond to the required fire-resistance rating prescribed by Table 508.3.3~~
 - ~~4. Exits serving the open parking garage shall discharge directly to a street or public way and shall be separated from the basement or first story use group by not less than 2-hour fire barriers constructed in accordance with Section 706 or 2-hour horizontal assemblies constructed in accordance with Section 711, or both, with opening protectives in accordance with Table 715.4.~~
1. The buildings are separated with a horizontal assembly having a minimum 2-hour fire-resistance rating.
 2. The occupancies in the building below the horizontal assembly are limited to Groups B and M.
 3. The building above the horizontal assembly is a Group S-2 open parking garage.
 4. The building below the horizontal assembly is no more than one story above grade plane.
 5. The building below the horizontal assembly is of Type I or II construction but not less than the type of construction required for the Group S-2 open parking garage above.
 6. The height and area of the building below the horizontal assembly does not exceed the limits set forth in Section 503.
 7. The height and area of the Group S-2 open parking garage does not exceed the limits set forth in Section 406.3. The height, in both feet and stories, of the open parking garage shall be measured from grade plane and shall include the building below the horizontal assembly.
 8. Exits serving the Group S-2 open parking garage discharge directly to a street or public way and are separated from the building below the horizontal assembly by 2-hour fire barriers constructed in accordance with Section 706 or 2-hour horizontal assemblies constructed in accordance with Section 711, or both.

Reason: The purpose of this proposal is to update the provisions for consistency with other related provisions in the code and to make them more understandable to the average code user. Item #3 currently refers to fire separation assemblies, which is the only instance in the IBC of the term. A fire-resistance-rated horizontal assembly is the likely intent. Section 711 on horizontal assemblies specifies technical provisions for horizontal assemblies ensuring horizontal compartmentation through fire-resistance of the assembly and the protection of penetrations and openings equivalent to a fire-resistance rating. There are no technical provisions in the IBC, however, for fire separation assemblies. Item #3 also refers to use groups but this term was effectively eliminated from the IBC by code change proposal G14-04/05.

Item #1 permits Group B or M occupancies in a basement or first story below a Group S-2 open parking garage to be considered a separate and distinct building if certain conditions are met. A story is defined in Section 502.1 as a “portion of a building included between the upper surface of a floor and the upper surface of the floor or roof next above.” Consequently, stories are established between all adjoining floors including basement floors. In a building with several floors below grade, the first story is located between the bottom two floors. A story no higher than the first story above grade plane is the likely intent.

The height of the first story above grade plane is well established elsewhere in Chapter 5 but that of a basement is not. The question of whether the term “basement” applies to each floor level that is partly or completely below grade or to all floor levels that are partly or completely below grade is addressed by a related code change proposal. Assuming that the term “basement” applies to each floor level that is partly or completely below grade, it is conceivable that more than one basement could qualify as a story above grade plane. The definition of basement in Section 502.1 establishes when a basement is considered a story above grade plane but there is no restriction in the definition or elsewhere in the IBC limiting such a basement to no higher than the first (one) story above grade plane.

Once the location of the basement or first story above grade plane is established, what about the floor levels below the basement or a first story above grade plane? Literally, they are currently excluded from the separate and distinct building below the fire-resistance-rated horizontal assembly. The proposed revision establishes a criterion that is more precise and closer to the intent, which is to consider a portion of a building whose topmost floor is no higher than the first story above grade plane to be a separate and distinct building.

Items #2, #3 and #4 of the proposal correspond to the current charging language. Items #5 and #6 of the proposal correspond to current Item #1. Item #7 of the proposal corresponds to current Item #2. Item #1 of the proposal corresponds to current Item #3. Item #8 of the proposal corresponds to current Item #4.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Based upon proponents request. The proponent plans to submit a public comment.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Philip Brazil, PE, Reid Middleton, Inc., representing himself requests, Approval as Modified by this public comment.

Replace the proposal with the following:

509.8 Group B or M with Group S-2 open parking garage below. Group B or M uses occupancies located in the basement or first story below a Group S-2 open parking garage no higher than the first story above grade plane shall be ~~classified~~ considered as a separate and distinct building for the purpose of determining the type of construction ~~when~~ where all of the following conditions are met:

1. ~~The basement or first story shall be Type I or Type II construction, but not less than the type of construction required for the open parking garage above. The height and area of the basement or first story shall not exceed the limitations in Section 503 for the B or M uses.~~
 2. ~~The height and area of the open parking garage shall not exceed the limitations permitted under Section 406.3. The height, in both feet and stories, of the open parking garage shall be measured from grade plane and include both the open parking garage and the basement or first story.~~
 3. ~~Fire separation assemblies between the open parking garage and the basement or first story use group shall correspond to the required fire resistance rating prescribed by Table 508.3.3.~~
 4. ~~Exits serving the open parking garage shall discharge directly to a street or public way and shall be separated from the basement or first story use group by 2-hour fire barriers constructed in accordance with Section 706 or 2-hour horizontal assemblies constructed in accordance with Section 711, or both, with opening protectives in accordance with Section 715.4.~~
1. The buildings are separated with a horizontal assembly having a minimum 2-hour fire-resistance rating.
 2. The occupancies in the building below the horizontal assembly are limited to Groups B and M.
 3. The occupancy above the horizontal assembly is limited to a Group S-2 open parking garage.
 4. The building below the horizontal assembly is of Type I or II construction but not less than the type of construction required for the Group S-2 open parking garage above.
 5. The height and area of the building below the horizontal assembly does not exceed the limits set forth in Section 503.
 6. The height and area of the Group S-2 open parking garage does not exceed the limits set forth in Section 406.3. The height, in both feet and stories, of the Group S-2 open parking garage shall be measured from grade plane and shall include the building below the horizontal assembly.
 7. Exits serving the Group S-2 open parking garage discharge directly to a street or public way and are separated from the building below the horizontal assembly by 2-hour fire barriers constructed in accordance with Section 706 or 2-hour horizontal assemblies constructed in accordance with Section 711, or both.

Commenter's Reason: The purpose for the public comment is to eliminate an unintended consequence of the originally proposed revisions. Section 509.8, as originally proposed for revision, could be interpreted as limiting the Group S-2 open parking garage above the horizontal assembly to one building. The current language of Section 509.8 does not intend to limit the open parking garage in such a manner and I did not intend to change that in the proposal. As currently intended and as intended by the revised proposal in this public comment, the Group S-2 open parking garage could consist of more than building.

Final Hearing Results

G157-06/07

AMPC1

Code Change No: G158-06/07

Original Proposal

Section: 509.9 (New)

Proponent: John Berry, Cole + Russell Architects, Inc., Cincinnati, OH

Add new text as follows:

509.9 Multiple buildings above an enclosed or open Group S-2 parking garage. Where two or more buildings are provided above the horizontal assembly separating a Group S-2 open or closed parking garage from the buildings above in accordance with the special provisions in Sections 509.2, 509.3, 509.4 and 509.7, the buildings above the horizontal assembly shall be regarded as separate and distinct buildings and shall comply with all other provisions of this code as applicable to each separate and distinct building.

Reason: This text is needed to clarify when two or more buildings are built atop a common parking garage that the buildings above the garage are to be considered as distinct buildings separate from one another. As an example, this will allow a four-story Type VA Group R-2 condominium building to be built as a separate building from a six-story Type IIA Group B office building. Although this may be obvious to some, I have had more than one jurisdiction interpret that multiple structures above the parking garage are actually one building and are limited to the most restrictive construction type and Use Group provisions. The proposed text legitimizes the evaluation of this example as two distinct buildings for construction type, fire separation distance, suppression, opening protectives, etc.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

509.9 Multiple buildings above an enclosed or open Group S-2 parking garage. Where two or more buildings are provided above the horizontal assembly separating a Group S-2 open or closed parking garage from the buildings above in accordance with the special provisions in Sections 509.2, 509.3, ~~509.4~~ and 509.7, the buildings above the horizontal assembly shall be regarded as separate and distinct buildings and shall comply with all other provisions of this code as applicable to each separate and distinct building.

Committee Reason: Clarifies that buildings located above the horizontal separation are allowed to be addressed as separate and distinct buildings from other buildings also located above the same horizontal separation. The modification removes reference to a section that is only focused upon a single building with a parking garage underneath.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Rick Thornberry, P.E., The Code Consortium, requests Approval as Modified by this public comment.

Further modify proposal as follows:

509.9 Multiple buildings above an enclosed or open Group S-2 parking garage. Where two or more buildings are provided above the horizontal assembly separating a Group S-2 open or closed parking garage from the buildings above in accordance with the special provisions in Sections 509.2, ~~and 509.3, and 509.7,~~ the buildings above the horizontal assembly shall be regarded as separate and distinct buildings and shall comply with all other provisions of this code as applicable to each separate and distinct building.

Commenter's Reason: The purpose of this Public Comment is to restrict the application of this proposed new section that allows two or more buildings to be located above the horizontal assembly that separates a Group S-2 parking garage from the buildings above so they can be treated as separate and distinct buildings. Currently, we believe the code would only allow that condition to occur for Sections 509.2 and 509.3 which specify that the buildings located above the horizontal assembly are considered separate from the parking garage below the horizontal assembly.

Furthermore, the horizontal assembly in that case is required to have a minimum 3 hour fire-resistance rating which, in effect, serves as a "horizontal" fire wall. Such is not the case for Sections 509.4 and 509.7 which simply specify an occupancy separation between the parking garage and the structure above. Therefore, in addition to the committee action for Approved as Modified which deleted the reference to Section 509.4 we have proposed to delete Section 509.7 from this code change proposal with this Public Comment.

These are different applications that still treat the building as one complete building with a different occupancy located above the Group S-2 parking garage. But they do not treat the horizontal fire separation between the Group S-2 parking garage and the occupancies above as creating a separate and distinct building like Sections 509.2 and 509.3. Therefore, if the membership believes this section is necessary to further clarify the application of the code regarding the buildings constructed above the horizontal assembly specified in the special provisions of Section 509, then we urge the membership to vote to approve this Public Comment. It further amends this code change proposal to delete the reference to Section 509.7 which does not apply for the purpose of this original code change proposal

Final Hearing Results

G158-06/07

AMPC1

Code Change No: G160-06/07

Original Proposal

Table 601

Proponent: Herb Yingling, Greenville County, South Carolina, representing himself

Add new footnote to table as follows:

**TABLE 601
FIRE-RESISTANCE RATING REQUIREMENTS FOR BUILDING ELEMENTS (hours)**

BUILDING ELEMENT
Structural frame ^{a,h}
Bearing walls
Exterior ^{g,h}
Interior

a. through g. (No change to current text)

h. Not less than the fire-resistance rating as referenced in Section 714.5.

(Portions of table and footnotes not shown do not change)

Reason: The purpose of the proposed change is to insure navigation to applicable corresponding section of the code. The reason is to coordinate the appropriate code sections with the table.

The section is commonly overlooked when determining the required ratings of structural members. The most common type of construction that is affected is IIIB construction, however all the "B" types are affected by the section.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The requirements in Section 714.5 for exterior walls are commonly overlooked. This reference in a footnote to Table 601 will ensure that the structural members are protected appropriately.

Assembly Action:

None

Final Hearing Results

G160-06/07

AS

Code Change No: **G168-06/07**

Original Proposal

Section: 603.1

Proponent: Joseph Holland, Hoover Treated Wood Products

Revise as follows:

603.1 Allowable materials. Combustible materials shall permitted in buildings of Type I or Type II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:

1. Fire-retardant-treated wood shall be permitted in:
 - 1.1. Nonbearing partitions where the required fire-resistance rating is 2 hours or less.
 - 1.2. Nonbearing exterior walls where no fire rating required.
 - 1.3. Roof construction, including girders, trusses, framing and decking.

Exception: In buildings of Type IA construction exceeding two stories in height, fire-retardant-treated wood is not permitted in roof construction when the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).

(Items 2 through 22 – no change to text)

Reason: The purpose of this change is to allow FRTW for the roof on a Type IB building.

Under the BOCA code Type 2 construction allowed FRTW use in roof systems. During the conversion from the legacy codes to the IBC changes in the types of construction resulted in the Boca 2A (2,2,1-½,) being eliminated and replaced with the IBC (2,2,2), Type IB. This change reduced the allowable height where FRTW can be used from a maximum of 100 feet to a maximum of 65 feet. Because Type 2A was lost, the roof application where FRTW could be used was unfairly lost. There is no fire record showing FRTW in the roofs of the BOCA 2A building did not perform as expected. By restricting the application to the IBC Type II construction the IBC has created a class of non-conforming building. Example: any business occupancy over 5 stories or any residential occupancy over 4 stories.

A comparison of IBC Type IB and BOCA Type 2A shows they are very similar in the fire protection required for the structural elements. In addition to the built in protection under the IBC, most multistory structures would have to be sprinklered.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The committee felt that allowing fire retardant treated wood in Type IB roof construction when less than 20 feet from the upper floor of a building us appropriate. The allowance is justified based upon the performance history of such materials.

Assembly Action:

None

Final Hearing Results

G168-06/07

AS

Code Change No: **G169-06/07**

Original Proposal

Section: 603.1

Proponent: Philip Brazil, PE, Reid Middleton, Inc., representing himself

Revise as follows:

603.1 Allowable materials. Combustible materials shall be permitted in buildings of Type I or Type II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:

1. Fire-retardant-treated wood shall be permitted in:
 - 1.1. Nonbearing partitions where the required fire-resistance rating is 2 hours or less.
 - 1.2. Nonbearing exterior walls where no fire rating is required.
 - 1.3. Roof construction, including girders, trusses, framing and decking.

Exception: In buildings of Type I construction exceeding two stories in height, fire-retardant-treated wood is not permitted in roof construction when the vertical distance from the upper floor to the roof is less than 20 feet (6096 mm).

2. Thermal and acoustical insulation, other than foam plastics, having a flame spread index of not more than 25.

Exceptions:

1. Insulation placed between two layers of noncombustible materials without an intervening airspace shall be allowed to have a flame spread index of not more than 100.
2. Insulation installed between a finished floor and solid decking without intervening airspace shall be allowed to have a flame spread index of not more than 200.
3. Foam plastics in accordance with Chapter 26.
4. Roof coverings that have an A, B or C classification.
5. Interior floor finish ~~and interior finish, trim and floor covering materials installed in accordance with Section 804.~~
6. Millwork such as doors, door frames, window sashes and frames.
7. Interior wall and ceiling finishes installed in accordance with Sections 801 and 803.
8. Trim installed in accordance with Section 806.
9. Where not installed over 15 feet (4572 mm) above grade, show windows, nailing or furring strips and wooden bulkheads below show windows, including their frames, aprons and show cases.
- 7- 10. Finished Finish flooring applied directly to the floor slab or to wood sleepers that are fireblocked in accordance with Section 717.2.7 installed in accordance with Section 805.

(Renumber remaining items #8 through 22 accordingly)

Reason: The purpose of this proposal is to restore portions of the revisions approved in the 2004/2005 code development cycle by code change proposals G154-04/05 (AS) and G160-04/05 (AM) that were inadvertently deleted by public comment #1 on code change proposal FS163-04/05 (D), which was approved at the final action hearings (AMPC1). Four proposals were submitted for the purpose of revising the provisions on floor finish, finished flooring and floor coverings. The fourth proposal was G153-04/05 (AS) in addition to the three proposals listed above. They were developed in coordination with each other and to be heard in a specific order. Proposal FS163-04/05 was intended to be heard last. It was assumed that the four proposals would be assigned to the same committee. Instead, they were assigned to two committees, the Fire Safety and General Code Committees. At the Cincinnati hearings, the Fire Safety Committee met before the General Code Committee. Instead of being heard last, proposal FS163-04/05 was heard first.

The proposed revisions to Section 603.1 in proposals G154-04/05 (AS) and G160-04/05 (AM) had been repeated in proposal FS163-04/05 for the reference of the committee members, assuming proposals G154-04/05 (AS) and G160-04/05 (AM). When I discovered that proposal FS163-04/05 would be heard first, rather than last, a floor amendment was submitted to correct the problem. The floor amendment was not sufficient to obtain approval of proposal FS163-04/05.

The purpose for public comment #1 to proposal FS163-04/05 was to address the committee's concerns with the language in Section 804.4.1 associating interior floor finish with the DOC FF-1 pill test and the rectify what the floor amendment had failed to do. Section 603.1 was included in public comment #1 to eliminate the proposed changes to Section 603.1 in proposal FS163-04/05 because they had already been approved by proposals G154-04/05 and G160-04/05. It was not my intent to reverse the approved revisions. Unfortunately, the effect of public comment #1 to proposal FS163-04/05 was to do just that. This proposal, if approved, will restore the revisions to Section 603.1 that had been approved by proposals G154-04/05 and G160-04/05.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal fixed a section that was revised but then unintentionally undone during the 04/05 public comment phase.

Assembly Action:

None

Final Hearing Results

G169-06/07

AS

Code Change No: G171-06/07

Original Proposal

Sections: 1203.2.1, IRC R806.1

Proponent: Roger R. Wristen, Collins Products, LLC, Portland, Oregon

THIS PROPOSAL IS ON THE AGENDA OF THE IBC GENERAL AND IRC BUILDING/ENERGY COMMITTEES. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

PART I – IBC

Revise as follows:

1203.2.1 Openings into attic. Exterior openings into the attic space of any building intended for human occupancy shall be covered with corrosion-resistant wire cloth screening, hardware cloth, perforated vinyl or similar material that will prevent the entry of birds, squirrels, rodents, snakes and other similar creatures. ~~The openings therein shall be a minimum of 1/8 inch (3.2 mm) and shall not exceed 1/4 inch (6.4 mm).~~ The openings shall be a penetration or multiple slots not to exceed 12 inches (305 mm) in length with width of the opening shall be a minimum of 1/8 inch (3.2 mm) and shall not exceed 1/4 inch (6.4 mm). Where combustion air is obtained from an attic area, it shall be in accordance with Chapter 7 of the *International Mechanical Code*.

PART II – IRC

Revise as follows:

R806.1 Ventilation required. Enclosed attics and enclosed rafter spaces formed where ceilings are applied directly to the underside of roof rafters shall have cross ventilation for each separate space by ventilating openings protected against the entrance of rain or snow. ~~Ventilating openings shall be provided with corrosion-resistant wire mesh, 1/8 inch (3.2 mm) minimum to 1/4 inch (6.4 mm) maximum openings.~~ The openings shall be a penetration or multiple slots not to exceed 12 inches (305 mm) in length with width of the opening shall be a minimum of 1/8 inch (3.2 mm) and shall not exceed 1/4 inch (6.4 mm).

Reason: The requested change for this product will reduce construction cost and slots will be so placed that venting compliance per Section 1203.2 Attic spaces, will be accomplished. The current language is overly restrictive as the maximum ¼ inch width regardless of length prohibits entry of bird, snakes, etc.

Cost Impact: The code change proposal will decrease the cost of construction and minimize building site errors.

Public Hearing Results

PART I C IBC

Committee Action:

Approved as Modified

Modify the proposal as follows:

1203.2.1 Openings into attic. Exterior openings into the attic space of any building intended for human occupancy shall be protected covered with corrosion-resistant wire cloth screening, hardware cloth, perforated vinyl or similar material that will prevent the entry of birds, squirrels, rodents, snakes and other similar creatures. The openings shall be a penetration or multiple slots not to exceed 12 inches (305 mm) in length with width of the opening shall be a minimum of 1/8 inch (3.2 mm) and shall not exceed 1/4 inch (6.4 mm). Openings for ventilation having a least dimension of 1/8 inch (3.2 mm) minimum and 1/4 inch (6.4 mm) maximum shall be permitted. Openings for ventilation larger than 1/4 inch (6.4 mm) shall be provided with corrosion-resistant wire cloth screening, hardware cloth, perforated vinyl or similar material with 1/8 inch (3.2 mm) minimum and 1/4 inch (6.4 mm) maximum openings. Where combustion air is obtained from an attic area, it shall be in accordance with Chapter 7 of the *International Mechanical Code*.

Committee Reason: The modified proposal provides more flexibility for size and number of openings for attic ventilation. The modification made the allowance for the size of openings in much more general terms to reduce possible confusion of the intention. The intent is that openings greater than 1/4 inch be protected.

Assembly Action:

None

PART II C IRC**Committee Action:**

Approved as Modified

Modify the proposal as follows:

R806.1 Ventilation required. Enclosed attics and enclosed rafter spaces formed where ceilings are applied directly to the underside of roof rafters shall have cross ventilation for each separate space by ventilating openings protected against the entrance of rain or snow. The openings shall be a penetration or multiple slots not to exceed 12 inches (305 mm) in length with width of the opening shall be a minimum of 1/8 inch (3.2 mm) and shall not exceed 1/4 inch (6.4 mm). Ventilation openings shall have a least dimension of 1/16 inch (1.6 mm) minimum and 1/4 inch (6.4 mm) maximum. Ventilation openings larger than 1/4 inch (6.4 mm) shall be provided with corrosion-resistant wire cloth screening, hardware cloth, or similar material with 1/8 inch (3.2 mm) minimum and 1/4 inch (6.4 mm) maximum openings.

Committee Reason: This change permits use of additional products to be used for screening ventilation openings. The modification clarifies the opening limitation on the screening products.

Assembly Action:

None

Final Hearing Results

G171-06/07, Part I	AM
G171-06/07, Part II	AM

Code Change No: G174-06/07

Original Proposal

Section: 1210.1

Proponent: David S. Collins, FAIA, The Preview Group, Inc., representing the American Institute of Architects

Revise as follows:

1210.1 Floors and wall base finish materials. In other than dwelling units, toilet, ~~and~~ bathing and shower room floors finish materials shall have a smooth, hard, nonabsorbent surface. The intersections of such floors with walls shall have a smooth, hard, nonabsorbent vertical base that extends upward onto the walls at least 6 1/4 inches (162 102 mm).

Reason: This code change stems from an interpretation that the floor of a bathroom does not permit the use of tile with a separate base. It was read as requiring a material that is homogenous, such as sheet vinyl or terrazzo. The explanation given was that if the *floor material extends upward*, then it must be continuous and unbroken, and you cannot do that with tile (or any other floor finish) and a separate base. The surface of VCT is slightly porous until it's polished, but it certainly cannot be considered absorbent. There did not appear to be any support in the background of any of the legacy codes that would lead to this interpretation.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The committee agreed with reducing the extension of the wall materials from 6 inches to 4 inches as it is a more reasonable minimum.

Assembly Action:

None

Final Hearing Results

G174-06/07

AS

Code Change No: G182-06/07

Original Proposal

Section: 3002.7

Proponent: Ron Drey, CBO, C-West Code Consultants

Revise as follows:

3002.7 Common enclosure with stairway. Elevators shall not be in a common shaft enclosure with a stairway.

Exception: Open parking garages.

Reason: Taken at face value, Section 3002.7 precludes elevators & stairs in a common shaft enclosure in all cases. This is not true. The infrequent user of the code would have to know to go to Sections 707.14 and 1019.1, Exception.5 to determine that's not the case for open parking garages.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This exception clarifies that elevators and stairways can be located in a common shaft enclosure when located in an open parking garage. This is specifically allowed in Section 1020.1 exception 5.

Assembly Action:

None

Final Hearing Results

G182-06/07

AS

Code Change No: **G183-06/07**

Original Proposal

Section: 3004.3

Proponent: Ed Donoghue, Edward A. Donoghue Associates, Inc. (EADAI), representing the National Elevator Industry, Inc. (NEII)

Revise as follows:

3004.3 Area of vents. Except as provided for in Section 3004.3.1, the area of the vents shall not be less than $3\frac{1}{2}$ percent of the area of the hoistway nor less than 3 square feet (0.28 m²) for each elevator car, and not less than $3\frac{1}{2}$ percent nor less than 0.5 square feet (0.047 m²) for each dumbwaiter car in the hoistway, whichever is greater. Of the total required vent area, not less than one-third shall be permanently open. Closed portions of the required vent area shall consist of openings glazed with annealed glass not greater than 0.125 inch (3.2 mm) in thickness. The manual override control shall be located in an approved location.

Exception: The total required vent area shall not be required to be permanently open where all the vent openings automatically open upon detection of smoke in the elevator lobbies or hoistway, upon power failure and upon activation of a manual override control.

Reason: To require that an approved location be established for the manual override.

Currently the section does not give any indication of location. This acknowledges that each situation is unique and such a location must be established for each building.

If a manual override control is required a location needs to be established. In this case an exact location can not be mandated within the code because each situation is different.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

3004.3 Area of vents. Except as provided for in Section 3004.3.1, the area of the vents shall not be less than $3\frac{1}{2}$ percent of the area of the hoistway nor less than 3 square feet (0.28 m²) for each elevator car, and not less than $3\frac{1}{2}$ percent nor less than 0.5 square feet (0.047 m²) for each dumbwaiter car in the hoistway, whichever is greater. Of the total required vent area, not less than one-third shall be permanently open. Closed portions of the required vent area shall consist of openings glazed with annealed glass not greater than 0.125 inch (3.2 mm) in thickness. ~~The manual override control shall be located in an approved location.~~

Exception: The total required vent area shall not be required to be permanently open where all the vent openings automatically open upon detection of smoke in the elevator lobbies or hoistway, upon power failure and upon activation of a manual override control. The manual override control shall be located in an approved location.

Committee Reason: Since manual override is required when using the exception to automatically open the vents the location of such controls needs to be addressed. In addition a modification was needed to move the new provisions to the end of the exception instead of the end of the main section. The language was more applicable to the exception which is where the manual control requirements are located.

Assembly Action:

None

Code Change No: G187-06/07

Original Proposal

Section: 3006.4

Proponent: Ed Donoghue, Edward A. Donoghue Associates, Inc. (EADAI), representing the National Elevator Industry, Inc. (NEII)

Revise as follows:

3006.4 Machine rooms and machinery spaces. Elevator machine rooms and machinery spaces shall be enclosed with fire barriers complying with Section 706 or horizontal assemblies complying with Section 711 having a minimum 1 hour fire-resistance rating and not less than the required rating of the hoistway enclosure served by the machinery. Openings shall be protected with assemblies having a fire-protection rating not less than that required for the hoistway enclosure doors.

Exception: Machine rooms and machinery spaces not abutting and not having any openings to the hoistway enclosure they serve shall be permitted to be enclosed by a 1 hour fire barrier.

Reason: Allows a machine room or machinery space to have a maximum fire resistance rating of 1 hour even if when the hoistway would require a higher rating. Only allowed when they are separate from one another.

The current requirement for Section 3006.4 is too strict for elevator machine rooms that do not abut and do not have any openings to the elevator shaft. Also, some elevators, such as those within an atrium space, are not required to be within a fire-rated hoistway enclosure. The 1 hour room enclosure is drawn from that required by the code for isolating a hazardous contents room from the remainder of the space on a floor.

Similar to code change G171-04/05.

Cost Impact: The code change proposal will decrease the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The language trying to provide a reduction in fire resistance construction for machinery rooms and spaces not next to the hoistway was not clear. The language in G188-06/07 was clearer though that was also disapproved.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

Ed Donoghue, Edward A. Donoghue Associates, Inc. (EADAI), representing the National Elevator Industry, Inc. (NEII), requests Approval as Modified by this public comment.

Replace proposal with the following:

3006.4 Machine rooms and machinery spaces. Elevator machine rooms and machinery spaces shall be enclosed with fire barriers complying with Section 706 or horizontal assemblies complying with Section 711 having a fire-resistance rating not less than the required rating of the hoistway enclosure served by the machinery. Openings shall be protected with assemblies having a fire-protection rating not less than that required for the hoistway enclosure doors.

Exception: Where machine rooms and machinery spaces do not abut and have no openings to the hoistway enclosure they serve the fire barriers complying with 706 or horizontal assemblies complying with Section 711 shall be permitted to be reduced to a 1 hour fire resistance rating.

Commenter's Reason: The original proposal had two objectives. The first was to retain a minimum rating of machine rooms and spaces when the hoistway was not required to be enclosed and the second objective was to give credit to machine rooms and machinery spaces remote from the hoistway. This public comment focuses on the latter. The intent of the original proposal with respect to the new exception was to allow a machine room or machinery space to have a reduced rating of 1 hour when the hoistway would require a 2 hour fire resistance rating in accordance with Section 707.4. This would only be allowed when the hoistway and machine room or machinery space do not abut one another. The current requirement for Section 3006.4 is too strict for elevator machine rooms that do not abut and do not have any openings to the elevator shaft. The language has been revised to be more consistent with that originally proposed by G188-06/07 but retaining a 1 hour minimum rating for the enclosure.

Final Hearing Results

G187-06/07

AMPC1

Code Change No: G188-06/07

Original Proposal

Section: 3006.4

Revise as follows:

3006.4 Machine rooms and machinery spaces. Elevator machine rooms and machinery spaces shall be enclosed with fire barriers complying with Section 706 or horizontal assemblies complying with Section 711 having a fire-resistance rating not less than the required rating of the hoistway enclosure served by the machinery. Openings shall be protected with assemblies having a fire-protection rating not less than that required for the hoistway enclosure doors.

Exception: When machine room and machinery spaces do not abut and have no openings to the hoistway enclosure they serve, the machine room and machinery spaces need not be rated.

Reason: This exception eliminates the need to fire rate the room enclosing the equipment in this situation. The reason is, there are no openings directly from the machine room to the elevator shaft and in some cases the machine room may be in a different part of the building. The intent of this code section is for rooms that become a part of an elevator shaft due to the fact that they have unprotected openings between the room and the shaft due to some of the mechanics involved with the elevator.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Language is clearer than what is proposed in G187-06/07 but there were concerns related to the lack of fire resistive separation. Specifically how will that affect fire fighter safety when using such elevators? It was suggested that perhaps it should be limited to lower rise buildings.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Jim McClintic, Sandy City Corporation, representing the Utah Chapter requests Approval as Modified by this public comment.

Modify proposal as follows:

3006.4 Machine rooms and machinery spaces. Elevator machine rooms and machinery spaces shall be enclosed with fire barriers complying with Section 706 or horizontal assemblies complying with Section 711 having a fire-resistance rating not less than the required rating of the hoistway enclosure served by the machinery. Openings shall be protected with assemblies having a fire-protection rating not less than that required for the hoistway enclosure doors.

Exception: In buildings 4 stories or less, above grade plane when machine room and machinery spaces do not abut and have no openings to the hoistway enclosure they serve, the machine room and machinery spaces need not be rated.

Commenter-s Reason: With committee's recommendations a revision has been added to limit this exception to lower rise buildings and eliminating concerns over fire fighter safety.

Final Hearing Results

G188-06/07

AMPC1

Code Change No: G189-06/07

Original Proposal

Section: 3102.2

Proponent: Juli Case, Industrial Fabrics Association International

Revise definition as follows:

3102.2 Definitions. The following words and terms shall, for the purposes of this section and as used elsewhere in this code, have the meanings shown herein:

AIR-INFLATED STRUCTURE. ~~A building where the shape of the structure is maintained by air pressurization of cells or tubes to form a barrel vault over the usable area.~~ A structure that uses air-pressurized membrane beams, arches or other elements to enclose space. Occupants of such a structure do not occupy the pressurized area used to support the structure.

Reason: To clarify the code. The suggested wording more accurately reflects terminology currently utilized in the membrane structure industry.

Members of the Industrial Fabrics Association International, including the Lightweight Structures Association; the Professional Awning Manufacturers Association; the Tent Rental Division; and the Banner, Flag & Graphics Association, worked jointly on assessing terminology. Participants reflected backgrounds in engineering, architecture, end product manufacturing and component suppliers.

The change reflected in the proposed definition is already being used in the membrane structure industry, having been published in the *Fabric Architecture* and *Industrial Fabric Products Review* magazines, published on the Lightweight Structures Association website, and used by the IFAI International Achievement Awards program.

Bibliography:

"By Any Other Name," *Industrial Fabric Products Review*, volume 91, Number 1, January 2006.
"A Defining Moment for Fabric Structures," *InTents*, volume 12, number 1, February/March 2005
"Defining the Basics," *InTents*, Volume 13, Number 1, February/March 2006
Lightweight Structures Association, Structure Definitions, <http://www.lightweightstructures-ifai.com>
IFAI International Achievement Awards 2006 entry brochure

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The revision allows greater flexibility for the types of air inflated structures available. The current definition is limited in scope.

Assembly Action:

None

Final Hearing Results

AS

Code Change No: **G190-06/07**

Original Proposal

Section: 3104.5

Proponent: Marshall A. Klein, P.E., Marshall A. Klein and Associates, Inc., representing the Erickson Retirement Communities

Revise as follows:

3104.5 Fire barriers between pedestrian walkways and buildings. Walkways shall be separated from the interior of the building by fire-barrier walls with a fire-resistance rating of not less than 2 hours. This protection shall extend vertically from a point 10 feet (3048 mm) above the walkway roof surface or the connected building roof line, whichever is lower, down to a point 10 feet (3048 mm) below the walkway and horizontally 10 feet (3048 mm) from each side of the pedestrian walkway. Openings within the 10-foot (3048 mm) horizontal extension of the protected walls beyond the walkway shall be equipped with devices providing a $\frac{3}{4}$ -hour fire protection rating in accordance with Section 715.

Exception: The walls separating the pedestrian walkway from a connected building and the openings within the 10 foot horizontal extension of the protected walls beyond the walkway are not required to have a fire-resistance rating by this section where any of the following conditions exist:

1. The distance between the connected buildings is more than 10 feet (3048 mm), the pedestrian walkway and connected buildings, except for open parking garages, are equipped throughout with an automatic sprinkler system in accordance with NFPA 13 and the wall is constructed of a tempered, wired or laminated glass wall and doors subject to the following:
 - 1.1. The glass shall be protected by an automatic sprinkler system in accordance with NFPA 13 and the sprinkler system shall completely wet the entire surface of interior sides of the glass wall when actuated.
 - 1.2. The glass shall be in a gasketed frame and installed in such a manner that the framing system will not deflect without breaking (loading) the glass before the sprinkler operates.
 - 1.3. Obstructions shall not be installed between the sprinkler heads and the glass.
2. The distance between the connected buildings is more than 10 feet (3048 mm) and both sidewalls of the pedestrian walkway are at least 50 percent open with the open area uniformly distributed to prevent the accumulation of smoke and toxic gases.
3. Buildings are on the same lot in accordance with Section 503.1.2.
4. Where exterior walls of connected buildings are required by Section 704 to have a fire-resistance rating greater than 2 hours, the walkway shall be equipped throughout with an automatic sprinkler system installed in accordance with NFPA 13.

Reason: The additional wording is intended to be editorial in order to clarify the application of the Exception to the base requirements of Section 3104.5. This section of the IBC (verbatim) on pedestrian walkways was originally from the BOCA Code. It was the result of BOCA Code Change B43-89, that was submitted by John W. McCormick, P.E., Rolf Jenson & Associates (Mr. McCormick is now a principle at Code Consultants, Inc., St. Louis, MO).

According to BOCA Code Change B43-89 supporting statement, and how it was applied under the BOCA Code when incorporated into the 1990 edition, the application of the exception conditions to Section 3104.5 are intended to apply to all the base requirements of Section 3104.5.

The base requirements of Section 3104.5 are to provide:

1. On each side of the pedestrian walkway, where the walkway connects to the buildings, the *interior* walls between the walkway and the connected buildings shall be 2 hour fire rated.
2. For 10' around the exterior of the pedestrian walkway, where the walkway connects to the buildings, the *exterior* walls of the buildings shall be 2 hour fire rated.
3. For 10' horizontally out from the exterior of the pedestrian walkway, where the walkway connects to the buildings, any *exterior* openings of the buildings shall be $\frac{3}{4}$ hour fire rated.

Therefore, the intent of the Section 3104.5 Exception is that application of *any* of the four listed design alternatives under the exception will apply to *all* the base requirements of Section 3104.5.

Since its inclusion into the first edition of the IBC, some designers and code officials are misunderstanding the application of this Exception and *only* applying the Exception to the *interior* walls between the walkway and the connected buildings (Base requirement #1 noted above). This is incorrect, and the proposed additional text is only intended to clear up this confusion.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: Clarifies that the exception not only applies to the wall but also to the openings contained in the wall. This reduces potential confusion for designers and authorities.

Assembly Action:

None

Final Hearing Results

G190-06/07

AS

Code Change No: G191-06/07

Original Proposal

Section: 3104.5

Proponent: Marshall A. Klein, P.E., Marshall A. Klein and Associates, Inc., representing the Erickson Retirement Communities

Revise as follows:

3104.5 Fire barriers between pedestrian walkways and buildings. Walkways shall be separated from the interior of the building by fire-barrier walls with a fire-resistance rating of not less than 2 hours. This protection shall extend vertically from a point 10 feet (3048 mm) above the walkway roof surface or the connected building roof line, whichever is lower, down to a point 10 feet (3048 mm) below the walkway and horizontally 10 feet (3048 mm) from each side of the pedestrian walkway. Openings within the 10-foot (3048 mm) horizontal extension of the protected walls beyond the walkway shall be equipped with devices providing a 3/4-hour fire protection rating in accordance with Section 715.

Exception: The walls separating the pedestrian walkway from a connected building are not required to have a fire-resistance rating by this section where any of the following conditions exist:

1. The distance between the connected buildings is more than 10 feet (3048 mm), ~~and~~ ~~the~~ pedestrian walkway and connected buildings, except for open parking garages, are equipped throughout with an automatic sprinkler system in accordance with NFPA 13, ~~and~~ ~~the~~ wall is capable of resisting the passage of smoke or is constructed of a tempered, wired or laminated glass wall and doors subject to the following:
 - 1.1. The wall or glass separating the interior of the building from the pedestrian walkway shall be protected by an automatic sprinkler system in accordance with NFPA 13 and the sprinkler system shall completely wet the entire surface of interior sides of the ~~glass wall~~ or glass when actuated.
 - 1.2. The glass shall be in a gasketed frame and installed in such a manner that the framing system will deflect without breaking (loading) the glass before the sprinkler operates.
 - 1.3. Obstructions shall not be installed between the sprinkler heads and the wall or glass.
2. The distance between the connected buildings is more than 10 feet (3048 mm) and both sidewalls of the pedestrian walkway are at least 50 percent open with the open area uniformly distributed to prevent the accumulation of smoke and toxic gases.
3. Buildings are on the same lot in accordance with Section 503.1.2.
4. Where exterior walls of connected buildings are required by Section 704 to have a fire-resistance rating greater than 2 hours, the walkway shall be equipped throughout with an automatic sprinkler system installed in accordance with NFPA 13.

Reason: The existing first sentence of Condition #1 is recommended to be broken into three separate sentences for editorial purposes. The existing first sentence has three distinct code requirements that are more user-friendly to understand if broken into three sentences.

The rest of the additional wording is intended to provide a reasonable equivalency to Condition #1 when the wall assembly is not entirely comprised of glass.

This section of the IBC (verbatim) on pedestrian walkways was originally from the BOCA Code. It was the result of BOCA Code Change B43-89, that was submitted by John W. McCormick, P.E., Rolf Jenson & Associates (Mr. McCormick is now a principle at Code Consultants, Inc., St. Louis, MO).

There are reasonable designs where the walls between the walkways and the connected buildings are a combination of both glass and drywall (or other solid opaque material) that are capable of resisting the passage of smoke equal to, or better, than the glass criteria stated under Condition #1. The added terminology used for this proposal "...capable of resisting the passage of smoke..." is consistent with the same wording used for construction of similar walls for incidental uses under Section 508.2.2.1.

Based on a recent informal interpretation from ICC staff, the literal text of Condition #1 would only permit assemblies entirely constructed of glass to be provided. Even though other wall assemblies may be equal to or better than glass, such as a wall "...capable of resisting the passage of smoke...", such a reasonable alternative would need to be considered under the present Code by way of Sections 104.10, "Modifications", and 104.11, "Alternative materials, design and methods of construction and equipment".

There is no reduction in the fire protection/life safety under this proposal, and one could reasonably argue that the proposed type of wall assembly added to this Condition #1 is not as smoke resistant as the glass wall condition now permitted under the existing Condition #1. This common situation of a glass wall, or solid wall capable of resisting the passage of smoke, or any combination of the two types, should be incorporated into the text of Condition #1 since it is a reasonable and logical design of such wall assemblies in the past, present and future editions of this Code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal was accepted as it would allow a solid wall the same exception already afforded to a glass wall as indicated in exception 1. A solid wall provides a equal or greater level of protection.

Assembly Action:

None

Final Hearing Results

G191-06/07

AS

Code Change No: G198 -06/07

Original Proposal

Sections: 3403.3 (IEBC [B] 302.3)

Proponent: William W. Stewart, FAIA, Chesterfield, MO, representing himself

Revise as follows:

3403.3 (IEBC 302.3) Nonstructural. Nonstructural alterations or repairs to an existing building or structure are permitted to be made of the same materials of which the building or structure is constructed, provided that they do not adversely affect any structural member or the fire-resistance rating of any part of the building or structure.

The work shall not make the building less conforming to the building, plumbing, mechanical, electrical or fire codes of the jurisdiction, or to alternative materials, design and methods of construction, or to any previously approved plans, modifications, alternative methods, or compliance alternatives, than it was before the repair was undertaken.

Reason: Section 3403.3 covers repairs fairly well but by adding the words from Section 401.3 in the *International Existing Building Code*, Section 3403.3 makes it even better.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The committee felt that the additional statement will ensure that the building or portion thereof will retain a baseline of compliance.

Assembly Action: **None**

Final Hearing Results

G198-06/07

AS

Code Change No: G199-06/07

Original Proposal

Sections: 3403.4.1 (New) [IEBC [B] 302.4.1 (New)]

Proponent: Bill Conner, Oak Park, IL, representing himself

Add new text as follows:

3403.4.1 (IEBC 302.4.1) Handrails. In alterations or replacement of an existing stairway in an existing structure, handrails shall comply with Section 1009.10.

Exception: In alterations, full extension of the handrails in accordance with Section 1012.5 is not required where such extensions would be hazardous due to plan configuration.

Reason: Replacement of handrails on existing stairways that meet new construction requirements may result in a conflict with the extensions and paths for means of egress. This proposed section would be a subsection of Section 3403.4 (IEBC 302.4), Stairways. This proposed language would be a coordination item with Section 505.10, Exception 3 of ICC A117.1 and the ADA/ABA Guidelines.

There does not appear to be a location that addressed existing stairways in the remaining chapters of the IEBC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The proposed language adds much needed language to address a potentially hazardous condition in existing buildings.

Assembly Action: **None**

Final Hearing Results

Sections: 3409.1, 3409.4.1 (New), 3409.4.2 (New) [IEBC [B] 308.4, [B] 308.4.1 (New), [B] 308.4.2 (New)]; IEBC 912.8, 912.8.1 (New), 912.8.2 (New)

Proponent: Brian D. Black, BD Black Codes, Inc., Perry, NY, representing himself

THIS PROPOSAL IS ON THE AGENDA OF THE IBC GENERAL AND IEBC CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES

PART I – IBC

Revise as follows:

3409.4 (IEBC 308.4) Change of occupancy. Existing buildings, ~~or portions thereof,~~ that undergo a change of group or occupancy shall ~~have all of the following accessible features~~ comply with this section:

3409.4.1 (IEBC 308.4.1) Partial change in occupancy. Where a portion of the building is changed to a new occupancy classification, any alterations shall comply with Sections 3409.6, 3409.7 and 3409.8.

3409.4.2 (IEBC 308.4.2) Complete change of occupancy. Where an entire building undergoes a change of occupancy, it shall comply with Section 3409.4.1 and shall have all of the following accessible features:

1. At least one accessible building entrance.
2. At least one accessible route from an accessible building entrance to primary function areas.
3. Signage complying with Section 1110.
4. Accessible parking, where parking is being provided.
5. At least one accessible passenger loading zone, when loading zones are provided.
6. At least one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.

Where it is technically infeasible to comply with the new construction standards for any of these requirements for a change of group or occupancy, the above items shall conform to the requirements to the maximum extent technically feasible. ~~Change of group or occupancy that incorporates any alterations or additions shall comply with this section and Sections 3409.5, 3409.6, 3409.7 and 3409.8.~~

PART II – IEBC

1. Revise as follows:

912.8 Accessibility. Existing buildings ~~or portions thereof~~ that undergo a change of group or occupancy classification shall ~~have all of the following accessible features:~~ comply with this section.

912.8.1 Partial change in occupancy. Where a portion of the building is changed to a new occupancy classification, any alterations shall comply with Sections 605 and 706 as applicable.

912.8.2 Complete change of occupancy. Where an entire building undergoes a change of occupancy, it shall comply with Section 912.8.1 and shall have all of the following accessible features:

1. At least one accessible building entrance.
2. At least one accessible route from an accessible building entrance to primary function areas.
3. Signage complying with Section 1110 of the *International Building Code*.
4. Accessible parking, where parking is provided.
5. At least one accessible passenger loading zone, where loading zones are provided.
6. At least one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.

Where it is technically infeasible to comply with the new construction standards for any of these requirements for a change of group or occupancy, the above items shall conform to the requirements to the maximum extent technically feasible. ~~Changes of group or occupancy that incorporate any alterations or additions shall comply with this section and Sections 605.1 and 1005.1 as applicable.~~

Exception: Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing buildings and facilities.

Reason: The purpose of the proposed code change is to establish a realistic benchmark at which a building must be provided with accessible features, regardless of cost, beyond those required in alterations.

The code requires that elements or spaces being altered comply with the accessibility requirements of ICC A117.1. Additional requirements apply where alterations affect an area containing a primary function, many of which may be included in the 'laundry list' in the current change of occupancy provisions of Section 3409.4. The difference is that when a space is altered, the additional requirements are capped at a cost of 20% of the base alteration cost, whereas the requirements for a change of occupancy have no cap.

This proposal offers a compromise by requiring the additional accessible elements to be provided regardless of cost only where an entire building is undergoing a change of occupancy. It is reasonable to insure this greater level of access where an existing high school building is being converted to apartments, or where an old warehouse is changed to a business occupancy containing office suites.

The problem is that the current code requires accessible entrances, routes, parking, *etc.* regardless of the size of an occupancy being changed or the cost of the alterations (if any) involved in that change. Changing a 500 square foot space in a building from a boutique jewelry store to a tax preparer's office could involve no building alterations and the simple removal of display cases and moving in a few desks and file cabinets, but the code could require a ramp or platform lift to get to that space that changed from a Group M to Group B occupancy. In some cases, the costs would far exceed the 20% cap in 3409.7 but would still be required by this section. Moreover, many of the changes required could be beyond the control of the person leasing that 500 s.f. tax office space, where a building manager or agent controls the corridors, entrances, parking areas, and building signs.

This proposal recognizes the fact that the ICC and legacy codes have traditionally placed a higher standard of code compliance on buildings and spaces undergoing a change of occupancy, and acknowledges the fact that the history of the code's access requirements – stretching back to the BCMC Accessibility Report -- included accessibility for persons with disabilities in that higher standard. At the same time, imposing excessively high costs for converting the use of portions of existing buildings is not supported by the ADA, the intent of the original code writers, or the economic realities of effectively reusing our nation's existing building stock. Applying the laundry list in 3409.4 only where an entire building undergoes a change of occupancy makes sense.

References to 3409.5 were deleted because the accessibility requirements for additions will apply regardless of the requirements of this section.

NOTE: This proposed change does not affect the harmonization of the code with the ADA or Fair Housing and is consistent with the U.S. Department of Justice interpretation of landlord-tenant responsibilities under its ADA regulations.

Cost Impact: This code change will not increase the cost of construction.

Public Hearing Results

PART I C IBC

Committee Action:

Approved as Submitted

Committee Reason: The proposed language clarifies the scope and achieves an appropriate level of accessibility for existing buildings. A partial change of occupancy will be handled similar to an alteration. The list of elements are only required where an entire building undergoes a change of occupancy.

Assembly Action:

None

PART II C IEBC

Committee Action:

Approved as Submitted

Committee Reason: The committee felt that this proposal achieved an appropriate level of accessibility for existing buildings by clarifying that the accessible features currently listed in Section 912.8 are only required where an entire building undergoes a change of occupancy. Further, this language provides relief to existing buildings where there is only a partial change of occupancy.

Assembly Action:

None

Final Hearing Results

Code Change No: **G206-06/07**

Original Proposal

Sections: 3409 .1, 3409.6, 3409.8.7 (IEBC) [B] 308.1, [B] 308.6, [B] 308.8.7; IEBC 605.1, 605.1.8, 706.3, 912.8

Proponent: Brian D. Black, BD Black Codes, Inc., Perry, NY, representing himself

PART I B IBC

Revise as follows:

3409.1 (IEBC 308.1) Scope. The provisions of Sections 3409.1 (IEBC 308.1) through 3409.9 (IEBC 308.9) apply to maintenance, change of occupancy, additions and alterations to existing buildings, including those identified as historic buildings.

Exception: Type B dwelling or sleeping units required by Section 1107 are not required to be provided in existing buildings and facilities being altered or undergoing a change of occupancy.

3409.6 (IEBC 308.6) Alterations. A building, facility or element that is altered shall comply with the applicable provisions in Chapter 11 and ICC A117.1, unless technically infeasible. Where compliance with this section is technically infeasible, the alteration shall provide access to the maximum extent technically feasible.

Exceptions:

1. The altered element or space is not required to be on an accessible route, unless required by Section 3409.7 (IEBC 308.7).
2. Accessible means of egress required by Chapter 10 are not required to be provided in existing buildings and facilities.
3. ~~The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provision for a Type B dwelling unit and shall comply with the applicable provisions in Chapter 11 and ICC/ANSI A117.1. Type A dwelling units or sleeping units required by Section 1107 are not required to be provided in existing building and facilities being altered.~~

3409.8.7 (IEBC 308.8.7) Dwelling or sleeping units. Where I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being altered or added, the requirements of Section 1107 for Accessible ~~or Type A~~ units and Section 907 for accessible alarms apply only to the quantity of spaces being altered or added.

PART II B IEBC

1. Revise as follows:

605.1 General. A building, facility or element that is altered shall comply with the applicable provisions in Sections 605.1.1 through 605.1.12, Chapter 11 of the *International Building Code* and ICC A117.1 unless it is technically infeasible. Where compliance with this section is technically infeasible, the alteration shall provide access to the maximum extent that is technically feasible. A building, facility or element that is constructed or altered to be accessible shall be maintained accessible during occupancy.

Exceptions:

1. The altered element or space is not required to be on an accessible route unless required by Section 605.2.
2. Accessible means of egress required by Chapter 10 of the *International Building Code* are not required to be provided in existing buildings and facilities.

3. ~~Type A and Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing buildings and facilities being altered.~~
4. ~~The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provisions for Type B dwelling units and shall comply with the applicable provisions in Chapter 11 of the *International Building Code* and ICC A117.1.~~

605.1.8 Dwelling units and sleeping units. Where Group I-1, I-2, I-3, R-1, R-2, or R-4 dwelling or sleeping units are being altered, the requirements of Section 1107 of the *International Building Code* for Accessible units ~~or Type A units~~ and Chapter 9 of the *International Building Code* for accessible alarms apply only to the quantity of spaces being altered.

706.3 Dwelling units and sleeping units. Where Group I-1, I-2, I-3, R-1, R-2, or R-4 dwelling units or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for Accessible units ~~or Type A units~~ and Chapter 9 of the *International Building Code* for accessible alarms apply only to the quantity of spaces being added.

912.8 Accessibility. Existing buildings or portions thereof that undergo a change of group or occupancy classification shall have all of the following accessible features:

1. At least one accessible building entrance.
2. At least one accessible route from an accessible building entrance to primary function areas.
3. Signage complying with Section 1110 of the *International Building Code*.
4. Accessible parking, where parking is provided.
5. At least one accessible passenger loading zone, where loading zones are provided.
6. At least one accessible route connecting accessible parking and accessible passenger loading zones to an accessible entrance.

Where it is technically infeasible to comply with the new construction standards for any of these requirements for a change of group or occupancy, the above items shall conform to the requirements to the maximum extent technically feasible. Changes of group or occupancy that incorporate any alterations or additions shall comply with this section and Sections 605.1 and 1005.1 as applicable.

Exception: Type B dwelling or sleeping units required by Section 1107 of the *International Building Code* are not required to be provided in existing buildings and facilities undergoing a change of occupancy.

Public Hearing Results

PART I C IBC

Committee Action:

Approved as Modified

Modify the proposal as follows:

3409.6 (IEBC 308.6) Alterations. A building, facility or element that is altered shall comply with the applicable provisions in Chapter 11 and ICC A117.1, unless technically infeasible. Where compliance with this section is technically infeasible, the alteration shall provide access to the maximum extent technically feasible.

Exceptions:

1. The altered element or space is not required to be on an accessible route, unless required by Section 3409.7 (IEBC 308.7).
2. Accessible means of egress required by Chapter 10 are not required to be provided in existing buildings and facilities.
3. The alteration to Type A individually owned dwelling units within a Group R-2 occupancy shall meet the provision for a Type B dwelling unit and shall comply with the applicable provisions in Chapter 11 and ICCI A117.1.
4. Type A dwelling units or sleeping units required by Section 1107 are not required to be provided in existing building and facilities being altered.

(Portions of proposal not shown remain unchanged)

Committee Reason: The proposed language clarifies when Type A units and Type B units are exempted in existing buildings. The modification was to maintain Section 3409.6 Exception 3. This language was added in the last code change cycle to allow Type A units in an existing building being altered to meet Type B unit requirements. This exception is still needed.

Assembly Action:

None

PART II C IEBC**Committee Action:****Disapproved**

Committee Reason: The committee indicated that requirements for Type A individually owned units within a Group R-2 occupancy currently contained in Exception 4 to Section 605.1 were appropriate with the intent of the IEBC by allowing flexibility to the owner and therefore should remain.

Assembly Action:**None**

Final Hearing Results

G206-06/07, Part I	AM
G206-06/07, Part II	D

Code Change No: G208-06/07

Original Proposal

Sections: 3409.8.4 (IEBC [B] 308.8.4); IEBC 706.2

Proponent: Bill Conner, Oak Park, IL, representing himself

THIS PROPOSAL IS ON THE AGENDA OF THE IBC GENERAL AND IEBC CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES

PART I – IBC**Revise as follows:**

3409.8.4 (IEBC 308.8.4) Stairs and escalators in existing buildings. In alterations, change or occupancy or additions where an escalator or stair is added where none existed previously and major structural modifications are necessary for installation, an accessible route shall be provided between the levels served by the escalator or stairs in accordance with Sections 1104.4 and 1104.5.

PART II – IEBC**Revise as follows:**

706.2 Stairs and escalators in existing buildings. In alterations, change of occupancy or additions where an escalator or stair is added where none existed previously and major structural modifications are necessary for installation, an accessible route shall be provided between the levels served by the escalator or stairs in accordance with Sections 1104.4 and 1104.5 of the *International Building Code*.

Reason: The proposed language would coordinate with ADA 206.2.3.1. The ADAAG approach seems more reasonable for when an elevator or platform lift would be required.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I — IBC**Committee Action:****Approved as Submitted**

Committee Reason: The proposed text is a good clarification for when the provisions are applicable for new escalators and stairways.

Assembly Action:**None**

PART II — IEBC

Committee Action:

Disapproved

Committee Reason: The committee indicated that providing requirements for change of occupancy and additions in the alterations chapter would be confusing to the code user. These proposed requirements would be more appropriately located in the chapters dealing with additions and change of occupancy. Additionally, the reason statement indicates coordination with portions of ADA; however, it does not appear that all of those portions are part of this change.

Assembly Action:

None

Final Hearing Results

G208-06/07, Part I	AS
G208-06/07, Part II	D

Code Change No: G209-06/07

Original Proposal

Sections: 3409.8.7 (IEBC [B] 308.8.7); IEBC 605.1.8, 706.3

Proponent: Maureen Traxler, City of Seattle, WA, representing the Washington Association of Building Officials

THIS PROPOSAL IS ON THE AGENDA OF THE IBC GENERAL AND IEBC CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES

PART I – IBC

Revise as follows:

3409.8.7 (IEBC 308.8.7) Dwelling or sleeping units. Where I-1, I-2, I-3, R-1, R-2 or R-4 dwelling or sleeping units are being altered or added, the requirements of Section 1107 for Accessible or Type A units and Section 907 for ~~accessible~~ visible alarms apply only to the quantity of spaces being altered or added.

PART II – IEBC

Revise as follows:

605.1.8 Dwelling or sleeping units. Where Group I-1, I-2, I-3, R-1, R-2, or R-4 dwelling or sleeping units are being altered, the requirements of Section 1107 of the *International Building Code* for accessible or Type A units and Chapter 9 of the *International Building Code* for ~~accessible~~ visible alarms apply only to the quantity of the spaces being altered.

706.3 Dwelling units and sleeping units. Where Group I-1, I-2, I-3, R-1, R-2, or R-4 dwelling units or sleeping units are being added, the requirements of Section 1107 of the *International Building Code* for accessible units or Type A units and Chapter 9 of the *International Building Code* for ~~accessible~~ visible alarms apply only to the quantity of spaces being added.

Reason: The term “accessible alarm” is not used anywhere in either the Building or Fire code except in this section. This provision is ambiguous because it references Chapter 9 for accessible alarm provisions, but there are no such provisions in Chapter 9. The term “visible alarm” is a commonly accepted term to describe the devices used to alert persons with hearing disabilities.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I C IBC

Committee Action:

Approved as Submitted

Committee Reason: The term >accessible alarm= is not defined. The use of the term >visible alarm= will clarify what type of alarms are being addressed for dwelling and sleeping units undergoing alterations. The terminology will be consistent with Chapter 9 of the IBC and IFC.

Assembly Action: **None**

PART II C IEBC

Committee Action: **Approved as Submitted**

Committee Reason: The committee agreed that changing the term "accessible alarm" to "visible alarm", with respect to requirements for dwelling units undergoing alterations, was appropriate and consistent with terminology used in both the IBC and IFC.

Assembly Action: **None**

Final Hearing Results

G209-06/07, Part I	AS
G209-06/07, Part II	AS

Code Change No: G210-06/07

Original Proposal

Sections: 3409.8.11 (IEBC [B] 308.8.11)

Proponent: Curt Whiele, Brooklyn Park, MN, representing himself

Delete without substitution:

~~**3409.8.11 (IEBC 308.8.11) Check-out aisles.** Where check-out aisles are altered, at least one of each check-out aisle serving each function shall be made accessible until the number of accessible check-out aisles complies with Section 1109.12.2.~~

Reason: Delete to match the provisions in IEBC, Chapter 6. The section is not needed because it is already covered by complying with requirements for areas being altered. The same should occur in the IEBC, Chapter 3 since this is a copy of IBC Chapter 34.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action: **Approved as Submitted**

Committee Reason: The provisions for check-out aisles are already addressed adequately in the general provisions for alterations. This language is not needed.

Assembly Action: **None**

Final Hearing Results

G210-06/07	AS
------------	----

Code Change No: **G211-06/07**

Original Proposal

Sections: 3409.8.12 (New) [IEBC [B] 308.8.12 (New)]; IEBC 605.1.11 (New)

Proponent: Bill Conner, Oak Park, IL, representing himself

THIS PROPOSAL IS ON THE AGENDA OF THE IBC GENERAL AND IEBC CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES

PART I – IBC

Add new text as follows:

3409.8.12 (IEBC 308.8.12) Fuel dispensers. Operable parts of replacement fuel dispensers shall be permitted to be 54 inches (1370 mm) maximum measured from the surface of the vehicular way where fuel dispensers are installed on existing curbs.

PART II – IEBC

Add new text as follows:

605.1.11 Fuel dispensers. Operable parts of replacement fuel dispensers shall be permitted to be 54 inches (1370 mm) maximum measured from the surface of the vehicular way where fuel dispensers are installed on existing curbs.

Reason: The proposal adds an exception for replacement fuel dispensing equipment providing an exception for maximum high reach range of 54 inches. Current ANSI A117.1 sets the maximum reach range at 48". This change will allow the use of existing equipment when it is installed on existing fuel dispensing islands.

Cost Impact: The code change proposal will not increase the cost of construction. There would be a cost increase if the proposal is not approved as existing fuel dispensing islands or existing inventory of replacement fuel dispensers could not be used as replacements for damaged or non working equipment.

Public Hearing Results

PART I C IBC

Committee Action:

Approved as Submitted

Committee Reason: This proposal would be consistent with the action on E168-04/05. Also the committee agreed that equipment installed on existing fuel dispensing islands is an alteration and allowance should be made for a height that would permit the reuse of the existing equipment.

Assembly Action:

None

PART II C IEBC

Committee Action:

Approved as Submitted

Committee Reason: The committee agreed that equipment installed (as an alteration) on existing fuel dispensing islands should be at a height that would allow the reuse of the existing equipment.

Assembly Action:

None

Final Hearing Results

G211-06/07, Part I AS
G211-06/07, Part II AS

Code Change No: **G213-06/07**

Original Proposal

Section: 3410.6.18 (New), Table 3410.6.18 (New), Table 3410.7

Proponent: Greg Wheeler, C.B.O., Chair, ICC Ad Hoc Committee on Existing Buildings

1. Add new text and table as follows:

3410.6.18 Standpipes. Evaluate the ability to initiate attack on a fire by making supply of water available readily through the installation of standpipes in accordance with Section 905. "Required Standpipes" shall be based on the requirements of this code. Under the categories and occupancies in Table 3410.6.18, determine the appropriate value and enter that value into Table 3410.7 under Safety Parameter 3410.6.18, Standpipes, for fire safety, means of egress, and general safety.

3410.6.18.1 Standpipe. The categories for standpipe systems are:

1. Category a—Standpipes are required; standpipe is not provided or the standpipe system design is not in compliance with Section 905.3.
2. Category b—Standpipes are not required; none are provided.
3. Category c—Standpipes are required; standpipes are provided in accordance with Section 905.
4. Category d—Standpipes are not required; standpipes are provided in accordance with Section 905.

(Renumber subsequent sections)

**TABLE 3410.6.18
STANDPIPE SYSTEM VALUES**

OCCUPANCY	CATEGORIES			
	a^a	b	c	D
A-1, A-3, F, M, R, S-1	-6	0	4	6
A-2	-4	0	2	4
A-4, B, E, S-2	-12	0	6	12

a. This option cannot be taken if Category a or Category b in Section 3410.6.17 is used

2. Revise table as follows:

**TABLE 3410.7
SUMMARY SHEET — BUILDING CODE**

SAFETY PARAMETERS	FIRE SAFETY (FS)	MEANS OF EGRESS (ME)	GENERAL SAFETY (GS)
3410.6.16 Mixed Occupancies		****	
3410.6.17 Automatic Sprinklers		÷2 =	
3410.6.18 Standpipes			
3410.6.18 3410.6.19 Incidental Use			

(Portions of table not shown do not change)

Reason: The ICC Board established the Ad Hoc Committee on Existing Buildings to evaluate and further refine the IEBC in response to issues raised by the membership over the past couple of code development cycles. This proposal coordinates the compliance alternatives of CH 34 of the IBC with the same alternatives found in Chapter 13, Section 1301.6.18, of the IEBC. The inconsistency occurred in 2001 during the drafting stage of the IEBC when the proposed entry for standpipes was added to the IEBC, however, a coordinating change by the proponent was not submitted to the IBC. The inconsistency occurs in both the 2003 and 2006 editions of the codes.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: Provides credit for standpipes in the existing building requirements. Makes the existing building provisions more comprehensive. See also proponents reason.

Assembly Action:

None

Final Hearing Results

G213-06/07

AS

Code Change No: G214-06/07

Original Proposal

Sections: 3410.2.5 (IEBC [B] 1301.2.5)

Proponent: Curt Wiehle, Brooklyn Park, MN, representing himself

Revise as follows:

3410.2.5 (IEBC 1301.2.5) Accessibility requirements. All portions of the buildings proposed for change of occupancy shall conform to the accessibility provisions of ~~Chapter 11~~ Section 3409 (IEBC Section 308).

Reason: New construction requirements for accessibility should not be required when compliance alternatives are utilized in existing buildings. Provisions should be the same as they are for alterations or change of occupancy. This is a conflict with how ADA would deal with existing buildings.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposed revision clarifies that a building using the compliance alternatives of IBC Section 3410 (IEBC 1301) are typically undergoing alterations, and therefore should use the provisions for accessibility for existing building in Section 3409 (IEBC 308). The current language could be interpreted to require full compliance for accessibility as in new construction.

Assembly Action:

None

Final Hearing Results

G214-06/07

AS

Code Change No: **G217-06/07**

Original Proposal

Sections: G102.1, G202.1, G901 (New)

Proponent: Rebecca C. Quinn, RCQuinn Consulting, Inc., representing the US Dept. of Homeland Security, Federal Emergency Management Agency

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

1. Revise as follows:

G102.1 General. This appendix, in conjunction with the *International Building Code*, provides minimum requirements for development located in flood hazard areas, including the subdivision of land; installation of utilities; placement and replacement of manufactured homes; new construction and repair, reconstruction, rehabilitation or additions to new construction; substantial improvement of existing buildings and structures, including restoration after damage temporary structures and temporary or permanent storage, and certain building work exempt from permit under Section 105.2.

G201.2 Definitions.

DEVELOPMENT. Any man-made change to improved or unimproved real estate, including but not limited to, buildings or other structures, temporary structures, temporary or permanent storage of materials, mining, dredging, filling, grading, paving, excavations, operations and other land disturbing activities.

2. Add new text as follows:

G901 TEMPORARY STRUCTURES AND TEMPORARY STORAGE

G901.1 Temporary structures. Temporary structures shall be erected for a period of less than 180 days. Temporary structures shall be anchored to prevent flotation, collapse or lateral movement resulting from hydrostatic loads, including the effects of buoyancy, during conditions of the design flood. Fully enclosed temporary structures shall have flood openings to allow for the automatic entry and exit of flood waters.

G901.2 Temporary storage. Temporary storage includes storage of goods and materials for a period of less than 180 days. Stored materials shall not include hazardous materials.

G901.3 Floodway encroachment. Temporary structures and temporary storage in floodways shall meet the requirements of G103.5.

(Renumber subsequent section)

Reason: The purpose of this code change proposal is to add temporary structures and temporary storage of materials to the definition of development that is subject to the provisions of Appendix G which addresses flood hazard areas.

To be consistent with the regulations of the National Flood Insurance Program, which include a broad definition of development (44 C.F.R. §59.1), this code change adds temporary structures and temporary storage of materials to the definition of "development" in Appendix G. It also adds minimum requirements that apply to temporary structures and temporary storage of materials in flood hazard areas. Temporary structures are to be provided with flood openings and anchored to prevent flotation during the design flood so that they do not contribute to damage of downstream structures or blockage of bridges and culverts. Floodways are portions of riverine floodplains that are to be reserved to convey the base flood; placement of development in floodways may alter flood elevations and increase flood depths, contributing to increased damage. Prior to placement of temporary buildings or temporary storage of materials in floodways, the effect on floodways is to be considered as set forth in G103.5.

Temporary structures are addressed in the IBC (Section 107 and Section 3103). Appendix G addresses flood resistant provisions that, if adopted in conjunction with provisions of the IBC related to flood resistant design and construction offer an option for jurisdictions to satisfy the minimum requirements of the National Flood Insurance Program. Appendix G includes administrative provisions required by the NFIP and specific provisions for certain activities that are not within the scope of the IBC, including subdivisions, certain site development activities, manufactured homes, recreational vehicles, and tanks.

Bibliography: Federal regulations are available online.

Cost Impact: The code change proposal will not increase the cost of construction (more than 20,000 local jurisdictions already participate in the NFIP).

Public Hearing Results

Errata: Add comma in Section G102.1 as follows:

G102.1 General. This appendix, in conjunction with the *International Building Code*, provides minimum requirements for development located in flood hazard areas, including the subdivision of land; installation of utilities; placement and replacement of manufactured homes; new construction and repair, reconstruction, rehabilitation or additions to new construction; substantial improvement of existing buildings and structures, including restoration after damage, temporary structures and temporary or permanent storage, and certain building work exempt from permit under Section 105.2.

Committee Action:

Approved as Submitted

Committee Reason: The proposal adds requirements for temporary structures to the appendix that regulates development in flood hazard areas.

Assembly Action:

None

Final Hearing Results

G217-06/07

AS

Code Change No: G218-06/07

Original Proposal

Sections: G102.1, G901 (New)

Proponent: Rebecca C. Quinn, RCQuinn Consulting, Inc., representing the US Dept. of Homeland Security, and the Federal Emergency Management Agency

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

1. Revise as follows:

G102.1 General. This appendix, in conjunction with the *International Building Code*, provides minimum requirements for development located in flood hazard areas, including the subdivision of land; installation of utilities; placement and replacement of manufactured homes; new construction and repair, reconstruction, rehabilitation or additions to new construction; substantial improvement of existing buildings and structures, including restoration after damage, utility and miscellaneous Group U buildings and structures, and certain building work exempt from permit under Section 105.2.

2. Add new text as follows:

G901
UTILITY AND MISCELLANEOUS GROUP U

G901.1 Utility and Miscellaneous Group U. Utility and Miscellaneous Group U includes buildings that are accessory in character and miscellaneous structures not classified in any specific occupancy in the *International Building Code*, including, but not limited to, agricultural buildings, aircraft hangars (accessory to a one- or two-family residence), barns, carports, fences more than 6 feet (1829 mm) high, grain silos (accessory to a residential occupancy), greenhouses, livestock shelters, private garages, retaining walls, sheds, stables, and towers.

G901.1 Flood loads. Utility and miscellaneous Group U buildings and structures, including substantial improvement of such buildings and structures, shall be anchored to prevent flotation, collapse or lateral movement resulting from flood loads, including the effects of buoyancy, during conditions of the design flood.

G901.2 Elevation. Utility and miscellaneous Group U buildings and structures, including substantial improvement of such buildings and structures, shall be elevated such that the lowest floor, including basement, is elevated to or above the design flood elevation in accordance with Section 1612 of the building code.

G901.4 Enclosures below design flood elevation. Fully enclosed areas below the design flood elevation shall be at or above grade on all sides and:

1. In flood hazard areas not subject to high velocity wave action, enclosed areas shall have flood openings to allow for the automatic inflow and outflow of floodwaters.
2. In flood hazard areas subject to high velocity wave action, enclosed areas shall have walls below the design flood elevation that are designed to break away or collapse from a water load less than that which would occur during the design flood, without causing collapse, displacement or other structural damage to the building or structure.

G901.5 Flood-damage resistant materials. Flood-damage resistant materials shall be used below the design flood elevation.

G901.6 Protection of mechanical, plumbing and electrical systems. Mechanical, plumbing and electrical systems, including plumbing fixtures, shall be elevated to or above the design flood elevation.

Exception: Electrical systems, equipment and components, and heating, ventilating, air conditioning, and plumbing appliances, plumbing fixtures, duct systems, and other service equipment shall be permitted to be located below the design flood elevation provided that they are designed and installed to prevent water from entering or accumulating within the components and to resist hydrostatic and hydrodynamic loads and stresses, including the effects of buoyancy, during the occurrence of flooding to the design flood elevation in compliance with the flood-resistant construction requirements of the *International Building Code*. Electrical wiring systems shall be permitted to be located below the design flood elevation provided they conform to the provisions of the *International Code Council Electrical Code Administrative Provisions*.

Reason: The purpose of this code change is to include in Appendix G the flood-resistant provisions that must be applied to buildings and structures that are listed in Section 312 in order to minimize damage during conditions of the design flood.

To be consistent with the regulations of the National Flood Insurance Program, which include a broad definition of development (44 C.F.R. §59.1) and includes all buildings and structures, this code change outlines flood-resistant provisions for utility and miscellaneous Group U buildings and structures. Section 312 of the IBC requires that "buildings and structures of an accessory character and miscellaneous structures not classified in any specific occupancy shall be constructed, equipped and maintained to conform to the requirements of this code commensurate with the fire and life hazard incidental to their occupancy." Flood resistance is appropriate in addition to fire and life safety and is required for consistency with the minimum requirements of the National Flood Insurance Program.

Appendix G addresses flood resistant provisions that, if adopted in conjunction with provisions of the IBC related to flood resistant design and construction offer an option for jurisdictions to satisfy the minimum requirements of the National Flood Insurance Program. Appendix G includes administrative provisions required by the NFIP and specific provisions for certain activities that are not within the scope of the IBC, including subdivisions, certain site development activities, manufactured homes, recreational vehicles, and tanks.

Bibliography: Federal regulations are available online.

Cost Impact: The code change proposal will not increase the cost of construction (more than 20,000 local jurisdictions already participate in the NFIP).

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal adds requirements for group U structures to the appendix that regulates development in flood hazard areas.

Assembly Action:

None

Final Hearing Results

G218-06/07

AS

Code Change No: G219-06/07

Original Proposal

Section: G401.2

Proponent: Rebecca C. Quinn, RC Quinn Consulting, Inc., representing the U.S. Department of Homeland Security, and Federal Emergency Management Agency

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL CODE DEVELOPMENT COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

Revise as follows:

G401.2 Flood hazard areas subject to high velocity wave action. In flood hazard areas subject to high velocity wave action:

1. ~~Development or land-disturbing activity~~ New buildings and buildings that are substantially improved shall only be authorized landward of the reach of mean high tide.
2. The use of fill for structural support of buildings is prohibited.

Reason: The purpose of this code change is to correct the inadvertent inclusion of all development, specifically all structures, in the limitations on what may be authorized seaward of the reach of mean high tide.

Flood-related provisions in the IRC generally are consistent with the regulations of the National Flood Insurance Program (44 C.F.R. §60.3). As currently written, R324.3.1(1) requires that piers and other non-building structures be constructed landward of the reach of mean high tide. The federal regulations limit the placement of "new construction," as defined in those regulations, to landward of the reach of mean high tide. The NFIP definition of "new construction" is limited to new buildings and buildings that are substantially improved (i.e., buildings that are to be brought into conformance with the flood-resistant provisions).

The technical information used to substantiate this proposal is the NFIP regulation §60.3(e)(3).

Bibliography: No substantiating material submitted (federal regulations are available online)

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal clarifies the limitation on what development may be authorized in flood hazard areas subject to high velocity wave action.

Assembly Action:

None

Final Hearing Results

G219-06/07

AS

Code Change No: **G220-06/07**

Original Proposal

Appendix K

Proponent: Maureen Traxler, City of Seattle, WA, Dept. of Planning & Development

Revise as follows:

CHAPTER K1 SCOPE

SECTION K101 GENERAL

~~**K101.1 Title.** These regulations shall be known as the *Electrical Code – Administrative Provisions* of [NAME OF JURISDICTION] and shall be cited as such and will be referred to herein as “this code.”~~

K101.2 K101.1 Purpose. The A purpose of this code is to ~~provide~~ establish minimum ~~standards~~ requirements to safeguard ~~life or limb,~~ public health, safety and general property and public welfare by regulating and controlling the design, construction, installation, quality of materials, location, operation, and maintenance or use of electrical systems and equipment.

~~**K101.3 K101.2 Scope.** This code shall regulate~~ applies to the design, construction, installation, alteration, repairs, relocation, replacement, addition to, use or maintenance of electrical systems and equipment.

SECTION K102 APPLICABILITY

K102.1 General. The provisions of this code ~~shall~~ apply to all matters affecting or relating to structures and premises, as set forth in Section K101.

~~**K102.1.1 K102.2 Existing installations.** Except as otherwise provided for in this chapter, a provision in this code shall not require the removal, alteration or abandonment of, nor prevent the continued utilization and maintenance of, existing electrical systems and equipment lawfully in existence at the time of the adoption of this code.~~

~~**K102.1.2 K102.3 Maintenance.** Electrical systems, equipment, materials and appurtenances, both existing and new, and parts thereof shall be maintained in proper operating condition in accordance with the original design and in a safe, hazard-free condition. Devices or safeguards that are required by this code shall be maintained in compliance with the code edition under which installed. The owner or the owner’s designated agent shall be responsible for the maintenance of the electrical systems and equipment. To determine compliance with this provision, the ~~code~~ building official shall have the authority to require that the electrical systems and equipment be reinspected.~~

~~**K102.1.3 K102.4 Additions, alterations and repairs.** Additions, alterations, renovations and repairs to electrical systems and equipment shall conform to that required for new electrical systems and equipment without requiring that the existing electrical systems or equipment comply with all of the requirements of this code. Additions, alterations and repairs shall not cause existing electrical systems or equipment to become unsafe, hazardous or overloaded.~~

Minor additions, alterations, renovations and repairs to existing electrical systems and equipment shall meet the provisions for new construction, except where such work is performed in the same manner and arrangement as was in the existing system, is not hazardous and is approved.

~~**K102.1.4 Change in occupancy.** It shall be unlawful to make a change in the occupancy of any structure that will subject the structure to any special provision of this code applicable to the new occupancy without approval. The code official shall certify that such structure meets the intent of the provisions of law governing building construction for the proposed new occupancy and that such change of occupancy does not result in any hazard to public health, safety or welfare.~~

~~**K102.1.5 Moved buildings.** Electrical systems and equipment that are a part of buildings or structures moved into or within the jurisdiction shall comply with the provisions of this code for new installations.~~

~~**K102.2 Differences.** Where, in any specific case, different sections of this code specify different materials, methods of construction or other requirements, the most restrictive shall govern. Where there is a conflict between a general requirement and a specific requirement, the specific requirement shall be applicable.~~

~~**K102.3 Other laws.** The provisions of this code shall not be deemed to nullify any provisions of local, state or federal law.~~

~~**K102.4 Validity.** In the event any part or provision of this code is held to be illegal or void, this shall not have the effect of making void or illegal any of the other parts or provisions thereof, which are determined to be legal; and it shall be presumed that this code would have been adopted without such illegal or invalid parts or provisions.~~

~~**K102.4.1 Segregation of invalid provisions.** Any invalid part of this code shall be segregated from the remainder of this code by the court holding such part invalid, and the remainder shall remain effective.~~

~~**K102.5 Application of references.** References to chapter or section numbers, or to provisions not specifically identified by number, shall be construed to refer to such chapters, sections or provisions of this code.~~

~~**K102.6 Referenced codes and standards.** The codes and standards referenced in this code shall be those that are listed in Chapter K13 and such codes and standards shall be considered part of the requirements of this code to the prescribed extent of each such reference. Where differences occur between provisions of this code and referenced codes or standards, the provisions of this code shall apply.~~

~~**Exception:** Where enforcement of a code provision would violate the conditions of the listing of the equipment or appliance, the conditions of the listing and manufacturer's instructions shall apply.~~

~~**K102.7 Appendices.** Provisions in the appendices shall not apply unless specifically referenced in the adopting ordinance.~~

~~**K102.8 K102.5 Subjects not regulated by this code.** Where no applicable standards or requirements are set forth in this code, or are contained within other laws, codes, regulations, ordinances or bylaws adopted by the jurisdiction, compliance with applicable standards of nationally recognized standards as are approved shall be deemed as prima facie evidence of compliance with the intent of this code. Nothing herein shall derogate from the authority of the ~~code~~ building official to determine compliance with codes or standards for those activities or installations within the ~~code~~ building official's jurisdiction or responsibility.~~

CHAPTER K2 DEFINITIONS

SECTION K201 GENERAL

~~**K201.1 Scope.** Unless otherwise expressly stated, the following words and terms shall, for the purposes of this code, have the meanings indicated in this chapter.~~

~~**K201.2 Interchangeability.** Words used in the present tense include the future; words in the masculine gender include the feminine and neuter; the singular number includes the plural and the plural, the singular.~~

~~**K201.3 Terms defined in other codes.** Where terms are not defined in this code and are defined in the *International Building Code, International Energy Conservation Code, International Fire Code, International Fuel Gas Code, International Mechanical Code, International Plumbing Code, International Private Sewage Disposal Code, International Property Maintenance Code, International Residential Code, International Zoning Code* or NFPA 70, such terms shall have meanings ascribed to them as in those codes.~~

~~**K201.4 Terms not defined.** Where terms are not defined through the methods authorized by this section, such terms shall have ordinarily accepted meanings such as the context implies.~~

SECTION K202 GENERAL DEFINITIONS

APPROVED. Approved by the code official or other authority having jurisdiction.

APPROVED AGENCY. An established and recognized agency regularly engaged in conducting tests or furnishing inspection services, where the agency has been approved by the code official.

CODE OFFICIAL. The officer or other designated authority charged with the administration and enforcement of this code, or a duly authorized representative.

LISTED AND LISTING. Equipment, appliances or materials included in a list published by a nationally recognized testing laboratory, inspection agency or other organization concerned with product evaluation that maintains periodic inspection of the production of listed equipment, appliances or materials, and whose listing states either that the equipment, appliances or materials meet nationally recognized standards, or has been tested and found suitable for use in a specified manner. Not all testing laboratories, inspection agencies and other organizations concerned with product evaluation use the same means for identifying listed equipment, appliances or materials. Some do not recognize equipment, appliances or materials as listed unless they are also labeled. The authority having jurisdiction shall utilize the system employed by the listing organization to identify a listed product.

OCCUPANCY. The purpose for which a building, or part thereof, is utilized or occupied.

CHAPTER K3 ORGANIZATION AND ENFORCEMENT

SECTION K301 DEPARTMENT OF ELECTRICAL INSPECTION

K301.1 Creation of enforcement agency. The department of electrical inspection is hereby created and the official in charge thereof shall be known as the code official. The function of the department shall be to assist the code official in the administration and enforcement of the provisions of this code.

K301.2 Appointment. The code official shall be appointed by the chief appointing authority of the jurisdiction.

K301.3 Deputies. In accordance with the prescribed procedures of this jurisdiction and with the concurrence of the appointing authority, the code official shall have the authority to appoint a deputy code official, the related technical officers, inspectors, plans examiners and other employees. Such employees shall have powers as delegated by the code official.

SECTION K302 DUTIES AND POWERS OF THE CODE OFFICIAL

K302.1 General. The code official is hereby authorized and directed to enforce the provisions of this code. The code official shall have the authority to render interpretations of this code, and to adopt policies, procedures, rules and regulations in order to clarify the application of its provisions. Such interpretations, policies, procedures, rules and regulations shall be in compliance with the intent and purpose of this code. Such policies and procedures shall not have the effect of waiving requirements specifically provided for in this code.

K302.2 Rule-making authority. The code official shall have authority as necessary in the interest of public health, safety and general welfare, to adopt and promulgate rules and regulations and to designate requirements applicable because of local climatic or other conditions. Such rules shall not have the effect of waiving requirements specifically provided for in this code, or of violating accepted engineering methods involving public safety.

K302.3 Applications and permits. The code official is authorized to receive applications, review construction documents and issue permits for the installation of electrical systems and equipment, inspect the premises for which such permits have been issued, and enforce compliance with the provisions of this code.

K302.4 Notices and orders. The code official is authorized to issue all necessary notices or orders in accordance with Chapter K10 as are required to effect compliance with this code.

~~**K302.5 Inspections.** The code official shall make all of the inspections necessary to determine compliance with the provisions of this code in accordance with Chapter K7.~~

~~**K302.6 Identification.** The code official shall carry proper identification as required by Section K702.4.1.~~

~~**K302.7 Right of entry.** The code official is authorized to enter the structure or premises at reasonable times to inspect or perform the duties imposed by this code in accordance with Section K702.4.~~

~~**K302.8 Department records.** The code official shall keep official records of applications received, permits and certificates issued, fees collected, reports of inspections, notices and orders issued, and as required by this code, such records shall be retained in the official records for the period required for retention of public records.~~

~~**K302.8.1 Approvals and modifications.** A record of approvals and modifications granted shall be maintained by the code official and shall be available for public inspection during business hours in accordance with applicable laws.~~

~~**K302.8.2 Inspections.** The code official shall keep a record of each inspection made, including notices and orders issued, showing the findings and disposition of each.~~

~~**K302.8.3 Alternative methods or materials.** The application for modification, alternative methods or materials, and the final decision of the code official shall be in writing and shall be officially recorded in the permanent records of the code official.~~

~~**K302.9 Liability.** The code official, officer or employee charged with the enforcement of this code, while acting for the jurisdiction in good faith and without malice in the discharge of the duties required by this code or other pertinent law or ordinance, shall not thereby be rendered liable personally, and is hereby relieved from all personal liability for any damage accruing to persons or property as a result of any act or by reason of an act or omission in the discharge of official duties. Any suit instituted against any officer or employee because of an act performed by that officer or employee in the lawful discharge of duties and under the provisions of this code shall be defended by the legal representative of the jurisdiction until the final termination of the proceedings.~~

~~The code official or any subordinate shall not be liable for costs in any action, suit or proceeding that is instituted in pursuance of the provisions of this code; and any official, officer or employee, acting in good faith and without malice, shall be free from liability for acts performed under any of its provisions or by reason of any act or omission in the performance of official duties in connection therewith.~~

SECTION K303 CERTIFICATE OF OCCUPANCY

~~**K303.1 Use and occupancy.** No building or structure shall be used or occupied until a certificate of occupancy has been provided in accordance with the *International Building Code*.~~

CHAPTER K4 SECTION K 103 PERMITS AND FEES

SECTION K401 GENERAL

~~**K401.1 Permits required.** Permits required by this code shall be obtained from the code official. Permit fees, if any, shall be paid prior to issuance of the permit. Issued permits shall be kept on the premises designated therein at all times and shall be readily available for inspection by the code official.~~

~~**K401.2 K103.1 Types of permits.** An owner, authorized agent or contractor who desires to construct, enlarge, alter, repair, move, demolish or change the occupancy of a building or structure, or to erect, install, enlarge, alter, repair, remove, convert or replace electrical systems or equipment, the installation of which is regulated by this code, or to cause such work to be done, shall first make application to the code building official and obtain the required permit for the work.~~

Exception: Where repair or replacement of electrical systems or equipment must be performed in an emergency situation, the permit application shall be submitted within the next working business day of the department of electrical inspection.

K401.3 K103.2 Work exempt from permit. The following work shall be exempt from the requirement for a permit:

1. Listed cord and plug connected temporary decorative lighting.
2. Reinstallation of attachment plug receptacles, but not the outlets therefor.
3. Repair or replacement of branch circuit over current devices of the required capacity in the same location.
4. Temporary wiring for experimental purposes in suitable experimental laboratories.
5. Electrical wiring, devices, appliances, apparatus or equipment operating at less than 25 volts and not capable of supplying more than 50 watts of energy. Exemption from the permit requirements of this code shall not be deemed to grant authorization for work to be done in violation of the provisions of this code or other laws or ordinances of this jurisdiction.

SECTION K402 APPLICATION

K402.1 General. The code official is authorized to receive applications for and issue permits as required by this code.

K402.2 Application. Application for a permit required by this code shall be made to the code official in such form and detail as prescribed by the code official. Applications for permits shall be accompanied by such plans as prescribed by the code official.

K402.3 Action on application. The code official shall examine or cause to be examined applications for permits and amendments thereto within a reasonable time after filing. If the application or the construction documents do not conform to the requirements of pertinent laws, the code official shall reject such application in writing, stating the reasons therefor. If the code official is satisfied that the proposed work conforms to the requirements of this code and laws and ordinances applicable thereto, the code official shall issue a permit therefor as soon as practicable.

K402.4 Inspection required. Before a permit is issued, the code official is authorized to inspect and approve the systems, equipment, buildings, devices, premises, and spaces or areas to be used.

K402.5 Time limitation of application. An application for a permit for any proposed work or operation shall be deemed to have been abandoned 180 days after the date of filing, unless such application has been pursued in good faith or a permit has been issued; except that the code official is authorized to grant one or more extensions of time for additional periods not exceeding 90 days each. The extension shall be requested in writing and justifiable cause demonstrated.

SECTION K403 CONDITIONS

K403.1 Conditions of a permit. A permit shall constitute permission to conduct work as set forth in this code in accordance with the provisions of this code. Such permission shall not be construed as authority to violate, cancel or set aside any of the provisions of this code or other applicable regulations or laws of the jurisdiction.

K403.2 Expiration. Every permit issued shall become invalid unless the work on the site authorized by such permit is commenced within 180 days after its issuance, or if the work authorized on the site by such permit is suspended or abandoned for a period of 180 days after the time the work is commenced. The code official is authorized to grant, in writing, one or more extensions of time, for periods not more than 180 days each. The extension shall be requested in writing and justifiable cause demonstrated.

K403.3 Extensions. The code official is authorized to grant, in writing, one or more extensions of the time period of a permit for periods of not more than 90 days each. Such extensions shall be requested by the permit holder in writing and justifiable cause demonstrated.

K403.4 Posting the permit. Issued permits shall be kept on the premises designated therein at all times and shall be readily available for inspection by the code official.

K403.5 Validity. The issuance or granting of a permit shall not be construed to be a permit for, or an approval of, any violation of any of the provisions of this code or of any other ordinance of the jurisdiction. Permits presuming to give authority to violate or cancel the provisions of this code or other ordinances of the jurisdiction shall not be valid. The issuance of a permit based on construction documents and other data shall not prevent the code official from requiring the correction of errors in the construction documents and other data. The code official is also authorized to prevent occupancy or use of a structure where in violation of this code or of any other ordinances of this jurisdiction.

K403.6 Information on the permit. The code official shall issue all permits required by this code on an approved form furnished for that purpose. The permit shall contain a general description of the operation or occupancy and its location and any other information required by the code official. Issued permits shall bear the signature of the code official.

K403.7 Suspension or revocation. The code official is authorized to suspend or revoke a permit issued under the provisions of this code wherever the permit is issued in error, on the basis of incorrect, inaccurate or incomplete information; in violation of any ordinance, regulation or any of the provisions of this code; or if any one of the following conditions exist:

1. The permit is used for a location or establishment other than that for which it was issued.
2. The permit is used for a condition or activity other than that listed in the permit.
3. Conditions and limitations set forth in the permit have been violated.
4. There have been any false statements or misrepresentations as to the material fact in the application for permit or plans submitted or a condition of the permit.
5. The permit is used by a different person or firm than the name for which it was issued.
6. The permittee failed, refused or neglected to comply with orders or notices duly served in accordance with the provisions of this code within the time provided therein.
7. The permit was issued in error or in violation of an ordinance, regulation or this code.

SECTION K404 FEES

K404.1 Payment of fees. A permit shall not be valid until the fees prescribed by law have been paid. Nor shall an amendment to a permit be released until the additional fee, if any, has been paid.

K404.2 Schedule of permit fees. A fee for each permit shall be paid as required, in accordance with the schedule as established by the applicable governing authority. The fees for electrical work shall be as indicated in the following schedule. [JURISDICTION TO INSERT APPROPRIATE SCHEDULE]

K404.3 Work commencing before permit issuance. Any person who commences any work before obtaining the necessary permits shall be subject to an additional fee established by the code official, which shall be in addition to the required permit fees.

K404.4 Related fees. The payment of the fee for the construction, alteration, removal or demolition for work done in connection with, or concurrently with, the work authorized by a permit shall not relieve the applicant or holder of the permit from the payment of other fees that are prescribed by law.

K404.5 Refunds. The code official is authorized to establish a refund policy.

CHAPTER K5 SECTION K104 CONSTRUCTION DOCUMENTS

SECTION K501 GENERAL

K501.1 Submittal documents. Construction documents, special inspection and structural observation programs, and other data shall be submitted in one or more sets with each application for a permit. The construction documents shall be prepared by a registered design professional where required by the statutes of the jurisdiction in which the project is to be constructed. Where special conditions exist, the code official is authorized to require additional construction documents to be prepared by a registered design professional.

Exception: The code official is authorized to waive the submission of construction documents and other data not required to be prepared by a registered design professional if it is found that the nature of the work applied for is such that reviewing of construction documents is not necessary to determine compliance with this code.

K501.2 K104.1 Information on construction documents. Construction documents shall be drawn to scale upon suitable material. Electronic media documents are permitted to be submitted where approved by the code building official. Construction documents shall be of sufficient clarity to indicate the location, nature and extent of the work proposed and show in detail that it will conform to the provisions of this code and relevant laws, ordinances, rules and regulations, as determined by the code building official.

~~K501.2.1~~ K104.2 Penetrations. Construction documents shall indicate where penetrations will be made for electrical systems and shall indicate the materials and methods for maintaining required structural safety, fire-resistance rating and fireblocking.

~~K501.2.2~~ K104.3 Load calculations. Where an addition or alteration is made to an existing electrical system, an electrical load calculation shall be prepared to determine if the existing electrical service has the capacity to serve the added load.

~~K501.3~~ Site plan. The construction documents submitted with the application for permit shall be accompanied by a site plan showing to scale the size and location of new construction and existing structures on the site, distances from lot lines, the established street grades and the proposed finished grades; and it shall be drawn in accordance with an accurate boundary line survey. In the case of demolition, the site plan shall show construction to be demolished and the location and size of existing structures and construction that are to remain on the site or plot. The code official is permitted to waive or modify the requirement for a site plan where the application for permit is for alteration or repair or where otherwise warranted.

SECTION K502 EXAMINATION OF DOCUMENTS

~~K502.1~~ General. The code official shall examine or cause to be examined the accompanying construction documents and shall ascertain by such examinations whether the construction indicated and described is in accordance with the requirements of this code and other pertinent laws or ordinances.

~~K502.2~~ Approval of construction documents. When the code official issues a permit, the construction documents shall be approved, in writing or by stamp, as "Reviewed for Code Compliance." One set of construction documents so reviewed shall be retained by the code official. The other set shall be returned to the applicant, shall be kept at the site of work and shall be open to inspection by the code official or the authorized representative.

~~K502.2.1~~ Previous approvals. This code shall not require changes in the construction documents, construction or installation of electrical systems or equipment for which a lawful permit has been heretofore issued or otherwise lawfully authorized, and the construction of which has been pursued in good faith within 180 days after the effective date of this code and has not been abandoned.

~~K502.2.2~~ Phased approval. The code official is authorized to issue a permit for the installation of part of an electrical system before the construction documents for the electrical system have been submitted, provided that adequate information and detailed statements have been filed complying with pertinent requirements of this code. The holder of such permit shall proceed at the holder's own risk with the building operation and without assurance that a permit for the entire system will be granted.

SECTION K503 DESIGN PROFESSIONAL IN RESPONSIBLE CHARGE

~~K503.1~~ General. Where it is required that documents be prepared by a registered design professional, the code official shall require the owner to engage and designate on the permit application a registered design professional who shall act as the registered design professional in responsible charge. If the circumstances require, the owner shall be permitted to designate a substitute registered design professional in responsible charge who shall perform the duties required of the original registered design professional in responsible charge. The code official shall be notified in writing by the owner if the registered design professional in responsible charge is changed or is unable to perform the duties. The registered design professional in responsible charge shall be responsible for reviewing and coordinating submittal documents prepared by others, including phased and deferred submittal items, for compatibility with the design of the system.

SECTION K504 HANDLING SUBMITTALS

~~K504.1~~ Deferred submittals. For the purposes of this section, deferred submittals are defined as those portions of the design that are not submitted at the time of the application and that are to be submitted to the code official within a specified period. Deferral of any submittal items shall have the prior approval of the code official. The registered design professional in responsible charge shall list the deferred submittals on the construction documents for review

by the code official. Submittal documents for deferred submittal items shall be submitted to the registered design professional in responsible charge, who shall review them and forward them to the code official with a notation indicating that the deferred submittal documents have been reviewed and that they have been found to be in general compliance with the design of the system. The deferred submittal items shall not be installed until their design and submittal documents have been approved by the code official.

K504.2 Amended construction documents. Work shall be installed in accordance with the reviewed construction documents, and any changes made during construction which are not in compliance with the approved construction documents shall be resubmitted for approval as an amended set of construction documents.

K504.3 Retention of construction documents. One set of approved construction documents shall be retained by the code official for a period of not less than 180 days from date of completion of the permitted work, or as required by state or local laws.

CHAPTER K6 APPROVAL

SECTION K601 GENERAL

K601.1 Approved materials and equipment. All materials, equipment and devices approved by the code official shall be constructed and installed in accordance with such approval.

K601.1.1 Technical assistance. To determine the acceptability of technologies, processes, products, facilities, materials and uses attending the design, operation or use of a building or premises subject to the inspection of the department, the code official is authorized to require the owner or the person in possession or control of the building or premises to provide, without charge to the jurisdiction, a technical opinion and report. The opinion and report shall be prepared by a qualified engineer, specialist, laboratory or organization acceptable to the code official and shall analyze the properties of the design, operation or use of the building or premises and the facilities and appurtenances situated thereon, to recommend necessary changes. The code official is authorized to require design submittals to be prepared by and bear the stamp of, a registered design professional.

K601.2 Modifications. Wherever there are practical difficulties involved in carrying out the provisions of this code, the code official shall have the authority to grant modifications for individual cases, provided the code official shall first find that special individual reason makes the strict letter of this code impractical and that the modification is in compliance with the intent and purpose of this code, and that such modification does not lessen health, life and fire-safety requirements. The details of action granting modifications shall be recorded and entered in the files of the department of electrical inspection.

K601.3 Alternative materials, methods, equipment and appliances. The provisions of this code are not intended to prevent the installation of any material or to prohibit any method of construction not specifically prescribed by this code, provided that any such alternative has been approved. An alternative material or method of construction shall be approved where the code official finds that the proposed design is satisfactory and complies with the intent of the provisions of this code, and that the material, method or work offered is, for the purpose intended, at least the equivalent of that prescribed in this code in quality, strength, effectiveness, fire resistance, durability and safety.

K601.4 Material, equipment and appliance reuse. Materials, equipment, appliances and devices shall not be reused unless such elements have been reconditioned, tested and placed in good and proper working condition and approved.

SECTION K602 TESTING

K602.1 Required testing. Wherever there is insufficient evidence of compliance with the provisions of this code, or evidence that a material or method does not conform to the requirements of this code, or in order to substantiate claims for alternative materials or methods, the code official shall have the authority to require tests as evidence of compliance to be made at no expense to the jurisdiction.

K602.2 Test methods. Test methods shall be as specified in this code or by other recognized test standards. In the absence of recognized and accepted test methods, the code official shall approve the testing procedures.

~~**K602.3 Testing agency.** All tests shall be performed by an approved agency.~~

~~**K602.4 Test reports.** Reports of tests shall be retained by the code official for the period required for retention of public records.~~

SECTION K603 K105 ALTERNATIVE ENGINEERED DESIGN

~~**K603.1 K105.1 General.** The design, documentation, inspection, testing and approval of an alternative engineered design electrical system shall comply with this section.~~

~~**K603.2 K105.2 Design criteria.** An alternative engineered design shall conform to the intent of the provisions of this code and shall provide an equivalent level of quality, strength, effectiveness, fire resistance, durability and safety. Materials, equipment or components shall be designed and installed in accordance with the manufacturer's installation instructions.~~

~~**K603.3 K105.3 Submittal.** The registered design professional shall indicate on the permit application that the electrical system is an alternative engineered design. The permit and permanent permit records shall indicate that an alternative engineered design was part of the approved installation.~~

~~**K603.4 K105.4 Technical data.** The registered design professional shall submit sufficient technical data to substantiate the proposed alternative engineered design and to prove that the performance meets the intent of this code.~~

~~**K603.5 K105.5 Construction documents.** The registered design professional shall submit to the ~~code~~ building official two complete sets of signed and sealed construction documents for the alternative engineered design. The construction documents shall include floor plans and a diagram of the work.~~

~~**K603.6 K105.6 Design approval.** Where the ~~code~~ building official determines that the alternative engineered design conforms to the intent of this code, the electrical system shall be approved. If the alternative engineered design is not approved, the ~~code~~ building official shall notify the registered design professional in writing, stating the reasons therefor.~~

~~**K603.7 K105.7 Inspection and testing.** The alternative engineered design shall be tested and inspected in accordance with the requirements of this code.~~

CHAPTER K7 INSPECTIONS AND TESTING

SECTION K701 GENERAL

~~**K701.1 General.** The code official is authorized to conduct inspections that are deemed necessary to determine the extent of compliance with the provisions of this code and to approve reports of inspection by approved agencies or individuals. All reports of such inspections shall be prepared and submitted in writing for review and approval. Inspection reports shall be certified by a responsible officer of such approved agency or by the responsible individual. The code official is authorized to engage such expert opinion as deemed necessary to report upon unusual, detailed or complex technical issues subject to the approval of the governing body.~~

SECTION K702 K106 REQUIRED INSPECTIONS

~~**K702.1 K106.1 General.** The ~~code~~ building official, upon notification, shall make the inspections set forth in this section.~~

~~**K702.1.1 Evaluation and follow-up inspection services.** Prior to the approval of a prefabricated construction assembly having concealed electrical work and the issuance of an electrical permit, the code official shall require the submittal of an evaluation report on each prefabricated construction assembly, indicating the complete details of the electrical system, including a description of the system and its components, the basis upon which the system is being evaluated, test results and similar information, and other data as necessary for the code official to determine conformance to this code.~~

~~**K702.1.1.1 Evaluation service.** The code official shall designate the evaluation service of an approved agency as the evaluation agency, and review such agency's evaluation report for adequacy and conformance to this code.~~

~~**K702.1.1.2 Follow-up inspection.** Except where ready access is provided to electrical systems, service equipment and accessories for complete inspection at the site without disassembly or dismantling, the code official shall conduct the in-plant inspections as frequently as necessary to ensure conformance to the approved evaluation report or shall designate an independent, approved inspection agency to conduct such inspections. The inspection agency shall furnish the code official with the follow-up inspection manual and a report of inspections upon request, and the electrical system shall have an identifying label permanently affixed to the system indicating that factory inspections have been performed.~~

~~**K702.1.1.3 Test and inspection records.** Required test and inspection records shall be available to the code official at all times during the fabrication of the electrical system and the erection of the building; or such records as the code official designates shall be filed.~~

~~**K702.1.2 Concealed work.** Work shall remain accessible and exposed for inspection purposes until approved. It shall be the duty of the permit applicant to cause the work to remain accessible and exposed for inspection purposes. Wherever any installation subject to inspection prior to use is covered or concealed without having first been inspected, the code official shall have the authority to require that such work be exposed for inspection. Neither the code official nor the jurisdiction shall be liable for expense entailed in the removal or replacement of any material required to allow inspection.~~

~~**K702.1.3 K106.2 Underground.** Underground inspection shall be made after trenches or ditches are excavated and bedded, piping and conductors installed, and before backfill is put in place. Where excavated soil contains rocks, broken concrete, frozen chunks and other rubble that would damage or break the raceway, cable or conductors, or where corrosive action will occur, protection shall be provided in the form of granular or selected material, approved running boards, sleeves or other means.~~

~~**K702.1.4 K106.3 Rough-in.** Rough-in inspection shall be made after the roof, framing, fireblocking and bracing are in place and all wiring and other components to be concealed are complete, and prior to the installation of wall or ceiling membranes.~~

~~**K702.1.5 Other inspections.** In addition to the inspections specified above, the code official is authorized to make or require other inspections of any construction work to ascertain compliance with the provisions of this code and other laws, which are enforced by the department of electrical inspection.~~

~~**K702.1.6 Final inspection.** The final inspection shall be made after all work required by the permit is completed.~~

~~**K702.1.7 Inspection record card.** Work requiring a permit shall not be commenced until the permit holder or an agent of the permit holder shall have posted or otherwise made available an inspection record card such as to allow the code official to make conveniently the required entries thereon regarding inspection of the work. This card shall be maintained by the permit holder until final approval has been granted by the code official.~~

~~**K702.1.8 Approval required.** Work shall not be performed beyond the point indicated in each successive inspection and test without first obtaining the approval of the code official. The code official, upon notification, shall make the requested inspections and tests and shall either indicate the portion of the construction that is satisfactory as completed, or shall notify the permit holder or an agent of the permit holder wherein the same fails to comply with this code. Any portions that do not comply shall be corrected and such portion shall not be covered or concealed until authorized by the code official.~~

~~**K702.2 Validity.** Approval as a result of an inspection shall not be construed to be an approval of a violation of the provisions of this code or of other ordinances of the jurisdiction. Inspections presuming to give authority to violate or cancel the provisions of this code or of other ordinances of the jurisdiction shall not be valid.~~

~~**K702.3 Preliminary inspection.** Before issuing a permit, the code official is authorized to examine or cause to be examined buildings, structures and sites for which an application has been filed. The code official shall be notified when the installation is ready for inspection and is authorized to conduct the inspection within a reasonable period of time.~~

~~**K702.4 Entry.** The code official is authorized to enter and examine any building, structure, marine vessel, vehicle or premises in accordance with Section K702.4.3 for the purpose of enforcing this code.~~

~~**K702.4.1 Identification.** The code official shall carry proper identification issued by the governing authority where inspecting structures, premises or facilities in the performance of duties under this code and shall be identified by proper credentials issued by this governing authority.~~

~~**K702.4.2 Impersonation prohibited.** A person shall not impersonate the code official through the use of a uniform, identification card, badge or any other means.~~

~~**K702.4.3 Right of entry.** Where it is necessary to make an inspection to enforce the provisions of this code, or where the code official has reasonable cause to believe that there exists in a structure or upon any premises a condition that is contrary to or in violation of this code, which makes the structure or premises unsafe, dangerous or hazardous, the code official is authorized to enter the structure or premises at reasonable times to inspect or to perform the duties imposed by this code, provided that if such structure or premises be occupied, that credentials be presented to the occupant and entry requested. If such structure or premises is unoccupied, the code official is authorized to first make a reasonable effort to locate the owner or other person having charge or control of the structure or premises and request entry. If entry is refused, the code official shall have recourse to the remedies provided by law to secure entry.~~

~~**K702.5 Inspection agencies.** The code official is authorized to accept reports of approved inspection agencies, provided such agencies satisfy the requirements as to qualifications and reliability.~~

~~**K702.6 Inspection requests.** It shall be the duty of the person doing the work authorized by a permit to notify the code official that such work is ready for inspection. It shall be the duty of the person requesting any inspections required by this code to provide access to and means for inspection of such work.~~

~~**K702.7 Assistance from other agencies.** The assistance and cooperation of police, building, fire and health department officials and all other officials shall be available as required in the performance of duties.~~

~~**K702.8 K106.4 Contractors' responsibilities.** It shall be the responsibility of every contractor who enters into contracts for the installation or repair of electrical systems for which a permit is required to comply with adopted state and local rules and regulations concerning licensing.~~

SECTION K107 **PREFABRICATED CONSTRUCTION**

K107 Prefabricated construction. Prefabricated construction is subject to Sections K107.1 through K107.4.

K107.1 Evaluation and follow-up inspection services. Prior to the approval of a prefabricated construction assembly having concealed electrical work and the issuance of an electrical permit, the building official shall require the submittal of an evaluation report on each prefabricated construction assembly, indicating the complete details of the electrical system, including a description of the system and its components, the basis upon which the system is being evaluated, test results and similar information, and other data as necessary for the code official to determine conformance to this code.

K107.2 Evaluation service. The building official shall designate the evaluation service of an approved agency as the evaluation agency, and review such agency's evaluation report for adequacy and conformance to this code.

K107.3 Follow-up inspection. Except where ready access is provided to electrical systems, service equipment and accessories for complete inspection at the site without disassembly or dismantling, the building official shall conduct the in-plant inspections as frequently as necessary to ensure conformance to the approved evaluation report or shall designate an independent, approved inspection agency to conduct such inspections. The inspection agency shall furnish the building official with the follow-up inspection manual and a report of inspections upon request, and the electrical system shall have an identifying label permanently affixed to the system indicating that factory inspections have been performed.

K107.4 Test and inspection records. Required test and inspection records shall be available to the building official at all times during the fabrication of the electrical system and the erection of the building; or such records as the building official designates shall be filed.

SECTION K703 **TESTING**

~~**K703.1 General.**~~ **K107.5 Testing.** Electrical work shall be tested as required in this code. Tests shall be performed by the permit holder and observed by the code official.

~~**K703.2 K107.5.1 Apparatus, material and labor for tests.** Apparatus, material and labor required for testing an electrical system or part thereof shall be furnished by the permit holder.~~

~~**K703.3 K107.5.2 Reinspection and testing.** Where any work or installation does not pass an initial test or inspection, the necessary corrections shall be made so as to achieve compliance with this code. The work or installation shall then be resubmitted to the code official for inspection and testing.~~

**CHAPTER K8
SERVICE UTILITIES**

**SECTION K801
GENERAL**

~~**K801.1 Connection of service utilities.** No person shall make connections from a utility, source of energy, fuel or power to any building or system that is regulated by this code for which a permit is required, until released by the code official.~~

~~**K801.2 Temporary connection.** The code official shall have the authority to authorize the temporary connection of the building or system to the utility source of energy, fuel or power.~~

~~**K801.3 Authority to disconnect service utilities.** The code official shall have the authority to authorize disconnection of utility services or energy sources to the building, structure or system regulated by this code in case of an emergency where it is necessary to eliminate an immediate hazard to life or property. The code official shall notify the serving utility and, wherever possible, the owner and occupant of the building, structure or service system of the decision to disconnect prior to taking such action. If not notified prior to disconnecting, the owner or occupant of the building, structure or service system shall be notified in writing as soon as practical thereafter.~~

SECTION K108
RECONNECTION

~~**K801.3.1 K108.1 Connection after order to disconnect.** A person shall not make utility service or energy source connections to systems regulated by this code, which have been disconnected or ordered to be disconnected by the code building official, or the use of which has been ordered to be discontinued by the code building official until the code building official authorizes the reconnection and use of such systems.~~

**CHAPTER K9
UNSAFE SYSTEMS AND EQUIPMENT**

**SECTION K901
CONDITIONS**

~~**K901.1 Unsafe electrical systems.** An electrical system that is unsafe, constitutes a fire or health hazard, or is otherwise dangerous to human life, as regulated by this code, is hereby declared as an unsafe electrical system. Use of an electrical system regulated by this code constituting a hazard to health, safety or welfare by reason of inadequate maintenance, dilapidation, fire hazard, disaster, damage or abandonment is hereby declared an unsafe use. Such unsafe equipment and appliances are hereby declared to be a public nuisance and shall be abated by repair, rehabilitation, demolition or removal.~~

SECTION K109
CONDEMNING ELECTRICAL SYSTEMS

~~**K901.2 K109.1 Authority to condemn electrical systems.** Wherever the code building official determines that any electrical system, or portion thereof, regulated by this code has become hazardous to life, health or property, the code building official shall order in writing that such electrical systems either be removed or restored to a safe condition. A time limit for compliance with such order shall be specified in the written notice. A person shall not use or maintain a defective electrical system or equipment after receiving such notice.~~

~~Where such electrical system is to be disconnected, written notice as prescribed in this code shall be given. In cases of immediate danger to life or property, such disconnection shall be made immediately without such notice.~~

~~**K901.3 Dangerous conditions.** Wherever the code official shall find in any structure or upon any premises dangerous or hazardous conditions or materials, the code official is authorized to order such dangerous conditions or materials to be removed or remedied in accordance with the provisions of this code.~~

~~**K901.4 Record.** The code official shall cause a report to be filed on an unsafe condition. The report shall state the occupancy of the structure and the nature of the unsafe condition.~~

~~**K901.5 Notice.** If an unsafe condition is found, the code official shall serve on the owner, agent or person in control of the structure, a written notice that describes the condition deemed unsafe and specifies the required repairs or improvements to be made to abate the unsafe condition, or that requires the unsafe condition to be removed within a stipulated time. Such notice shall require the person thus notified to declare immediately to the code official acceptance or rejection of the terms of the order.~~

~~**K901.6 Method of service.** Such notice shall be deemed properly served if a copy thereof is: (a) delivered to the owner personally; or (b) sent by certified or registered mail addressed to the owner at the last known address with the return receipt requested. If the certified or registered letter is returned showing that the letter was not delivered, a copy thereof shall be posted in a conspicuous place in or about the structure affected by such notice. Service of such notice in the foregoing manner upon the owner's agent or upon the person responsible for the structure shall constitute service of notice upon the owner.~~

CHAPTER K10 VIOLATIONS

SECTION K1001 UNLAWFUL ACTS

~~**K1001.1 General.** It shall be unlawful for any person, firm or corporation to erect, construct, alter, extend, repair, move, remove, demolish or occupy any system or equipment regulated by this code, or cause same to be done, in conflict with or in violation of any of the provisions of this code.~~

SECTION K1002 NOTICE OF VIOLATION

~~**K1002.1 Issuance.** Where the code official finds any building, premises, vehicle, system or equipment that is in violation of this code, the code official is authorized to issue corrective orders.~~

~~**K1002.2 Notice.** Wherever the code official determines violations of this code or observes an apparent or actual violation of a provision of this code or other codes or ordinances under the code official's jurisdiction, the code official is authorized to prepare a written notice of violation describing the conditions deemed unsafe and, where compliance is not immediate, specifying a time for reinspection. Such order shall direct the discontinuance of the illegal action or condition and the abatement of the violation.~~

~~**K1002.3 Service.** Any order or notice issued pursuant to this code shall be served upon the owner, operator, occupant or other person responsible for the condition or violation, either by personal service, mail or by delivering the same to, and leaving it with, some person of responsibility upon the premises. For unattended or abandoned locations, a copy of such order or notice shall be posted on the premises in a conspicuous place at or near the entrance to such premises, and the order or notice shall be mailed by certified mail with return receipt requested or a certificate of mailing, to the last known address of the owner, occupant or both.~~

~~**K1002.4 Compliance with orders and notices.** Orders and notices issued or served as provided by this code shall be complied with by the owner, operator, occupant or other person responsible for the condition or violation to which the order or notice pertains.~~

~~**K1002.5 Failure to correct violations.** If the notice of violation is not complied with, the code official is authorized to request the legal counsel of the jurisdiction to institute the appropriate legal proceedings to restrain, correct or abate such violation or to require removal or termination of the unlawful occupancy of the structure in violation of the provisions of this code or of any order or direction made pursuant thereto.~~

~~**K1002.6 Failure to comply.** Failure to comply with an abatement notice or other corrective notice issued by the code official shall result in each day that such violation continues being regarded as a new and separate offense.~~

~~**K1002.7 Unauthorized tampering.** Signs, tags or seals posted or affixed by the code official shall not be mutilated, destroyed or tampered with or removed without authorization from the code official.~~

SECTION K1003 PENALTIES

~~**K1003.1 Penalties.** Any person who fails to comply with the provisions of this code or who fails to carry out an order made pursuant of this code or violates any condition attached to a permit, approval or certificate shall be subject to the penalties established by this jurisdiction.~~

~~**K1003.2 Abatement of violation.** The imposition of the penalties herein described shall not prevent the legal officer of the jurisdiction from instituting appropriate action to prevent unlawful construction or to restrain, correct or abate a violation; or to prevent illegal occupancy of a structure or premises; or to stop an illegal act, conduct of business or occupancy of a structure on or about any premises.~~

SECTION K1004 STOP WORK ORDER

~~**K1004.1 Issuance.** Upon notice from the code official that any electrical work is being done contrary to the provisions of this code or in a dangerous or unsafe manner, such work shall immediately cease. Such notice shall be in writing and shall be given to the owner of the property, or to the owner's agent, or to the person doing the work. The notice shall state the conditions under which work is authorized to resume.~~

~~**K1004.2 Emergencies.** Where an emergency exists, the code official shall not be required to give a written notice prior to stopping the work.~~

~~**K1004.3 Unlawful continuance.** Any person who shall continue any work in or about the structure after having been served with a stop work order, except such work as that person is directed to perform to remove a violation or unsafe condition, shall be subject to penalties as prescribed by law.~~

CHAPTER K11 MEANS OF APPEAL

SECTION K1101 GENERAL

~~**K1101.1 Board of appeals established.** In order to hear and decide appeals of orders, decisions or determinations made by the code official relative to the application and interpretation of this code, there shall be and is hereby created a board of appeals. The board of appeals shall be appointed by the governing body and shall hold office at its pleasure. The board shall adopt rules of procedure for conducting its business, and shall render all decisions and findings in writing to the appellant with a duplicate copy to the code official.~~

~~**K1101.2 Limitations on authority.** An application for appeal shall be based on a claim that the true intent of this code or the rules legally adopted there under have been incorrectly interpreted, the provisions of this code do not fully apply, or an at least equivalent method of protection or safety is proposed. The board shall have no authority to waive the requirements of this code.~~

SECTION K1102 MEMBERSHIP

~~**K1102.1 Membership of board.** The board of appeals shall consist of five members appointed by the chief appointing authority as follows: one for five years; one for four years; one for three years; one for two years and one for one year. Thereafter, each new member shall serve for five years or until a successor has been appointed.~~

~~**K1102.2 Qualifications.** The board of appeals shall consist of five individuals, one from each of the following professions or disciplines:~~

- ~~1. Registered design professional who is a registered architect; or a builder or superintendent of building construction with at least 10 years' experience, five of which shall have been in responsible charge of work.~~
- ~~2. Registered design professional with structural engineering or architectural experience.~~

3. Registered design professional with mechanical, plumbing or fuel-gas engineering experience; or a mechanical, plumbing or fuel-gas contractor with at least 10 years' experience, five of which shall have been in responsible charge of work.
4. Registered design professional with electrical engineering experience; or an electrical contractor with at least 10 years' experience, five of which shall have been in responsible charge of work.
5. Registered design professional with fire protection engineering experience; or a fire protection contractor with at least 10 years' experience, five of which shall have been in responsible charge of work.
6. The code official shall be an ex officio member of said board, but shall have no vote on any matter before the board.

K1102.3 Alternate members. The chief appointing authority shall appoint two alternate members who shall be called on by the board chairman to hear appeals during the absence or disqualification of a member. Alternate members shall possess the qualifications required for board membership and shall be appointed for five years, or until a successor has been appointed.

K1102.4 Chairman. The board shall annually select one of its members to serve as chairman.

K1102.5 Disqualification of members. A member shall not hear an appeal in which that member has a personal, professional or financial interest.

K1102.6 Secretary. The chief appointing authority shall designate a qualified clerk to serve as secretary to the board. The secretary shall file a detailed record of all proceedings in the office of the chief appointing authority.

K1102.7 Compensation of members. Compensation of members shall be determined by law.

SECTION K1103 PROCEDURES

K1103.1 Application for appeal. A person shall have the right to appeal a decision of the code official to the board of appeals. An application for appeal shall be based on a claim that the true intent of this code or the rules legally adopted there under, have been incorrectly interpreted, the provisions of this code do not fully apply, or an equally good or better form of construction is proposed. The application shall be filed on a form obtained from the code official within 20 days after the notice was served.

K1103.2 Notice of meeting. The board shall meet upon notice from the chairman, within 10 days of the filing of an appeal, or at stated periodic meetings.

K1103.3 Open hearing. All hearings before the board shall be open to the public. The appellant, the appellant's representative, the code official and any person whose interests are affected shall be given an opportunity to be heard.

K1103.4 Rules of procedure. The board shall adopt and make available to the public through the secretary rules of procedure under which a hearing will be conducted. The procedures shall not require compliance with strict rules of evidence, but shall mandate that only relevant information be received.

K1103.5 Postponed hearing. Where five members are not present to hear an appeal, either the appellant or the appellant's representative shall have the right to request a postponement of the hearing.

K1103.6 Decisions. The board shall modify or reverse the decision of the code official by a concurring vote of three members.

K1103.6.1 Resolution. The decision of the board shall be by resolution. Certified copies shall be furnished to the appellant and to the code official.

K1103.6.2 Administration. The code official shall take immediate action in accordance with the decision of the board.

K1103.7 Court review. Any person, whether or not a previous party of the appeal, shall have the right to apply to the appropriate court for a writ of certiorari to correct errors of law. Application for review shall be made in the manner and time required by law following the filing of the decision in the office of the chief appointing authority.

**CHAPTER K12
ELECTRICAL PROVISIONS**

**SECTION K1204 K110
ELECTRICAL PROVISIONS**

K110.1 General.

~~**K1201.1 Scope.** This chapter governs the design and construction of electrical systems and equipment.~~

~~**K1201.1.1 Adoption.** **K110.1.1 Referenced codes.** Electrical systems and equipment shall be designed and constructed in accordance with the *International Residential Code* or NFPA 70 as applicable, except as otherwise provided in this code.~~

~~**[F] K1201.2 K110.1.2 Abatement of electrical hazards.** All identified electrical hazards shall be abated. All identified hazardous electrical conditions in permanent wiring shall be brought to the attention of the code building official responsible for enforcement of this code. Electrical wiring, devices, appliances and other equipment which is modified or damaged and constitutes an electrical shock or fire hazard shall not be used.~~

~~**[F] K1201.3 K110.1.3 Appliance and fixture listing.** Electrical appliances and fixtures shall be tested and listed in published reports of inspected electrical equipment by an approved agency and installed in accordance with all instructions included as part of such listing.~~

SECTION K1202

K110.2 Provisions

~~**K1202.1 General.** The provisions of this section shall apply to the design, construction, installation, use and maintenance of electrical systems and equipment. Where differences occur between provisions of this code and referenced codes or standards, the provisions of this code shall apply.~~

~~**K1202.2 K110.2.1 Nonmetallic-sheathed cable.** The use of Type NM, NMC and NMS (nonmetallic sheathed) cable wiring methods shall not be limited based on height, number of stories or construction type of the building or structure.~~

~~**K1202.3 K110.2.2 Cutting, notching and boring.** The cutting, notching and boring of wood and steel framing members, structural members and engineered wood products shall be in accordance with the *International Building Code*.~~

~~**K1202.4 Penetrations.** Penetrations of walls, floors, ceilings and assemblies required to have a fire-resistance rating, shall be protected in accordance with the *International Building Code*. Where cables, conductors and raceways penetrate fireblocking or draftstopping, such penetrations shall be protected by filling the annular space with an approved fireblocking material.~~

~~**K1202.5 K110.2.3 Smoke detector circuits.** Smoke detectors required by the *International Building Code* and installed within dwelling units shall not be connected as the only load on a branch circuit. Such detectors shall be supplied by branch circuits having lighting loads consisting of lighting outlets in habitable spaces.~~

~~**[M] K1202.6 Appliance access.** Where appliances requiring access are installed in attics or underfloor spaces, a luminaire controlled by a switch located at the required passageway opening to such space and a receptacle outlet shall be provided at or near the appliance location.~~

~~**[FG] K1202.7 Prohibited grounding electrode.** Fuel gas piping shall not be used as a grounding electrode.~~

~~**[F] K1202.8 Emergency and standby power.** Emergency and standby power systems required by the *International Building Code* or *International Fire Code* shall be installed in accordance with the *International Building Code*, the *International Fire Code*, NFPA 110, NFPA 111 and this code.~~

~~**[F] K1202.9 Smoke control systems.** Smoke control systems required by the *International Building Code* or *International Fire Code* shall be supplied with two sources of power. Primary power shall be the normal building power systems. Secondary power shall be from an approved standby source complying with this code. The standby~~

power source and its transfer switches shall be in a separate room from the normal power transformers and switch gear, and shall be enclosed in a room constructed of not less than 1-hour fire-resistance-rated fire barriers, ventilated directly to and from the exterior. Power distribution from the two sources shall be by independent routes. Transfer to full standby power shall be automatic and within 60 seconds of failure of the primary power.

~~[F] K1202.9.1 Power sources and power surges.~~ Elements of the smoke management system relying on volatile memories or the like shall be supplied with uninterruptible power sources of sufficient duration to span 15-minute primary power interruption. Elements of the smoke management system susceptible to power surges shall be suitably protected by conditioners, suppressors or other approved means.

~~[F] K1202.9.2 Wiring.~~ In addition to meeting the requirements of this code, all signal and control wiring for smoke control systems, regardless of voltage, shall be fully enclosed within continuous raceways.

~~[M] K1202.10 Wiring in plenums.~~ Combustible electrical or electronic wiring methods and materials, optical fiber cable, and optical fiber raceway exposed within plenums regulated by Section 602 of the *International Mechanical Code* shall have a peak optical density not greater than 0.50, an average optical density not greater than 0.15, and a flame spread not greater than 5 feet (1524 mm) when tested in accordance with NFPA 262. Only type OFNP (plenum-rated nonconductive optical fiber cable) shall be installed in plenum-rated optical fiber raceways. Wiring, cable and raceways addressed in this section shall be listed and labeled as plenum rated and shall be installed in accordance with this code.

~~[M] K1202.10.1 Combustible electrical equipment.~~ Combustible electrical equipment exposed within plenums regulated by Section 602 of the *International Mechanical Code* shall have a peak rate of heat release not greater than 100 kilowatts (kW), a peak optical density not greater than 0.50, and an average optical density not greater than 0.15 when tested in accordance with UL 2043. Combustible electrical equipment shall be listed and labeled.

~~[M] K1202.11 Engine and gas turbine-powered equipment and appliances.~~ Permanently installed equipment and appliances powered by internal combustion engines and turbines shall be installed in accordance with the manufacturer's installation instructions, the *International Mechanical Code*, *International Fuel Gas Code* and NFPA 37.

~~[F] K1202.12 Stationary fuel cell power systems.~~ Stationary fuel cell power systems having a power output not exceeding 10MW shall be tested in accordance with ANSI-ISA America FC1 and shall be installed in accordance with the manufacturer's installation instructions and NFPA 853.

~~[M] K1202.13 Boiler control requirements.~~ The power supply to the electrical control system for boilers shall be from a two-wire branch circuit that has a grounded conductor or from an isolation transformer with a two-wire secondary. Where an isolation transformer is provided, one conductor of the secondary winding shall be grounded. Control voltage shall not exceed 150 volts nominal, line to line. Control and limit devices shall interrupt the ungrounded side of the circuit. A means of manually disconnecting the control circuit shall be provided, and controls shall be arranged so that when deenergized, the burner shall be inoperative. Such disconnecting means shall be capable of being locked in the off position and shall be provided with ready access.

~~[F] K1202.14 K110.2.4 Equipment and door labeling.~~ Doors into electrical control panel rooms shall be marked with a plainly visible and legible sign stating ELECTRICAL ROOM or similar approved wording. The disconnecting means for each service, feeder or branch circuit originating on a switchboard or panelboard shall be legibly and durably marked to indicate its purpose unless such purpose is clearly evident.

~~[F] K1202.15 Smoke alarm power source.~~ In new construction, required smoke alarms shall receive their primary power from the building wiring where such wiring is served from a commercial source and shall be equipped with a battery backup. Smoke alarms shall emit a signal when the batteries are low. Wiring shall be permanent and without a disconnecting switch other than as required for overcurrent protection.

Exception: Smoke alarms are not required to be equipped with battery backup in Group R-1 where they are connected to an emergency electrical system.

~~[F] K1202.16 Smoke alarm interconnection.~~ Where more than one smoke alarm is required to be installed within an individual dwelling unit or sleeping unit in Group R-2, R-3 or R-4, or within an individual sleeping unit in Group R-1, the smoke alarms shall be interconnected in such a manner that the activation of one alarm will activate all of the alarms in the individual unit. The alarm shall be clearly audible in all bedrooms over background noise levels with all intervening doors closed.

**SECTION K1203
EXISTING ELECTRICAL FACILITIES**

~~**[PM] K1203.1 Existing buildings.** This section shall apply to buildings and structures that are within the scope of the *International Property Maintenance Code*. Every occupied building shall be provided with an electrical system in compliance with the requirements of Sections K1203.1.1 through K1203.1.5.~~

~~**[PM] K1203.1.1 Service.** The size and usage of appliances and equipment shall serve as a basis for determining the need for additional facilities in accordance with this code. Dwelling units shall be served by a three-wire, 120/240 volt, single-phase electrical service having a rating of not less than 60 amperes.~~

~~**[PM] K1203.1.2 Electrical system hazards.** Where it is found that the electrical system in a structure constitutes a hazard to the occupants or the structure by reason of inadequate service, improper fusing, insufficient receptacle and lighting outlets, improper wiring or installation, deterioration or damage, or for similar reasons, the code official shall require the defects to be corrected to eliminate the hazard.~~

~~**[PM] K1203.1.3 Installation.** All electrical equipment, wiring and appliances shall be properly installed and maintained in a safe and approved manner.~~

~~**[PM] K1203.1.4 Receptacles.** Every habitable space in a dwelling shall be provided with at least two separate and remote receptacle outlets. Every laundry area shall be provided with at least one grounding-type receptacle outlet or a receptacle outlet with ground fault circuit interrupter protection. Every bathroom shall contain at least one receptacle outlet. Any new bathroom receptacle outlet shall have ground fault circuit interrupter protection.~~

~~**[PM] K1203.1.5 Luminaires.** Every public hall, interior stairway, toilet room, kitchen, bathroom, laundry room, boiler room and furnace room shall be provided with at least one electric luminaire.~~

Reason: The purpose of this code change proposal is to eliminate redundant and otherwise unnecessary text from Appendix K, and to coordinate the Appendix with the body of the IBC. It is not intended to make substantive changes to the provisions of Appendix K with one exception noted below.

At the 2005 Annual Business Meeting, the membership voted to place the text of the entire *International Code Council Electrical Code Administrative Provisions* in an appendix chapter of the IBC. We did not, however, coordinate the new appendix chapter with the IBC.

This proposal deletes sections that duplicate other sections of the IBC or sections of other codes adopted by reference in the IBC. Those sections are unnecessary because Appendix K is intended to be used in conjunction with the IBC—before a jurisdiction would adopt Appendix K, it will have already adopted the IBC.

Some provisions of Appendix K are copied from the IFC, IMC, IFGC and IPMC. This proposal deletes those sections because those sections address subjects that are not governed by the Building Code.

The following list shows the sections proposed to be deleted from Appendix K and the sections of the IBC and other codes which are duplicated. In cases where procedures specified in Appendix K are different than the IBC, this proposal deletes the Appendix K provision unless it is specific to electrical systems.

<u>Appendix K Section</u>	<u>Other Code Section</u>
K101.1 Title	IBC 101.1

Other Code Section

The only instance in which this proposal would make a substantive change to Appendix K is in the deletion of Section K1202.15. Appendix K applies the requirement for battery back up for all smoke alarms in new construction. The IFC applies this requirement only to Group R occupancies.

In addition, some provisions of Section K101, such as K101, are modified slightly to make them more parallel to language in Chapter 1 while addressing electrical issues. The term "code official" is changed to "building official" for consistency with the rest of the IBC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal was approved to ensure that the appendix correlates with the body of the code. Without correlation the adoption of the appendix would create redundancies.

Assembly Action:

None

Final Hearing Results

Code Change No: G221-06/07

Original Proposal

Chapters 1 and 2

THIS PROPOSAL IS ON THE AGENDA OF THE IBC GENERAL, IEBC, IECC, IFC, IFGC, IMC, IPC, IPSDC, IRC BUILDING/ENERGY, IWUIC AND IZC CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEE

Proponent: Lawrence Brown, CBO, National Association of Home Builders

PART I – IBC GENERAL

Revise chapters as follows:

Unless otherwise noted, the section numbers shown below are inclusive of all subsections as shown in the 2006 Codes, Chapter 1. Only those sections that have been divided into two separate chapters are noted below with the proposed new subsection number (applies to all codes represented in this code change proposal).

CHAPTER 1
ADMINISTRATION

SECTION 101
GENERAL

101.1 Title.

(All other Subsections of Section 101 moved into new Chapter 2, Section 201)

SECTION ~~102~~ 403
DEPARTMENT OF BUILDING SAFETY

**SECTION 103 ~~404~~
DUTIES AND POWERS OF BUILDING OFFICIAL**

**SECTION 104 ~~405~~
PERMITS**

**SECTION 105 ~~407~~
TEMPORARY STRUCTURES AND USES**

105.1 ~~407.1~~ Permits **General. The building official is authorized to issue a permit for temporary structures and temporary uses. Such permits shall be limited as to time of service, but shall not be permitted for more than 180 days. The building official is authorized to grant extensions for demonstrated cause.**

105.2 ~~407.4~~ Termination of approval. The building official is authorized to terminate such permit for a temporary structure or use and to order the temporary structure or use to be discontinued.

**SECTION 106 ~~408~~
FEES**

**SECTION 107 ~~409~~
INSPECTIONS**

**SECTION 108 ~~410~~
CERTIFICATE OF OCCUPANCY**

**SECTION 109 ~~411~~
SERVICE UTILITIES**

**SECTION 110 ~~412~~
BOARD OF APPEALS**

**SECTION 111 ~~413~~
VIOLATIONS**

**SECTION 112 ~~414~~
STOP WORK ORDER**

**CHAPTER 2
SCOPE AND APPLICATION**

**SECTION 201 ~~401~~
SCOPE AND GENERAL REQUIREMENTS**

201.1 ~~401.2~~ Scope.

201.2 ~~401.2.1~~ Appendices.

201.3 ~~401.3~~ Intent.

201.4 ~~401.4~~ Referenced codes.

**SECTION 202 ~~402~~
APPLICABILITY**

**SECTION 203 ~~406~~
CONSTRUCTION DOCUMENTS**

**SECTION 204 ~~407~~
TEMPORARY STRUCTURES AND USES**

204.1 ~~407.2~~ Conformance. Temporary structures and uses shall conform to the structural strength, fire safety, means of egress, accessibility, light, ventilation and sanitary requirements of this code as necessary to ensure public health, safety and general welfare.

204.2 107.3 Temporary power. The building official is authorized to give permission to temporarily supply and use power in part of an electric installation before such installation has been fully completed and the final certificate of completion has been issued. The part covered by the temporary certificate shall comply with the requirements specified for temporary lighting, heat or power in the *International Code Council Electrical Code Administrative Provisions*.

**SECTION ~~202~~ ~~403~~
EXISTING BUILDINGS AND USES**

(Renumber subsequent chapters)

Reason: This proposal separates out the “Scoping” and “Application” provisions from the “Administration” provisions of Chapter 1, and places them in a new Chapter 2. As the code grows, the first chapter is becoming a catch-all for the administrative provisions needed to enforce the code. As many jurisdictions are required to drastically modify or completely revise Chapter 1 to coordinate with the jurisdiction’s codified ordinances or other state and local administrative law, having these non-administrative provisions in a separate chapter will help retain the scoping, application, and intent of this code’s provisions when the code is adopted.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I — IBC GENERAL

Committee Action:

Disapproved

Committee Reason: A modification consistent with the actions taken by other committees was not presented to the committee therefore as currently proposed it was not acceptable. One specific concern about the published proposal was that permits would be addressed in a different chapter than construction documents.

Assembly Action:

None

PART II — IEBC

Committee Action:

Approved as Modified

Replace the proposal with the following:

**CHAPTER 1
SCOPE AND ADMINISTRATION**

Part 1 – Scope and Application

**SECTION 101
GENERAL**

**SECTION 102
APPLICABILITY**

Part 2 – Administration and Enforcement

**SECTION 103
DEPARTMENT OF BUILDING SAFETY**

Committee Reason: The committee agreed that separating scoping and application provisions from administrative provisions within Chapter 1 of the IEBC was appropriate and allowed for jurisdictions to modify the administrative provisions as required by their local laws while easily retaining the scoping, application and intent provisions of the code. The modification allows for two separate parts versus two separate Chapters. This modification eliminates a massive chapter and section reference re-numbering requirement throughout the I-codes that would be a possible source of confusion and future errata.

Assembly Action:

None

PART III — IECC

Committee Action:

Approved as Modified

Replace the current proposal with the following:

**CHAPTER 1
SCOPE AND ADMINISTRATION**

Part 1 – Scope and Application

**SECTION 101
SCOPE AND GENERAL REQUIREMENTS**

**SECTION 102
MATERIALS, SYSTEMS AND EQUIPMENT**

**SECTION 103
ALTERNATE MATERIALS – METHOD OF CONSTRUCTION, DESIGN OR INSULATING SYSTEMS**

Part 2 – Administration and Enforcement

**SECTION 104
CONSTRUCTION DOCUMENTS**

**SECTION 105
INSPECTIONS**

**SECTION 106
VALIDITY**

**SECTION 107
REFERENCED STANDARDS**

Committee Reason: The committee agreed with the proponent that separation of the administrative requirements from the scope and intent requirements avoids losing the scope and intent statements when a jurisdiction modifies the administrative requirements, as is often done. This modification eliminates a massive chapter and section reference re-numbering and correlation requirement throughout the I-codes that would be a possible source of confusion and future errata.

Assembly Action: **None**

**PART IV — IFC
Committee Action:** **Approved as Modified**

Replace the proposal with the following:

Revise Chapter 1 arrangement as follows:

**CHAPTER 1
SCOPE AND ADMINISTRATION**

Part 1 – General Provisions

Section 101 Scope and General Requirements

Section 102 Applicability

Part 2 – Administrative Provisions

Section 103 Department of Fire Prevention

Section 104 General Authority and Responsibilities

Section 105 Permits

Section 106 Inspections

Section 107 Maintenance

Section 108 Board of Appeals

Section 109 Violations

Section 110 Unsafe Buildings

Section 111 Stop Work Order

Committee Reason: The committee agreed that separating scoping and application provisions from administrative provisions within Chapter 1 of the IFC was appropriate and allowed for jurisdictions to modify the administrative provisions as required by their local laws while easily retaining the scoping, application and intent provisions of the code. The modification allows for two separate parts versus two separate chapters. This modification eliminates a massive chapter and section reference re-numbering and correlation requirement throughout the I-codes that would be a possible source of confusion and future errata.

Assembly Action: **None**

**PART V - IFGC
Committee Action:** **Approved as Modified**

Replace the current proposal with the following:

CHAPTER 1

SCOPE AND ADMINISTRATION**Part 1 – Scope and Application**SECTION 101
GENERALSECTION 102
APPLICABILITY**Part 2 – Administration and Enforcement**SECTION 103
DEPARTMENT OF INSPECTIONSECTION 104
DUTIES AND POWERS OF CODE OFFICIALSECTION 105
APPROVALSECTION 106
PERMITSSECTION 107
INSPECTIONS AND TESTINGSECTION 108
VIOLATIONSSECTION 109
MEANS OF APPEAL

Committee Reason: Many jurisdictions delete or modify chapter one of the ICC codes and in doing so, may lose some needed code text.. Separating scoping and application provisions from administrative provisions within Chapter 1 of the IFGC is appropriate and allows jurisdictions to modify the administrative provisions as required by their local laws while easily retaining the scoping, application and intent provisions of the code. The modification allows for two separate parts of Chapter one instead of creating two separate chapters. This modification eliminates the massive task of re-numbering all sections and section references throughout the ICC codes. Such re-numbering would be a likely source of confusion and future errata.

Assembly Action:**None****PART VI — IMC****Committee Action:****Approved as Modified**

Replace the proposal with the following:

**CHAPTER 1
SCOPE AND ADMINISTRATION****Part 1 – Scope and Application**SECTION 101
GENERALSECTION 102
APPLICABILITY**Part 2 – Administration and Enforcement**SECTION 103
DEPARTMENT OF MECHANICAL INSPECTIONSECTION 104
DUTIES AND POWERS OF CODE OFFICIALSECTION 105
APPROVALSECTION 106
PERMITSSECTION 107
INSPECTIONS AND TESTING

**SECTION 108
VIOLATIONS**

**SECTION 109
MEANS OF APPEAL**

Committee Reason: This change provides a needed reorganization of Chapter 1 which will allow local jurisdictions to revise or delete the Administration and Enforcement portion of the chapter without losing the Scope and Application requirements. The modification moves the proposed Chapter 2 to a new section in Chapter 1, Scope and Application, to avoid renumbering all subsequent chapters of the IMC.

Assembly Action:

None

**PART VII — IPC
Committee Action:**

Approved as Modified

Replace the proposal with the following:

**CHAPTER 1
SCOPE AND ADMINISTRATION**

Part 1 – Scope and Application

**SECTION 101

Original Proposal

Sections: 106.1, 106.1.1, 106.1.1.1, 106.1.2, 106.1.3, 106.2, 106.3, 106.3.4.2; IEBC 106.1, 106.1.1, 106.1.1.1, 106.1.2, 106.1.3, 106.2, 106.3, 106.3.4; IRC R106.1, R106.1.1, R106.2, R106.3,

Proponent: Philip Brazil, P.E., Reid Middleton, Inc., representing the Washington Association of Building Officials

THIS PROPOSAL IS ON THE AGENDA OF THE IBC GENERAL, IEBC AND IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

PART I – IBC

Revise as follows:

**SECTION 106
CONSTRUCTION SUBMITTAL DOCUMENTS**

106.1 Submittal documents. General. Submittal documents consisting of Cconstruction documents, statement of special inspections and other data shall be submitted in one or more sets with each permit application. The construction documents shall be prepared by a registered design professional where required by the statutes of the jurisdiction in which the project is to be constructed. Where special conditions exist, the building official is authorized to require additional construction documents to be prepared by a registered design professional.

Exception: The building official is authorized to waive the submission of construction documents and other data not required to be prepared by a registered design professional if it is found that the nature of the work applied for is such that review of construction documents is not necessary to obtain compliance with this code.

106.2 Construction documents. Construction documents shall be in accordance with Sections 106.2.1 through 106.2.5

106.1.1 Information on 106.2.1 Quality of construction documents. Construction documents shall be dimensioned and drawn upon suitable material. Electronic media documents are permitted to be submitted when approved by the building official. Construction documents shall be of sufficient clarity to indicate the location, nature and extent of the work proposed and show in detail that it will conform to the provisions of this code and relevant laws, ordinances, rules and regulations, as determined by the building official.

106.1.1.1 106.2.2 Fire protection system shop drawings. Shop drawings for the fire protection system(s) shall be submitted to indicate conformance with this code and the construction documents and shall be approved prior to the start of system installation. Shop drawings shall contain all information as required by the referenced installation standards in Chapter 9.

106.1.2 106.2.3 Means of egress. The construction documents shall show in sufficient detail the location, construction, size and character of all portions of the means of egress in compliance with the provisions of this code. In other than occupancies in Groups R-2, R-3, and I-1, the construction documents shall designate the number of occupants to be accommodated on every floor, and in all rooms and spaces.

106.1.3 106.2.4 Exterior wall envelope. Construction documents for all buildings shall describe the exterior wall envelope in sufficient detail to determine compliance with this code. The construction documents shall provide details of the exterior wall envelope as required, including flashing, intersections with dissimilar materials, corners, end details, control joints, intersections at roof, eaves or parapets, means of drainage, water-resistive membrane and details around openings.

The construction documents shall include manufacturer's installation instructions that provide supporting documentation that the proposed penetration and opening details described in the construction documents maintain the weather resistance of the exterior wall envelope. The supporting documentation shall fully describe the exterior wall system which was tested, where applicable, as well as the test procedure used.

106.2 106.2.5 Site plan. The construction documents submitted with the application for permit shall be accompanied by a site plan showing to scale the size and location of new construction and existing structures on the site, distances from lot lines, the established street grades and the proposed finished grades and, as applicable, flood hazard areas, floodways, and design flood elevations; and it shall be drawn in accordance with an accurate boundary line survey. In the case of demolition, the site plan shall show construction to be demolished and the location and size of existing structures and construction that are to remain on the site or plot. The building official is authorized to waive or modify the requirement for a site plan when the application for permit is for alteration or repair or when otherwise warranted.

106.3 Examination of documents. The building official shall examine or cause to be examined the accompanying ~~construction~~ submittal documents and shall ascertain by such examinations whether the construction indicated and described is in accordance with the requirements of this code and other pertinent laws or ordinances.

106.3.4.2 Deferred submittals. For the purposes of this section, deferred submittals are defined as those portions of the design that are not submitted at the time of the application and that are to be submitted to the building official within a specified period.

Deferral of any submittal items shall have the prior approval of the building official. The registered design professional in responsible charge shall list the deferred submittals on the construction documents for review by the building official.

Documents for deferred submittal items shall be submitted to the registered design professional in responsible charge who shall review them and forward them to the building official with a notation indicating that the deferred submittal documents have been reviewed and been found to be in general conformance to the design of the building. The deferred submittal items shall not be installed until the ~~design and~~ deferred submittal documents have been approved by the building official.

PART II – IEBC

Revise as follows:

**SECTION 106
CONSTRUCTION SUBMITTAL DOCUMENTS**

106.1 Submittal documents. General. Submittal documents consisting of ~~C~~construction documents special inspection and structural observation programs, investigation and evaluation reports, and other data shall be submitted in one or more sets with each application for a permit. The construction documents shall be prepared by a

registered design professional where required by the statutes of the jurisdiction in which the project is to be constructed. Where special conditions exist, the code official is authorized to require additional construction documents to be prepared by a registered design professional.

Exception: The code official is authorized to waive the submission of construction documents and other data not required to be prepared by a registered design professional if it is found that the nature of the work applied for is such that reviewing of construction documents is not necessary to obtain compliance with this code.

106.2 Construction documents. Construction documents shall be in accordance with Sections 106.2.1 through 106.2.5

~~106.1.1~~ 106.2.1 Quality of construction documents. Construction documents shall be dimensioned and drawn upon suitable material. Electronic media documents are permitted to be submitted when approved by the code official. Construction documents shall be of sufficient clarity to indicate the location, nature, and extent of the work proposed and show in detail that it will conform to the provisions of this code and relevant laws, ordinances, rules, and regulations, as determined by the code official. The work areas shall be shown.

~~106.1.1.1~~ 106.2.2 Fire protection system shop drawings. Shop drawings for the fire protection system(s) shall be submitted to indicate conformance with this code and the construction documents and shall be approved prior to the start of system installation. Shop drawings shall contain all information as required by the referenced installation standards in Chapter 9 of the *International Building Code*.

~~106.1.2~~ 106.2.3 Means of egress. The construction documents for alterations Level 2, alterations Level 3, additions, and changes of occupancy shall show in sufficient detail the location, construction, size, and character of all portions of the means of egress in compliance with the provisions of this code. The construction documents shall designate the number of occupants to be accommodated in every work area of every floor and in all affected rooms and spaces.

~~106.1.3~~ 106.2.4 Exterior wall envelope. Construction documents for all work affecting the exterior wall envelope shall describe the exterior wall envelope in sufficient detail to determine compliance with this code. The construction documents shall provide details of the exterior wall envelope as required, including windows, doors, flashing, intersections with dissimilar materials, corners, end details, control joints, intersections at roof, eaves, or parapets, means of drainage, water-resistive membrane, and details around openings.

The construction documents shall include manufacturer's installation instructions that provide supporting documentation that the proposed penetration and opening details described in the construction documents maintain the wind and weather resistance of the exterior wall envelope. The supporting documentation shall fully describe the exterior wall system which was tested, where applicable, as well as the test procedure used.

106.2.5 Site plan. The construction documents submitted with the application for permit shall be accompanied by a site plan showing to scale the size and location of new construction and existing structures on the site, distances from lot lines, the established street grades, and the proposed finished grades; and it shall be drawn in accordance with an accurate boundary line survey. In the case of demolition, the site plan shall show construction to be demolished and the location and size of existing structures and construction that are to remain on the site or plot. The code official is authorized to waive or modify the requirement for a site plan when the application for permit is for alteration, repair, or change of occupancy.

106.3 Examination of documents. The code official shall examine or cause to be examined the ~~construction~~ submittal documents and shall ascertain by such examinations whether the construction or occupancy indicated and described is in accordance with the requirements of this code and other pertinent laws or ordinances.

106.3.4 Deferred submittals. For the purposes of this section, deferred submittals are defined as those portions of the design that are not submitted at the time of the application and that are to be submitted to the code official within a specified period.

Deferral of any submittal items shall have the prior approval of the code official. The registered design professional in responsible charge shall list the deferred submittals on the construction documents for review by the code official.

Submittal documents for deferred submittal items shall be submitted to the registered design professional in responsible charge who shall review them and forward them to the code official with a notation indicating that the deferred submittal documents have been reviewed and that they have been found to be in general conformance to the design of the building. The deferred submittal items shall not be installed until their ~~design and~~ deferred submittal documents have been approved by the code official.

PART III – IRC

Revise as follows:

**SECTION 106
CONSTRUCTION SUBMITTAL DOCUMENTS**

R106.1 Submittal documents. General. Submittal documents consisting of construction documents, special inspection and structural observation programs and other data shall be submitted in one or more sets with each application for a permit. The construction documents shall be prepared by a registered design professional where required by the statutes of the jurisdiction in which the project is to be constructed. Where special conditions exist, the building official is authorized to require additional construction documents to be prepared by a registered design professional.

Exception: The building official is authorized to waive submission of construction documents and other data required to be prepared by a registered design professional if it is found that the nature of the work applied for is that reviewing of construction documents is not necessary to obtain compliance with this code.

R106.2 Construction documents. Construction documents shall be in accordance with Sections R106.2.1 through R106.2.2

R106.1.4 R106.2.1 Information on Quality of construction documents. Construction documents shall be drawn upon suitable material. Electronic media documents are permitted to be submitted when approved by the building official. Construction documents shall be of sufficient clarity to indicate the location, nature and extent of the work proposed and show in detail that it will conform to the provisions of this code and relevant laws, ordinances, rules and regulations, as determined by the building official.

R106.2.2 Site plan. The construction documents submitted with the application for permit shall be accompanied by a site plan showing the size and location of new construction and existing structures on the site and distances from lot lines. In the case of demolition, the site plan shall show construction to be demolished and the location and size of existing structures and construction that are to remain on the site or plot.

R106.3 Examination of documents. The building official shall examine or cause to be examined submittal ~~construction~~ documents for code compliance.

(Renumber subsequent sections)

Reason: The proposed revisions are in conjunction with a related code change proposal on design data. Their purpose is to better distinguish between submittal documents and construction documents as well as give equal weight to each segment of the requirements for documentation in the construction documents. Note that Section 106.1 refers to construction documents, the statement of special inspections, and other data submitted with each application for a permit. Section 106.3 is proposed for revision to clarify that examination of documents by the building official is not limited to construction documents. It may also include examination of the statement of special inspections and other data as specified in Section 106.1. Note that Section 106.3.4.1 requires the registered design professional in responsible charge to review and coordinate the submittal documents prepared by others, including phased and deferred submittal items. The replacement of “design and” with “deferred” in Section 106.3.4.2 is proposed to clarify that deferred submittal items shall not be installed until the building official has approved by deferred submittal documents for them.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I CIBC GENERAL

Committee Action:

Approved as Modified

Modify the proposal as follows:

106.2.1 Information on Quality of construction documents. Construction documents shall be dimensioned and drawn upon suitable material. Electronic media documents are permitted to be submitted when approved by the building official. Construction documents shall be of sufficient clarity to indicate the location, nature and extent of the work proposed and show in detail that it will conform to the provisions of this code and relevant laws, ordinances, rules and regulations, as determined by the building official.

(Portions of proposal not shown remain unchanged)

Committee Reason: Clarifies difference between construction documents and submittal documents. The modification simply revises the title in new Section 106.2.1 to Information on® from the proposed AQuality of® based on a committee preference of terminology. It should be noted that section titles are considered editorial.

Assembly Action:

None

**PART II C IEBC
Committee Action:**

Approved as Modified

Modify the proposal as follows:

106.2.1 Quality of Construction documents. Construction documents shall be dimensioned and drawn upon suitable material. Electronic media documents are permitted to be submitted when approved by the code official. Construction documents shall be of sufficient clarity to indicate the location, nature, and extent of the work proposed and show in detail that it will conform to the provisions of this code and relevant laws, ordinances, rules, and regulations, as determined by the code official. The work areas shall be shown.

(Portions of proposal not shown remain unchanged)

Committee Reason: The committee agreed that this change provided clarity in that it better distinguished between submittal documents and construction documents. Further, this change delineated the requirements for documentation for construction documents. The modification was to provide consistency between I-codes based on the actions of other code committees on similar changes.

Assembly Action:

None

**PART III C IRC
Committee Action:**

Disapproved

Committee Reason: The committee felt that the language presented in this code change proposal was already contained in the current code text and that the new language was an unnecessary reorganization.

Assembly Action:

None

G222-06/07, Part I	AM
G222-06/07, Part II	AM
G222-06/07, Part III	D

Code Change No: G223-06/07

Original Proposal

Sections: 506.2.1, 506.3, 507.3, 1013.1, 3104.3**Proponent:** Philip Brazil, PE, Reid Middleton, Inc., representing himself**Revise as follows:**

506.2.1 Width limits. ~~The value of "W" must shall~~ be at least 20 feet (6096 mm). Where the value of W varies along the perimeter of the building, the calculation performed in accordance with Equation 5-2 shall be based on the weighted average of each portion of exterior wall and open space where the value of W is greater than or equal to 20 feet (6096 mm). Where the value of W exceeds 30 feet (9144 mm), a value of 30 feet (9144 mm) shall be used in calculating the weighted average, regardless of the actual width of the open space.

Exception: The quantity value of W divided by 30 shall be permitted to be a maximum of 2 when the building meets all requirements of Section 507 except for compliance with the 60-foot (18 288 mm) public way or yard requirement, as applicable.

506.3 Automatic sprinkler system increase. Where a building is equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1, the area limitation in Table 503 is permitted to be increased by an additional 200 percent ($I_s = 2$) for buildings with more than one story above grade plane and an additional 300 percent ($I_s = 3$) for buildings with no more than one story above grade plane. These increases are permitted in addition to the height and story increases in accordance with Section 504.2.

Exception: The area limitation increases shall not be permitted for the following conditions:

1. The automatic sprinkler system increase shall not apply to buildings with an occupancy in Use Group H-1.
2. The automatic sprinkler system increase shall not apply to the ~~floor~~ building area of an occupancy in Use Group H-2 or H-3. For ~~mixed-use~~ buildings containing such occupancies, the allowable area shall be ~~calculated~~ determined in accordance with Section 508.3.3.2, with the sprinkler system increase applicable only to the portions of the building not classified as Use Group H-2 or H-3.
3. Fire-resistance rating substitution in accordance with Table 601, Note e.

3. Revise as follows:

507.3 Sprinklered, one story. The area of a one-story, Group B, F, M or S building, or a one-story Group A-4 building, of other than Type V construction, shall not be limited when the building is provided with an automatic sprinkler system throughout in accordance with Section 903.3.1.1 and is surrounded and adjoined by public ways or yards not less than 60 feet (18 288 mm) in width.

Exceptions:

1. Buildings and structures of Type I and II construction for rack storage facilities that do not have access by the public shall not be limited in height, provided that such buildings conform to the requirements of Sections 507.2 and 903.3.1.1 and NFPA 230.
2. The automatic sprinkler system shall not be required in areas occupied for indoor participant sports, such as tennis, skating, swimming and equestrian activities in occupancies in Group A-4, provided that:
 - 2.1. Exit doors directly to the outside are provided for occupants of the participant sports areas; and
 - 2.2. The building is equipped with a fire alarm system with manual fire alarm boxes installed in accordance with Section 907.
3. Group A-1 and A-2 occupancies of other than Type V construction shall be permitted, provided:
 - 3.1. All assembly occupancies are separated from other spaces as required for separated ~~uses~~ occupancies in Section 508.3.3.4 with no reduction allowed in the fire-resistance rating of the separation based upon the installation of an automatic sprinkler system;
 - 3.2. Each Group A occupancy shall not exceed the maximum allowable area permitted in Section 503.1; and
 - 3.3. All required exits shall discharge directly to the exterior.

4. Revise as follows:

1013.1 Where required. Guards shall be located along open-sided walking surfaces, mezzanines, ~~industrial~~ equipment platforms, stairways, ramps and landings that are located more than 30 inches (762 mm) above the floor or grade below. Guards shall be adequate in strength and attachment in accordance with Section 1607.7. Where glass is used to provide a guard or as a portion of the guard system, the guard shall also comply with Section 2407. Guards shall also be located along glazed sides of stairways, ramps and landings that are located more than 30 inches (762 mm) above the floor or grade below where the glazing provided does not meet the strength and attachment requirements in Section 1607.7.

Exception: Guards are not required for the following locations:

1. On the loading side of loading docks or piers.
2. On the audience side of stages and raised platforms, including steps leading up to the stage and raised platforms.
3. On raised stage and platform floor areas, such as runways, ramps and side stages used for entertainment or presentations.
4. At vertical openings in the performance area of stages and platforms.
5. At elevated walking surfaces appurtenant to stages and platforms for access to and utilization of special lighting or equipment.
6. Along vehicle service pits not accessible to the public.
7. In assembly seating where guards in accordance with Section 1025.14 are permitted and provided.

5. Revise as follows:

3104.3 Construction. The pedestrian walkway shall be of noncombustible construction.

Exceptions:

1. Combustible construction shall be permitted where connected buildings are of combustible construction.
2. Fire-retardant-treated wood, in accordance with Table 601, Note e-d, shall be permitted for the roof construction of the pedestrian walkway where connected buildings are ~~a minimum of~~ Type I or II construction.

Reason:

1. Internal consistency with revisions approved by code change proposal G113-04/05(AM).
2. Consistency with revisions approved by code change proposal G14-04/05(AMPC1) plus editorial suggestions.
3. Consistency with revisions approved by code change proposal G14-04/05(AMPC1).
4. Consistency with the other deletions approved by code change proposal G88-04/05(AS).
5. First change is for consistency with revisions approved by code change proposal G158-04/05(AMPC1). Second change is because the phrase is superfluous.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Disapproved**

Committee Reason: Based upon proponents request. See committee reason for G10-06/07

Assembly Action:**None**

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Philip Brazil, PE, Reid Middleton, Inc., representing himself requests Approval as Modified by this public comment.

Replace proposal with the following:

506.2.1 Width limits. ~~The value of "W" must~~ shall be at least 20 feet (6096 mm). Where the value of *W* varies along the perimeter of the building, the calculation performed in accordance with Equation 5-2 shall be based on the weighted average of each portion of exterior wall and open space where the value of *W* is greater than or equal to 20 feet (6096 mm). Where ~~the value of~~ *W* exceeds 30 feet (9144 mm), a value of 30 feet (9144 mm) shall be used in calculating the weighted average, regardless of the actual width of the open space.

Exception: The ~~quantity value~~ value of *W* divided by 30 shall be permitted to be a maximum of 2 when the building meets all requirements of Section 507 except for compliance with the 60-foot (18 288 mm) public way or yard requirement, as applicable.

506.3 Automatic sprinkler system increase. Where a building is equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1, the area limitation in Table 503 is permitted to be increased by an additional 200 percent (*I*s = 2) for buildings with more than one story above grade plane and an additional 300 percent (*I*s = 3) for buildings with no more than one story above grade plane. These increases are permitted in addition to the height and story increases in accordance with Section 504.2.

Exception: The area limitation increases shall not be permitted for the following conditions:

1. The automatic sprinkler system increase shall not apply to buildings with an occupancy in ~~Use~~ Group H-1.
2. The automatic sprinkler system increase shall not apply to the ~~floor building~~ area of an occupancy in ~~Use~~ Group H-2 or H-3. For ~~mixed-use~~ buildings containing such occupancies, the allowable area shall be ~~calculated~~ **determined** in accordance with Section 508.3.3.2, with the sprinkler ~~system~~ increase applicable only to the portions of the building not classified as ~~Use~~ Group H-2 or H-3.
3. Fire-resistance rating substitution in accordance with Table 601, Note e.

507.3 Sprinklered, one story. The area of a one-story, Group B, F, M or S building, or a one-story Group A-4 building, of other than Type V construction, shall not be limited when the building is provided with an automatic sprinkler system throughout in accordance with Section 903.3.1.1 and is surrounded and adjoined by public ways or yards not less than 60 feet (18 288 mm) in width.

Exceptions:

1. Buildings and structures of Type I and II construction for rack storage facilities that do not have access by the public shall not be limited in height, provided that such buildings conform to the requirements of Sections 507.2 and 903.3.1.1 and NFPA 230.

2. The automatic sprinkler system shall not be required in areas occupied for indoor participant sports, such as tennis, skating, swimming and equestrian activities in occupancies in Group A-4, provided that:
 - 2.1. Exit doors directly to the outside are provided for occupants of the participant sports areas; and
 - 2.2. The building is equipped with a fire alarm system with manual fire alarm boxes installed in accordance with Section 907.
3. Group A-1 and A-2 occupancies of other than Type V construction shall be permitted, provided:
 - 3.1. All assembly occupancies are separated from other spaces as required for separated ~~uses~~ occupancies in Section 508.3.3.4 with no reduction allowed in the fire-resistance rating of the separation based upon the installation of an automatic sprinkler system;
 - 3.2. Each Group A occupancy shall not exceed the maximum allowable area permitted in Section 503.1; and
 - 3.3. All required exits shall discharge directly to the exterior.

1013.1 Where required. Guards shall be located along open-sided walking surfaces, mezzanines, ~~industrial~~ equipment platforms, stairways, ramps and landings that are located more than 30 inches (762 mm) above the floor or grade below. Guards shall be adequate in strength and attachment in accordance with Section 1607.7. Where glass is used to provide a guard or as a portion of the guard system, the guard shall also comply with Section 2407. Guards shall also be located along glazed sides of stairways, ramps and landings that are located more than 30 inches (762 mm) above the floor or grade below where the glazing provided does not meet the strength and attachment requirements in Section 1607.7.

Exception: Guards are not required for the following locations:

1. On the loading side of loading docks or piers.
2. On the audience side of stages and raised platforms, including steps leading up to the stage and raised platforms.
3. On raised stage and platform floor areas, such as runways, ramps and side stages used for entertainment or presentations.
4. At vertical openings in the performance area of stages and platforms.
5. At elevated walking surfaces appurtenant to stages and platforms for access to and utilization of special lighting or equipment.
6. Along vehicle service pits not accessible to the public.
7. In assembly seating where guards in accordance with Section 1025.14 are permitted and provided.

Commenter's Reason: At the 2006/2007 ICC code development hearings in Orlando, I agreed to ask for disapproval in conjunction with the initiative by several organizations to pursue resolution to the ongoing differences over the IBC provisions for allowable building heights and building areas, specifically through the efforts of the ICC Code Technology Committee. At the time of the deadline to submit public comments for consideration at the final action hearings in Rochester, that effort was ongoing. Consequently, I am asking for approval as submitted, except for Item #5, based on the original reason statement.

I am requesting the membership disregard Item #5 because my understanding at the time of the deadline for submittal of public comments was that Section 3104.3, Exception 2, will be corrected by ICC errata.

Staff note: Please note that the errata to Section 3104.3 which will be corrected in the 3rd printing of the 2006 IBC is as follows:

3104.3 Construction. The pedestrian walkway shall be of noncombustible construction.

Exceptions:

1. Combustible construction shall be permitted where connected buildings are of combustible construction.
2. Fire-retardant-treated wood, in accordance with ~~Table 601, Note c~~ Section 603.1, Item 1.3, shall be permitted for the roof construction of the pedestrian walkway where connected buildings are a minimum of Type I or II construction.

Final Hearing Results

1124-06 03	Manufacture, Transportation, Storage and Retail Sales of Fireworks and Pyrotechnic Articles

Reason: The *ICC Code Development Process for the International Codes (Procedures)* Section 4.5* requires the updating of referenced standards to be accomplished administratively, and be processed as a Code Proposal. In May 2005, a letter was sent to each developer of standards that are referenced in the I-Codes, asking them to provide ICC with a list of their standards in order to update to the current edition. Above is the list received of the referenced standards under the maintenance responsibility of the IBC General Committee.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

***4.5 Updating Standards:** The updating of standards referenced by the Codes shall be accomplished administratively by the appropriate code development committee in accordance with these full procedures except that multiple standards to be updated may be included in a single proposal.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: Appropriately updates to most current edition of referenced standards within the IBC for sections related to the General Building Code requirements.

Assembly Action:

None

Final Hearing Results

G224-06/07

AS

IBC – MEANS OF EGRESS

Code Change No: **E5-06/07**

Original Proposal

Sections: 1002.1 (IFC [B] 1002.1)

Proponent: Marshall A. Klein, P.E., Marshall A. Klein & Associates, Inc.

Revise definition as follows:

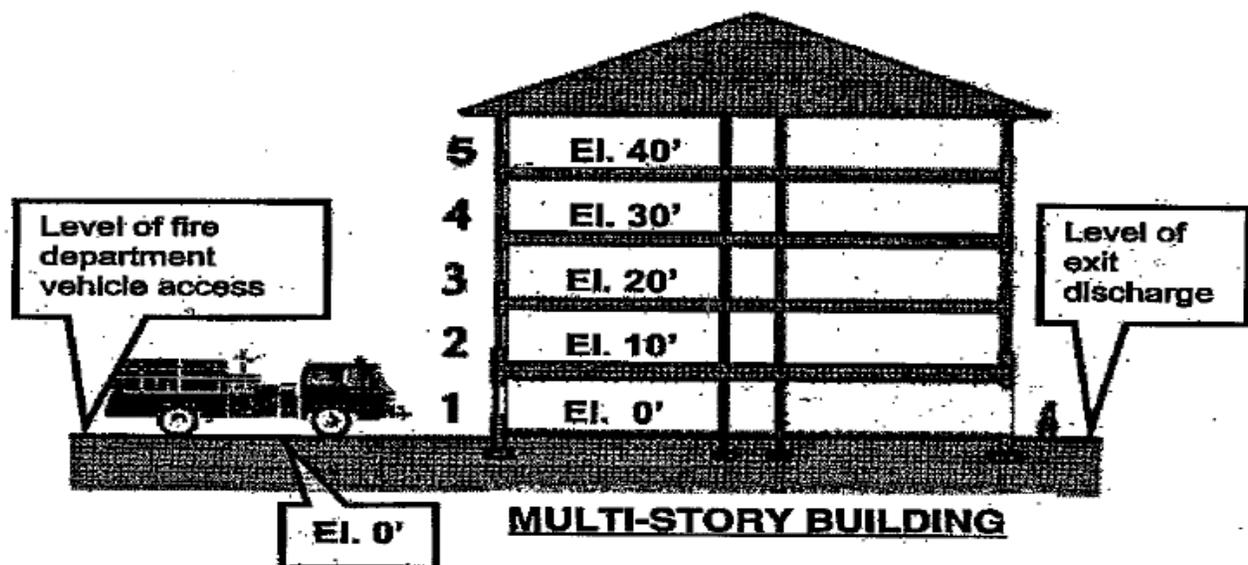

1002.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

EXIT DISCHARGE, LEVEL OF. The horizontal plane located lowest story at the point at which an exit terminates and an exit discharge begins.

Reason: IFC Formal Interpretations 44-03, 26-03, & 25-03, all issued on 5/11/04, stated the following:

“When determining stories above the lowest level of exit discharge, a level, or floor level, is not a story. A “level” is the horizontal plane that is part of a story, not the entire story height. A “story” is the vertical space between the upper surface of one floor level and the upper surface of the floor level next above or below.”

The level of exit discharge as shown in the attached drawing of a Multi-Story Building is at elevation 0.0', the first floor level of the building is also at elevation 0.0'; therefore, the level of exit discharge and the first floor level of the building are at the same elevation. The first story of the building begins at elevation 0.0' (first floor) and extends to the elevation 10.0' (second floor). The first story of the building is the first story above the level of exit discharge.”

The intent of the “level of exit discharge” definitions in the previous three legacy codes, and in the ICC Codes was to use a similar definition for “level of exit discharge” as was being used in the NFPA 101, “Life Safety Code”, which originally defined this term. Such similar definitions for “level of exit discharged” correlated between model codes and the NFPA Standards for user friendliness. For reference, 2006 NFPA 101 (LSC) defines “level of exit discharge”:

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

"3.3.72.1 Level of Exit Discharge. (1) The lowest story from which not less than 50 percent of the required number of exits and not less than 50 percent of the required egress capacity from such a story discharge directly outside at grade; (2) the story with the smallest elevation change needed to reach grade where no story has 50 percent or more of the required number of exits and 50 percent or more of the required egress capacity from such a story discharge directly outside at grade."

The major difference between the IFC formal interpretations and the NFPA 101 definition is that NFPA 101 defines the "level of exit discharge" as a volume (story), not as a "horizontal plane". Therefore, in the diagram of the multistory building above, the "first story above the level of exit discharge" under NFPA 101 (and for that matter, as used under the legacy codes) was always considered the second story (El. 10'). However, under the IFC Formal Interpretations, it is now the first story (El. 0').

These formal IFC interpretations have been a rude awakening for many experienced users of the Codes, in particular to some ICC Staff members. Since a different ICC Committee, other than the ICC Means of Egress Code Development Committee, made these interpretations, this code proposal is providing the Means of Egress Code Development Committee its opportunity to "weigh in" on the intent of the Code when it comes to application of this definition.

This code proposal is only attempting to correlate the definition for "level of exit discharge" with the definition in NFPA 101, where the "level of exit discharge" concept came from. I believe that the NFPA 101 definition is a little too wordy for the ICC Codes. My proposed wording appears more than adequate to work for the ICC Codes, and to correlate between the ICC and NFPA Codes.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

EXIT DISCHARGE, LEVEL OF. The lowest story at the point at which an exit terminates and an exit discharge begins.

Committee Reason: The revised language will clarify that the level of exit discharge is the story the occupants are egressing from rather than the floor they are walking on. The modification was made because the story could be the lowest, highest or any level of building.

Assembly Action:

None

Final Hearing Results

E5-06/07

AM

Code Change No: E6-06/07

Original Proposal

Sections: 1002 (New) [IFC [B] 1002 (New)]; IRC R202

Proponent: David W. Cooper, Stairway Manufacturers' Association

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC

Add new definition as follows:

1002.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

FLIGHT. A continuous run of rectangular treads (fliers) or winders or combination thereof from one landing to another.

PART II – IRC

Add new definition to Section R202 as follows:

FLIGHT. A continuous run of rectangular treads (fliers) or winders or combination thereof from one landing to another.

Reason: The purpose of the change is to clarify the code. This proposal will foster a better understanding of what distinguishes a flight from a stairway. This definition is needed because the word "Flight" is used specifically to reference that part of a stairway that is between landings no less than 8 times in IBC 1009 and no less than 9 times in IRC 311.5. Often this word is misinterpreted to be stairs between *floors* causing the extending of handrails across landings, varying determinations of handrail continuity, dimensional uniformity, riser height, and tread depth. Furthermore this will help to clarify a major difference between winders and landings i.e., Landings separate flights within a stairway, winders are treads within a flight and are often combined with fliers in the same flight. Winders do not separate flights.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I C IBC

Committee Action:

Approved as Modified

Modify the proposal as follows:

FLIGHT. A continuous run of rectangular treads (~~fliers~~) or winders or combination thereof from one landing to another.

Committee Reason: The definition will clarify the difference between ~~flight~~ and when a stairway moves from floor to floor. The term ~~fliers~~ was dropped because it was confusing, not commonly used and not needed.

Assembly Action:

None

PART II C IRC

Committee Action:

Approved as Modified

Modify the proposal as follows:

FLIGHT. A continuous run of rectangular treads (~~fliers~~) or winders or combination thereof from one landing to another.

Committee Reason: The definition of Flight is a useful addition to Chapter 2 of the *International Residential Code*. The modification was passed by the Means of Egress committee and keeps the definitions consistent in the IBC and IRC.

Assembly Action:

None

Final Hearing Results

E6-06/07, Part I

AM

E6-06/07, Part II

AM

Code Change No: **E8-06/07**

Original Proposal

Sections: 1003.2 (IFC [B] 1003.2)

Proponent: Bill Conner, Conner Associates LLC, representing himself

Revise as follows:

1003.2 Ceiling height. The means of egress shall have a ceiling height of not less than 7 feet 6 inches (2286 mm).

Exceptions:

1. Sloped ceilings in accordance with Section 1208.2.
2. Ceilings of dwelling units and sleeping units within residential occupancies in accordance with Section 1208.2.
3. Allowable projections in accordance with Section 1003.3.

4. Stair headroom in accordance with Section 1009.2.
5. Door height in accordance with Section 1008.1.1.
6. Ramp headroom in accordance with Section 1010.5.2.

Reason: For consistency Section 1003.2 should include ramps in headroom height exceptions. The change is also for coordination with ICC A117.1 Section 307.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: Ramps are part of the means of egress, and it is logical to include them in the exceptions for the ceiling height provisions. This will coordinate the IBC requirements with ICC A117.1.

Assembly Action:

None

Final Hearing Results

E8-06/07

AS

Code Change No: E11-06/07

Original Proposal

Sections: 1003.3.2, 1003.3.3, 1003.3.4 (IFC [B] 1003.3.2, [B] 1003.3.3, [B] 1003.3.4)

Proponent: Bill Conner, Conner Associates LLC, representing himself

Revise as follows:

1003.3.2 ~~Free-standing~~ Post mounted objects. A free-standing object mounted on a post or pylon shall not overhang that post or pylon more than 4 inches (102 mm) where the lowest point of the leading edge is more than 27 inches (686 mm) and less than 80 inches (2032 mm) above the walking surface. Where a sign or other obstruction is mounted between posts or pylons and the clear distance between the posts or pylons is greater than 12 inches (305 mm), the lowest edge of such sign or obstruction shall be 27 inches (685 mm) maximum or 80 inches (2030 mm) minimum above the finished floor or ground.

Exception: ~~This~~ These requirements shall not apply to sloping portions of handrails ~~servng~~ between the top and bottom riser of stairs and above the ramps run.

1003.3.3 Horizontal projections. Structural elements, fixtures or furnishings shall not project horizontally from either side more than 4 inches (102 mm) over any walking surface between the heights of 27 inches (686 mm) and 80 inches (2032 mm) above the walking surface.

Exception: Handrails ~~servng stairs and ramps~~ are permitted to protrude 4.5 inches (114 mm) from the wall.

1003.3.4 Clear width. Protruding objects shall not reduce the minimum clear width of accessible routes ~~as required in Section 1104.~~

Reason: The concern is to two fold: 1) Not to apply the provisions of Section 1003.3.2 to the portions of the handrails along the stair or ramp run, but to apply those provisions to the handrail extensions. (Ex: A handrail on posts on a grand stairway.) 2) To allow handrails to protrude from the wall but never get less than the 36" wide ramp or route required for accessibility. The change is also for coordination with ICC A117.1 Sections 405 and 307.3. The change to Section 1003.3.4 would cover accessible routes for the way in as well as the way out.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal would add clarity on how to measure ramp width. The proposed language would increase coordination with the ICC A117.1 and new ADA/ABA Accessibility Guidelines.

Assembly Action:

None

Final Hearing Results

E11-06/07

AS

Code Change No: **E16-06/07**

Original Proposal

Table 1005.1 (IFC [B] Table 1005.1)

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

Revise table as follows:

**TABLE 1005.1
EGRESS WIDTH PER OCCUPANT SERVED**

OCCUPANCY	WITHOUT SPRINKLER SYSTEM		WITH SPRINKLER SYSTEM ^a	
	Stairways (inches per occupant)	Other egress components (inches per occupant)	Stairways (inches per occupant)	Other egress components (inches per occupant)
Occupancies other than those listed below	0.3	0.2	0.2	0.15
Hazardous: H-1, H-2, H-3 and H-4	0.7 Not Permitted	0.4 Not Permitted	0.3	0.2
Institutional: I-2	NA Not Permitted	NA Not Permitted	0.3	0.2

For SI: 1 inch = 25.4 mm. NA = Not applicable.

- a. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.

Reason: Table 1005.1 is somewhat misleading in that Group H-1, H-2, H-3 and H-4 occupancies are not permitted in buildings without a sprinkler system according to Section 903.2.4.1. The format of the Institutional occupancy cells has been changed to be consistent with other similar tables in Chapter 10 such as Tables 1016.1 and 1017.1 It should be noted that this proposal was disapproved by the Means of Egress Code Committee during the previous code development cycle. Their rationale for that action was that there are existing, unsprinklered Group H occupancies and those data need to be retained for existing building purposes. If this logic is valid, there are numerous tables and other IBC provisions that need to reflect former requirements. The primary purpose of the International Building Code is to govern the design and construction of new buildings and structures. Its requirements should reflect that purpose. The code in effect at the time an existing building was constructed would be a better reference for prior code requirements, should they be needed. Approval of this proposal would result in technical consistency of International Building Code provisions.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposed language would provide consistency and clarity to the code for Group H and I-2 requirements.

Assembly Action:

None

Final Hearing Results

E16-06/07

AS

Code Change No: E17-06/07

Original Proposal

Sections: 1005.2 (IFC [B] 1005.2)

Proponent: Ralph Vasami, The Kellen Company, representing The Door Safety Council

Revise as follows:

1005.2 Door encroachment. Doors opening into the path of egress travel shall not reduce the required width to less than one-half during the course of the swing. ~~When fully open,~~ Excluding hardware, the door shall not project more than 7 inches (178 mm) into the required width when fully opened.

Exception: The restrictions on a door swing shall not apply to doors within individual dwelling units and sleeping units of Group R-2 and dwelling units of Group R-3.

Reason: This proposal modifies text regarding door encroachment. The existing code language fails to address the issue of hardware that is required as part of the door assembly to satisfy egress and security requirements. The proposed language seeks to clarify the manner in which the *Door Encroachment* language is enforced. Hardware projections should not be part of the measurement as they do not materially reduce the corridor width or impede egress flow.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Based on the testimony, if the hardware can be up to 10 inches from tip to tip, taking away the door and one handle, exclusion of the hardware could result in an additional protrusion of up to 11 inches into the path for means of egress. The 7 inches should include the hardware. In addition, when the door open 90 degrees, the 7 inches is the obstruction, while if it opens 180 degrees, there is credit given for the hardware so it is not a protrusion - this seems inconsistent.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Ralph Vasami, The Kellen Company, representing The Door Safety Council, requests Approval as Modified by this public comment.

Replace proposal with the following:

1005.3 Door hardware encroachment. Surface-mounted latch release hardware shall be exempt from inclusion in the 7-inch maximum (178mm) projection requirement of 1005.2 when:

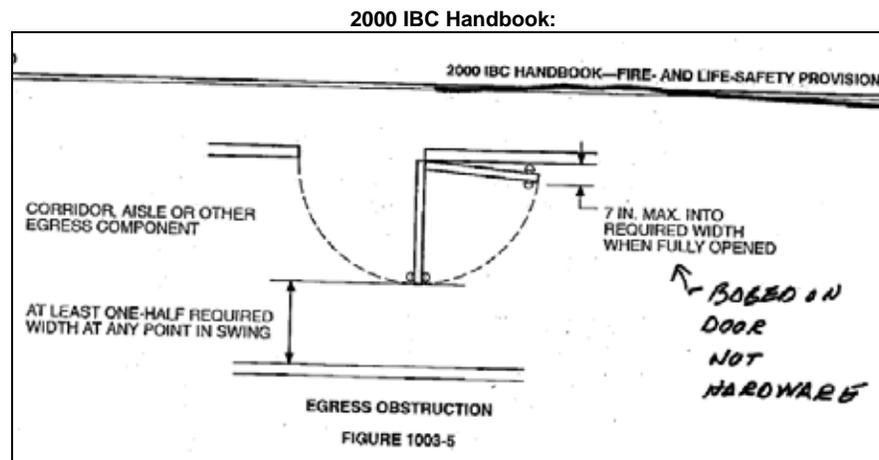

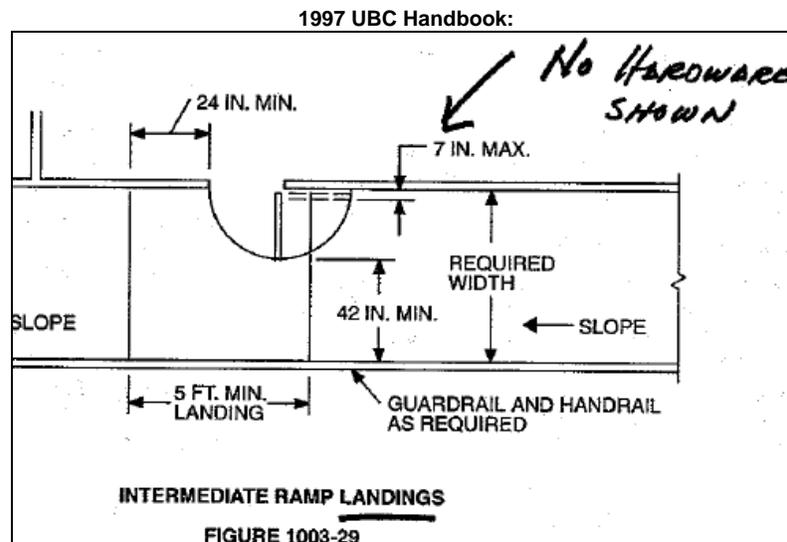

1. The hardware is mounted to the side of the door facing the corridor width when the door is in the open position and;
2. The hardware is mounted not less than 34 inches (865mm) nor more than 48 inches (1220mm) above the finished floor.

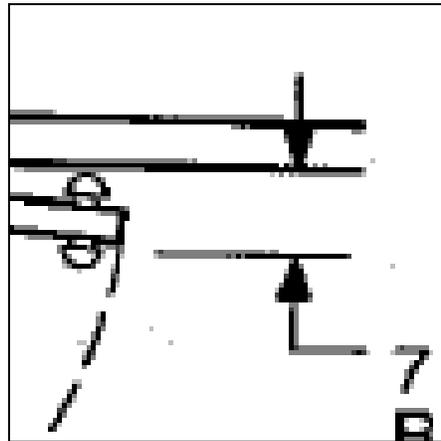

Commenter's Reason: The IFC and IBC requirements for door encroachment have not clearly addressed the issue of attached door latching hardware. The intent of the proposal as submitted was to clarify that door latching hardware should not be included in the dimensional requirement for door encroachment. The committee discussion and stated reasons for disapproval of E17 demonstrate the confusion surrounding this requirement. This public comment separates the door encroachment requirement from hardware, but adds restrictions on the height and mounting surface to capture the appropriate hardware encroachment prescriptions. The additional text is taken from NFPA 101 means of egress requirements.

The best illustration of just how confusing the current text is, and the best justification for this needed clarification, are the ICC Commentaries. The 7" door encroachment requirement is based upon legacy code provisions and has survived intact. In the *1997 UBC Handbook*, figure 1003-29 provides a detail with a dimension indicating a maximum of 7" door encroachment, but the figure shows no hardware and the dimension line leads to the edge of the door surface. Fast-forward to the *2000 IBC Handbook Fire and Life-safety Provisions* and to figure 1003-5. In this detail, hardware has been added to the illustration but the 7" dimension line has moved to some vague point between the door slab and the doorknob. In the *2003 IBC Commentary* Figure 1005.2, the detail has been modified to show accessible hardware instead of a doorknob, but the dimension line again leads to some vague spot on the door latch.

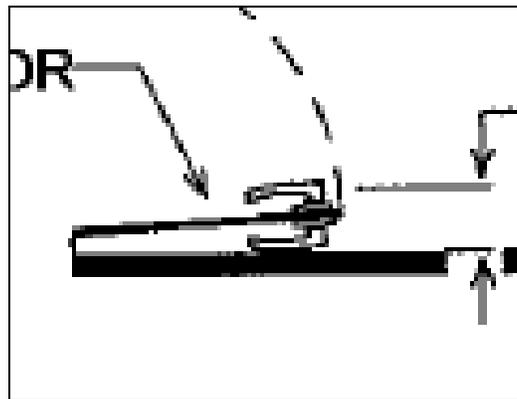

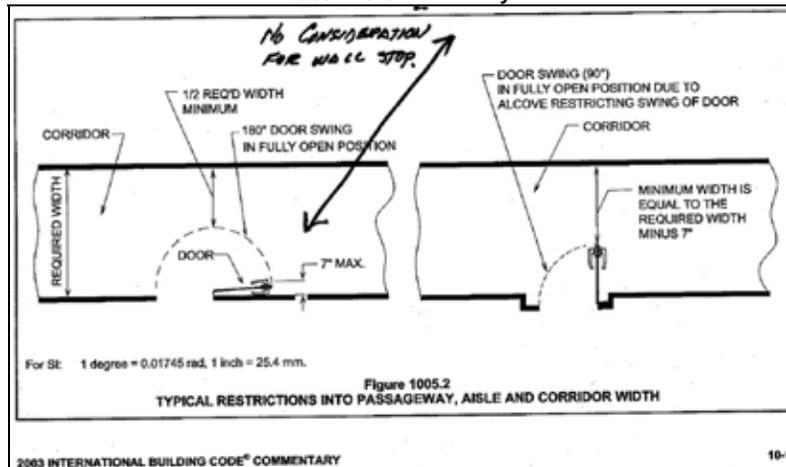

Despite the fact that the technical provision for door encroachment has not changed since the legacy codes, ICC artists have arbitrarily changed the details in the commentaries. The clarification provided by this proposal is necessary to clean up the ambiguity and resolve the issue in order to facilitate consistent code interpretations. The proposal is not a change in the requirement, merely a clarification made necessary by the confusion created by the ICC commentaries.

The following details are taken from the above referenced ICC and ICBO publications.

2003 IBC Commentary:

Final Hearing Results

E17-06/07

AMPC1

Code Change No: **E18-06/07**

Original Proposal

Sections: 1005.2, 1014.4, 1017.2, 1021.2, 1024.5.1 (IFC [B] 1005.2, [B] 1014.4, [B] 1017.2, [B] 1021.2, [B] 1024.5.1)

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

Revise as follows:

1005.2 Door Encroachment. ~~Doors, when fully opened, and handrails, shall not reduce the required means of egress width by more than 7 inches (178 mm). Such door measurements shall include the thickness of the door and any hardware between the door and the adjacent wall surface. Doors in any position shall not reduce the required width by more than one-half. Other nonstructural projections such as trim and similar decorative features are permitted to project into the required width 1.5 inches (38 mm) on each side. Doors opening into the path of egress travel shall not reduce the required width to less than one-half during the course of the swing. When fully open, the door shall not project more than 7 inches (178 mm) into the required width.~~

Exception: The restrictions on a door swing shall not apply to doors within individual dwelling units and sleeping units of Group R-2 and dwelling units of Group R-3.

1014.4 Aisles. Aisles serving as a portion of the exit access in the means of egress system shall comply with the requirements of this section. Aisles shall be provided from all occupied portions of the exit access which contain seats, tables, furnishings, displays and similar fixtures or equipment. Aisles serving assembly areas, other than seating at tables, shall comply with Section 1025. Aisles serving reviewing stands, grandstands and bleachers shall also comply with Section 1025. The required width of aisles shall be unobstructed.

Exception: ~~Doors complying with Section 1005.2, when fully opened, and handrails shall not reduce the required width by more than 7 inches (178 mm). Doors in any position shall not reduce the required width by more than one-half. Other nonstructural projections such as trim and similar decorative features are permitted to project into the required width 1.5 inches (38 mm) from each side.~~

1017.2 Corridor width. The minimum corridor width shall be as determined in Section 1005.1, but not less than 44 inches (1118 mm).

Exceptions:

1. Twenty-four inches (610 mm)—For access to and utilization of electrical, mechanical or plumbing systems or equipment.
2. Thirty-six inches (914 mm)—With a required occupant capacity of less than 50.
3. Thirty-six inches (914 mm)—Within a dwelling unit.
4. Seventy-two inches (1829 mm)—In Group E with a corridor having a required capacity of 100 or more.
5. Seventy-two inches (1829 mm)—In corridors serving surgical Group I, health care centers for ambulatory patients receiving outpatient medical care, which causes the patient to be not capable of self-preservation.
6. Ninety-six inches (2438 mm)—In Group I-2 in areas where required for bed movement.

The required width of corridors shall be unobstructed.

Exception: Doors complying with Section 1005.2.

1021.2 Width. The width of exit passageways shall be determined as specified in Section 1005.1 but such width shall not be less than 44 inches (1118 mm), except that exit passageways serving an occupant load of less than 50 shall not be less than 36 inches (914 mm) in width. The required width of exit passageways shall be unobstructed.

Exception: ~~Doors complying with Section 1005.2, when fully opened, and handrails, shall not reduce the required width by more than 7 inches (178 mm). Doors in any position shall not reduce the required width by more than one-half. Other nonstructural projections such as trim and similar decorative features are permitted to project into the required width 1.5 inches (38 mm) on each side.~~

1024.5.1 Width. The width of egress courts shall be determined as specified in Section 1005.1, but such width shall not be less than 44 inches (1118 mm), except as specified herein. Egress courts serving Group R-3 and U occupancies shall not be less than 36 inches (914 mm) in width. The required width of egress courts shall be unobstructed to a height of 7 feet (2134 mm).

Exception: ~~Doors complying with Section 1005.2, when fully opened, and handrails shall not reduce the required width by more than 7 inches (178 mm). Doors in any position shall not reduce the required width by more than one-half. Other nonstructural projections such as trim and similar decorative features are permitted to project into the required width 1.5 inches (38 mm) from each side.~~

Where an egress court exceeds the minimum required width and the width of such egress court is then reduced along the path of exit travel, the reduction in width shall be gradual. The transition in width shall be affected by a guard not less than 36 inches (914 mm) in height and shall not create an angle of more than 30 degrees (0.52 rad) with respect to the axis of the egress court along the path of egress travel. In no case shall the width of the egress court be less than the required minimum.

Reason: Currently, there are no obstruction provisions for corridors in Section 1017. Section 1014.4 provides such criteria for aisles. Section 1021.2 provides such criteria for exit passageways. Section 1024.5.1 provides such criteria for egress courts. During the previous code development cycle, a similar proposal was disapproved by the means of egress code development committee. Their rationale was that the issue was already sufficiently addressed in the general provisions of Section 1005.2. Unfortunately, those general provisions are not as detailed as those encroachment provisions currently contained in the aforementioned means of egress component sections. Therefore, it is also proposed that Section 1005.2 be modified to be consistent with those component sections. Inasmuch as the required width encroachment provisions apply to more than doors, the section heading has been altered to reflect the more general nature of the provision. Additionally, the specific language currently contained in Sections 1014.4, 1021.2 and 1024.5 has been modified with an applicable cross-reference to Section 1005.2 as preferred by the previous code development committee. Lastly, the code is unclear as to how the seven inch door encroachment is measured (i.e. is door hardware included in the measurement). The proposal provides appropriate clarification. The approval of this proposal would result in the continuity of application of means of egress width encroachment requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

1005.2 Door encroachment. Doors, when fully opened, and handrails, shall not reduce the required means of egress width by more than 7 inches (178 mm). ~~Such door measurements shall include the thickness of the door and any hardware between the door and the adjacent wall surface.~~ Doors in any position shall not reduce the required width by more than one-half. Other nonstructural projections such as trim and similar decorative features are permitted to project into the required width 1.5 inches (38 mm) on each side.

Exception: The restrictions on a door swing shall not apply to doors within individual dwelling units and sleeping units of Group R-2 and dwelling units of Group R-3.

(Portions of proposal not shown remain unchanged)

Committee Reason: The proposed language would combine protrusion requirements in one section and would reduce redundancy. The sentence regarding measuring of the door and one-half of the hardware was deleted for consistency with the committee action on E17-06/07. Clear width or corridors should include hardware.

Assembly Action:

None

Final Hearing Results

E18-06/07

AM

Code Change No: **E21-06/07**

Original Proposal

Sections: 1007.1 (IFC [B] 1007.1)

Proponent: Ed Roether, HOK SVE

Revise as follows:

1007.1 Accessible means of egress required. Accessible means of egress shall comply with this section. Accessible spaces shall be provided with not less than one accessible means of egress. Where more than one means of egress is required by Section 1015.1 or 1019.1 from any accessible space, each accessible portion of the space shall be served by not less than two accessible means of egress.

Exceptions:

1. Accessible means of egress are not required in alterations to existing buildings.
2. One accessible means of egress is required from an accessible mezzanine level in accordance with Section 1007.3, 1007.4 or 1007.5.
3. In assembly spaces areas with sloped floors or stepped aisles, one accessible means of egress is required from a space permitted where the common path of travel is accessible and of the accessible route for access to the wheelchair spaces meets the requirements in Section 1025.8.

Reason: The purpose of this proposed change is threefold, first coordination with other sections of the building code, ICC A117.1, and ADAAG by the use of the term "assembly areas", and second for the common path of travel to be the same for sloped or tiered seating arrangements, and then third to clarify the language of this exception.

"Assembly area" is a term that is used for seating elsewhere in the code and is coordinated with ICC A117.1 and ADAAG, therefore it should be the appropriate term used here for consistency. An accessible route to and from wheelchair spaces is required for safe ingress and egress. The same concern for the accessible route is applicable in both ramped or tiered seating arrangements, therefore, the exception should be applicable to both situations.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal would allow theaters to use common path of travel for stepped aisles as well as sloped floors. This is an improvement that was lacking in the code.

Assembly Action:

None

Final Hearing Results

E21-06/07

AS

Code Change No: **E23-06/07**

Original Proposal

Sections: 1007.2, 1007.3, 1007.6, 1007.6.2 (IFC [B] 1007.2, [B] 1007.3, [B] 1007.6, [B] 1007.6.2)

Proponent: Philip Brazil, Reid Middleton, Inc., representing himself

Revise as follows:

1007.2 Continuity and components. Each required accessible means of egress shall be continuous to a public way and shall consist of one or more of the following components:

1. Accessible routes complying with Section 1104.
2. Interior exit stairways ~~within vertical exit enclosures~~ complying with Sections 1007.3 and 1020.
3. Exterior exit stairways complying with Sections 1007.3 and 1023.
4. Elevators complying with Section 1007.4.
5. Platform lifts complying with Section 1007.5.
6. Horizontal exits complying with Section 1022.
7. Ramps complying with Section 1010.
8. Areas of refuge complying with Section 1007.6

Exceptions:

4. Where the exit discharge is not accessible, an exterior area for assisted rescue must be provided in accordance with Section 1007.8.
2. ~~Where the exit stairway is open to the exterior, the accessible means of egress shall include either an area of refuge in accordance with Section 1007.6 or an exterior area for assisted rescue in accordance with Section 1007.8.~~

1007.3 Exit stairways. In order to be considered part of an accessible means of egress, an exit stairway shall have a clear width of 48 inches (1219 mm) minimum between handrails and shall either incorporate an area of refuge within an enlarged floor-level landing or shall be accessed from either an area of refuge complying with Section 1007.6 or a horizontal exit.

Exceptions:

1. ~~Unenclosed exit stairways as permitted by Section 1020.1 are permitted to be considered part of an accessible means of egress.~~
- 1.2. The area of refuge is not required at unenclosed interior exit stairways as permitted by Section 1020.1 in buildings or facilities that are equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
- 2.3. The clear width of 48 inches (1219 mm) between handrails is not required at exit stairways in buildings or facilities equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
- 3.4. The clear width of 48 inches (1219 mm) between handrails is not required for exit stairways accessed from a horizontal exit.
- 4.5. Areas of refuge are not required at exit stairways serving open parking garages.
5. Where the exit stairway is open to the exterior, the accessible means of egress shall include either an area of refuge in accordance with Section 1007.6 or an exterior area for assisted rescue in accordance with Section 1007.8

1007.6 Areas of refuge. Every required area of refuge shall be accessible from the space it serves by an accessible means of egress. The maximum travel distance from any accessible space to an area of refuge shall not exceed the travel distance permitted for the occupancy in accordance with Section 1016.1. Every required area of refuge shall have direct access to an ~~enclosed~~ a stairway within an exit enclosure complying with Sections 1007.3 and ~~1020.4~~

1020 or an elevator complying with Section 1007.4. Where an elevator lobby is used as an area of refuge, the shaft and lobby shall comply with Section 1020.1.7 for smokeproof enclosures except where the elevators are in an area of refuge formed by a horizontal exit or smoke barrier.

1007.6.2 Separation. Each area of refuge shall be separated from the remainder of the story by a smoke barrier complying with Section 709 or a horizontal exit complying with Section 1021. Each area of refuge shall be designed to minimize the intrusion of smoke.

Exception: Areas of refuge located within a ~~vertical~~ an exit enclosure.

Reason: The purpose of this proposal is to reorganize the requirements for accessible means of egress and eliminate extraneous provisions. Section 1007.1 specifies the minimum number of accessible means of egress. Section 1007.2 requires each one to be continuous to a public way by means of one or more components. Exception #1 is appropriately located but Exception #2 is better located in Section 1007.3.

The items in Section 1007.2 include stairways within vertical exit enclosures and exterior exit stairways. Unenclosed interior exit stairways are excluded, but Exception #1 to Section 1007.3 effectively includes them. The proposal simplifies the provisions by modifying Item #2 of Section 1007.2 to specify interior exit stairways complying with Sections 1007.3 and 1020. This has the effect of including unenclosed exit stairways as permitted by Section 10201. Exception #1 to Section 1007.3 is deleted in coordination with this change. The current Exception #2 (proposed Exception #1) to Section 1007.3 is also modified for consistency with the changes.

Section 1007.6 is changed for consistency with the current language in Item #2 of Section 1007.2, which is appropriate in this case. The reference to Section 1020.1 is changed to Section 1020 for the same reason.

In the exception to Section 1007.6.2, the change from "vertical exit enclosure" to "exit enclosure" is made for consistency with other provisions in the IBC, which consistently use the term "exit enclosure." This consistency was established by code change proposal E1-03/04 (AS).

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1007.2 Continuity and components. Each required accessible means of egress shall be continuous to a public way and shall consist of one or more of the following components:

1. Accessible routes complying with Section 1104.
2. Interior exit stairways within vertical exit enclosures complying with Sections 1007.3 and 1020.
3. Exterior exit stairways complying with Sections 1007.3 and 1023.
4. Elevators complying with Section 1007.4.
5. Platform lifts complying with Section 1007.5.
6. Horizontal exits complying with Section 1022.
7. Ramps complying with Section 1010.
8. Areas of refuge complying with Section 1007.6

Exceptions:

1. Where the exit discharge is not accessible, an exterior area for assisted rescue must be provided in accordance with Section 1007.8.
2. ~~Where the exit stairway is open to the exterior, the accessible means of egress shall include either an area of refuge in accordance with Section 1007.6 or an exterior area for assisted rescue in accordance with Section 1007.8.~~

1007.3 Exit stairways. In order to be considered part of an accessible means of egress, an exit stairway shall have a clear width of 48 inches (1219 mm) minimum between handrails and shall either incorporate an area of refuge within an enlarged floor-level landing or shall be accessed from either an area of refuge complying with Section 1007.6 or a horizontal exit.

Exceptions:

1. The area of refuge is not required at unenclosed interior exit stairways as permitted by Section 1020.1 in buildings or facilities that are equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
2. The clear width of 48 inches (1219 mm) between handrails is not required at exit stairways in buildings or facilities equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
3. The clear width of 48 inches (1219 mm) between handrails is not required for exit stairways accessed from a horizontal exit.
4. Areas of refuge are not required at exit stairways serving open parking garages.
5. ~~Where the exit stairway is open to the exterior, the accessible means of egress shall include either an area of refuge in accordance with Section 1007.6 or an exterior area for assisted rescue in accordance with Section 1007.8~~

(Portions of proposal not shown remain unchanged)

Committee Reason: The proposal clarifies the continuity for the accessible means of egress. The proponent asked for the modification to not relocate current Section 1007.2, Exception 2 to a new Section 1007.3, Exception 5. The proponent wished to bring this portion forward in a later proposal.

Staff note: The committee action to Sections 1007.2 and 1007.6.2 have removed the final direct reference to Vertical exit enclosures® in Chapter 10. The result is that the title of Section 1020 will be changed from Vertical exit enclosures® to Exit enclosures®. Note that titles are editorial.

None

Final Hearing Results

E23-06/07

AM

Code Change No: E25-06/07

Original Proposal

Sections: 1007.3, 1007.4 (IFC [B] 1007.3, [B] 1007.4)

Proponent: Dave Frable, U.S. General Services Administration

Revise as follows:

1007.3 Exit stairways. In order to be considered part of an accessible means of egress, an exit stairway shall have a clear width of 48 inches (1219 mm) minimum between handrails and shall either incorporate an area of refuge within an enlarged floor-level landing or shall be accessed from either an area of refuge complying with Section 1007.6 or a horizontal exit.

Exceptions:

1. Unenclosed exit stairways as permitted by Section 1020.1 are permitted to be considered part of an accessible means of egress.
2. The area of refuge is not required at unenclosed exit stairways as permitted by Section 1020.1 in buildings or facilities that are equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
3. The clear width of 48 inches (1219 mm) between handrails is not required at exit stairways in buildings or facilities equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
4. Areas of refuge are not required at exit stairways in buildings or facilities equipped throughout by an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
4. 5. The clear width of 48 inches (1219 mm) between handrails is not required for exit stairways accessed from a horizontal exit.
- ~~5.~~ 6. Areas of refuge are not required at exit stairways serving open parking garages.

1007.4 Elevators. In order to be considered part of an accessible means of egress, an elevator shall comply with the emergency operation and signaling device requirements of Section 2.27 of ASME A17.1. Standby power shall be provided in accordance with Sections 2702 and 3003. The elevator shall be accessed from either an area of refuge complying with Section 1007.6 or a horizontal exit.

Exceptions:

1. Elevators are not required to be accessed from an area of refuge or horizontal exit in open parking garages.
2. Elevators are not required to be accessed from an area of refuge or horizontal exit in buildings and facilities equipped throughout by an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.

Reason: The purpose of this Code change is to reinstate into the Code the subject exceptions regarding not requiring areas of refuge (AOR) in buildings or facilities protected throughout by an automatic sprinkler system designed and installed in accordance with Section 903.3.1.1 or 903.3.1.2. The subject exceptions had been in all previous editions of the IBC; including each of the legacy Codes, which recognized any floor of

a building protected throughout by an approved, operational automatic sprinkler system as an AOR. This recognition is based on sound technical research and acknowledges the ability of a properly designed and operational automatic sprinkler system to control a fire at its point of origin and to limit production of toxic products to a level that is not life threatening.

However, at the Final Action Hearings of the ICC in September 2005, the ICC membership voted to delete the subject two exceptions. However, no technical research data was provided to support any of the proponent's substantiation or rationale for deleting the exceptions for installing AOR in buildings protected throughout by an operational automatic fire sprinkler system.

Below, I have provided the technical research data that substantiated the rationale for not installing AOR in buildings that are protected throughout by an operational automatic fire sprinkler system in the previous editions of the IBC.

In 1989, at the request of Congress, the U.S. General Services Administration (GSA) undertook a project to construct AOR for persons with mobility limitations. In 1991, GSA funded the National Institute of Standards and Technology (NIST) to evaluate the concept of AOR as a means of providing fire protection for persons with disabilities in office buildings.

The NIST evaluation consisted of field tests, threat analysis, and a human behavior study of AOR in six office buildings. The threat analysis included hazards inside the AOR as well as hazards traveling to these areas for both sprinklered and unsprinklered office buildings.

In 1992, NIST issued their findings and recommendations in a report titled "*Staging Areas for Persons with Mobility Impairments*" – NISTIR 4770. The NIST report resulted in a number of conclusions regarding fire protection strategies for persons with disabilities that are believed to be applicable to many other buildings. The primary conclusion of the report was that the operation of a properly designed sprinkler system eliminates the life threat to all occupants regardless of their individual abilities and can provide superior protection for persons with disabilities as compared to staging areas.

To the best of our knowledge, no physical tests or scientifically based fire safety analysis of AOR's has occurred since the printing of this 1992 report. In addition, sprinkler technology has also improved since 1992. Quick response sprinklers are now required to be used where in 1992, standard response sprinklers were utilized.

Regarding some of the opinions expressed at the Final Action Hearings of the ICC in September 2005 regarding automatic sprinkler reliability. A recent comprehensive analysis in 2005 of high-rise fires by NFPA identified that no fatalities had occurred for more than a decade in any U.S. high-rise occupancy (> 10 story) other than the 6 fatalities in the unsprinklered Cook County Office Building (2003); the 1 fatality in the unsprinklered First Interstate Bank Building (1991); and 3 firefighter fatalities in the partially sprinklered (unsprinklered on floor of fire origin and several floors above) Meridian Plaza Building (1991). The Murrah Federal Building (1995) and the World Trade Center (1993 & 2001) bombings were excluded from this analysis.

The recently issued NFPA 2005 report on sprinkler reliability also indicated that automatic fire sprinklers successfully operating in reported structural fires was an exemplary 93%. In addition, NFPA also reported that 2/3rds of the reported automatic fire sprinkler system failures were because the automatic fire sprinkler systems were shut off. Since the IBC requires the supervision of the automatic fire sprinkler system, one can conclude that the successful operation of an automatic fire sprinkler system designed and installed in compliance with the IBC requirements could be reasonably estimated at 98%. NFPA also reported that the percentage of successfully operating automatic fire sprinkler systems is probably higher since a large percentage of small fire extinguished by fire sprinklers are not reported. Therefore, for an automatic fire sprinkler system designed and installed in accordance with the IBC requirements, the successful operation of an automatic fire sprinkler system could be reasonably estimated at 98% or more.

Based on all these points stated above, we strongly believe that it unreasonable not to recognize that any floor of a building protected throughout by an approved, operational automatic fire sprinkler system serve as an AOR. We believe the rationale is sound and based on technical research that acknowledges the ability of a properly designed and operational automatic sprinkler system to control a fire at its point of origin and to limit production of toxic products to a level that is not life threatening to all occupants of the building, including persons with disabilities. In addition, we believe the cost to construct AOR's will significantly increase building construction and maintenance costs without increasing the overall safety to the building occupants.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The sprinkler exception for areas of refuge was deleted from Sections 1007.2 and 1007.3 as part of the final action hearings of the 04/05 cycle. No technical justification was provided to support the deletion of this option. There has been no loss of life in sprinklered high rise buildings. In addition, the deletion of the exceptions have resulted in conflicts with the elevator protection provisions and smoke barrier construction. There would be significant ramifications to current building construction.

Assembly Action:

None

Final Hearing Results

E25-06/07

AS

Code Change No: **E27-06/07**

Original Proposal

Sections: 1007.4 (IFC [B] 1007.4)

Proponent: Lawrence G. Perry, AIA, representing BOMA

Revise as follows:

1007.4 Elevators. In order to be considered part of an accessible means of egress, an elevator shall comply with the emergency operation and signaling device requirements of Section 2.27 of ASME A17.1. Standby power shall be provided in accordance with Sections 2702 and 3003. The elevator shall be accessed from either an area of refuge complying with Section 1007.6 or a horizontal exit.

Exceptions:

1. Elevators are not required to be accessed from an area of refuge or horizontal exit in open parking garages.
2. Elevators not required to be located in a shaft in accordance with Section 707.2 are not required to be accessed from an area of refuge or horizontal exit.
3. Elevators are not required to be accessed from an area of refuge or a horizontal exit where all portions of the means of egress are essentially open to the outside.

Reason: The proposed two new exceptions attempt to coordinate the accessible means of egress/area of refuge requirements, which were significantly modified by floor action at the Final Hearings of the '04/'05 Cycle, with the requirements for enclosed elevator lobbies (707.14.1). Proposed exception 2 allows omission of the area of refuge at elevators that are not required to be located within a shaft enclosure. A common example is elevators located within an atrium. The code specifically exempts such elevators from lobby enclosure requirements; it makes no sense to mandate a small enclosed box around the elevator when the elevator is otherwise permitted to be totally open to the atrium.

Proposed exception 3 addresses outdoor locations where elevators may be provided, such as transit station platforms and A-5 assembly occupancies. The purpose of the area of refuge or horizontal exit is to provide separation from the products of combustion during a fire. If the area is open to the outside, smoke will not accumulate.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1007.4 Elevators. In order to be considered part of an accessible means of egress, an elevator shall comply with the emergency operation and signaling device requirements of Section 2.27 of ASME A17.1. Standby power shall be provided in accordance with Sections 2702 and 3003. The elevator shall be accessed from either an area of refuge complying with Section 1007.6 or a horizontal exit.

Exceptions:

1. Elevators are not required to be accessed from an area of refuge or horizontal exit in open parking garages.
2. Elevators not required to be located in a shaft in accordance with Section 707.2 are not required to be accessed from an area of refuge or horizontal exit.
3. ~~Elevators are not required to be accessed from an area of refuge or a horizontal exit where all portions of the means of egress are essentially open to the outside.~~

Committee Reason: The proposed exception 2 is a logical extension. If an elevator is not in a shaft, an area of refuge in front of it would not make sense. The modification to delete Exception 3 was for consistency with the committee action on E26-06/07. The term "essentially" is not readily defined.

Assembly Action:

None

Final Hearing Results

E27-06/07

AM

Code Change No: E28-06/07

Original Proposal

Sections: 1007.3, 1007.4, 1007.7 (IFC [B] 1007.3, [B] 1007.4, [B] 1007.7)

Proponent: Ed Roether, HOK SVE

Revise as follows:

1007.3 Exit stairways. In order to be considered part of an accessible means of egress, an exit stairway shall have a clear width of 48 inches (1219 mm) minimum between handrails and shall either incorporate an area of refuge within an enlarged floor-level landing or shall be accessed from either an area of refuge complying with Section 1007.6 or a horizontal exit.

Exceptions:

1. Unenclosed exit stairways as permitted by Section 1020.1 are permitted to be considered part of an accessible means of egress.
2. The area of refuge is not required at unenclosed exit stairways as permitted by Section 1020.1 in buildings or facilities that are equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
3. The clear width of 48 inches (1219 mm) between handrails is not required at exit stairways in buildings or facilities equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
4. The clear width of 48 inches (1219 mm) between handrails is not required for exit stairways accessed from a horizontal exit.
5. Areas of refuge are not required at exit stairways serving open parking garages.
6. Areas of refuge are not required for smoke protected seating areas complying with Section 1025.6.2.

1007.4 Elevators. In order to be considered part of an accessible means of egress, an elevator shall comply with the emergency operation and signaling device requirements of Section 2.27 of ASME A17.1. Standby power shall be provided in accordance with Sections 2702 and 3003. The elevator shall be accessed from either an area of refuge complying with Section 1007.6 or a horizontal exit.

Exceptions:

1. Elevators are not required to be accessed from an area of refuge or horizontal exit in open parking garages.
2. Elevators are not required to be accessed from an area of refuge or horizontal exit for smoke protected seating areas complying with Section 1025.6.2.

1007.7 Signage. At exits and elevators serving a required accessible space but not providing an approved accessible means of egress, signage shall be installed indicating the location of accessible means of egress. At refuge areas created by horizontal exits or where areas of refuge are not required, provide signage indicating areas to wait for rescue assistance.

Reason: The purpose of this proposed change is to rectify a potentially unintended result of a recent code change. The purpose of a smoke barrier is to minimize the intrusion of smoke. In environments where the entire area has protection against the accumulation of smoke, requiring an additional smoke barrier is not only redundant but potentially hazardous. For example, enclosing a room in an exterior stadium concourse does not enhance safety, if anything it would diminish it.

Smoke-protected seating is performance based design providing an environment where smoke is maintained away from occupants from the seat to exit discharge with design criterion established in Section 909. Therefore, smoke-protected seating already provides an environment meeting the intent of the protection offered by areas of refuge. For seating to be considered smoke-protected it is required to maintain the level of smoke at least 6 feet above the floor of the means of egress (please refer to Section 1025.6.2.1). In addition, a life safety evaluation, complying with NFPA 101, is required for smoke-protected assembly seating (please refer to Section 1025.6.2).

Even when areas of refuge are not provided, signage indicating where people can wait for assisted rescue should be provided. This would happen at horizontal exits, an open exit stairway or in smoke free environments such as open parking garages or smoke protected seating areas.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

1007.7 Signage. At exits and elevators serving a required accessible space but not providing an approved accessible means of egress, signage shall be installed indicating the location of accessible means of egress. ~~At refuge areas created by horizontal exits or where areas of refuge are not required, provide signage indicating areas to wait for rescue assistance.~~

(Portions of proposal not shown remain unchanged)

Committee Reason: The modification provided definable criteria for areas where smoke protected seating for all occupants is provided. It is logical that this is a viable alternative for areas of refuge for persons with mobility impairments. The modification removed the proposed revision to Section 1007.7. If an area of refuge is not required, then signage for that area of refuge does not make sense.

Assembly Action:

None

Final Hearing Results

E28-06/07

AM

Code Change No: E29-06/07

Original Proposal

Sections: 1007.3 (IFC [B] 1007.3)

Proponent: Ron Nickson, National Multi Housing Council/National Apartment Association

Revise as follows:

1007.3 Exit stairways. In order to be considered part of an accessible means of egress, an exit stairway shall have a clear width of 48 inches (1219 mm) minimum between handrails and shall either incorporate an area of refuge within an enlarged floor-level landing or shall be accessed from either an area of refuge complying with Section 1007.6 or a horizontal exit.

Exceptions:

1. Unenclosed exit stairways as permitted by Section 1020.1 are permitted to be considered part of an accessible means of egress.
2. The area of refuge is not required at unenclosed exit stairways as permitted by Section 1020.1 in buildings or facilities that are equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
3. The clear width of 48 inches (1219 mm) between handrails is not required at exit stairways in buildings or facilities equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
4. The clear width of 48 inches (1219 mm) between handrails is not required for exit stairways accessed from a horizontal exit.
5. Areas of refuge are not required at exit stairways serving open parking garages.
6. The areas of refuge are not required in Group R-2 occupancies.

Reason: To allow an exception to not require an area of refuge in apartment buildings and individual dwellings because the individual sprinklered apartment provide a much superior area to protect the apartment occupant than would be provided by the area of refuge. In addition to each individual unit being surrounded by partitions and horizontal assemblies in accordance with Section 419, the unit also has the special items necessary for the individual occupant.

NFPA fire data from *U.S. Experience with Sprinklers* by Kimberly Rohr and John R. Hall, Jr., December 2005 (copy attached) supports the safety of the individual apartment. According to the report 95% (Table 12, page 46) of the fires in sprinklered apartment buildings are confined within the room of origin (object of origin – 69%, area of origin – 20%, and room of origin – 6%). More important the report goes on to address the

effectiveness of sprinklers in saving lives by stating "NFPA has no record of a fire killing more than two people in a completely sprinklered public assembly, educational, institutional, or residential building where the system was properly operating" (Page 32). NFPA also reports that residential sprinkler system reliability of 98% (2% failure, Table 4, page 17) is the highest for all occupancies. The Operation Life Safety reported on the safety of residential systems also shows that the systems save lives. An evaluation of the report *Residential Sprinkler Activations* (copy attached) shows no deaths in buildings protected with the NFPA 13D and 13R sprinkler systems?

Cost Impact: The code change proposal will decrease the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: Since Group R-2 occupancies are required to be sprinklered and separated, there is sufficient protection for the residents. There was a question if with the committee action on E25-06/07 that this exception may be redundant.

Assembly Action:

None

Final Hearing Results

E29-06/07

AS

Code Change No: E30-06/07

Original Proposal

Sections: 1007.3 (IFC [B] 1007.3)

Proponent: Ron Nickson, National Multi Housing Council/National Apartment Association

Revise as follows:

1007.3 Exit stairways. In order to be considered part of an accessible means of egress, an exit stairway shall have a clear width of 48 inches (1219 mm) minimum between handrails and shall either incorporate an area of refuge within an enlarged floor-level landing or shall be accessed from either an area of refuge complying with Section 1007.6 or a horizontal exit.

Exceptions:

1. Unenclosed exit stairways as permitted by Section 1020.1 are permitted to be considered part of an accessible means of egress.
2. The area of refuge is not required at unenclosed exit stairways as permitted by Section 1020.1 in buildings or facilities that are equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.1.1.2.
3. The clear width of 48 inches (1219 mm) between handrails is not required at exit stairways in buildings or facilities equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
4. The clear width of 48 inches (1219 mm) between handrails is not required for exit stairways accessed from a horizontal exit.
5. Areas of refuge are not required at exit stairways serving open parking garages.

Reason: To allow the exceptions for not requiring an area of refuge at unenclosed exit stairways permitted for buildings with NFPA 13 sprinkler systems to also be allowed with NFPA 13R sprinkler systems. The design requirements and thus the protection provided with NFPA 13R system in the area being protected are the same as that provided with a NFPA 13 system.

Cost Impact: The code change proposal will decrease the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: In this particular case, the use of sprinkler systems provided in accordance with NFPA 13R is reasonable and will provide the needed level of protection.

Assembly Action:

None

Final Hearing Results

E30-06/07

AS

Code Change No: **E35-06/07**

Original Proposal

Sections: 1007.6 (IFC [B] 1007.6)

Proponent: Ed Roether, HOK SVE

Revise as follows:

1007.6 Areas of refuge. Every required area of refuge shall be accessible from the space it serves by an accessible means of egress. The maximum travel distance from any accessible space to an area of refuge shall not exceed the travel distance permitted for the occupancy in accordance with Section 1016.1. Every required area of refuge shall have direct access to an enclosed exit stairway complying with Sections 1007.3 and 1020.1 or an elevator complying with Section 1007.4. Where an elevator lobby is used as an area of refuge, the shaft and lobby shall comply with Section 1020.1.7 for smokeproof enclosures except where the elevators are in an area of refuge formed by a horizontal exit or smoke barrier.

Exceptions:

1. A stairway serving an area of refuge is not required to be enclosed where permitted in Section 1020.1.
2. Smokeproof enclosure is not required for an elevator lobby used as an area of refuge not required to be enclosed.

Reason: The purpose of this proposed change is to clarify two things: first that an exit stair that is not required to be enclosed by Section 1020.1 is not otherwise required to be enclosed in order to serve an area of refuge, and then second that elevator shaft and lobby is not required to be smokeproof where the area of refuge would not need to be separated from the remaining space. Without this proposed change, it may be interpreted that the limited conditions where an exit stair is not required to be enclosed would need to be enclosed when it serves an area of refuge. In addition, it may be interpreted providing smokeproof enclosure for elevator lobbies and shafts would be required even when the area of refuge is not required to be separated.

An exterior stair in A5 occupancy is not required to be enclosed per Section 1020.1. However, without this proposed change that same exterior stair might be required to be enclosed when it serves an area of refuge. As stated in another proposed change, separating an area of refuge from an open air exterior concourse is counter-productive when the concourse is already protected from smoke. Enclosing an exterior exit stair does not seem to offer any greater protection from smoke, but potentially reduces its protection. Similarly, enclosing an exterior elevator shaft and lobby might offer more potential for smoke collection compared to an open air exterior space.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The level of protection offered by an open exit access stair is negligible, and what is needed is an actual exit enclosure.

Assembly Action:

None

Final Hearing Results

E35-06/07

AS

Code Change No: **E40-06/07**

Original Proposal

Sections: 1008.1.1.1 (IFC [B] 1008.1.1.1)

Proponent: Bill Conner, Bill Conner Associates LLC, representing himself

Revise as follows:

1008.1.1.1 Projections into clear width. There shall not be projections into the required clear width lower than 34 inches (864 mm) above the floor or ground. Projections into the clear opening width between 34 inches (864 mm) and 80 inches (2032 mm) above the floor or ground shall not exceed 4 inches (102 mm).

Exception: Door closers and door stops shall be permitted to be 78 inches (1980 mm) minimum above the floor.

Reason: The purpose of this proposal is to allow for door closers and stops to protrude into the 80" minimum height. This is coordinated with ICC A117.1, Section 404.2.2.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The lower headroom height for door closers and stops will allow design flexibility without adversely affecting the means of egress.

Assembly Action:

None

AS

Code Change No: **E41-06/07**

Original Proposal

Sections: 1008.1.2 (IFC [B] 1008.1.2)

Proponent: John Neff, Washington State Building Code Council

Revise as follows:

1008.1.2 Door swing. Egress doors shall be side-hinged swinging.

Exceptions:

1. Private garages, office areas, factory and storage areas with an occupant load of 10 or less.
2. Group I-3 occupancies used as a place of detention.
3. Critical or intensive care patient rooms within suites of health care facilities.
4. Doors within or serving a single dwelling unit in Groups R-2 and R-3.
5. In other than Group H occupancies, revolving doors complying with Section 1008.1.3.1.
6. In other than Group H occupancies, horizontal sliding doors complying with Section 1008.1.3.3 are permitted in a means of egress.
7. Power-operated doors in accordance with Section 1008.1.3.2.
8. Doors serving a bathroom within an individual sleeping unit in Group R-1.
9. In other than Group H Occupancies, manually operated horizontal sliding doors are permitted in a means of egress from spaces with an occupant load of 10 or less.

Doors shall swing in the direction of egress travel where serving an occupant load of 50 or more persons or a Group H occupancy.

The opening force for interior side-swinging doors without closers shall not exceed a 5-pound (22 N) force. For other side-swinging, sliding and folding doors, the door latch shall release when subjected to a 15-pound (67 N) force. The door shall be set in motion when subjected to a 30-pound (133 N) force. The door shall swing to a full-open position when subjected to a 15 pound (67 N) force. Forces shall be applied to the latch side.

Reason: The purpose of the code change is to add an exception to the code to allow a specific type of door for egress from areas of low occupancy. This exception is needed to allow space efficient design while maintaining a proven level of safety. Use of manual horizontal sliding doors for egress from low occupancy spaces was allowed under legacy codes with no impact on the health and safety of the occupants. Examples of where these doors have been used for egress include hotel balconies and in teacher break rooms in school facilities.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1008.1.2 Door swing. Egress doors shall be side-hinged swinging.

Exceptions:

- ~~1. Private garages, office areas, factory and storage areas with an occupant load of 10 or less.~~
- 9 1. In other than Group H Occupancies, manually operated horizontal sliding doors are permitted in a means of egress from spaces with an occupant load of 10 or less.
2. Group I-3 occupancies used as a place of detention.
3. Critical or intensive care patient rooms within suites of health care facilities.
4. Doors within or serving a single dwelling unit in Groups R-2 and R-3.
5. In other than Group H occupancies, revolving doors complying with Section 1008.1.3.1.
6. In other than Group H occupancies, horizontal sliding doors complying with Section 1008.1.3.3 are permitted in a means of egress.
7. Power-operated doors in accordance with Section 1008.1.3.2.
8. Doors serving a bathroom within an individual sleeping unit in Group R-1.

Doors shall swing in the direction of egress travel where serving an occupant load of 50 or more persons or a Group H occupancy.

The opening force for interior side-swinging doors without closers shall not exceed a 5-pound (22 N) force. For other side-swinging, sliding and folding doors, the door latch shall release when subjected to a 15-pound (67 N) force. The door shall be set in motion when subjected to a 30-pound (133 N) force. The door shall swing to a full-open position when subjected to a 15 pound (67 N) force. Forces shall be applied to the latch side.

Committee Reason: The change allowing for a horizontal sliding door instead of a side swinging door in areas with small occupant loads would not decrease safety for the means of egress. The modification to delete Exception 1 was to eliminate redundant text with the new exception. The Assembly Action was due to the deletion of Exception 1 resulting in overhead doors not being permitted as an option for some of these small areas.

Assembly Action:

Approved as Submitted

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because an assembly action was successful.

Final Hearing Results

E41-06/07

AS

Code Change No: **E43-06/07**

Original Proposal

Sections: 1008.1.2, 1008.1.3 (New), 1008.1.3.1 (New) [IFC 1008.1.2, [B] 1008.1.3 (New), [B] 1008.1.3.1 (New)]

Proponent: Philip Brazil, Reid Middleton, Inc., representing himself

Revise as follows:

1008.1.2 (IFC 1008.1.2) Door swing. Egress doors shall be side-hinged swinging.

Exceptions:

1. Private garages, office areas, factory and storage areas with an occupant load of 10 or less.
2. Group I-3 occupancies used as a place of detention.
3. Critical or intensive care patient rooms within suites of health care facilities.
4. Doors within or serving a single dwelling unit in Groups R-2 and R-3 as applicable in Section 101.2.
5. In other than Group H occupancies, revolving doors complying with Section 1008.1.3.1.
6. In other than Group H occupancies, horizontal sliding doors complying with Section 1008.1.3.3 are permitted in a means of egress.
7. Power-operated doors in accordance with Section 1008.1.3.2.
8. Doors serving a bathroom within an individual sleeping unit in Group R-1.

Doors shall swing in the direction of egress travel where serving an occupant load of 50 or more persons or a Group H occupancy.

1008.1.3 Door opening force. The opening force for pushing or pulling open interior side-swinging egress doors without closers other than fire doors, shall not exceed a 5-pound 5 pounds (22 N) force. For other side-swinging doors, and sliding and folding doors, the door latch shall release when subjected to a 15-pound (67 N) force. The door shall be set in motion when subjected to a 30-pound (133 N) force. The door shall swing to a full-open position when subjected to a 15-pound (67 N) force.

1008.1.3.1 Location of applied forces. Forces shall be applied to the latch side of the door.

Reason: The purpose of this proposal is to make the provisions for door opening forces more technically sound and more consistent with similar provisions in ICC A117.1. IBC Section 1008.1.2 requires egress doors to be side-hinged swinging except for several cases noted in Exceptions #1 through #8. In paragraph #3, the opening force is limited to 5 pounds for interior side-swinging doors without closers. The charging language in paragraph #1, however, is limited to side-hinged swinging doors, which does not include side-swinging doors other than side-hinged swinging (i.e., pivoted). Paragraph #3 specifies limits on opening forces for sliding and folding doors, which is also beyond the scope of the same charging language. Because of this, a new code section is proposed so that the requirements for door opening force are not limited to the charging language in Section 1008.1.2.

Scoping issues aside, the current provisions in paragraph #3 are limited to side-swinging doors, sliding doors and folding doors. Excluded are swinging doors other than side-swinging (i.e., pivoted), which is not the intent. It is also not consistent Section 404.2.8 of ICC A117.1-03 on door-opening force, which applies to all interior hinged doors other than fire doors, not just side-swinging (hinged) doors. The change from "side-swinging" to "swinging" doors will make the necessary correction.

The current language in paragraph #3 of Section 1008.1.2 specifies "opening force." This is changed to "force for pushing and pulling open," also for consistency with Section 404.2.8 of ICC A117.1-03. The substitution of "fire doors" for "without closers" is being done for the same reason. The change from "5-pound force" to "5 pounds" is being done to eliminate redundancy. Note that "force" is specified at the beginning of the sentence.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The reorganization clarifies the operational force is applicable to all inside non-fire doors, including types other than side swinging doors.

Assembly Action:

None

Final Hearing Results

E43-06/07

AS

Code Change No: **E44-06/07**

Original Proposal

Sections: 1008.1.3.1 (IFC [B] 1008.1.3.1)

Proponent: Bill Conner, Conner Associates LLC, representing himself

Revise as follows:

1008.1.3.1 Revolving doors. Revolving doors shall comply with the following:

1. Each revolving door shall be capable of collapsing into a bookfold position with parallel egress paths providing an aggregate width of 36 inches (914 mm).
2. A revolving door shall not be located within 10 feet (3048 mm) of the foot of or top of stairs or escalators. A dispersal area shall be provided between the stairs or escalators and the revolving doors.
3. The revolutions per minute (rpm) for a revolving door shall not exceed those shown in Table 1008.1.3.1.
4. Each revolving door shall have a side-hinged swinging door which complies with Section 1008.1 in the same wall and within 10 feet (3048 mm) of the revolving door.
5. Revolving doors shall not be part of an accessible route required by Section 1007 and Chapter 11.

Reason: Revolving doors cannot be used on an accessible route.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: Revolving doors are a safety hazard along accessible routes without specifications for just how to make them accessible.

Assembly Action:

None

Final Hearing Results

Code Change No: **E47-06/07**

Original Proposal

Sections: 1008.1.8.3 (IFC [B] 1008.1.8.3)

Proponent: Ralph Vasami, The Kellen Company, representing The Door Safety Council

Revise as follows:

1008.1.8.3 Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following exists:

1. Places of detention or restraint. 2. In buildings in occupancy Group A having an occupant load of 300 or less, Groups B, F, M and S, and in places of religious worship, the main exterior door or doors are permitted to be equipped with key-operated locking devices from the egress side provided:
2. In buildings in occupancy Group A having an occupant load of 300 or less, Groups B, F, M and S, and in places of religious worship, the main exterior door or doors are permitted to be equipped with key-operated locking devices from the egress side provided:
 - 2.1. The locking device is readily distinguishable as locked,
 - 2.2. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN BUILDING IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background, 2.3. The use of the key-operated locking device is revokable by the building official for due cause.
3. Where egress doors are used in pairs, approved automatic flush bolts shall be permitted to be used, provided that the door leaf having the automatic flush bolts has no doorknob or surface-mounted hardware.
4. Doors from individual dwelling or sleeping units of Group R occupancies having an occupant load of 10 or less are permitted to be equipped with a night latch, dead bolt or security chain, provided such devices are openable from the inside without the use of a key or tool.
5. Fire rated doors after the minimum elevated temperature has disabled the unlatching mechanism in accordance with listed fire door test procedures

Reason: This proposal will revise Section 1008 to clarify conditions under which latching devices shall be permitted to prevent door operation. The current code contains a contradiction in that the listed procedures for a fire door include the disabling of the mechanism. Without this added text, the code does not allow the listed feature.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

1008.1.8.3 Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following exists:

1. Places of detention or restraint. 2. In buildings in occupancy Group A having an occupant load of 300 or less, Groups B, F, M and S, and in places of religious worship, the main exterior door or doors are permitted to be equipped with key-operated locking devices from the egress side provided:
2. In buildings in occupancy Group A having an occupant load of 300 or less, Groups B, F, M and S, and in places of religious worship, the main exterior door or doors are permitted to be equipped with key-operated locking devices from the egress side provided:
 - 2.1. The locking device is readily distinguishable as locked,
 - 2.2. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN BUILDING IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background, 2.3. The use of the key-operated locking device is revokable by the building official for due cause.
3. Where egress doors are used in pairs, approved automatic flush bolts shall be permitted to be used, provided that the door leaf having the automatic flush bolts has no doorknob or surface-mounted hardware.
4. Doors from individual dwelling or sleeping units of Group R occupancies having an occupant load of 10 or less are permitted to be equipped with a night latch, dead bolt or security chain, provided such devices are openable from the inside without the use of a key or tool.
5. Fire rated doors after the minimum elevated temperature has disabled the unlatching mechanism in accordance with listed fire door test procedures.

Committee Reason: The proposed language would codify application for doors currently used. A concern was expressed if the listing information would be sufficient to regulate this type of mechanism. The modification to the new item five is for consistency with the terminology for fire doors.

Assembly Action:

None

Final Hearing Results

E47-06/07

AM

Code Change No: E52-06/07

Original Proposal

Sections: 1008.1.8.7 (New) [IFC [B] 1008.1.8.7 (New)]

Proponent: Dave Frable, U.S. General Services Administration

Revise as follows:

1008.1.8.7 Electromagnetically Locked Egress Doors. Doors in the means of egress in buildings with an occupancy in Group A, B, E, M, R-1 or R-2 and doors to tenant spaces in Group A, B, E, M, R-1 or R-2 shall be permitted to be electromagnetically locked if equipped with listed hardware that incorporates a built-in switch that meets the requirements below:

1. The listed hardware is affixed to the door leaf has an obvious method of operation that is readily operated under all lighting conditions.
2. The listed hardware is capable of being operated with one hand.
3. Operation of the listed hardware interrupts power supply to the electromagnetic lock and unlocks the door.
4. Loss of power to the listed hardware automatically unlocks the door.

Reason: The intent of this code change proposal is add a new requirement that would permit doors in the means of egress to be electromagnetically locked if equipped with listed hardware that incorporates a built-in switch that interrupts the power supply to the electromagnetic lock and unlocks the door.

Current code requirements do not permit the use of this new type of technology for electromagnetically locked egress door. Current requirements only permit the use of delayed egress locking systems and egress access control systems. However, these two types of egress locking systems typically do not meet the security needs of the building and are often misapplied.

The listed hardware that incorporates a built-in switch has been tested by UL under Special Locking Arrangements FWAX.SA6635. For example, the Adams Rite 3000 bars are OEM listed as 3700, 3600, 3300, and 3100. In addition, the Securitron Touch Sense Bars and Handles are also listed.

We believe type of locking arrangement will address a majority of security concerns in buildings while still maintaining a reasonable degree of safety. This new type of locking arrangement would also be acceptable in the 2006 edition of the NFPA 101, *Life Safety Code*.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

1008.1.8.7 Electromagnetically locked egress doors. Doors in the means of egress that are not otherwise required to have panic hardware in buildings with an occupancy in Group A, B, E, M, R-1 or R-2 and doors to tenant spaces in Group A, B, E, M, R-1 or R-2 shall be permitted to be electromagnetically locked if equipped with listed hardware that incorporates a built-in switch, and meet that meets the requirements below:

1. The listed hardware affixed to the door leaf has an obvious method of operation that is readily operated under all lighting conditions.
2. The listed hardware is capable of being operated with one hand.
3. Operation of the listed hardware releases interrupts power supply to the electromagnetic lock and unlocks the door immediately.
4. Loss of power to the listed hardware automatically unlocks the door.

Committee Reason: The proposal resolves a huge misunderstanding in the code that all door locks are required to be mechanical. The modification to the base paragraph is to clarify that these locks will not conflict with panic hardware requirements. The modification to Item 2 clarifies that this type of lock is not a delayed egress lock or access control lock addressed elsewhere in the locking requirements.

Assembly Action:

None

E52-06/07

AM

Code Change No: E63-06/07

Original Proposal

Sections: 1009.3.3 (IFC [B] 1009.3.3)

Proponent: William McErlane, City of Springdale, Ohio, representing Ohio Building Officials Association

Revise as follows:

1009.3.3 Profile. The radius of curvature at the leading edge of the tread shall be not greater than 0.5 inch (12.7 mm). Beveling of nosings shall not exceed 0.5 inch (12.7 mm). Risers shall be solid and vertical or sloped from the underside of the leading edge of the tread above at an angle not more than 30 degrees (0.52 rad) from the vertical. The leading edge (nosings) of treads shall project not more than 1.25 inches (32 mm) beyond the tread below and all projections of the leading edges shall be of uniform size, including the leading edge of the floor at the top of a flight.

Exceptions:

1. Solid risers are not required for stairways that are not required to comply with Section 1007.3, provided that the opening between treads does not permit the passage of a sphere with a diameter of 4 inches (102 mm).
2. Solid risers are not required for occupancies in Group I-3 or in F, H and S occupancies other than areas accessible to the public.

Reason: Solid risers are required in occupancies where guards are limited to maximum four inch openings because open risers are typically more than four inches high. They are also a concern for mobility impaired persons. This section already recognizes one occupancy where the opening limitations are relaxed due to decreased hazard. This would allow stairs such as those at loading docks and industrial mezzanines to have open risers.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: Areas that are not open to the public in F, H and S occupancies should not be required to have solid risers on stairway.

Assembly Action:

None

Final Hearing Results

E63-06/07

AS

Code Change No: **E64-06/07**

Original Proposal

Sections: 1009.4 (IFC [B] 1009.4)

Proponent: Bill Conner, Conner Associates LLC, representing himself

Revise as follows:

1009.4 Stairway landings. There shall be a floor or landing at the top and bottom of each stairway. The width of landings shall not be less than the width of stairways they serve. Every landing shall have a minimum dimension measured in the direction of travel equal to the width of the stairway. Such dimension need not exceed 48 inches (1219 mm) where the stairway has a straight run. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into a landing. When wheelchair spaces are required on the stairway landing in accordance with Section 1007.6.1, the wheelchair space shall not be located in the required width of the landing and doors shall not swing over the wheelchair spaces.

Exceptions: 1- Aisle stairs complying with Section 1025.

2- ~~Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into a landing.~~

Reason: The intent of this proposal is to maintain clear width for the general means of egress down an exit stairway. If a wheelchair space that is part of an area of refuge is located on the landing it is important for the safety of both the general public and the persons using the wheelchair spaces that this area is outside of the general path of travel. The door should not swing over the wheelchair space so that someone can be in the space and not block the door. Wheelchair spaces should be outside of the general traffic flow so that they do not cause a bottle neck and the persons using the wheelchair spaces are not bumped. The other moved language was for consistency with corridors as paths for means of egress (e.g. don't allow the door swing to block the path of travel). This is a requirement, not an exception.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proponent has provided clarifying language for adequate stairway landings when dealing with both doors opening onto landing and when wheelchair spaces are located on the landing.

Assembly Action:

None

Final Hearing Results

E64-06/07

AS

Code Change No: **E65-06/07**

Original Proposal

Sections: 1009.5.1 (IFC [B] 1009.5.1)

Proponent: Bill Conner, Conner Associates LLC, representing himself

Revise as follows:

1009.5.1 Stairway walking surface. The walking surface of treads and landings of a stairway shall not be sloped steeper than one unit vertical in 48 units horizontal (2-percent slope) in any direction. Stairway treads and landings shall have a solid surface. Finish floor surfaces shall be securely attached.

Exceptions:

1. Openings in stair walking surfaces shall be a size that does not permit the passage of ½ inch (13 mm) diameter sphere. Elongated opening shall be places so that the long dimension is perpendicular to the dominant direction of travel.
2. In Group F, H and S occupancies, other than areas of parking structures accessible to the public, openings in treads and landings shall not be prohibited provided a sphere with a diameter of 1.125 inches (29 mm) cannot pass through the opening.

Reason: The purpose of this proposal is to address what holes in treads should be permitted. This change is intended to coordinate with stairway treads as scoped in ADAAG.

For stairway walking surfaces ICC A117.1 Section 302.3 says ½" openings are permitted on walking surfaces.

There are many locations, especially outside, where allowing perforated treads would help keep snow and water off the tread surfaces.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

1009.5.1 Stairway walking surface. The walking surface of treads and landings of a stairway shall not be sloped steeper than one unit vertical in 48 units horizontal (2-percent slope) in any direction. Stairway treads and landings shall have a solid surface. Finish floor surfaces shall be securely attached.

Exceptions:

1. Openings in stair walking surfaces shall be a size that does not permit the passage of 2 inch (13 mm) diameter sphere. Elongated opening shall be placed so that the long dimension is perpendicular to the ~~dominant~~ direction of travel.
2. In Group F, H and S occupancies, other than areas of parking structures accessible to the public, openings in treads and landings shall not be prohibited provided a sphere with a diameter of 1.125 inches (29 mm) cannot pass through the opening.

Committee Reason: The allowances for grill or grate type stairways, especially in outdoor areas in climates subject to snow accumulation, is necessary for a safe means of egress. A modification was made to delete the word >dominant<-in Exception 1 because the word was redundant.

Assembly Action:

None

Final Hearing Results

E65-06/07

AM

Code Change No: E67-06/07

Original Proposal

Sections: 1009.8 (IFC [B] 1009.8); IRC R311.5.8.1

Proponent: David W. Cooper, Stairway Manufacturers' Association

THIS PROPOSAL IS ON THE AGENDA OF THE IBC MEANS OF EGRESS AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC

Revise as follows:

1009.8 Spiral stairways. Spiral stairways are permitted to be used as a component in the means of egress only within dwelling units or from a space not more than 250 square feet (23 m²) in area and serving not more than five occupants, or from galleries, catwalks and gridirons in accordance with Section 1015.6.

A spiral stairway shall have a 7.5 inch (191 mm) minimum clear tread depth at a point 12 inches (305 mm) from the narrow edge. The risers shall be sufficient to provide a headroom of 78 inches (1981 mm) minimum, but riser height shall not be more than 9.5 inches (241 mm). The minimum stairway clear width at and below the handrail shall be 26 inches (660 mm).

PART II – IRC

Revise as follows:

R311.5.8.1 Spiral stairways. Spiral stairways are permitted, provided the minimum clear width at and below the handrail shall be 26 inches (660 mm) with each tread having a 7 1/2-inches (190 mm) minimum tread depth at 12 inches from the narrower edge. All treads shall be identical, and the rise shall be no more than 9 1/2 inches (241 mm). A minimum headroom of 6 feet 6 inches (1982 mm) shall be provided.

Reason: The purpose of the change is to clarify the code. This proposal will allow consistent interpretation.

(IBC) The intent of the code needs to be clarified. The added text clarifies the width that has long been accepted and enforced. This issue is further complicated by the fact that the IBC Commentary drawing does not show the handrail. Another option would be to insert the text "measured at the tread" as the commentary drawing would imply however this is not felt to be the historical interpretation.

(IRC) In R311.5.1 Width, the section discusses the width of the stair at several points. Although this level of detail is not necessary in the Spiral stairway section the added text clarifies the width that has long been accepted and enforced. Because the exception in R311.5.1 refers to this section it is necessary to insert the additional text. The is further complicated by the fact that the IRC Commentary drawing does not show the handrail. Another option would be to insert the text "measured at the tread" as the commentary would imply however this is not felt to be the historical interpretation.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I C IBC

Committee Action:

Approved as Submitted

Committee Reason: The proposed language clarifies where to measure the width of a spiral stairway.

Assembly Action:

None

PART II C IRC

Committee Action:

Approved as Submitted

Committee Reason: The new language for spiral stairways helps to add clarity to this code section and it helps to keep the area at and below the guardrail clear.

Assembly Action:

None

Final Hearing Results

E67-06/07, Part I	AS
E67-06/07, Part II	AS

Code Change No: E69-06/07

Original Proposal

Sections: 1009.10, 1010.8, 1025.13 (IFC [B] 1009.10, [B] 1010.8, [B] 1025.13)

Proponent: Ed Roether, HOK SVE

Revise as follows:

1009.10 Handrails. Stairways shall have handrails on each side and shall comply with Section 1012. Where glass is used to provide the handrail, the handrail shall also comply with Section 2407.

Exceptions:

1. ~~Aisle stairs complying with Section 1025 provided with a center handrail need not have additional handrails.~~ Handrails for aisle stairs are not required where permitted by Section 1025.13.
2. Stairways within dwelling units, spiral stairways and aisle stairs serving seating only on one side are permitted to have a handrail on one side only.
3. Decks, patios and walkways that have a single change in elevation where the landing depth on each side of the change of elevation is greater than what is required for a landing do not require handrails.
4. In Group R-3 occupancies, a change in elevation consisting of a single riser at an entrance or egress door does not require handrails.
5. Changes in room elevations of only one riser within dwelling units and sleeping units in Group R-2 and R-3 occupancies do not require handrails.

1010.8 Handrails. Ramps with a rise greater than 6 inches (152 mm) shall have handrails on both sides. Handrails shall comply with Section 1012.

Exception: Handrails for ramped aisles are not required where permitted by Section 1025.13.

1025.13 Handrails. Ramped aisles having a slope exceeding one unit vertical in 15 units horizontal (6.7-percent slope) and aisle stairs shall be provided with handrails located either at the side or within the aisle width.

Exceptions:

1. Handrails are not required for ramped aisles having a gradient no greater than one unit vertical in eight units horizontal (12.5-percent slope) and seating on both sides.
2. Handrails are not required if, at the side of the aisle, there is a guard that complies with the graspability requirements of handrails.
3. Handrail extensions are not required at the top and bottom of aisle stair and aisle ramp runs to permit crossovers within the aisles.

Reason: The intent is clarification of the handrail provisions for aisle steps and aisle ramps in assembly seating and coordination with ICC A117.1 and ADAAG Section 505.

Section 1009.10, Exception 1: The handrail exception for aisle steps should provided direct reference to handrail provisions.

Section 1010.8: Coordination with handrails provisions for ramps is required.

Section 1025.13: New language – coordination with A117.1 and ADA 505.2 and 505.10. The handrail extensions could become protruding objects at these locations.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal clarifies handrail requirements in aisles serving seating areas. Perhaps a public comment could be brought forward to clean up Anot required where permitted® and put the exceptions in better code language.

Assembly Action:

None

Final Hearing Results

E69-06/07

AS

Code Change No: E70-06/07

Original Proposal

Sections: 1009.10 (IFC [B] 1009.10)

Proponent: Tom Rubotton, City of Lakewood, Colorado, representing the Colorado Chapter of ICC

Revise as follows:

1009.10 Handrails. Stairways shall have handrails on each side and shall comply with Section 1012. Where glass is used to provide the handrail, the handrail shall also comply with Section 2407.

Exceptions:

1. Aisle stairs complying with Section 1025 provided with a center handrail need not have additional handrails.
2. Stairways within dwelling units, spiral stairways and aisle stairs serving seating only on one side are permitted to have a handrail on one side only.
3. Decks, patios and walkways that have a single change in elevation where the landing depth on each side of the change of elevation is greater than what is required for a landing do not require handrails.
4. In Group R-3 occupancies, a change in elevation consisting of a single riser at an entrance or egress door does not require handrails.
5. Changes in room elevations of ~~only one riser~~ 3 or fewer risers within dwelling units and sleeping units in Group R-2 and R-3 do not require handrails.

Reason: This code change will make these requirements for when handrails are required on stairs within dwelling units and sleeping units in R-2 and R-3 occupancies the same as the requirements when building under the IRC. These occupancies are considered non transient and therefore the occupants are living there for longer periods of time and are much more familiar with their surroundings. It does not make sense to require handrails when there are 2 or more risers in a condo or house built under the IBC and to only require handrails when 4 or more risers when single family house or townhouse is built under the IRC. The same types of people are living in these structures and they are often built on same street by the same builder.

It should be noted that the last sentence of Section R310 for R-3 states “Adult and Child care facilities that are within a single-family home are permitted to comply with the International Residential Code” which would allow the conditions this change proposes.

Cost Impact: The code change proposal will reduce the cost of construction.

Analysis: Section 308.5 would limit adult and child care facilities in Group R-3 to five or fewer persons.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal would coordinate the IBC and IRC requirements for stairways in Group R-2 and R-3 with three of fewer risers. The hazard does not increase for this situation between single family homes and within a townhouse or apartment.

Assembly Action:

None

Final Hearing Results

E70-06/07

AS

Code Change No: E74-06/07

Original Proposal

Sections: 1010.5.1 (IFC [B] 1010.5.1)

Proponent: William W. Stewart, Chesterfield, MO, representing himself

Revise as follows:

1010.5.1 Width. The minimum width of a means of egress ramp shall not be less than that required for corridors by Section 1017.2. The clear width of a ramp ~~and the clear width between handrails, if provided, or other permissible projections~~ shall be 36 inches (914 mm) minimum.

Reason: Ramps require handrails on both sides per 1010.8 thus the deleted text is redundant. It is also misleading because it implies ramps do not need handrails on both sides. If the slope is less than 1:20 then the walking surface is not a ramp and is not regulated by this section. Other permissible projections are introduced because someone might think that ramp curbs and similar components should be included in the width if a ramp.

Cost Impact: The code change will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

1010.5.1 Width. The minimum width of a means of egress ramp shall not be less than that required for corridors by Section 1017.2. The clear width of a ramp between handrails, if provided, or other permissible projections shall be 36 inches (914 mm) minimum.

Committee Reason: The proposal will clarify that the clear width for an ramp is all the way down from the handrails to the ground. The term *if provided* was added back in as a modification to allow for ramps with a rise of less than 6 inches not having handrails.

Assembly Action:

None

Final Hearing Results

E74-06/07

AM

Code Change No: E75-06/07

Original Proposal

Sections: 1010.6.3, 1010.6.4 (IFC [B] 1010.6.3, [B] 1010.6.4)

Proponent: John Rooney, United Spinal Association

Revise as follows:

1010.6.3 Length. The landing length shall be 60 inches (1525 mm) minimum.

Exceptions:

1. ~~Landings in nonaccessible~~ Group R-2 and R-3 individual dwelling and sleeping units that are not required to be Accessible, Type A or Type B units in accordance with Section 1107, landings are permitted to be 36 inches (914 mm) minimum.
2. Where the ramp is not a part of an accessible route, the length of the landing shall not be required to be more than 48 inches (1220 mm) in the direction of travel.

1010.6.4 Change in direction. Where changes in direction of travel occur at landings provided between ramp runs, the landing shall be 60 inches by 60 inches (1524 mm by 1524 mm) minimum.

Exception: ~~Landings in nonaccessible~~ Group R-2 and R-3 individual dwelling or sleeping units that are not required to be Accessible, Type A or Type B units in accordance with Section 1107, landings are permitted to be 36 inches by 36 inches (914 mm by 914 mm) minimum.

Reason: The purpose of this change is for code clarification. This change specifies where the exceptions are not permitted (i.e. within Accessible, Type A or Type B dwelling or sleeping units). The three levels of accessibility for units can lead to discussions about what is accessible. This language is more specific.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposed language for >wet= conditions is too vague and open to opinion. A question would be if just the possibility of tracking water into an area would constitute a wet condition.

Assembly Action:

None

Final Hearing Results

E75-06/07

AS

Code Change No: **E77-06/07**

Original Proposal

Sections: 1010.9 (IFC [B] 1010.9)

Proponent: Ed Roether, HOK SVE

Revise as follows:

1010.9 Edge protection. Edge protection complying with Sections 1010.9.1 or 1010.9.2 shall be provided on each side of ramp runs and at each side of ramp landings.

Exceptions:

1. Edge protection is not required on ramps that are not required to have handrails, provided they have flared sides that comply with the ICC A117.1 curb ramp provisions.
2. Edge protection is not required on the sides of ramp landings serving an adjoining ramp run or stairway.
3. Edge protection is not required on the sides of ramp landings having a vertical dropoff of not more than 0.5 inch (12.7 mm) within 10 inches (254 mm) horizontally of the required landing area.
4. In assembly spaces with fixed seating, edge protection is not required on the sides of ramps where the ramps provide access to the adjacent seating and aisle accessways.

Reason: The current requirements for ramp edge protection are applicable to all ramps, including those in assembly seating. While 1010.9.2 could cover a ramp that went up with the sloped seating, the exception is attached to the location of the handrail. Ramped aisles may not have handrails, or may have a central handrail.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposed text clarifies the code and reduces a potential tripping hazard along access to the seats.

Assembly Action:

None

Final Hearing Results

AS

Code Change No: **E78-06/07**

Original Proposal

Sections: 1010.9.1 (IFC [B] 1010.9.1)

Proponent: John Rooney, United Spinal Association

Revise as follows:

1010.9.1 Curb, rail, wall or barrier. A curb, rail, wall or barrier shall be provided to serve as edge protection. A curb must be a minimum of 2 inches (51mm) in height. Barriers must be constructed so that the barrier prevents the passage of a 4-inch-diameter (102 mm) sphere, where any portion of the sphere is within 4 inches (102 mm) of the floor or ground surface.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

Reason: The proposed change will harmonize the code language with Section 405.9.2 of ICC/ANSI A117.1 and Section 405.9.2 of the ADA/ABA Guidelines. The laundry list is not needed since a “rail” or “wall” are types of barriers.

The proposal for a 2” dimension for a curb is consistent with current ADAAG. The new ADA/ABA Guidelines and ICC A117.1 do not indicate the height requirements if a curb option is chosen.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposed 2 inch minimum high curb would conflict with the requirements in ICC A117.1 and the new ADA/ABA Accessibility Guidelines which require a 4 inch minimum high curb.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 2:

John Rooney, United Spinal Association, requests Approval as Modified by this public comment.

Modify proposal as follows:

1010.9.1 Curb, rail, wall or barrier. A curb, rail, wall or barrier shall be provided to serve as edge protection. A curb must be a minimum of 2 inches (51 mm) ~~4 inches (102 mm)~~ in height. Barriers must be constructed so that the barrier prevents the passage of a 4-inch-diameter (102 mm) sphere, where any portion of the sphere is within 4 inches (102 mm) of the floor or ground surface.

Commenter's Reason: The proposed deletion of “rail, wall” has been withdrawn from this proposal. The important issue is to identify the height of a curb when that option is chosen. The current language is not clear. Two proposals are offered to allow the members to decide on which curb height should be required – 2” or 4”. Testimony during the hearings indicated that the language in the new ADA/ABA Guideline (which do not give a specific requirement for curbs) could be interpreted as requiring a 4” high curb.

Final Hearing Results

E78-06/07

AMPC2

Code Change No: E82-06/07

Original Proposal

Sections: 1011.4, Chapter 35 (IFC [B] 1011.4, Chapter 45)

Proponent: Manny Muniz, Manny Muniz Associates, LLC, representing himself

1. Revise as follows:

1011.4 Internally illuminated exit signs. Internally illuminated exit signs shall be listed and labeled in accordance with UL 924 and shall be installed in accordance with the manufacturer’s instructions and Section 2702. Exit signs shall be illuminated at all times.

2. Add new standard to Chapter 35 as follows:**Underwriters Laboratories (UL)**UL 924-06, Standard for Safety Emergency Lighting and Power Equipment

Reason: The purpose of the change is to clarify what standard internally illuminated exit signs shall be listed and labeled to. A requirement for a safety device to be listed must identify the standard that the device must be listed to. The code cannot require a device to be listed but then stay silent as to what standard it should be listed in accordance with. This section of the code would most likely be looked at by the courts as ambiguous, unclear and perhaps even unenforceable.

The Life Safety Code (NFPA 101), which is used in every state in the US, contains a similar requirement in Section 7.10.7.1 which does identify UL 924, Standard for Safety Emergency Lighting and Power Equipment, as the standard that internally illuminated exit signs must be listed to.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The standard UL 924-06 has been reviewed for compliance with ICC Council Policy #28, Section 3.6. In the opinion of ICC Staff, the standard complies with ICC Criteria for referenced standards.

Public Hearing Results

Committee Action:**Approved as Submitted**

Committee Reason: UL 924 is an appropriate standard for illumination of exit signage. The standard has been revised to meet ICC criteria.

Assembly Action:**None**

Final Hearing Results

E82-06/07**AS**

Code Change No: **E83-06/07**

Original Proposal

Sections: 1011.4, Chapter 35 (IFC [B] 1011.4, Chapter 45)**Proponent:** Bob Eugene, Underwriters Laboratories, Inc.**1. Revise as follows:**

1011.4 Internally illuminated exit signs. Electrically powered internally illuminated, self-luminous and photoluminescent exit signs shall be listed and labeled in accordance with UL 924 and shall be installed in accordance with the manufacturer's instructions and Section 2702. Exit signs shall be illuminated at all times.

2. Add standard to Chapter 35 as follows:**UL**UL 924-06 Emergency Lighting and Power Equipment

Reason: The purpose is broadening the scope of this section to include self-luminous and photoluminescent exit signs and to add the specific standard for listing of these illuminated exit signs.

The reason for the change is to provide flexibility and to add clarity to the user. Internally powered covers all exit signs that generate their own luminosity. Using the phrase "electrically-powered" will capture LED, incandescent, fluorescent, and electroluminescent. In combination with self-luminous and photoluminescent, that covers the full range of product types currently in the market.

UL 924 applies to emergency lighting and power equipment for use in unclassified locations and intended for connection to branch circuits of 600 volts or less. Such equipment is intended to automatically supply illumination or power or both to critical areas and equipment in the event of failure of the normal supply, in accordance with Article 700 or 701 of the National Electrical Code, NFPA 70, the Life Safety Code, NFPA 101, and the International Building Code, IBC. EXIT SIGN is general term used to refer to an Exit Light, Exit Fixture, and Self-Luminous or Photoluminescent Exit Sign.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: A concern would be if the reference to Section 2702 for self-luminous and photoluminescent signage could be interpreted as a power requirement for signs that use no power.

The standard UL 924-06 has been reviewed for compliance with ICC Council Policy #28, Section 3.6. In the opinion of ICC Staff, the standard complies with ICC Criteria for referenced standards.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: Indicating the three types of exit signage permitted is a good clarification for the code, UL 924 is an appropriate standard for illumination of exit signage. The standard has been revised to meet ICC criteria.

Assembly Action:

None

E83-06/07

AS

Code Change No: E84-06/07

Original Proposal

Sections: 403.15 (New); 1011.6, Chapter 35 (IFC 1011.6, Chapter 45)

Proponent: William M. Connolly, State of New Jersey, Department of Community Affairs, Division of Codes and Standards, representing International Code Council Ad Hoc Committee on Terrorism Resistant Buildings

1. Add new text as follows:

403.15 Exit path markings. Exit path markings shall be provided in accordance with Section 1011.6.

1011.6 Photoluminescent exit path markings: Photoluminescent exit path markings (outlining stripes) complying with UL 1994 shall be provided in buildings of Group B, E, M, and R-1 with occupied floors greater than 75 feet above the lowest level of fire department vehicle access. Exit stairways where photoluminescent exit path markings are required shall be continuously illuminated and lighting shall not be controlled by motion sensors or timers.

1011.6.1 Markings (outlining stripes) within vertical exits: Markings within vertical exits shall comply with Section 1011.6.1.1 through Section 1011.6.1.4.

1011.6.1.1 Steps: Outlining stripes shall be applied to the horizontal leading edge of each step and shall extend for the full length of the step. Outlining stripes shall have a minimum horizontal width of 1 inch (25 mm) and a maximum width of 2 inches (51 mm). The leading edge of the stripe shall be placed at a maximum of ½ inch (13 mm) from the leading edge of the step and the stripe shall not overlap the leading edge of the step by not more than ½ inch (13 mm) down the vertical face of the step.

1011.6.1.2 Landings: The leading edge of landings in exits shall be marked with outlining stripes consistent with the dimensional requirements for steps and shall be the same length as and consistent with the stripes on the steps or shall extend the full length of the leading edge of the landing.

1011.6.1.3 Handrails: All handrails and handrail extensions shall be marked with a stripe having a minimum width of 1 inch (25 mm). The stripe shall be placed on the top surface of the handrail for the entire length of the handrail, including extensions and newel post caps. Where handrails or handrail extensions bend or turn corners, the stripe shall not have a gap of more than 4 inches (102 mm).

1011.6.1.4 Floor perimeter demarcation stripes: Stair landings and other parts of the egress path, with the exception of the sides of steps, shall be provided with demarcation lines on the floor or on the walls or a combination of both. The stripes shall be 1 (25 mm) to 2 inches (51 mm) wide with interruptions not exceeding 4 inches (102 mm).

1011.6.1.4.1 Floor mounted demarcation lines: Perimeter demarcation lines shall be placed within 4 inches of the wall and shall extend to within 2 inches (51 mm) of the markings on the leading edge of landings. The demarcation lines shall continue across the floor in front of all doors.

1011.6.1.4.2 Wall mounted demarcation lines: Perimeter demarcation lines shall be placed on the bottom edge of the wall no more than 4 inches (102 mm) above the finished floor. At the top or bottom of the stairs, demarcation lines shall drop vertically to the floor within 2 inches (51 mm) of the step or landing edge. Demarcation lines on walls shall transition vertically to the floor and then extend across the floor where a line on the floor is the only practical method of outlining the path. Demarcation lines on walls shall continue across the face of all doors or may transition to the floor and extend across the floor in front of such doors.

2. Add standard to Chapter 35 (IFC Chapter 45) as follows:

UL

UL 1994-04 Luminous Egress Path Marking Systems, with revisions through February, 2005

Reason: This code change proposal is one of fourteen proposals being submitted by the International Code Council Ad Hoc Committee on terrorism Resistant Buildings.

The purpose of this code change is to add new requirements for photoluminescent exit path markings into the code.

The proposed new section on exit path markings will require photoluminescent exit path markings be provided in vertical exit enclosures. The Code currently has no requirements for the installation of these markings. This proposal will facilitate rapid egress and assist in full building evacuation and is drawn from Recommendations 17 and 18 of the National Institute of Standards and Technology's (NIST) report on the World Trade Center tragedy.

Up to this point, code requirements for high rise buildings were written under the assumption that the building would be evacuated floor by floor. In most instances, in a building with a full suppression system, only the floor where the fire is located and the floors immediately above and below would be evacuated. Acts of terrorism and accidental incidents like power failures have made it necessary to consider design for full building evacuation that is as rapid as possible. This may be made necessary in response to an event within the building or an event outside the building. The proposed code change to require exit path markings is intended to facilitate the most rapid possible full building evacuation.

In the City of New York, after the first bombing of the WTC, requirements were instituted to require exit path markings in vertical exit enclosures. This proposal is taken directly from those requirements.

New Section 1011.6 establishes the base requirement for the markings and requires compliance with UL 1994, a standard developed using an approved consensus process. As per this new section, the markings are required only in vertical exit enclosures. This is unlike previously unsuccessful proposals that attempted to establish requirements for low-level exit signage and exit access markings. The remainder of the new text establishes the minimum requirements for the markings.

Bibliography:

1. Reference Standard 6-1, Photoluminescent exit path markings as required by Local Law 26 of 2004, New York City Building Code, § 27-383(b)
2. National Institute of Standards and Technology. Final Report of the National Construction Safety Team on the Collapses of the World Trade Center Towers. United States Government Printing Office: Washington, D.C. September 2005.
3. UL 1994

Cost Impact: This proposal establishes a requirement for markings in vertical exit enclosures, which may increase costs, but only very modestly. The proponents believe that the decrease in egress and full building evacuation time outweighs the moderate cost of the markings.

Analysis: The standard UL 1994-04 has been reviewed for compliance with ICC Council Policy #28, Section 3.6. In the opinion of ICC Staff, the standard complies with ICC Criteria for referenced standards.

The action on the proposed change to Section 403.15 is dependent on the decision of the Means of Egress Committee to the remainder of the proposal, therefore, for consistency, the MEO Committee will make the determination for the entire proposal.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The committee agreed the intent for egress guidance had merit, but believed that there were other products that could address the exiting issues raised. Several proponents had similar proposals. The committee asked the proponents to work together to resolve issues brought up during the discussions. The proposal should be technology neutral - not just for photoluminescent materials. The markings should delineate the exit path in the enclosed exit stairway. An additional concerns about E84-06/07 was that there was no explanation of the limitation to Groups B, E, M and R-1. Of special concern was no inclusion of Groups A and I. This proposal also extended the requirements outside the exit stairway by the wording in proposed Section 1011.6.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 2:

James P. Colgate, RA, Esq., Executive Architect, New York City Department of Buildings, requests Approval as Modified by this public comment.

Modify proposal as follows:

403.15 Exit path markings. Exit path markings shall be provided in accordance with Section 1027.4044.6.

1027 EXIT PATH MARKINGS

1027.1 General. 4044.6 Photoluminescent exit path markings: Photoluminescent Approved luminous exit path markings delineating the exit path (outlining stripes) complying with UL 4994 shall be provided in exit enclosures, including vertical exit enclosures and exit passageways, of buildings of Group A, B, E, I, M, and R-1 with having occupied floors greater located more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access and shall comply with Sections 1027.1.1 through 1027.1.7. Exit stairways where photoluminescent exit path markings are required shall be continuously illuminated and lighting shall not be controlled by motion sensors or timers.

Exception: Exit path markings shall not be required in lobbies or areas of open parking garages, where such lobby or area is located on the level of exit discharge and complies with the exception to Section 1023.1.

1044.6.1 Markings (outlining stripes) within vertical exits: Markings within vertical exits shall comply with Section 1044.6.1.1 through Section 1044.6.1.4.

1027.1.1 1044.6.1.1 Steps: ~~Outlining A stripes shall be applied to the horizontal leading edge of each step and shall extend for the full length of the step. Outlining stripes shall have a minimum horizontal width of 1 inch (25 mm) and a maximum width of 2 inches (51 mm). The leading edge of the stripe shall be placed at a maximum of ½ inch (13 mm) from the leading edge of the step and the stripe shall not overlap the leading edge of the step by not more than ½ inch (13 mm) down the vertical face of the step.~~ Outlining A stripes shall be applied to the horizontal leading edge of each step and shall extend for the full length of the step. Outlining stripes shall have a minimum horizontal width of 1 inch (25 mm) and a maximum width of 2 inches (51 mm). The leading edge of the stripe shall be placed at a maximum of ½ inch (13 mm) from the leading edge of the step and the stripe shall not overlap the leading edge of the step by not more than ½ inch (13 mm) down the vertical face of the step.

1027.1.2 1044.6.1.2 Landings: ~~The leading edge of landings in exits shall be marked with outlining a stripes consistent with the dimensional requirements for steps and shall be the same length as and consistent with the stripes on the steps or shall extend the full length of the leading edge of the landing.~~ The leading edge of landings in exits shall be marked with outlining a stripes consistent with the dimensional requirements for steps and shall be the same length as and consistent with the stripes on the steps or shall extend the full length of the leading edge of the landing.

1027.1.3 1044.6.1.3 Handrails: All handrails and handrail extensions shall be marked with a stripe having a minimum width of 1 inch (25 mm). The stripe shall be placed on the top surface of the handrail for the entire length of the handrail, including extensions and newel post caps. Where handrails or handrail extensions bend or turn corners, the stripe shall not have a gap of more than 4 inches (102 mm).

1027.1.4 1044.6.1.4 Floor perimeter demarcation lines stripes: ~~Stair landings and other parts of the floor areas within exit enclosures egress path, with the exception of the sides of steps, shall be provided with demarcation lines on the floor or on the walls or a combination of both. The stripes shall be 1 (25 mm) to 2 inches (51 mm) wide with interruptions not exceeding 4 inches (102 mm).~~ Stair landings and other parts of the floor areas within exit enclosures egress path, with the exception of the sides of steps, shall be provided with demarcation lines on the floor or on the walls or a combination of both. The stripes shall be 1 (25 mm) to 2 inches (51 mm) wide with interruptions not exceeding 4 inches (102 mm).

1027.1.4.1 1044.6.1.4.1 Floor mounted demarcation lines: ~~Perimeter demarcation lines shall be placed within 4 inches of the wall and shall extend to within 2 inches (51 mm) of the markings on the leading edge of landings. The demarcation lines shall continue across the floor in front of all doors.~~ Perimeter demarcation lines shall be placed within 4 inches of the wall and shall extend to within 2 inches (51 mm) of the markings on the leading edge of landings. The demarcation lines shall continue across the floor in front of all doors.

Exception: Demarcation lines shall not extend in front of exit doors that lead out of an exit enclosure and through which occupants must travel to complete the exit path.

1027.1.4.2 1044.6.1.4.2 Wall mounted demarcation lines: ~~Perimeter demarcation lines shall be placed on the wall with the bottom edge of the stripe wall no more than 4 inches (102 mm) above the finished floor. At the top or bottom of the stairs, demarcation lines shall drop vertically to the floor within 2 inches (51 mm) of the step or landing edge. Demarcation lines on walls shall transition vertically to the floor and then extend across the floor where a line on the floor is the only practical method of outlining the path. Where the wall line is broken by a door, demarcation lines on walls shall continue across the face of the all doors or may transition to the floor and extend across the floor in front of such doors.~~ Perimeter demarcation lines shall be placed on the wall with the bottom edge of the stripe wall no more than 4 inches (102 mm) above the finished floor. At the top or bottom of the stairs, demarcation lines shall drop vertically to the floor within 2 inches (51 mm) of the step or landing edge. Demarcation lines on walls shall transition vertically to the floor and then extend across the floor where a line on the floor is the only practical method of outlining the path. Where the wall line is broken by a door, demarcation lines on walls shall continue across the face of the all doors or may transition to the floor and extend across the floor in front of such doors.

Exception: Demarcation lines shall not extend in front of exit doors that lead out of an exit enclosure and through which occupants must travel to complete the exit path.

1027.1.4.3 Transition. ~~Where a wall mounted demarcation line transitions to a floor mounted demarcation line, or vice-versa, the wall mounted demarcation line shall drop vertically to the floor to meet a complimentary extension of the floor mounted demarcation line, thus forming a continuous marking.~~ Where a wall mounted demarcation line transitions to a floor mounted demarcation line, or vice-versa, the wall mounted demarcation line shall drop vertically to the floor to meet a complimentary extension of the floor mounted demarcation line, thus forming a continuous marking.

1027.1.5 Uniformity. Placement and dimensions of markings shall be consistent and uniform throughout the same exit enclosure.

1027.1.6 Materials. ~~Luminescent exit path markings shall be permitted to be made of any material, including paint, provided that an electrical charge is not required to maintain the required luminance. Such materials shall include, but not limited to, self-luminous materials and photoluminescent materials. Materials shall comply with either:~~ Luminescent exit path markings shall be permitted to be made of any material, including paint, provided that an electrical charge is not required to maintain the required luminance. Such materials shall include, but not limited to, self-luminous materials and photoluminescent materials. Materials shall comply with either:

1. UL 1994, or
2. ASTM E 2072, except that the charging source shall be 1 fc (10 lux) of fluorescent illumination for 60 minutes, and the minimum luminance shall be 5 milicandelas per square meter after 90 minutes. **1027.1.7 Illumination.** Exit enclosures where photoluminescent exit path markings are installed shall be provided with the minimum means of egress illumination required by Section 1006 for at least 60 minutes prior to periods when the building is occupied.

1027.1.7 Illumination. Exit enclosures where photoluminescent exit path markings are installed shall be provided with the minimum means of egress illumination required by Section 1006 for at least 60 minutes prior to periods when the building is occupied.

Chapter 35 (IFC Chapter 45):

UL

UL 1994-04 Luminous Egress Path Marking Systems, with revisions through February, 2005

ASTM

ASTM E 2072-04 Standard Specification for Photoluminescent (Phosphorescent) Safety Markings

Commenter's Reason: The Means of Egress Committee agreed that the intent of the provision has merit. However, because of the great number of similar proposals, the committee asked that the various proponents work together to resolve the issues. This comment amends the text from proposal E84 and draws on the standards of proposal E142. Among other recommendations, the Means of Egress Committee requested that the revised proposal be "technology neutral."

"TECHNOLOGY NEUTRAL": A fundamental characteristic of good governmental regulation is that, to the extent possible, it does not specify particular technologies, so that competition and innovation are fostered. However, the issue of technological neutrality must not be confused with the sensible restriction of materials proven to be inappropriate to a particular fire and life safety requirement. Electrically-based exit path systems are good systems that can provide much brighter luminance than photoluminescent materials, and are very useful in the right applications. However, we need to ask why we are requiring exit path markings in high-rise stairways, and whether electrically-based systems are appropriate for this specific code requirement.

For high-rise buildings, the IBC already requires electrical back-up to both exit lighting and those smokeproof enclosures that utilize mechanical means. So in an emergency condition where the backup power operates as designed, the stairs will remain lighted and smokeproof, rendering the exit path markings of limited utility. The real import of exit path markings is to provide a safe system of way-guidance in the dark, i.e. when even the backup power fails.

The lessons learned from the 1993 terrorist bombing of the World Trade Center resulted in many upgrades to the complex, including the installation of luminous exit path markings in the exits. The markings installed were photoluminescent, which meant that once the ambient lighting was removed, they will remain luminous without any additional electrical charge.

On 9/11, these exit path markings were put to use, and were later credited by NIST as a feature that aided the evacuation of the towers. The water in the stairs from the sprinklers did not affect the photoluminescent markings because there was no electrical wiring or circuitry to get wet or short-circuit. The explosion and vibration did not affect the photoluminescent markings because there were no wires or circuits to sever. The fire and heat on the upper floors did not affect the photoluminescent markings on the lower floors since there were no wires or circuits to melt or burn. On 9/11, the exit path markings worked, unlike other, electrically-based features that failed that day, because the photoluminescent markings did not rely on electricity, alarms, wires, or circuitry.

The extensive experience that the New York City Department of Buildings has had with egress failures in high rise buildings underscores this point. We are responsible for approximately 8,000 high rise buildings. When the August 2003 Northeast power grid blackout hit New York City, many of our high-rise buildings' emergency exit lighting systems failed, including in the municipal office building in which I work. Most of the failures stemmed from faulty maintenance of batteries or generators, and in some cases from improper installations. But the fact is that many people, including me and my staff, were left wholly in the dark.

New York City took the lead in this area and, pursuant to its in-depth Report of the World Trade Center Building Code Task Force, enacted a local law in 2004 requiring exit path markings that do not rely on electricity, despite objections from the electroluminescent industry. The local law requires photoluminescent exit path markings to be installed retroactively in all of our approximately 1,700 existing high-rise office buildings.

To argue that electrically-based path making must be permitted in this code change, in the name of technological neutrality, is thus incorrect. Rather, what we must do as code officials charged with protecting the public is to distinguish between "technology neutral" and "technology appropriate." New York City's assessment is that electrically-based exit path systems in high rise buildings that already have backup power and smokeproof enclosures is not the appropriate technology. What is appropriate is a system of luminous markings that do not rely on an electrical charge, which is what this comment, if approved, would require.

OTHER COMMENTS:

1. **Section 403.13.** The only modification here is to point the user to the new section 1027.
2. **Section 1011.** The original proposal would have appended the requirements for exit path markings to Section 1011, which currently deals only with exit signs – i.e. the signs placed above doors and near the ceiling directing people to exits. Rather than complicate Section 1011 with an unrelated new concept of path markings to be located only within enclosed exits, a new Section 1027 is added to include all the low-location exit path markings. This now neatly divides the two topics, similar to New York City's local modifications to the IBC. Therefore, the title of Section 1011 reverts to the current IBC text; all exit path markings are relocated to Section 1027.
3. **Section 1027.1 (formerly 1011.6).** The term "outlining stripes" is deleted because of possible confusion with the subsequent term "demarcation lines"; instead, the phrase "delineating the exit path" is added, as requested by the Means of Egress Committee to clarify what the markings are intended to do. The text of the original proposal would have required exit path markings for the entire "exit path" or "egress path", which could include all portions of the means of egress including exit access – and would therefore have been too broad a requirement. The Means of Egress Committee recommended modifying the proposal in application only to the "enclosed exit stairway". But only the enclosed exit stairway would have been too narrow, since it would not have included enclosed transfer exit passageways – the marking of which was deemed important by the WTC Building Code Task Force. Therefore, the phrase "exit enclosures, including vertical exit enclosures and exit passageways" is added to specify where in the high rise building exit path markings are required, and make clear that exit access corridors are not included. For organizational improvement, the requirements for materials (reference standards) and lighting are relocated to Sections 1027.1.6 and 1027.1.7. Group A and I occupancies are added in response to concerns expressed by the Means of Egress Committee; the nature of these occupancies, and the occupants' lack of familiarity with the exits, justifies the safeguards as a minimum requirement. In addition, an exception is added to exempt lobbies at the level of exit discharge.
4. **Former section 1011.6.1.** Due to the simplified organization, the scoping provisions formerly contained in section 1011.6.1 are now incorporated in to Section 1027.1. Therefore, the former section 1011.6.1 is deleted.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

5. **Section 1027.1.1 (formerly 1011.6.1.1).** The term “outlining stripes” is deleted because of possible confusion with the subsequent term “demarcation lines”. The minimum 1” width is maintained, as it is crucial to achieve minimum visibility for the visually impaired, and follows established 1” minimum standards (e.g., ASTM E 2072-04 and NYC RS 6-1). The 2” maximum width is crucial to prevent the visual illusion that occurs in the dark when overly-thick markings on the various steps merge into one glowing object; the 2” maximum follows an established requirement (e.g., NYC RS 6-1). The maximum ½” overlap is important to prevent confusion in the dark by making clear to the occupant what represents the top plane of the steps, following an established minimum requirement (e.g., NYC RS 6-1).
6. **Section 1027.1.2 (formerly 1011.6.1.2).** The term “outlining stripes” is deleted because of possible confusion with the subsequent term “demarcation lines”. The word “exit” is removed because this idea is already provided for in the scoping provisions for Section 1027.1. The last phrase is removed as it is redundant.
7. **Section 1027.1.3 (formerly 1011.6.1.3).** The minimum 1” width is maintained, as it is crucial to achieve minimum visibility for the visually impaired, and follows established 1” minimum standards (e.g., ASTM E 2072-04 and NYC RS 6-1).
8. **Section 1027.1.4 (formerly 1011.6.1.4).** As requested by the Means of Egress Committee, the proposal is modified to be specific that it only applies to the exit enclosures. The minimum 1” width is maintained, as it is crucial to achieve minimum visibility for the visually impaired, and follows established 1” minimum standards (e.g., ASTM E 2072-04 and NYC RS 6-1).
9. **Section 1027.1.4.1 (formerly 1011.6.1.4.1).** An exception is added to clarify that markings shall not extend in front of discharge doors.
10. **Section 1027.1.4.2 (formerly 1011.6.1.4.2).** A clarification is added indicating from where the 4” measurement is taken. This will allow the stripe to be placed above a standard 3 ½ -inch base molding, while still keeping the stripe low enough to signify to the occupant that it represents the intersecting planes of the wall and the floor. In tests conducted by NYC prior to the establishment of its RS 6-1, luminescent markings that were placed too high on the wall caused occupants to be unable to discern in the dark where the floor was. Language is added to clarify the two options for marking the door – either across the door or on the floor in front of it. An exception is added to clarify that markings shall not extend in front of discharge doors.
11. **Section 1027.1.4.3.** Clarifies ambiguous language in the former Section 1016.6.1.4. The new language makes clear that the owner has the option of wall-mounted or floor-mounted stripes, and that the stripes may transition from one to the other.
12. **Section 1027.1.5.** Clarifies that the placement and dimensions must be uniform.
13. **Section 1027.1.6.** Relocates the technical requirements for the materials to this section for organizational improvement. ASTM E 2072 is added as an option, in addition to UL 1994. (Note that ASTM E 2072 had been specified in Proposal E 142 by David Frable, US GSA, and was found to comply with ICC Council Policy #28). The original E84 proposal provided UL 1994 as the only standard. However, UL 1994 does not recognize the use of photoluminescent paints, which the New York City Department of Buildings has found an important type of product to achieve safe results and avoid tripping hazards, particularly in retrofits where the substrate is more likely to be uneven. ASTM E 2072 permits photoluminescent paints, and is therefore added for technological neutrality, in accordance with the comments of the Means of Egress Committee. The addition of ASTM E2073 as an option pulls together the proposals E84 and E142. The charging source for ASTM E 2072 has been changed to 1 footcandle with 5 mcd/m² to be consistent with the means of egress illumination requirements of IBC Section 1006.2.
14. **Section 1027.1.7.** The illumination provisions for photoluminescent products have been relocated from 1011.6 to this new subsection to provide additional clarity.

A note about New York City’s Reference Standard RS 6-1. The International Code Council’s Ad Hoc Committee on Terrorism-Resistant Buildings’ proposal for E84 was based in large part on NYC’s RS 6-1, and there are therefore many references to NYC RS 6-1 in this comment. The NYC RS 6-1 was developed by the New York City Department of Buildings’ architects and engineers after over one year of research of all available relevant standards, including but not limited to those published by the ASTM, UL, ISO, IMO, APTA (American Public Transportation Association). In addition, the department performed outreach and consultation with the various industries, including those from overseas. The Buildings Department also inspected mock-up/test installations of luminescent markings in various permutations, with different placement and dimensional configurations, to ensure that the resulting standards were adequate and appropriate. The result of all this research was a draft standard that was published for public comment – the public hearing on the proposal drew over 80 attendees representing a wide range of egress and safety experts. As a result of the public comment, the draft standard was refined and published in final form on May 31, 2005. Since then over 1000 installations have been completed in high rise buildings pursuant to this standard. It is on the basis of this experience that this comment is being made.

Code Change No: **E86-06/07**

Original Proposal

Sections: 1012.2 (IFC [B] 1012.2)

Proponent: Robert Bagnetto, Lapeyre Stair, Inc./Laitram Corp.

Revise as follows:

1012.2 Height. Handrail height, measured above stair tread nosings, or finish surface of ramp slope, shall be uniform, not less than 34 inches (864 mm) and not more than 38 inches (965 mm). Handrail height of alternating tread devices, measured above tread nosings shall be uniform, not less than 30 inches (762 mm) and not more than 34 inches (864 mm).

Reason: The purpose of this proposed change is to replace the current handrail height requirements for alternating tread devices, which are inappropriately based on the handrail height requirements for traditional type stairs, with new handrail height requirements more appropriate to alternating tread devices.

This proposal is superior to the current provisions of the code in that it rectifies shortcomings in the existing code for alternating tread device handrail height. The current required handrail height of alternating tread devices of 34 inches to 38 inches is based on the required handrail height of traditional type stairs which have stair angles much lower than alternating tread devices. This alternating tread device handrail height appears to have been chosen arbitrarily, assuming that the handrail height best suited for traditional type stairs would also be best for alternating tread devices. Although they have treads as a traditional stair does, alternating tread devices have considerable different characteristics (the most important being a much steeper angle) from a traditional stair and thus the requirements for the features for an alternating tread device often must differ from a traditional stair. The alternating tread device features result in differences of handrail use such as, different arm posture, the hand gripping the handrail near a higher part of the body and the use of the handrails under the arms for stabilization. Therefore, a lower handrail height of 30 inches to 34 inches is more appropriate for alternating tread devices.

Alternating tread devices have been used for approximately 25 years with handrail heights (measured vertically from the tread nosings to the top of the handrail) of approximately 32 inches. Lapeyre Stair is not aware of any cases where this handrail height has been a problem for users of alternating tread devices. Prior to release of the alternating tread device, Lapeyre Stair performed informal testing to verify that this is the most appropriate handrail height. Additionally, a scientific study titled "Performance, perceived safety and comfort of the alternating tread stair" was performed that demonstrated the satisfactory use of alternating tread devices. The 34 inch to 38 inch handrail height requirement for alternating tread devices appears to have first been introduced in sections 1003.3.3.10.1 and 1003.3.3.11.1 of IBC-2000 and then carried forward to sections 1009.10.1 and 1009.11.1 of IBC-2003. The precursor codes to IBC appear either not to discuss alternating tread device handrail height or to allow whatever handrail height provides safe use of the device. (Ref: BOCA-1999 Sections 1014.6.6.1 and 1022.2.5, SBC-1999 Section 1007.8.4 and 1007.8.5; UBC Section 1003.3.3.1). Furthermore, Lapeyre Stair is not aware of any documented scientific testing to verify that the current handrail heights in IBC for alternating tread devices are the most appropriate. Finally, an IBC code interpretation letter dated July 23, 2004 to Fanning/Howley Associates Inc, indicates that the current handrail height in the IBC may not be appropriate for alternating tread devices, and a code official could approve an alternating tread device with a handrail height inconsistent with IBC, Section 1012.2.

The lower handrail height for alternating tread devices does not substantially alter the design of alternating tread devices, and actually results in less occupied space which could minimally lower costs.

Code Change No: **E88-06/07**

Original Proposal

Sections: 1012.3 (IFC [B] 1012.3)

Proponent: David W. Cooper, Stairway Manufacturers' Association

Revise as follows:

1012.3 Handrail graspability. All required handrails shall meet Type I criteria as follows or shall provide equivalent graspability.

Type I. Handrails with a circular cross-section shall have an outside diameter of at least 1.25 inches (32 mm) and not greater than 2 inches (51 mm) or shall provide equivalent graspability. If the handrail is not circular, it shall have a perimeter dimension of at least 4 inches (102 mm) and not greater than 6.25 inches (160 mm) with a maximum cross-section dimension of 2.25 inches (57 mm). Edges shall have a minimum radius of 0.01 inch (0.25 mm).

Exception: In Group R-3 occupancies; within dwelling units in Group R-2 occupancies; and in Group U occupancies that are accessory to a Group R-3 occupancy or accessory to individual dwelling units in Group R-2 occupancies; handrails shall be Type I, Type II as follows or shall provide equivalent graspability.

Type II. Handrails with a perimeter greater than 6.25 inches (160 mm) shall provide a graspable finger recess area on both sides of the profile. The finger recess shall begin within a distance of .75 inch (19 mm) measured vertically from the tallest portion of the profile and achieve a depth of at least .3125 inch (8 mm) within .875 inch (22 mm) below the widest portion of the profile. This required depth shall continue for at least .375 inch (10mm) to a level that is not less than 1.75 inches (45 mm) below the tallest portion of the profile. The minimum width of the handrail above the recess shall be 1.25 inches (32 mm) to a maximum of 2.75 inches (70 mm). Edges shall have a minimum radius of 0.01 inch (0.25 mm).

Reason: The purpose of the change is to add new requirements to the code. This proposal is offered only as an alternative to our other change to this section, which would allow a more comprehensive solution.

Other types of rail have been proven to be equivalent to, or better than those currently allowed. Although this proposal will allow the use of additional types of rails now restricted from the code. The Type II shape allows for the development of new ergonomic profiles that could exceed the properties of the limited handrail options now allowed in the IBC. Such options would not only permit the design of profiles for those with impairments, unable to close their hand to grasp small round objects, but also would allow greater flexibility to the designer that must respond to the aesthetic preferences of the consumer, thereby encouraging long-term and committed compliance with code regulations. Because this proposals scope is only for residential use these advantages would be severely compromised and only available to persons in the home environment.

The handrail shape description that is proposed for Type II handrails has been developed by independent researchers retained by the SMA to investigate graspability of handrails. Acting without specific mandate from SMA, these researchers developed and implemented tests, experiments, and analyses that revealed stairway fall kinematics, the forces that stairway users exert on handrails during falls, and the forces that persons in the general population can exert on handrails of various shapes.

Specifically, through a collaborative effort with researchers at the University of Toronto, the primary researchers – engineers with Simpson Gumpertz & Heger Inc. – conducted tests with human subjects to determine forces exerted on handrails. During these tests, test subjects stood on an activated stairway in postures and positions that represent those of a descending stairway user. Then, the stairway was induced to move forward and then suddenly stopped to cause the test subjects to lurch forward. By setting certain test parameters and through the introduction of barriers that prevented the test subjects from recovering, test subjects fell forward while attempting to arrest their fall by grabbing a handrail. During these tests, the researchers measured the forces exerted on the handrail and monitored the movements of the test subjects to understand fall kinematics.

To account for the broad variation in human stature, the researchers used a computer program, calibrated against the Toronto tests with live subjects, to extrapolate those test results to determine forces generated on handrails by persons representing the distribution within the population.

In a separate set of tests, the researchers investigated forces that persons can exert on handrails of various shapes. For these studies, the researchers developed test apparatus that allowed test subjects to grasp segments of handrails, which were then pulled by a motor out of the test subjects' grasp while forces were recorded. The test subjects were in a seated position (which represents a position that is similar to the posture that persons falling on stairways attain at the time they are exerting maximum arresting force on handrails), and forces were measured in three orthogonal directions: transverse, perpendicular upward, and longitudinal relative to the rail. Hundreds of tests were performed with dozens of test subjects ranging in age from sub-adolescent to elderly.

These tests, experiments, and analyses evaluated round handrails and a broad range of dimensions of handrails that are not round. With the results of these studies, the researchers conducted statistical analyses to determine the proportion of the population that would likely not be able to maintain a grasp on handrails of various shapes during a fall. Using this method, the researchers determined which shapes are graspable (meaning, at least as likely as round handrails to be secure handholds in actual fall scenarios). These statistical analyses showed that Type II handrails have graspability that is essentially equal to or greater than the graspability of handrails meeting the long-accepted and codified shape defined in this proposal as Type I (essentially round handrails, of common size).

The key feature of the graspability of Type II handrails is graspable finger recesses on both sides of the handrail. These recesses allow users to firmly grip a properly proportioned grasping surface on the top of the handrail, ensuring that the user can tightly retain a grip on the handrail for all forces that are associated with attempts to arrest a fall. In addition, Type II handrails have been shown to more than serve adequately for "guidance and support" as required by codes.

The research conducted by these independent researchers validates experience with handrails in service. Handrails meeting the Type II definition have been in service for perhaps hundreds of years without documentation that there is any deficiency in their functional characteristics. Indeed, some handrails conforming to the Type II definition perhaps are among the most common shapes presently used in the United States. Furthermore, by adopting the definition of Type II handrails in the IBC, we will be positively excluding from use a wide spectrum of handrail shapes that also are in common use, but do not meet the standard for graspability that has led to this proposal. With the adoption of this proposal, much of the uncertainty about what constitutes "equivalent graspability" will be removed, since a specific definition of acceptable alternative shapes will be introduced and codified.

The Type II definition has been expressly included in the IRC for five years. During that time, this shape definition has become a standard for determining the suitability of handrail shapes, even in jurisdictions that have not adopted the IRC. Furthermore, the SMA is aware of no documentation that suggests that inclusion of the Type II definition in the IRC has in any way diminished safety of handrails.

The adoption of the Type II shape allows the use of viable, lower-cost, safe handrails. Without allowing Type II shapes, we run the risk that economical and fully functional handrail designs (including those of wood, which require closely-spaced supports which potentially interfere with the grasping surface of round handrails) will be unreasonably excluded from use, to the detriment of the population which is entitled to cost-efficient construction when it has been demonstrated to be safe. Acceptance of the Type II shape would once again permit the use of low-cost, renewable-resource handrail shapes, all but eliminated as an option for the jurisdictions adopting the current IBC code.

The research and testing summarized above has been published and is available on the Internet as listed below in the bibliography. We believe that these landmark studies, sponsored by the SMA but performed by independent researchers, constitute the most thorough and legitimate research on handrail graspability performed anywhere in the world.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal is limited to handrails along stairways within individual dwelling units in Group R-2 and R-3. Approval will allow for coordination with the IRC. The studies have proved that these handrails proposed as Type II would result in handrails which provide equivalent graspability to what is currently permitted in the code.

Assembly Action:

None

Final Hearing Results

E88-06/07

AS

Code Change No: E89-06/07

Original Proposal

Sections: 1012.4 (IFC [B] 1012.4)

Proponent: David W. Cooper, Stairway Manufacturers' Association

Revise as follows:

1012.4 Continuity. Handrail-gripping surfaces shall be continuous, without interruption by newel posts or other obstructions.

Exceptions:

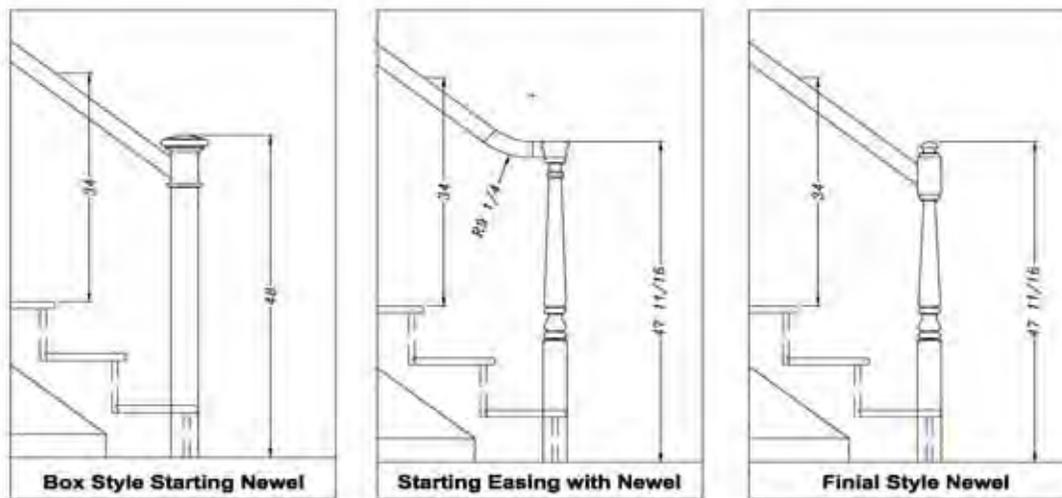

1. Handrails within dwelling units are permitted to be interrupted by a newel post at a turn stair landing.
2. Within a dwelling unit, the use of a volute, turnout, ~~or starting easing~~ or starting newel is allowed ~~on~~ over the lowest tread.
3. Handrail brackets or balusters attached to the bottom surface of the handrail that do not project horizontally beyond the sides of the handrail within 1.5 inches (38 mm) of the bottom of the handrail shall not be considered obstructions. For each 0.5 inch (12.7 mm) of additional handrail perimeter dimension above 4 inches (102 mm), the vertical clearance dimension of 1.5 inches (38 mm) shall be permitted to be reduced by 0.125 inch (3 mm).

Reason: The proposed change will make editorial corrections required as well as clarify the use of newels

The need to allow the use of a newel at intersections of the rail in dwelling units at a turn in the stair to provide for the use of newels within a flight has been recognized and allowed within the IRC and should be included in the IBC to allow lower cost options that have not caused any known attributable safety issues.

The use of a starting newel, like starting fittings, been a historically accepted practice in stairway construction and design. A starting newel installation presents no variance in the continuity of the handrail when compared to starting fittings and should be permitted. Please see attached graphic. As the user approaches the stair, if they use the handrail, the hand is extended more than the distance of one tread to grasp the rail. This is visually apparent in the wear marks on rails that extend beyond the nosing. The placement of the newel over the lowest step also allows for the post to be attached to the stair shortening the overall length of the stairway allowing more room to fit larger tread depths in the same space.

The editorial change in the preposition from “on” to “over” more clearly describes the position of the listed items to the lowest tread and has been used in the IRC with consistent interpretation.

FOR COMPARISON EACH OF THE ABOVE CONDITIONS ARE SHOWN ON THE SAME STAIR AT THE SAME RAIL HEIGHT

The above illustration shows little or no variation in continuity for the stairway user.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

1012.4 Continuity. Handrail-gripping surfaces shall be continuous, without interruption by newel posts or other obstructions.

Exceptions:

1. Handrails within dwelling units are permitted to be interrupted by a newel post at a turn or stair landing.
2. Within a dwelling unit, the use of a volute, turnout starting easing or starting newel is allowed over the lowest tread.
3. Handrail brackets or balusters attached to the bottom surface of the handrail that do not project horizontally beyond the sides of the handrail within 1.5 inches (38 mm) of the bottom of the handrail shall not be considered obstructions. For each 0.5 inch (12.7 mm) of additional handrail perimeter dimension above 4 inches (102 mm), the vertical clearance dimension of 1.5 inches (38 mm) shall be permitted to be reduced by 0.125 inch (3 mm).

Committee Reason: The proposal will provide clarification for different stair configurations. The modification would allow for landings at L or U shaped stairways to have newel posts at the corners.

Assembly Action:

None

Code Change No: **E90-06/07**

Original Proposal

Sections: 1012.4 (IFC [B] 1012.4)

Proponent: Bill Conner, Conner Associates LLC, representing himself

Revise as follows:

1012.4 Continuity. Handrail-gripping surfaces shall be continuous, without interruption by newel posts or other obstructions.

Exceptions:

1. Handrails within dwelling units are permitted to be interrupted by a newel post at a stair landing.
2. Within a dwelling unit, the use of a volute, turnout or starting easing is allowed on the lowest tread.
3. Handrail brackets or balusters attached to the bottom surface of the handrail that do not project horizontally beyond the sides of the handrail within 1.5 inches (38 mm) of the bottom of the handrail shall not be considered obstructions. For each 0.5 inch (12.7 mm) of additional handrail perimeter dimension above 4 inches (102 mm), the vertical clearance dimension of 1.5 inches (38 mm) shall be permitted to be reduced by 0.125 inch (3 mm).
4. Where handrails are provided along walking surfaces with slopes not steeper than 1:20, the bottoms of the handrail gripping surfaces shall be permitted to be obstructed along their entire length where they are integral to crash rails or bumper guards.

Reason: Sometime handrails are provided for patient use in nursing homes and hospitals along hallways. In these situations, it would not be practicable to require them to meet the gripping surface and still work as a bumper guard or handrail. While a patient may fall in a corridor, they do not have the same safety concern of continuing to fall, such as on a stairway, therefore, this compromise would not create a safety concern. The change is also for coordination with ADAAG and ICC A117.1 Section 505.6

Cost Impact: This code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: Handrails located along areas other than ramps and stairways are used differently. The new exception is useful for rails that serve as walking aids along hallways. The change would also coordinate with ICC A117.1.

Assembly Action:

None

Original Proposal

Sections: 1012.5 (New) [IFC [B] 1012.5 (New)]

Proponent: Bill Conner, Conner Associates LLC, representing himself

Add new text as follows:

1012.5 Fittings. Handrails shall not rotate within their fittings.

(Renumber subsequent sections)

Reason: This is an important safety concern that is not currently in the IBC requirements. This will also coordinate with ADAAG and ICC A117.1 Section 505.9.

Cost Impact: The code change proposal will not increase the cost of construction.

Code Change No: **E93-06/07**

Original Proposal

Sections: 1012.5 (IFC [B] 1012.5)

Proponent: Robert Bagnetto, Lapeyre Stair, Inc./Laitram Corp.

Revise as follows:

1012.5 Handrail extensions. Handrails shall return to a wall, guard or the walking surface or shall be continuous to the handrail of an adjacent stair flight. Where handrails are not continuous between flights the handrails shall extend horizontally at least 12 inches (305 mm) beyond the top riser and continue to slope for the depth of one tread beyond the bottom riser. At ramps where handrails are not continuous between runs, the handrail shall extend horizontally above the landing 12 inches (305 mm) minimum beyond the top and bottom ramps.

Exceptions:

1. Handrails within a dwelling unit that is not required to be accessible need extend only from the top riser to the bottom riser.
2. Aisle handrails in Group A occupancies in accordance with Section 1025.13.

3. Handrails for alternating tread devices may terminate at a location vertically above the top and bottom risers. Handrails for alternating tread devices are not required to be continuous between flights or to extend beyond the top or bottom risers.

Reason: The purpose of this proposed change is to remove the current requirements for handrail continuity between flights of alternating tread devices and to remove the requirements for handrail extensions at the top and bottom of non-continuous flights of alternating tread devices.

This proposal is superior to the current provisions of the code in that it removes overly restrictive requirements for handrails of alternating tread devices. The current required handrail extension of alternating tread devices of 12 inches horizontally beyond the top riser and the slope of one tread depth beyond the bottom riser, as well as the requirement for handrail continuity between adjacent flights is based on the requirements for handrails of traditional type stairs. The alternating tread device handrail extension and continuity requirements appear to have been chosen arbitrarily, assuming that the handrail requirements best suited for traditional type stairs would also be best for alternating tread devices. However, considering alternating tread devices are typically used as a safer alternative to a ladder, typically used in tight spaces where traditional type stairs cannot be used, have stair angles much steeper than traditional type stairs, and have different usage than traditional type stairs, removal of the existing extension and continuity requirements is appropriate.

Alternating tread devices have been used for approximately 25 years without handrail extensions or continuous handrails been flights. Lapeyre Stair is not aware of any cases where these handrail features has been a problem for users of alternating tread devices. Alternating tread device handrails without extensions or continuity between flights have proved to provide adequate gripping length to allow the user to safely reach the top or bottom landing. Prior to release of the alternating tread device, Lapeyre Stair performed informal testing to verify the acceptability of this handrail configuration. Additionally, a scientific stud titled "Performance, perceived safety and comfort of the alternating tread stair" was performed that demonstrated the satisfactory use of alternating tread devices. The handrail extension and continuity requirements for alternating tread devices appears to have first been introduced in sections 1003.3.3.10.1, and 1003.3.3.11.5 of IBC-2000 and then carried forward to sections 1009.10.1 and 1009.11.5 of IBC-2003. The precursor codes to IBC appear not to discuss alternating tread device handrail extensions or continuity or to allow whatever handrail configuration provides safe use of the device. (Ref: BOCA-1999 Sections 1014.6.6.1 and 1022.2.5, SBC-1999 Section 1007.8.4 and 1007.8.5; UBC Section 1003.3.3.1). Finally, in an IBC code interpretation letter dated July 23, 2004 to Fanning/Howley Associates Inc, indicates that the current handrail extension requirements in the IBC may not be appropriate for alternating treads, and of alternative approval for an alternating tread device without handrail extensions may be acceptable. The elimination of extension and continuity requirements of handrails for alternating tread devices does not substantially alter the design of alternating tread devices, and actually results is less occupied space which could minimally lower costs.

Code Change No: E99-06/07

Original Proposal

Sections: 1013.2 (IFC [B] 1013.2)

Proponent: Robert Bagnetto, Lapeyre Stair, Inc./Laitram Corp.

Revise as follows:

1013.2 Height. Guards shall form a protective barrier not less than 42 inches (1067 mm) high, measured vertically above the leading edge of the tread, adjacent walking surface or adjacent seatboard.

Exceptions:

1. For occupancies in Group R-3, and within individual dwelling units in occupancies in Group R-2, guards whose top rail also serves as a handrail shall have a height not less than 34 inches (864 mm) and not more than 38 inches (1067 mm) measured vertically from the leading edge of the stair tread nosing.
2. The height in assembly seating areas shall be in accordance with section 1024.14.
3. Along alternating tread device, guards whose top rail also serves as a handrail, shall have height not less than 30 inches (762 mm) and not more than 34 inches (864 mm), measured vertically from the leading edge of the device tread nosing.

Reason: The purpose of this proposed change is to replace the current guardrail height requirements for alternating tread devices, which are inappropriately based on the guardrail height requirements for traditional type stairs, with new guardrail height requirements more appropriate to alternating tread devices. This change also allows the top rail of a guardrail to also be used as a handrail.

This proposal is superior to the current provisions of the code in that it rectifies shortcomings in the existing code for alternating tread device guard requirements. The current required guardrail height of alternating tread devices of 42 inches is based on the required guardrail height of traditional type stairs which have a stair angles much lower than alternating tread devices. This alternating tread device guardrail height appears to have been chosen arbitrarily, assuming that the guardrail height best suited for traditional type stairs would also be best for alternating tread devices. Although they have treads as a traditional stair does, alternating tread devices have considerable different characteristics (the most important being a much steeper angle) from a traditional stair and thus the requirements for the features for an alternating tread device often must differ from a traditional stair. Considering that the steeper angle of alternating tread devices and that the rails are often used under the arms for stabilization, a lower guardrail height of 30 inches to 34 inches is more appropriate and the existence of a separate handrail and guardrail is unnecessary for alternating tread devices.

Alternating tread devices have been used for approximately 25 years with a single rail, with a height (measured vertically from the tread nosings to the top of the rail) of approximately 32 inches, acting both as a guardrail and a handrail. Lapeyre Stair is not aware of any cases where this rail height has been a problem for users of alternating tread devices. Prior to release of the alternating tread device, Lapeyre Stair performed informal testing to verify that this is the optimal rail height. Additionally, a scientific stud titled "Performance, perceived safety and comfort of the alternating tread stair" was performed that demonstrated the satisfactory use of alternating tread devices. The 42 inch guardrail height requirement for alternating tread devices appears to have first been introduced in sections 1003.2.12 and 1003.2.12.1 of IBC-2000 and then carried forward to Section 1012.1 and 1012.2 of IBC-2003. The precursor codes to IBC are unclear or appear not to discuss alternating tread device guardrail height at all. (Ref: BOCA-1999 Sections 1014.6.6.1, 1021.2, 1022.2.2 and 1022.2.5, SBC-1999 Sections 1007.5, 1007.8.4 and 1007.8.5, 1015.1; UBC Section 1003.3.3.1, 1003.3.3.7, 509.1 and 509.2). Furthermore, there does not appear to be any documented scientific testing to verify that the current guardrail heights in IBC for alternating tread devices are the most appropriate. Finally, an IBC code interpretation letter dated July 23, 2004 to Fanning/Howley Associates Inc, indicated that the current rail height in the IBC may not be appropriate, and alternative approval of an alternating tread device with a rail configuration inconsistent with IBC, Section 1013.2 may be appropriate. The lower guardrail height and allowing a single rail to act as both a guardrail and a handrail for alternating tread devices does not substantially alter the design of alternating tread devices, and actually results in less construction cost and less occupied space which could minimally lower costs.

Code Change No: E100-06/07

Original Proposal

Sections: 1013.3 (IFC [B] 1013.3)

Proponent: Robert Bagnetto, Lapeyre Stair, Inc./Laitram Corp.

Revise as follows:

1013.3 Opening limitations. Open guards shall have balusters or ornamental patterns such that a 4-inch-diameter (102 mm) sphere cannot pass through any opening up to a height of 34 inches (864 mm). From a height of 34 inches (864 mm) to 42 inches (1067 mm) above the adjacent walking surfaces, a sphere 8 inches (203 mm) in diameter shall not pass.

Exceptions:

1. The triangular openings formed by the riser, tread and bottom rail at the open side of a stairway shall be of a maximum size such that a sphere of 6 inches (152 mm) in diameter cannot pass through the opening.
2. At elevated walking surfaces for access to and use of electrical, mechanical or plumbing systems or equipment, guards shall have balusters or be of solid materials such that a sphere with a diameter of 21 inches (533 mm) cannot pass through any opening.
3. In areas that are not open to the public within occupancies in Group I-3, F, H or S, and for alternating tread devices, balusters, horizontal intermediate rails or other construction shall not permit a sphere with a diameter of 21 inches (533 mm) to pass through any opening.
4. In assembly seating areas, guards at the end of aisles where they terminate at a fascia of boxes, balconies and galleries shall have balusters or ornamental patterns such that a 4-inch-diameter (102 mm) sphere cannot pass through any opening up to a height of 26 inches (660 mm). From a height of 26 inches (660 mm) to 42 inches (1067 mm) above the adjacent walking surfaces, a sphere 8 inches (203 mm) in diameter shall not pass.
5. Within individual dwelling units and sleeping units in Group R-2 and R-3 occupancies, openings for required guards on the sides of stair treads shall not allow a sphere of 4.375 inches (111 mm) to pass through.

Reason: The purpose of this proposed change is to replace the current requirements for guard openings for alternating tread devices, which are inappropriately based on the requirements for guard openings for traditional type stairs, with new requirements for guard openings more appropriate to alternating tread devices.

This proposal is superior to the current provisions of the code in that it rectifies shortcomings in the existing code for requirements of, and provides clarification for, guard openings on alternating tread devices. The current requirements for guard openings of alternating tread devices are identical to the required guard openings of traditional type stairs. IBC currently requires open guards on stairs to have baluster or ornamental patterns such that a 4 inch diameter sphere cannot pass through (with exceptions above 34 inches and between the tread, riser and bottom rail). IBC provides an exception which allows guard openings such that a 21 inch diameter sphere cannot pass through for guards in areas not open to the public within occupancies in Group I-3, F, H or S. Requirements for guard openings on alternating tread devices appears to have not been addressed in the code, and by lack of any other requirements default to the requirements for traditional type stairs. Alternating tread devices are not limited to uses within the occupancies in Group I-3, F, H or S. In addition to use in the areas of these occupancies, alternating tread devices can be used for access to a.) unoccupied roofs (1009.11), b.) boiler, a incinerator and furnace rooms (1015.3) c.) refrigeration machinery rooms (1015.4) and d.) catwalks, gridirons and galleries used for stages (1015.6.1). None of the uses allowed in IBC for alternating tread devices are of the type such that the device would require guards with openings such that a 4 inch diameter sphere could not pass through. Guard requirements for alternating tread devices in uses than other Group I-3, F, H or S would therefore be unnecessarily restrictive by not allowing guard openings such that a 21 inch diameter sphere could not pass through.

Alternating tread devices have been used for approximately 25 years without guards having openings such that a 4 inch sphere cannot pass through. Lapeyre Stair is not aware of any cases where the guards have been a problem for users of alternating tread devices. Alternating tread devices are typically not used in locations where the 4 inch sphere rule would apply (i.e. where small children would use the device, etc.). The guardrail opening requirement for alternating tread devices appears to have first been introduced in section 1003.2.12.2 of IBC-2000 and then carried forward to section 1012.3 of IBC-2003. The precursor codes to IBC are unclear or appear not to discuss alternating tread device guardrail openings. (ref: BOCA-1999 Sections 1014.6.6, 1021.3 and 1022.2.5, SBC-1999 Sections 1007.8.4 and 1007.8.5, 1015.3; UBC Section 1003.3.3.1, 1003.3.3.7 and 509.3). Finally, in an IBC code interpretation letter dated July 23, 2004 to Fanning/Howley Associates Inc, indicated that rail requirements in the IBC may not be appropriate for alternating tread devices, and alternate approval of an alternating tread device with a rail configuration inconsistent with IBC, Section 1013.3 may be acceptable. Allowing a 21 inch guard opening in alternating tread devices does not substantially alter their design of, and actually results in less construction cost.

Bibliography:

The BOCA National Building Code/1999 sections 1014.6.6, 1021.3, and 1022.2.5
 Standard Building Code 1999 Edition sections 1007.8.4 and 1007.8.5, 1015.3
 1997 Uniform Building Code section 1003.3.3.1 (exception), 1003.3.3.7 and 509.3

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The locations of where alternating tread devices are permitted is limited, therefore a large guard opening is appropriate. This would be consistent with the committee action on E99-06/07.

Assembly Action:

None

Final Hearing Results

E100-06/07

AS

Code Change No: E104-06/07

Original Proposal

Sections: 1014.2.2 (IFC [B] 1014.2.2)

Proponent: John Williams, Construction Review Services, Washington State Department of Health

Revise as follows:

1014.2.2 Group I-2. Habitable rooms or suites in Group I-2 occupancies shall have an exit access door leading directly to a corridor.

Exceptions:

1. Rooms with exit doors opening directly to the outside at ground level.
2. Patient sleeping rooms are permitted to have one intervening room if the intervening room is not used as an exit access for more than eight patient beds.
3. Special nursing suites are permitted to have one intervening room where the arrangement allows for direct and constant visual supervision by nursing personnel.
4. For rooms other than patient sleeping rooms located within a suite, exit access travel from within the suite shall be permitted through one intervening room where the travel distance to the exit access door is not greater than 100 feet (30 480 mm).
5. For rooms other than patient sleeping rooms located within a suite, exit access travel from within the suite shall be permitted through two intervening rooms where the travel distance to the exit access door is not greater than 50 feet (15 240 mm).

Suites of sleeping rooms shall not exceed 5,000 square feet (465 m²). Suites of rooms other than patient sleeping rooms shall not exceed 10,000 square feet (929 m²). Any patient sleeping room, or any suite that includes patient sleeping rooms, of more than 1,000 square feet (93 m²) shall have at least two exit access doors remotely located from each other. Any room or suite of rooms other than patient sleeping rooms of more than 2,500 square feet (232 m²) shall have at least two exit access doors remotely located from each other. The travel distance between any point in a Group I-2 occupancy and an exit access door in the room shall not exceed 50 feet (15 240 mm). The travel distance between any point in a suite of sleeping rooms and an exit access door of that suite shall not exceed 100 feet (30 480 mm).

Reason: The purpose of the proposed change is to clarify the required access to exits provided in a non sleeping suite of patient rooms. The term "access door" is not consistent with similar requirements in this section. This change would mend an omission to the original text. The charging statement of this code refers to an "exit access door". All other requirements in this section that relate to size of suites and access to exits use the term "exit access door".

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal will provide consistency in the code for the use of the term ~~exit access~~.

Assembly Action:

None

Final Hearing Results

Code Change No: E105-06/07

Original Proposal

Sections: 1014.2.2, 1014.2.3 through 1014.2.5 (New) [IFC [B] 1014.2.2, [B] 1014.2.3 through [B] 1014.2.5 (New)]

Proponent: John Williams, Construction Review Services, Washington State Department of Health

Delete and substitute as follows:

1014.2.2 Group I-2. Habitable rooms or suites in Group I-2 occupancies shall have an exit access door leading directly to a corridor.

Exceptions:

1. Rooms with exit doors opening directly to the outside at ground level.
2. ~~Patient sleeping rooms are permitted to have one intervening room if the intervening room is not used as an exit access for more than eight patient beds.~~
3. ~~Special nursing suites are permitted to have one intervening room where the arrangement allows for direct and constant visual supervision by nursing personnel.~~
4. ~~For rooms other than patient sleeping rooms located within a suite, exit access travel from within the suite shall be permitted through one intervening room where the travel distance to the exit access door is not greater than 100 feet (30 480 mm).~~
5. ~~For rooms other than patient sleeping rooms located within a suite, exit access travel from within the suite shall be permitted through two intervening rooms where the travel distance to the exit access door is not greater than 50 feet (15 240 mm).~~

~~Suites of sleeping rooms shall not exceed 5,000 square feet (465 m²). Suites of rooms other than patient sleeping rooms shall not exceed 10,000 square feet (929 m²). Any patient sleeping room, or any suite that includes patient sleeping rooms, of more than 1,000 square feet (93 m²) shall have at least two exit access doors remotely located from each other. Any room or suite of rooms other than patient sleeping rooms of more than 2,500 square feet (232 m²) shall have at least two access doors remotely located from each other. The travel distance between any point in a Group I-2 occupancy and an exit access door in the room shall not exceed 50 feet (15 240 mm). The travel distance between any point in a suite of sleeping rooms and an exit access door of that suite shall not exceed 100 feet (30 480 mm).~~

1014.2.3 Suites in patient sleeping areas. Patient sleeping areas in Group I-2 Occupancies shall be permitted to be divided into suites if one of the following conditions is met:

1. The intervening room within the suite is not used as an exit access for more than eight patient beds.
2. The arrangement of the suite allows for direct and constant visual supervision by nursing personnel.

1014.2.3.1 Area. Suites of sleeping rooms shall not exceed 5,000 square feet (465 m²).

1014.2.3.2 Exit access. Any patient sleeping room, or any suite that includes patient sleeping rooms, of more than 1,000 square feet (93m²) shall have at least two exit access doors remotely located from each other.

1014.2.3.3 Travel distance. The travel distance between any point in a suite of sleeping rooms and an exit access door of that suite shall not exceed 100 feet (30 480 mm).

1014.2.4 Suites in areas other than patient sleeping areas. Areas other than patient sleeping areas in Group I-2 Occupancies shall be permitted to be divided into suites.

1014.2.4.1 Area. Suites of rooms, other than patient sleeping rooms, shall not exceed 10,000 square feet (929 m²).

1014.2.4.2 Exit access. Any room or suite of rooms, other than patient sleeping rooms, of more than 2,500 square feet (232 m²) shall have at least two access doors remotely located from each other.

1014.2.4.3 One intervening room. For rooms other than patient sleeping rooms, suites of rooms are permitted to have one intervening room if the travel distance within the suite to the exit access door is not greater than 100 feet (30480mm).

1014.2.4.4 Two intervening rooms. For rooms other than patient sleeping rooms located within a suite, exit access travel from within the suite shall be permitted through two intervening rooms where the travel distance to the exit access door is not greater than 50 feet (15 240 mm).

1014.2.5 Travel distance. The travel distance between any point in a Group I-2 occupancy room and an exit access door in that room shall not exceed 50 feet (15 240 mm).

Reason: This amendment serves to clarify the existing language to help designers and code enforcement personnel understand the current requirements.

The existing text is covers two main concepts:

- Suites that contain patient sleeping areas; and,
- Suites that do not contain patient sleeping areas.

The requirements for each of these concepts are different, but they are not arranged consecutively. The proposed change clarifies the language by grouping the requirements for these two primary concepts into consecutive sections of code.

Exception 1, 2 and 3 moved. The benefit of allowing the use of suites is the ability to have intervening rooms. These two exceptions provide the only instances where intervening room is acceptable for patient sleeping areas. Therefore, they also define the only acceptable conditions for a sleeping suite. These exceptions are reworded and moved to the "sleeping suite" area (1014.2.3.x) of the proposed code.

Exception 4 and 5 moved. These exceptions deal with non sleeping suites and have been moved to the "non sleeping suite" area (1014.2.4.x) of the proposed code.

There are no intended changes to the actual requirements. This proposal is intended to rearrange and put logical breaks into a long and confusing section of code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal provides a logical order for the separation of different types of suites found in hospitals and will help clarify requirements for means of egress.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 1:

John Williams, Washington State Department of Health – Construction Review Services, requests Approval as Modified by this public comment.

Modify proposal as follows:

1014.2.3 Suites in patient sleeping areas. Patient sleeping areas in Group I-2 Occupancies shall be permitted to be divided into suites with one intervening room if one of the following conditions is met:

1. The intervening room within the suite is not used as an exit access for more than eight patient beds.
2. The arrangement of the suite allows for direct and constant visual supervision by nursing personnel.

(Portions of the proposal not shown remain unchanged)

Commenter's Reason: This modification clarifies that suites in patient sleeping areas are allowed only one intervening room between the patient sleeping areas and an exit access corridor. As written, the restriction to one intervening room is too vague and would cause confusion. This change is consistent with the federal requirements for Medicare certification.

Public Comment 2:

John Williams Washington State Department of Health – Construction Review Services, requests Approval as Modified by this public comment.

Modify proposal as follows:

1014.2.5 Travel distance. The travel distance between any point in a Group I-2 Occupancy patient sleeping room and an exit access door in that room shall not exceed 50 feet (15,240 mm).

(Portions of proposal not shown remain unchanged)

Commenter's Reason: The slowest evacuation rate in an I-2 occupancy is in patient sleeping areas, due to the equipment and support functions that must be moved with the patient when they are evacuated. Other common accessory uses in a hospital; such as supply rooms, dining rooms, gyms; do not have this complication. This change is consistent with the federal requirements for Medicare certification.

E105-06/07

AMPC 1, 2

Code Change No: E106-06/07

Original Proposal

Sections: 1014.2.3 (New) [IFC [B] 1014.2.3 (New)]

Proponent: John Williams, Construction Review Services, Washington State Department of Health

Add new text as follows:

1014.2.3 Separation. Suites in Group I-2 occupancies shall be separated from other portions of the building by a smoke partition complying with Section 710.

Reason: The purpose of the proposed change is to clarify the walls that define an I-2 suite. Nowhere in the current code does it explain how the wall surrounding the suite should be constructed. The additional reference would help code officials determine how these suites should be designed.

The existing requirement listed in 1014 is that an I-2 occupant is able to travel directly from a room into a corridor or through a suite into a corridor. In either case, the occupant passes through a smoke partition (corridor wall) by entering the corridor. The occupancies are often designed with suites being placed directly adjacent to each other. The code also states that the sizes of suites should be limited. It appears that the intent of code is to create separate atmospheres of a certain size that are constructed limit the transfer of smoke.

Cost Impact: The code change proposal will not increase the cost of construction. Smoke partitions create an atmospheric separation only and do not require dampers in most cases.

Analysis: Requirements for smoke barriers in Group I-2 is located in Section 407.4.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal addresses a common question regarding separation of areas within hospitals. This is a good clarification.

Assembly Action:

None

Final Hearing Results

Code Change No: **E107-06/07**

Original Proposal

Sections: 1014.3 (IFC [B] 1014.3)

Proponent: Ron Nickson, National Multi Housing Council/National Apartment Association

Revise as follows:

1014.3 Common path of egress travel. In occupancies other than Groups H-1, H-2 and H-3, the common path of egress travel shall not exceed 75 feet (22 860 mm). In Group H-1, H-2 and H-3 occupancies, the common path of egress travel shall not exceed 25 feet (7620 mm). For common path of egress travel in Group A occupancies having fixed seating, see Section 1025.8.

Exceptions:

1. The length of a common path of egress travel in Group B, F and S occupancies shall not be more than 100 feet (30 480 mm), provided that the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
2. Where a tenant space in Group B, S and U occupancies has an occupant load of not more than 30, the length of a common path of egress travel shall not be more than 100 feet (30 480 mm).
3. The length of a common path of egress travel in a Group I-3 occupancy shall not be more than 100 feet (30 480 mm).
4. The length of a common path of egress travel in a Group R-2 occupancy shall not be more than 125 feet (38 100 mm), provided that the building is protected throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.

Reason: To increase the allowable common path of travel in R-2 occupancies from 75 feet to 125 feet when the R-2 occupancy is protected with a NFPA 13R sprinkler system. The design requirements and thus the protection provided with NFPA 13R system in the area being protected are the same as that provide with a NFPA 13 system. The 98% operational effectiveness of residential sprinkler systems is the best of all occupancy classifications.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal does not increase the overall travel distance, but increases the common path of travel only. The trade off is appropriate for a NFPA 13R system. The trade off will provide incentive for providing sprinkler systems and will provide adequate protection for the areas addressed in this change as far as the common path of travel. The proposals for E107 and E108 are the same.

Assembly Action:

None

Code Change No: E108-06/07

Original Proposal

Sections: 1014.3 (IFC [B] 1014.3)**Proponent:** Richard B. Alpert, P.E., Schirmer Engineering Corporation**Revise as follows:**

1014.3 Common path of egress travel. In occupancies other than Groups H-1, H-2 and H-3, the common path of egress travel shall not exceed 75 feet (22 860 mm). In occupancies in Groups H-1, H-2, and H-3, the common path of egress travel shall not exceed 25 feet (7620 mm). For common path of egress travel in Group A occupancies having fixed seating, see Section 1025.8.

Exceptions:

1. The length of a common path of egress travel in an occupancy in Groups B, F and S shall not be more than 100 feet (30 480 mm), provided that the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
2. Where a tenant space in an occupancy in Groups B, S and U has an occupant load of not more than 30, the length of a common path of egress travel shall not be more than 100 feet (30 480 mm).
3. The length of a common path of egress travel in occupancies in Group I-3 shall not be more than 100 feet (30 480 mm).
4. The length of a common path of egress travel in a Group R-2 occupancy shall not be more than 125 feet (38 100 mm), provided that the building is protected throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.

Reason: The purpose of the code change is to revise the code to allow exception provision for sprinkler systems installed in accordance with NFPA 13R. Exception 4 to Section 1014.3, "Common path of egress travel" allows the extension of the common path of travel in R-2 occupancies from 75 feet to 125 feet for buildings protected throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1 of the code. This allows the exception provision for sprinkler systems installed in accordance with NFPA 13. The code is overly restrictive in that it does not allow the exception provision for building protected throughout with an approved automatic sprinkler system installed in accordance with Section 903.3.1.2 of the code which would allow the exception provision for sprinkler systems installed in accordance with NFPA 13R.

Substantiation: Exception 4 to Section 1014.3, "Common path of egress travel" allows the extension of the common path of travel in R-2 occupancies from 75 feet to 125 feet for buildings protected throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1 of the code. R-2 occupancies are defined in the code as "residential occupancies containing sleeping units or more than two dwelling units where the occupants are primarily permanent in nature". NFPA 13R is the standard for the installation of sprinklers in residential occupancies up to and including four stories in height. As stated in the administrative section of the handbook to this standard "the Technical Committee on Residential Sprinkler Systems intends that NFPA 13R provides an acceptable level of fire protection with respect to life safety and property protection". Per the title and scope of NFPA 13R, R-2 occupancies greater than four stories would be required follow the requirements of NFPA 13 for the installation of automatic sprinkler systems.

The increase in the common path of egress is for the portion of egress travel within the dwelling unit, once outside of the dwelling unit and in the exit access corridor two paths of travel are available to the occupants as shown in Figure 1014.3 of the 2006 IBC Commentary. In addition to the protection provided by the automatic sprinkler systems the dwelling units of an R-2 occupancy are required to be separated from each other by a minimum of a 1-hour fire resistive construction per Section 708.1 of the IBC, and from the exit access corridor by a minimum of a ½ hour fire resistive construction per Section 1017.1 of the IBC.

As stated in the commentary for the 2006 IBC Section 1015.2.1, Exception 2, "The protection provided by an automatic sprinkler system installed in accordance with either NFPA 13 or NFPA 13R can reduce the threat of fire buildup so that the reduction in remoteness is not unreasonable, based on the presumption that it provides the occupants with an acceptable level of safety from fire". This same reasoning in the protection provided by an automatic sprinkler system is applicable to an increase in the common path of travel. This revision to allow the exception provision for automatic sprinkler systems installed in accordance with NFPA 13R would be consistent with the provisions of Exception 2 to Section 1015.2.1 of the code which allows the exception for the reduction of the required exit doors or exit access doorways separation distance "where a building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2".

NFPA 13, "Standard for the Installation of Sprinkler Systems", 2002 Edition, National Fire Protection Association, Quincy, MA.
NFPA 13R, "Standard for the Installation of Sprinkler Systems in Residential Occupancies up to and Including Four Stories in Height", 2002 Edition, National Fire Protection Association, Quincy, MA.
Automatic Sprinkler Systems Handbook, 2002, National Fire Protection Association, Quincy, MA

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal does not increase the overall travel distance, but increases the common path of travel only. The trade off is appropriate for a NFPA 13R system. The trade off will provide incentive for providing sprinkler systems and will provide adequate protection for the areas addressed in this change as far as the common path of travel. The proposals for E107 and E108 are the same.

Assembly Action:

None

Final Hearing Results

E108-06/07

AS

Code Change No: E110-06/07

Original Proposal

Sections: 1014.4 (IFC [B] 1014.4)

Proponent: Jay Hall, Virginia Department of Housing & Community Development, representing Virginia Building and Code Officials Association

Revise as follows:

1014.4 Aisles. Aisles serving as a portion of the exit access in the means of egress system shall comply with the requirements of this section. Aisles shall be provided from all occupied portions of the exit access which contain seats, tables, furnishings, displays and similar fixtures or equipment. Aisles serving assembly areas, ~~other than seating at tables~~, shall comply with Section 1025. Aisles serving reviewing stands, grandstands and bleachers shall also comply with Section 1025. The required width of aisles shall be unobstructed.

Reason: Aisle and aisle accessway are defined terms in the IBC and IFC. Section 1014.4.2.1 and 1014.4.2.2 provide requirements for aisle accessway widths only. Section 1014.4 requires the user to obtain width requirements on aisles serving seating at tables from this section. This section does not provide width requirements for aisles serving seating at tables. The proposed language sends the user to section 1025, specifically 1025.9.1 to obtain minimum aisle widths serving seating at tables.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal provides necessary direction for the different requirements for the width of aisles and aisle accessways.

Assembly Action:

None

Final Hearing Results

Code Change No: E111-06/07

Original Proposal

Sections: 1002.1, 1014.4 through 1014.5.2 (IFC [B] 1002.1, [B] 1014.4 through [B] 1014.5.2)

Proponent: Gregory R. Keith, Professional heuristic Development, representing The Boeing Company

Revise as follows:

1002.1 Definitions. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

AISLE. An unenclosed exit access component that defines and provides a path of egress travel to a corridor or to an exit.

SECTION 1017 AISLES

4014.4 1017.1 Aisles General. Aisles serving as a portion of the exit access in the means of egress system shall comply with the requirements of this section. Aisles shall be provided form all occupied portions of the exit access which contain seats, tables, furnishings, displays and similar fixtures or equipment. Aisles serving assembly areas, other than seating at tables, shall comply with Section 1025. Aisles serving reviewing stands, grandstands and bleachers shall also comply with Section 1025.

The required width of aisles shall be unobstructed.

Exception: Doors, when fully opened, and handrails shall not reduce the required width by more than 7 inches (178 mm). Doors in any position shall not reduce the required width by more than one-half. Other nonstructural projections such as trim and similar decorative features are permitted to project into the required width 1.5 inches (38 mm) from each side.

4014.4.1 1017.2 Aisles in Groups B and M. In Group B and M occupancies, the minimum clear aisle width shall be determined by Section 1005.1 for the occupant load served, but shall not be less than 36 inches (914 mm).

Exception: Nonpublic aisles serving less than 50 people and not required to be accessible by Chapter 11 need not exceed 28 inches (711 mm) in width.

4014.4.2 1017.3 Aisle accessways in Group M. An aisle accessway shall be provided on at least one side of each element within the merchandise pad. The minimum clear width for an aisle accessway not required to be accessible shall be 30 inches (762 mm). The required clear width of the aisle accessway shall be measured perpendicular to the elements and merchandise within the merchandise pad. The 30-inch (762 mm) minimum clear width shall be maintained to provide a path to an adjacent aisle or aisle accessway. The common path of travel shall not exceed 30 feet (9144 mm) from any point in the merchandise pad.

Exception: For areas serving not more than 50 occupants, the common path of travel shall not exceed 75 feet (22 880 mm).

4014.4.3 1017.4 Seating at tables. Where seating is located at a table or counter and is adjacent to an aisle or aisle accessway, the measurement of required clear width of the aisle or aisle accessway shall be made to a line 19 inches (483 mm) away from and parallel to the edge of the table or counter. The 19-inch (483 mm) distance shall be measured perpendicular to the side of the table or counter. In the case of other side boundaries for aisle or aisle accessways, the clear width shall be measured to walls, edges of seating and tread edges, except that handrail projections are permitted.

Exception: Where tables or counters are served by fixed seats, the width of the aisle accessway shall be measured from the back of the seat.

1014.4.3.1 1017.4.1 Aisle accessway for tables and seating. Aisle accessways serving arrangements of seating at tables or counters shall have sufficient clear width to conform to the capacity requirements of Section 1005.1 but shall not have less than the appropriate minimum clear width specified in Section 1014.4.3.2.

1014.4.3.2 1017.4.2 Table and seating accessway width. Aisle accessways shall provide a minimum of 12 inches (305 mm) of width plus 0.5 inch (12.7 mm) of width for each additional 1 foot (305 mm), or fraction thereof, beyond 12 feet (3658 mm) of aisle accessway length measured from the center of the seat farthest from an aisle.

Exception: Portions of an aisle accessway having a length not exceeding 6 feet (1829 mm) and used by a total of not more than four persons.

1014.4.3.3 1017.4.3 Table and seating aisle accessway length. The length of travel along the aisle accessway shall not exceed 30 feet (9144 mm) from any seat to the point where a person has a choice of two or more paths of egress travel to separate exits.

SECTION 1019 EGRESS BALCONIES

1014.5 1019.1 Egress balconies General. Balconies used for egress purposes shall conform to the same requirements as corridors for width, headroom, dead ends and projections.

1014.5.1 1019.2 Wall separation. Exterior egress balconies shall be separated from the interior of the building by walls and opening protectives as required for corridors.

Exception: Separation is not required where the exterior egress balcony is served by at least two stairs and a dead-end travel condition does not require travel past an unprotected opening to reach a stair.

1014.5.2 1019.3 Openness. The long side of an egress balcony shall be at least 50 percent open, and the open area above the guards shall be so distributed as to minimize the accumulation of smoke or toxic gases.

Reason: A definition of aisle was introduced into the 2006 IBC. Unfortunately, a corridor, by definition, also meets the present definition of an aisle. The proposed modifications to the definition of aisle are based on the root definition of corridor as an exit access component. Inasmuch as there are only two interior exit access means of egress components and a corridor is defined as "an enclosed exit access component," an aisle must be an unenclosed exit access component. The definition of corridor also prescribes the extent of egress travel within that component. Similar language has been added to the definition of aisle. It is felt that more comprehensive definitions will assist code users in the proper design and analysis of means of egress systems

Additionally, since aisles and exterior egress balconies are formal exit access components, it is felt that they should enjoy full section status similar to many other means of egress components. This will help users quickly and efficiently access necessary provisions. The reorganization of means of egress provisions in the 2003 IBC created several illogical locations for technical provisions. This provision will help correct that situation.

Approval of this proposal will clarify current code provisions and assist users in the proper determination of means of egress requirements.

Approval of this proposal will greatly assist design professionals and code enforcement officials in the proper application of these fundamental and essential *International Building Code* provisions, especially those with minimal experience.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: If approved, the following editorial changes will occur. The proposed Section 1017, Aisles, would occur between current Section 1016, Exit Access Travel Distance, and Section 1017, Corridors. The proposed Section 1019, Egress Balconies, would occur between current Section 1017, Corridors, and Section 1018, Exits. Sections and references would be renumbered accordingly.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

AISLE. An unenclosed exit access component that defines and provides a path of egress travel ~~to a corridor or to an exit.~~

(Portions of proposal not shown remain unchanged)

Committee Reason: The proposal will provide a more easily understood format for the requirements for aisles and egress balconies.

A modification was made to the definition for ~~aisles~~ to delete the words ~~to a corridor or to an exit.~~ Since an aisle could extend to an exit access door or intervening room the text would be too restrictive. In addition, requirements should not be in a definition.

Assembly Action:

None

Final Hearing Results

AM

Code Change No: E113-06/07

Original Proposal

Sections: 1015.1, 1015.1.1, 1019.1, 1019.2 (IFC [B] 1015.1, [B] 1015.1.1, [B] 1019.1, [B] 1019.2)

Proponent: Philip Brazil, Reid Middleton, Inc., representing Washington Association of Building Officials (WABO)

Revise as follows:

1015.1 Exits or exit access doorways required from spaces. Two exits or exit access doorways from any space shall be provided where one of the following conditions exists:

1. The occupant load of the space exceeds one of the values in Table 1015.1.
2. The common path of egress travel exceeds one of the limitations of Section 1014.3.
3. Where required by Sections 1015.3, 1015.4, and 1015.5, 1015.6 or 1015.6.1.

Exception: Group I-2 occupancies shall comply with Section 1014.2.2.

**TABLE 1015.1
SPACES WITH ONE MEANS OF EGRESS**

OCCUPANCY	MAXIMUM OCCUPANT LOAD
A, B, E ^a , F, M, U	49
H-1, H-2, H-3	3
H-4, H-5, I-1, I-3, I-4, R	10
S	29

a. Day care maximum occupant load 10.

1015.1.1 Three or more exits or exit access doorways. ~~Access to three or more~~ Three exits or exit access doorways shall be provided from a floor area where required by Section 1019.1 any space with an occupant load of 501-1,000. Four exits or exit access doorways shall be provided from any space with an occupant load greater than 1,000.

1019.1 Minimum number of Exits from stories. ~~All rooms and spaces within each story shall be provided with and have access to the minimum number of approved independent exits as required by specified in Table 1019.1 based on the occupant load of the story, except as modified in Section 1015.1 or 1019.2. For the purposes of this chapter, occupied roofs shall be provided with exits as required for stories. The required number of exits from any story, basement or individual space shall be maintained until arrival at grade or the public way.~~

**TABLE 1019.1
MINIMUM NUMBER OF EXITS FOR OCCUPANT LOAD**

OCCUPANT LOAD (persons per story)	MINIMUM NUMBER OF EXITS (per story)
1-500	2
501-1,000	3
More than 1,000	4

1019.2 Buildings with one exit. Only one exit shall be required in buildings as ~~described~~ specified below:

1. Buildings ~~described in meeting the limitations of~~ Table 1019.2, provided that the building has not more than one level below the first story above grade plane.
2. Buildings of Group R-3 occupancy.
3. Single-level buildings with ~~the occupied spaces at the level of exit discharge provided that the story or each~~ space complies with Section 1015.1 as a space with one means of egress exit or exit access doorway.

**TABLE 1019.2
BUILDINGS WITH ONE EXIT**

OCCUPANCY	MAXIMUM HEIGHT OF BUILDING ABOVE GRADE PLANE	MAXIMUM OCCUPANTS (OR DWELLING UNITS) PER FLOOR AND TRAVEL DISTANCE
A, B ^d , E ^e , F, M, U	1 Story	49 occupants and 75 feet travel distance
H-2, H-3	1 Story	3 occupants and 25 feet travel distance
H-4, H-5, I, R	1 Story	10 occupants and 75 feet travel distance
S ^a	1 Story	29 occupants and 100 feet travel distance
B ^b , F, M, S ^a	2 Stories	30 occupants and 75 feet travel distance
R-2	2 Stories ^c	4 dwelling units and 50 feet travel distance

For SI: 1 foot = 304.8 mm.

- a. For the required number of exits for open parking structures, see Section 1019.1.1.
- b. For the required number of exits for air traffic control towers, see Section 412.1.
- c. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1026 shall have a maximum height of three stories above grade plane.
- d. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 with an occupancy in Group B shall have a maximum travel distance of 100 feet.
- e. Day care maximum occupant load 10.

Reason: This proposal addresses questions raised by code users in the state of Washington concerning the application of Sections 1015.1, 1015.1.1, 1019.1 and 1019.2 in determining the required number of exits and exit access doorways. Section 1015.1 intends to specify when two exits or exit access doorways are required from a space. Section 1015.1.1 intends to specify when three or more exits or exit access doorways are required from a space. Section 1019.1 intends to specify the minimum number of exits from a story based on the occupant load of that story. At least two exits are required as specified in Table 1019.1. Section 1019.2 effectively serves as an exception to Section 1019.1, permitting a building to have one exit if certain conditions are met.

The proposal will make the application of the proposals clearer. The phrase “one off” is added to Items 1 and 2 of Section 1015.1 clarifying that not all of the values in Table 1015.1 need to be exceeded before two exits or exit access doorways are required from a space. Sections 1015.6 and 1015.6.1 are added to Item 3 of Section 1015.1 because of the requirements in those sections for means of egress.

The reference to Section 1019.1 in Section 1015.1.1 is replaced with language requiring more than two exits or exit access doorways from a space based on its occupant load. Note that Section 1019.1 does not require three or more exits from floor areas. The reference to “floor area” in Section 1015.1.1 is replaced with references to spaces for consistency with Section 1015.1. Section 1015.1.1 applies to spaces, not stories, which is implied by the reference to floor areas.

Section 1019.1 is revised to require access from all spaces within each story to the minimum number of exits for each story as specified in Table 1019.1, which is based on the occupant load of each story. Reference to “rooms” is deleted because Section 1014.1 refers only to spaces. Its presence in Section 1019.1 is superfluous and the lack of its presence in Section 1015.1 is a potential conflict.

Reference to Table 1019.1 for the required number of exits from spaces has been the source of much confusion and is deleted. The required number of exits from spaces is specified more comprehensively in Sections 1015.1 and 1015.1.1, which require two or more exits or exit access doorways from spaces based on their occupant load and other factors. Note that Table 1019.1 does not require a minimum number of exits from spaces, but does require a minimum number from each story. The phrase “approved independent” in Section 1019.1 is superfluous and is deleted. The phrase “basement or individual space” is also deleted. A basement is a story that is partly or completely below grade plane making it superfluous. A story is composed of spaces making reference to them superfluous since stories include them.

Reference to Section 1015.1 in Section 1019.1 is superfluous and is deleted. Section 1019.1 requires at least two exits from each story. Section 1015.1 requires two exits from certain spaces but does not require exits from stories. Consequently, Section 1015.1 would never modify the requirements of Section 1019.1. Section 1015.1.1 intends to require three exits or exit access doorways from spaces with an occupant load of 501-1,000 and four exits or exit access doorways from spaces with an occupant load greater than 1,000. This is consistent with Table 1019.1, which specifies three exits from stories with an occupant load of 501-1,000 and four exits from stories with an occupant load greater than 1,000.

The proposed revisions to Section 1019.2 are largely editorial. The charging statement and Item #1 are revised to mandatory language. In Item #3, reference to the story is deleted and the phrase “means of egress” is replaced with “exit or exit access doorway” because compliance with Section 1015.1 is dependent on the number of exits or exit access doorways from spaces, not from stories, and requirements for the means of egress are not specified other than exits or exit access doorways from spaces.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Tables 1015.1, 1019.1 and 1019.2 are shown for information only.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

1019.1 Exits from stories. All spaces within each story shall have access to the minimum number of approved independent exits as specified in Table 1019.1 based on the occupant load of the story, except as modified in Section 1015.1 or 1019.2. For the purposes of this chapter, occupied roofs shall be provided with exits as required for stories. The required number of exits from any story shall be maintained until arrival at grade or the public way.

(Portions of proposal not shown remain unchanged)

Committee Reason: The proposal will address floors with smaller occupant loads than the level above or below, separating exits from spaces and exits from stories. The language will also clear up a reference circle.

The modification was to leave in the term >approved independent-in Section 1019.1. This is important text to remain for the means of egress system.

Assembly Action:

None

Final Hearing Results

E113-06/07

AM

Code Change No: E115-06/07

Original Proposal

Sections: 1015.1, 1019.1 (IFC [B] 1015.1, [B] 1019.1)

Proponent: Maureen Traxler, City of Seattle, Washington, representing Washington Association of Building Officials

Revise as follows:

1015.1 Exit or exit access doorways required. Two exits or exit access doorways from any space shall be provided where one of the following conditions exists:

1. The occupant load of the space exceeds the values in Table 1015.1.

Exception: In Groups R-2 and R-3 occupancies, one means of egress is permitted within and from individual dwelling units with a maximum occupant load of 16 where the dwelling unit is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

2. The common path of egress travel exceeds the limitations of Section 1014.3.
3. Where required by Sections 1015.3, 1015.4 and 1015.5.

Exception: Group I-2 occupancies shall comply with Section 1014.2.2.

1019.1 Minimum number of exits. All rooms and spaces within each story shall be provided with and have access to the minimum number of approved independent exits required by Table 1019.1 based on the occupant load of the story, except as modified in Section 1015.1 or 1019.2. For the purposes of this chapter, occupied roofs shall be provided with exits as required for stories. The required number of exits from any story, basement or individual space shall be maintained until arrival at grade or the public way.

Exception: In Groups R-2 and R-3 occupancies, one means of egress is permitted within and from individual dwelling units with a maximum occupant load of 16 where the dwelling unit is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

Reason: This proposal allows one exit in some dwelling units. This proposal is consistent with the IRC provisions allowing one exit from dwelling units, and is safer because dwellings built according to the IBC will have sprinkler protection. This reduction in exiting requirements is mitigated by the familiarity of the occupants with the exits, and their control over the environment. The code still requires two exits from every story outside the dwelling unit.

This provision is important for small dwelling units where there often is not enough space for two exits. It's also important for larger dwelling units in multifamily buildings in which it can be impracticable to provide the required separation between exits, particularly for buildings on urban infill lots with small footprints.

The occupant load of 16 was chosen for consistency with new provisions for Group R congregate living facilities. According to Section 310.1, congregate living facilities with 16 or fewer persons are Group R-3 occupancies, and those with more are Group R-2 occupancies.

The proposal is limited to dwelling units that are less than 3,200 square feet (Table 1004.1.1 specifies 200 sq.ft./person x 16 occupants = 3,200 sq.ft.) which corresponds with maximum allowable area for dwellings with one exit in one of the legacy codes. Other provisions of Chapter 10 may require additional exits to be provided – provisions limiting the length of the common path of egress travel and travel distance will apply. The limit of 125 feet on common path of egress travel found in Section 1014.3 is an especially strict limit.

There are cases where multifloor dwelling units with a small floor area and small occupant load are required to have access to two exits from the upper floors. In these cases, the common path of egress travel, which will be measured along stairways, will limit the size of a dwelling that can have one exit.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

1015.1 Exit or exit access doorways required. Two exits or exit access doorways from any space shall be provided where one of the following conditions exists:

- 1. The occupant load of the space exceeds the values in Table 1015.1.

Exception: In Groups R-2 and R-3 occupancies, one means of egress is permitted within and from individual dwelling units with a maximum occupant load of ~~46~~ 20 where the dwelling unit is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.

- 2. The common path of egress travel exceeds the limitations of Section 1014.3.
- 3. Where required by Sections 1015.3, 1015.4 and 1015.5.

Exception: Group I-2 occupancies shall comply with Section 1014.2.2.

1019.1 Minimum number of exits. All rooms and spaces within each story shall be provided with and have access to the minimum number of approved independent exits required by Table 1019.1 based on the occupant load of the story, except as modified in Section 1015.1 or 1019.2. For the purposes of this chapter, occupied roofs shall be provided with exits as required for stories. The required number of exits from any story, basement or individual space shall be maintained until arrival at grade or the public way.

Exception: In Groups R-2 and R-3 occupancies, one means of egress is permitted within and from individual dwelling units with a maximum occupant load of ~~46~~ 20 where the dwelling unit is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2.

Committee Reason: This proposal specifically addressed allowances for a single exit access door from an individual dwelling unit. This is a common problem resulting from dwelling units getting larger without an increase in actual occupant load.. A concern was expressed on how this propose would affect Group R-2 dormitories or congregate residences.

A modification was made to also allow a NFPA 13R systems, commonly used in Group R occupancies, for this allowance for one means of egress.

A second modification was made to increase the occupant load to 20 so that this provision would cover a dwelling unit up to 4,000 square feet in area. A concern was expressed about this number possibly leading to confusion with 16 occupants being used to determine congregate residences that could use Group R-3 requirements.

Assembly Action:

None

Code Change No: E122-06/07

Original Proposal

Sections: 1016.1, 1019.1, 1020.1 (IFC [B] 1016.1, [B] 1019.1, [B] 1020.1)

Proponent: Sarah A. Rice, CBO, Schirmer Engineering Corporation

Revise as follows:

1016.1 Travel distance limitations. Exits shall be so located on each story such that the maximum length of exit access travel, measured from the most remote point within a story to the entrance to an exit along the natural and unobstructed path of egress travel, shall not exceed the distances given in Table 1016.1.

Where the path of exit access includes unenclosed stairways or ramps within the exit access or includes ~~unenclosed exit ramps or stairways as permitted in Section 1020.4~~, the distance of travel on such means of egress components shall also be included in the travel distance measurement. The measurement along stairways shall be made on a plane parallel and tangent to the stair tread nosings in the center of the stairway.

Exceptions:

1. Travel distance in open parking garages is permitted to be measured to the closest riser of open stairs.
2. In outdoor facilities with open exit access components and open exterior stairs or ramps, travel distance is permitted to be measured to the closest riser of a stair or the closest slope of the ramp.
3. ~~Where an exit stair is permitted to be unenclosed in accordance with Exception 8 or 9 of Section 1019.1, the travel distance shall be measured from the most remote point within a building to an exit discharge. In other than occupancy Groups H and I, the exit access travel distance to a maximum of 50 percent of the exits is permitted to be measured from the most remote point within a building to an exit discharge using unenclosed stairways or ramps when connecting a maximum of 2 stories. The two connected stories shall be provided with at least two means of egress. Such interconnected stories shall not be open to other stories. The measurement along stairways shall be made on a plane parallel and tangent to the stair tread nosings in the center of the stairway.~~
4. In other than occupancy Groups H and I, exit access travel distance is permitted to be measured from the most remote point within a building to an exit discharge using unenclosed stairways or ramps in the first and second stories in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1. The first and second stories shall be provided with at least two means of egress. Such interconnected stories shall not be open to other stories. The measurement along stairways shall be made on a plane parallel and tangent to the stair tread nosings in the center of the stairway.

1019.1 Minimum number of exits. All rooms and spaces within each story shall be provided with and have access to the minimum number of approved independent exits required by Table 1019.1 based on the occupant load of the story, ~~except as modified in Section 1015.1 or 1019.2~~. For the purposes of this chapter, occupied roofs shall be provided with exits as required for stories. The required number of exits from any story, basement or individual space shall be maintained until arrival at grade or the public way.

Exceptions:

1. As modified by Section 1015.1.
2. As modified by Section 1019.2.
3. Rooms and spaces within each story provided with and having access to a means of egress that complies with Exception 3 or 4 in Section 1016.1 shall not be required to be provide the minimum number of approved independent exits required by Table 1019 on each story.

1020.1 Enclosures required. Interior exit stairways and interior exit ramps shall be enclosed with fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both. Exit enclosures shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories. The number of stories connected by the exit enclosure shall include any basements but not any mezzanines. An exit enclosure shall not be used for any purpose other than means of egress.

Exceptions:

1. In all occupancies, other than Group H and I occupancies, a stairway is not required to be enclosed when the stairway serves an occupant load of less than 10 and the stairway complies with either Item 1.1 or 1.2. In all cases, the maximum number of connecting open stories shall not exceed two.
 - 1.1. The stairway is open to not more than one story above the story at the level of exit discharge; or
 - 1.2. The stairway is open to not more than one story below the story at the level of exit discharge.
2. Exits in buildings of Group A-5 where all portions of the means of egress are essentially open to the outside need not be enclosed.
3. Stairways serving and contained within a single residential dwelling unit or sleeping unit in Group R-1, R-2 or R-3 occupancies are not required to be enclosed.
4. ~~Stairways that are not a required means of egress element are not required to be enclosed where such stairways comply with Section 707.2.~~
5. Stairways in open parking structures that serve only the parking structure are not required to be enclosed.
6. Stairways in Group I-3 occupancies, as provided for in Section 408.3.6, are not required to be enclosed.
7. Means of egress stairways as required by Section 410.5.3 are not required to be enclosed.

- ~~8. In other than Group H and I occupancies, a maximum of 50 percent of egress stairways serving one adjacent floor are not required to be enclosed, provided at least two means of egress are provided from both floors served by the unenclosed stairways. Any two such interconnected floors shall not be open to other floors. Unenclosed exit stairways shall be remotely located as required in Section 1015.2.~~
- ~~9. In other than Group H and I occupancies, interior egress stairways serving only the first and second stories of a building equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 are not required to be enclosed, provided at least two means of egress are provided from both floors served by the unenclosed stairways. Such interconnected stories shall not be open to other stories. Unenclosed exit stairways shall be remotely located as required in Section 1015.2.~~

Reason: There appears to be two distinct egress concepts that though integrally tied, are being confused. How exit access travel distance is measured (Section 1016.1) and when exits are required to be enclosed in fire rated constructions (Section 1020.1).

Section 1016.1 is intended to tell the code user how to measure “exit access travel distance” , e.g., from the most remote point on a story to an “exit.” Section 1020.1 tells the code user that all exits are to be enclosed in fire rated construction, and more importantly, the conditions when an exit is not required to be enclosed in fire rated construction. In multiple story buildings, that “exit” is typically an interior stairway or an exterior stairway, separated from the remainder of the story by fire rated construction.

Through past code change activity, the membership has accepted the concept that exit access travel distance does not always have to terminate at an “exit” which is located on that story, but under certain circumstances (those found in Exceptions 8 & 9 in Section 1020.1) can continue down a vertical egress element until the exit access travel distance is exceeded. At that point, regardless of where within the building the person is they must enter an “exit” that is enclosed in fire rated construction.

We do not disagree with the concept of allowing the exit access travel distance to continue past what has traditionally been the termination point, the top of a stairway. But we do feel that code, as currently written in Sections 1016.1 and 1020.1, does not accurately depict the concept. Rather than making the allowance for exit access travel distance to extend past the story in which it started in Section 1016.1, the code has made exceptions to when a vertical exit is required to be enclosed in Section 1020.1.

The proposed language here, and in Section 1020.1, seeks to clarify the application of this concept. The exceptions now found in Section 1020.1 are proposed for deletion and relocated into Section 1016.1. In addition, the current arrangement of the concept of measuring exit access travel distance has created confusion with regard to the application of other provisions within the code, e.g., enclosure of exit access corridors, levels of exit discharge, exit passageways.

Regarding the deletion of Exception 4: Section 1020 is only applicable to “vertical exit enclosures.” One would not even look to Section 1020 for a stair that is not an “exit.” Openings created by stairs that are not exits are not treated unlike any other opening in a floor assembly. They are classified as “openings” in horizontal assemblies and subject to the applicable provisions for such, potentially shaft enclosures or classification as an atrium. Retaining the text of Exception 4 is misleading as it seems to imply that stairs that are not exits are in some way regulated by the provisions of Section 1020 when this is untrue. The proposed deletion of Exception 4 removes any possible confusion.

The intent of the revision to Section 1019.1 is to address the concern over two exit access stairways being provided from a 2nd floor when two exits were required. This is basically a correlation issue.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1016.1 Travel distance limitations. Exits shall be so located on each story such that the maximum length of exit access travel, measured from the most remote point within a story to the entrance to an exit along the natural and unobstructed path of egress travel, shall not exceed the distances given in Table 1016.1.

Where the path of exit access includes unenclosed stairways or ramps within the exit access the distance of travel on such means of egress components shall also be included in the travel distance measurement. The measurement along stairways shall be made on a plane parallel and tangent to the stair tread nosings in the center of the stairway.

Exceptions:

1. Travel distance in open parking garages is permitted to be measured to the closest riser of open stairs.
2. In outdoor facilities with open exit access components and open exterior stairs or ramps, travel distance is permitted to be measured to the closest riser of a stair or the closest slope of the ramp.
3. In other than occupancy Groups H and I, the exit access travel distance to a maximum of 50 percent of the exits is permitted to be measured from the most remote point within a building to an exit discharge using unenclosed stairways or ramps when connecting a maximum of 2 stories. The two connected stories shall be provided with at least two means of egress. Such interconnected stories shall not be open to other stories. The measurement along stairways shall be made on a plane parallel and tangent to the stair tread nosings in the center of the stairway.
4. In other than occupancy Groups H and I, exit access travel distance is permitted to be measured from the most remote point within a building to an exit discharge using unenclosed stairways or ramps in the first and second stories in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1. The first and second stories shall be provided with at least two means of egress. Such interconnected stories shall not be open to other stories. The measurement along stairways shall be made on a plane parallel and tangent to the stair tread nosings in the center of the stairway.

(Portions of proposal not shown remain unchanged)

Committee Reason: The proposal moves exit access requirements out of the current exit requirements in Section 1020.1 and into the correct location, Section 1016.1. This clarifies the limits for the open stairways that are part of the means of egress and their use in the building. The modification deleted the term ‘discharge’ from Section 1016.1 in Exceptions 3 and 4. Travel down the open exit access stairways could lead to an enclosed exit stairway, and not always directly to the door to the outside (i.e. exit discharge).

Assembly Action:

None

Code Change No: **E130-06/07**

Original Proposal

Sections: 1017.3 (IFC [B] 1017.3)**Proponent:** William E. Koffel, P.E., Koffel Associates, Inc.**Revise as follows:**

1017.3 Dead ends. Where more than one exit or exit access doorway is required, the exit access shall be arranged such that there are no dead ends in corridors more than 20 feet (6096 mm) in length.

Exceptions:

1. In occupancies in Group I-3 of Occupancy Condition 2, 3 or 4 (see Section 308.4), the dead end in a corridor shall not exceed 50 feet (15 240 mm).
2. In occupancies in Groups B₁ and E, F, I-1, M, R-1, R-2, R-4, S, and U, where the building is equipped throughout with an automatic sprinkler system in accordance with 903.3.1.1, the length of the dead-end corridors shall not exceed 50 feet (15 240 mm).
3. A dead-end corridor shall not be limited in length where the length of the dead-end corridor is less than 2.5 times the least width of the dead-end corridor.

Reason: The allowance of 50 foot dead-end corridors in fully sprinkler protected buildings is consistent with other national codes, including the 2006 Edition of NFPA 101 Table A.7.6, the 2006 Edition of NFPA 5000, the 2006 Edition of the International Existing Building Code (2006 IEBC), and the 2006 Edition of the International Fire Code (IFC). In other than Group A and H occupancies, the 2006 IEBC permits newly created dead-end corridors of 50 feet on floors protected with an automatic sprinkler system in accordance with the 2006 International Building Code (IBC) for Alterations – Level 2 (605.6 exc. 4) and Alterations – Level 3 (705.1). In addition, Section 812.4.1.1 (Means of egress for change in occupancy to higher hazard) of the 2006 IEBC references Section 605.6 for existing dead-end corridors. Further, when the change of occupancy complies with Section 812.3 of the 2006 IEBC, Section 812.4.1.2 (Means of egress for change of use to equal or lower hazard category) of the 2006 IEBC allows existing dead-end corridors no matter what length to remain regardless of the presence of an automatic sprinkler system. Section 1027.17.2 of the 2006 IFC permits dead-end corridors of 50 feet in buildings with an automatic sprinkler system in accordance with the 2006 IFC.

Once a new building is given its Use & Occupancy approval, any future work in the building can reference the 2006 IEBC and 2006 IFC requirements. The lack of conformity between the 2006 IBC and the 2006 IEBC and the 2006 IFC creates a conflict when future Alteration level work occurs. Amending Section 1017.3 of the 2006 IBC to allow 50 foot dead-end corridors in buildings containing the proposed occupancies, where the building is protected throughout with an automatic sprinkler system in accordance with NFPA 13 requirements allows for consensus between the two ICC building codes and the 2006 IFC. A similar code change is necessary for the Section 1017.3 (new dead-end corridors) of the 2006 IFC to address the allowable dead-end corridor distance of the 2006 IEBC and Section 1027.17.2 of the 2006 IFC.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Approved as Submitted**

Committee Reason: The committee agreed that a 50 foot dead end corridor would allow for safe egress and increase design options. It was noted that a NFPA 13 system was required for this increase even for Group R occupancies.

Assembly Action:

None

Final Hearing Results

E130-06/07

AS

Code Change No: E134-06/07

Original Proposal

Sections: 1019.1.2 (IFC [B] 1019.1.2)

Proponent: Robert Bagnetto, Lapeyre Stair, Inc./Laitram Corp.

Revise as follows:

1019.1.2 Helistops. The means of egress from helistops shall comply with the provisions of this chapter, provided that landing areas located on buildings or structures shall have two or more exits. For landing platforms or roof areas less than 60 feet (18 288 mm) long, or less than 2,000 square feet (186 m²) in area, the second means of egress is permitted to be a fire escape, alternating tread device, or ladder leading to the floor below.

Reason: The purpose of this proposed code change to IBC-2006 is to allow the use of alternating tread devices as a means of egress from Helistops.

IBC-2006 Section 1019.1.2 is overly restrictive in that it does not allow the use of alternating tread devices as a means of egress from Helistops. IBC-2003 allows the use of alternating tread devices in sections, including but not limited to, 1009.11, 1015.3, 1015.4, and 1015.6.1. Alternating tread devices are typically safer to use than ladders and would be suitable for the application specified in section 1019.1.2. This proposal is superior to the current code in that it allows an additional adequate means of egress from Helistops that is not allowed under the current code.

Cost Impact: The change could result in a minor increase in construction costs if alternating tread devices are used in lieu of ladders as the second means of egress to Helistops.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The alternating tread device provides the same level of safety as the ladder, which is already permitted by the code as a second exit from helistops.

Assembly Action:

None

Original Proposal

Sections: 1019.2, Table 1019.2, 1019.3 (New) [IFC [B] 1019.2, [B] Table 1019.2, [B] 1019.3 (New)]

Proponent: Lori Lee Graham, City of Portland, Oregon

1. Revise as follows:

1019.2 Buildings Stories with one exit. Only one exit shall be required in ~~buildings~~ from stories as described below:

1. ~~Buildings~~ Stories described in Table 1019.2, ~~provided that the building has not more than one level below the first story above grade plane.~~

2. Buildings of Group R-3 occupancy.
3. Single-level buildings with the occupied space at the level of exit discharge provided that the story or space complies with Section 1015.1 as a space with one means of egress.

2. Delete table and substitute as follows:

TABLE 1019.2
BUILDINGS WITH ONE EXIT

OCCUPANCY	MAXIMUM HEIGHT OF BUILDING ABOVE GRADE PLANE	MAXIMUM OCCUPANTS (OR DWELLING UNITS) PER FLOOR AND TRAVEL DISTANCE
A, B ^a , E ^e , F, M, U	1 Story	49 occupants and 75 feet travel distance
H-2, H-3	1 Story	3 occupants and 25 feet travel distance
H-4, H-5, I, R	1 Story	10 occupants and 75 feet travel distance
S ^a	1 Story	29 occupants and 100 feet travel distance
B ^b , F, M S ^a	2 Stories	30 occupants and 75 feet travel distance
R-2	2 Stories	4 dwelling units and 50 feet travel distance

For SI: 1 foot = 304.8 mm.

- a. For the required number of exits for parking structures, see Section 1019.1.1.
- b. For the required number of exits for air traffic control towers, see Section 412.1.
- c. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1026 shall have a maximum height of three stories above grade plane.
- d. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 with an occupancy in Group B shall have a maximum travel distance of 100 feet.
- e. Day care maximum occupant load is 10.

TABLE 1019.2
STORIES WITH ONE EXIT

STORY ABOVE GRADE PLANE	OCCUPANCY	MAXIMUM OCCUPANTS (OR DWELLING UNITS) PER FLOOR AND TRAVEL DISTANCE TO EXIT
First story or basement	A, B ^d , E ^e , F ^d , M, U, S ^d	49 occupants and 75 feet travel distance
	H-2, H-3	3 occupants and 25 feet travel distance
	H-4, H-5, I, R	10 occupants and 75 feet travel distance
	S ^a	29 occupants and 100 feet travel distance
Second story	B ^b , F, M, S ^a	29 occupants and 75 feet travel distance
	R-2	4 dwelling units and 50 feet travel distance
Third Story	R-2 ^c	4 dwelling units and 50 feet travel distance

- a. For the required number of exits for parking structures, see Section 1019.1.1.
- b. For the required number of exits for air traffic control towers, see Section 412.1.
- c. Emergency escape and rescue openings as provided in accordance with Section 1026.
- d. Group B, F and S occupancies in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 shall have a maximum travel distance of 100 feet.
- e. Day care occupancies shall have a maximum occupant load of 10.

1019.3 Egress from multi-story dwelling units. Only one exit is required from individual multi-story dwelling units located in buildings of any height provided the dwelling unit meets all of the following requirements:

1. The individual dwelling unit occupies not more than three stories; and

2. The exit from the dwelling unit is located at the level of exit discharge or is located to provide immediate access to not less than two approved independent exits from the story; and
3. The dwelling unit complies with Section 1015.1 as a space with one means of egress.

Reason: The purpose of the proposed code change is to provide clarity to egress review in conditions where only one exit is provided. The reasons are as follows:

- Confusion Regarding Application of Table: Table 1019.2 has caused great confusion amongst the plans examiners and the public. Frequently a building has multiple exits on the Ground Level and people have assumed that the table does not apply in these conditions. Yet, oftentimes, the exits are not available to all spaces or tenants.
- Mixed Occupancies: Table 1019.2 does not address mixed occupancies and yet planning codes are encouraging mixed occupancies. It is common to have residential use over commercial space but frequently the access and egress systems are completely independent of each other.
- Multiple Tenants: This code section fails to address the separations that occur in buildings due to multiple tenant spaces. Tenant configurations have become less standardized. Tenants frequently want to control access and egress from their space.
- Discrepancy in Application: The current table treats the first story of a two story building differently than a one-story building. This makes no sense. It would be preferable to review each level separately. For instance, under the current table, a one story mercantile building may have 50 occupants and 75 feet travel distance but the first story of a two story mercantile building may only have 30 occupants.

Examples:

- A two-story office building has separate tenant spaces on each story. There is a lobby shared by both tenants with a stair serving the 2nd floor tenant. There is a 2nd door, leading from the ground level tenant space to the parking lot. The 2nd floor does not have a 2nd exit access.
- A two story office building with a demising wall separating the building into two, two-story spaces. Each tenant has its own entrance and stair. There is no shared exit way.
- Three story, mixed use building with Retail on the first floor, offices on the 2nd floor and apartments on the 3rd floor. The offices and apartments share one exit stair. The Retail tenants have individual exits.

Substantiation: The proposed table evaluates the egress system based on the specific story in question and the occupancy of that story. This provides more flexibility in evaluating egress systems when there are mixed occupancies or multiple tenants. It also reduces the confusion that the present table has created.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The proponent has a similar proposal that matches the last new section proposed, Section 1019.3. If approved, the committee should be aware of the different location for the proposed text.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

**TABLE 1019.2
STORIES WITH ONE EXIT**

(No change to content of table)

- a. For the required number of exits for parking structures, see Section 1019.1.1.
- b. For the required number of exits for air traffic control towers, see Section 412.1.
- c. Emergency escape and rescue openings as provided in accordance with Section 1026. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1026.
- d. Group B, F and S occupancies in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 shall have a maximum travel distance of 100 feet.
- e. Day care occupancies shall have a maximum occupant load of 10.

~~**1019.3 Egress from multi-story dwelling units.** Only one exit is required from individual multi-story dwelling units located in buildings of any height provided the dwelling unit meets all of the following requirements:~~

1. ~~The individual dwelling unit occupies not more than three stories; and~~
2. ~~The exit from the dwelling unit is located at the level of exit discharge or is located to provide immediate access to not less than two approved independent exits from the story; and~~
3. ~~The dwelling unit complies with Section 1015.1 as a space with one means of egress.~~

(Portions of proposal not shown remain unchanged)

Committee Reason: The proposal clarifies the intent of the code. The charging statement in 1019.1 states that every story has two exits. The proposal carries on with that and references stories again versus the entire building. The proposal will allow for small 2nd floors or basements that meet the travel distance over a much larger 1st floor to have single exits. Note c from the original text will be maintained. It is necessary to provide information that for a single exit to be permitted, both a sprinkler system and emergency escape window are necessary for adequate safety. A modification was offered by the proponent for the deletion of proposed section 1019.3 since it was already addressed by committee action on E115-06/07 and E135-06/07.

Code Change No: E138-06/07

Original Proposal

Sections: 1020.1 (IFC [B] 1020.1)

Proponent: Jason T. Thompson, National Concrete Masonry Alliance (NCMA), representing Masonry Alliance for Codes and Standards (MACS)

Revise as follows:

1020.1 Enclosures required. Interior exit stairways and interior exit ramps shall be enclosed with fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both. Exit enclosures shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories. The number of stories connected by the exit enclosure shall include any basements but not any mezzanines. Exit enclosures shall have a fire-resistance rating not less than the floor assembly penetrated, but need not exceed 2 hours. An exit enclosure shall not be used for any purpose other than means of egress.

Exceptions:

1. In all occupancies, other than Group H and I occupancies, a stairway is not required to be enclosed when the stairway serves an occupant load of less than 10 and the stairway complies with either Item 1.1 or 1.2. In all cases, the maximum number of connecting open stories shall not exceed two.
 - 1.1. The stairway is open to not more than one story above the story at the level of exit discharge; or
 - 1.2. The stairway is open to not more than one story below the story at the level of exit discharge.
2. Exits in buildings of Group A-5 where all portions of the means of egress are essentially open to the outside need not be enclosed.
3. Stairways serving and contained within a single residential dwelling unit or sleeping unit in Group R-1, R-2 or R-3 occupancies are not required to be enclosed.
4. Stairways that are not a required means of egress element are not required to be enclosed where such stairways comply with Section 707.2.
5. Stairways in open parking structures that serve only the parking structure are not required to be enclosed.
6. Stairways in Group I-3 occupancies, as provided for in Section 408.3.6, are not required to be enclosed.
7. Means of egress stairways as required by Section 410.5.3 are not required to be enclosed.
8. In other than Group H and I occupancies, a maximum of 50 percent of egress stairways serving one adjacent floor are not required to be enclosed, provided at least two means of egress are provided from both floors served by the unenclosed stairways. Any two such interconnected floors shall not be open to other floors. Unenclosed exit stairways shall be remotely located as required in Section 1015.2.
9. In other than Group H and I occupancies, interior egress stairways serving only the first and second stories of a building equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 are not required to be enclosed, provided at least two means of egress are provided from both floors served by the unenclosed stairways. Such interconnected stories shall not be open to other stories. Unenclosed exit stairways shall be remotely located as required in Section 1015.2.

Reason: The purpose of this code change is for vertical exit enclosures to have their minimum required fire-resistance rating determined in the same manner as required for shaft enclosures in Section 707.4. The added text is taken from the last sentence of that section. Since a vertical exit enclosure is basically the same as a shaft enclosure in regard to the protection of vertical openings penetrating multiple floors, the minimum fire-resistance rating requirements should be the same.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal will promote consistency between the floor rating requirements and the vertical enclosure ratings. A concern was expressed regarding the lack of substantiation for this change.

Assembly Action:

None

Original Proposal

Sections: 1011.3, 1020.1.6 (IFC [B] 1011.3, [B] 1020.1.6), 1110.3

Proponent: Bill Conner, Conner Associates LLC, representing himself

Revise as follows:

1011.3 Tactile exit signs. A tactile sign stating EXIT and complying with ICC A117.1 Section 703.3 shall be provided adjacent to each door to an egress ~~exit~~ stairway, an exit ramp, an exit passageway and the exit discharge.

1020.1.6 Stairway Floor number signs. A sign shall be provided at each floor landing in interior exit enclosures connecting more than three stories designating the floor level, the terminus of the top and bottom of the ~~stair exit~~ enclosure and the identification of the stair or ramp. The signage shall also state the story of, and the direction to the exit discharge and the availability of roof access from the ~~stairway enclosure~~ for the fire department. The sign shall be located 5 feet (1524 mm) above the floor landing in a position that is readily visible when the doors are in the open and closed positions. Floor level identification signs in tactile characters complying with ICC A117.1, Section 703.3 shall be located at each floor level landing adjacent to the door leading from the enclosure into the corridor to identify the floor level.

1110.3 Other signs. Signage indicating special accessibility provisions shall be provided as shown:

1. Each assembly area required to comply with Section 1108.2.6 shall provide a sign notifying patrons of the availability of assistive listening systems.

Exception: Where ticket offices or windows are provided, signs are not required at each assembly area provided that signs are displayed at each ticket office or window informing patrons of the availability of assistive listening systems.

2. At each door to an egress stairway, exit passageway and exit discharge, signage shall be provided in accordance with Section 1011.3.
3. At areas of refuge, signage shall be provided in accordance with Sections 1007.6.3 through 1007.6.5.
4. At areas for assisted rescue, signage shall be provided in accordance with Section 1007.8.3.
5. Within exit enclosures signage shall be provided in accordance with Section 1020.1.6.

Reason: Tactile signs should also be required at exit ramps, similar to exit stairways. Exit signage is not required at all stairways, just exit stairways. The change will also coordinate with ADAAG 216.4.1 and ICC A117.1 504.9.

Persons with visual impairments need to know what floor level they are on both for general use and emergency situations. This is coordination with ICC A117.1 504.9. The proposal to Section 1110.3 is coordination only.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Disapproved**

Committee Reason: The proposal was disapproved because the reason was given as coordination with ICC A117.1 and floor number signs are not required by ICC A117.1. The IBC should not reference specific sections of the ICC A117.1 standard.

Assembly Action:**None**

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Bill Conner, representing himself, requests Approval as Modified by this public comment.

Modify proposal as follows:

1011.3 Tactile exit signs. A tactile sign stating EXIT and complying with ICC A117.1 ~~Section 703.3~~ shall be provided adjacent to each door to an exit stairway, an exit ramp, an exit passageway and the exit discharge.

1020.1.6 Floor number signs. A sign shall be provided at each floor landing in interior exit enclosures connecting more than three stories designating the floor level, the terminus of the top and bottom of the exit enclosure and the identification of the stair or ramp. The signage shall also state the story of, and the direction to the exit discharge and the availability of roof access from the enclosure for the fire department. The sign shall be located 5 feet (1524 mm) above the floor landing in a position that is readily visible when the doors are in the open and closed positions. Floor level identification signs in tactile characters complying with ICC A117.1, ~~Section 703.3~~ shall be located at each floor level landing adjacent to the door leading from the enclosure into the corridor to identify the floor level.

1110.3 Other signs. Signage indicating special accessibility provisions shall be provided as shown:

1. Each assembly area required to comply with Section 1108.2.6 shall provide a sign notifying patrons of the availability of assistive listening systems.

Exception: Where ticket offices or windows are provided, signs are not required at each assembly area provided that signs are displayed at each ticket office or window informing patrons of the availability of assistive listening systems.

2. At each door to an egress stairway, exit passageway and exit discharge, signage shall be provided in accordance with Section 1011.3.
3. At areas of refuge, signage shall be provided in accordance with Sections 1007.6.3 through 1007.6.5.
4. At areas for assisted rescue, signage shall be provided in accordance with Section 1007.8.3.
5. Within exit enclosures signage shall be provided in accordance with Section 1020.1.6.

Commenter's Reason: The reference to Section 703.3 in ICC A117.1 was intended to provide specific direction to appropriate requirements for the signage rather than a general reference, but based on the committee comments, it has been removed from the proposal.

The committee was incorrect in its assumption that floor level identification is not found in A117.1. See ICC A117.1-2003, Section 504.9. It is proposed to add this important safety information into the building code. This is not just an accessibility issue.

Final Hearing Results

E139-06/07**AMPC1**

Code Change No: **E140-06/07**

Original Proposal

Sections: 1020.1.6, 1020.1.6.1 (New) [IFC [B] 1020.1.6, [B] 1020.1.6.1 (New)]

Proponent: Dave Frable, U.S. General Services Administration

Revise as follows:

1020.1.6 Stairway identification floor number signs. A sign shall be provided at each floor landing in interior exit enclosures connecting more than three stories designating the floor level, the terminus of the top and bottom of the stair enclosure and the identification of the stair. The signage shall also state the story of, and the direction to the exit discharge and the availability of roof access from the stairway for the fire department. The sign shall be located 5 feet (1524 mm) above the floor landing in a position that is readily visible when the doors are in the open and closed positions.

1020.1.6.1 Signage requirements. Stairway identification signs shall comply with all of the following requirements:

1. The signs shall be a minimum size of 18 inches (457 mm) by 12 inches (305 mm).
2. The letters designating the identification of the stair enclosure shall be a minimum of 1-1/2 inches (38 mm) in height.
3. The number designating the floor level shall be a minimum of 5 inches (127 mm) in height and located in the center of the sign.
4. All other lettering and numbers shall be a minimum of 1 inch in height (22 mm).
5. Characters and their background shall have a nonglare finish. Characters shall contrast with their background, with either light characters on a dark background, or dark characters on a light background.

Reason: The only intent of this code change proposal is to revise the title of this section to a title that more accurately reflects the content of the Section. In addition, the proposed signage requirements will provide some sort of consistency for stairway identification signs across the U.S. The signage requirements are based on current GSA requirements as well current signage requirement in the NFPA 101, *Life Safety Code*.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal adds necessary clarification and standardization to the code regarding stairway floor signage requirements.

Assembly Action:

None

Final Hearing Results

E140-06/07

AS

Code Change No: **E146-06/07**

Original Proposal

Sections: 1022.4 (New) [IFC [B] 1022.4 (New)

Proponent: Dennis Richardson, City of San Jose, CA Building Division, representing Tri-Chapter Code Committee (Peninsula, East Bay and Monterey Chapters of ICC)

Add new text as follows:

1022.4 Ducts and air transfer openings, Ducts and air transfer openings through fire walls or fire barriers, forming a horizontal exit, shall be designed and protected in accordance with Section 716 in order to afford safety from both fire and smoke in the refuge area. All ducts and air transfer openings shall be protected by listed combination fire/smoke dampers.

Reason: The purpose of the code change is to provide code language that implements the intent of Section 1002.1, definition of Horizontal Exit. Horizontal exits are intended to afford safety from both fire **and smoke**.

No code provisions specifically require duct and air transfer openings in horizontal exit walls to be designed and protected in order to afford safety from both fire and smoke in the refuge area.

Section 1022.2 Separation, refers to sections 705 and 706 which refer to 716.5.1 and 716.5.2 There are no provisions in 716.5.1 Fire walls, and 716.5.2 Fire barriers, requiring ducts and air transfer openings in horizontal exit walls to be protected by anything other than fire dampers.

Cost Impact: The code change proposal will not increase the cost of construction as the definition of Horizontal Exit is very clear. It is currently the intent of the code to provide protection from smoke in addition to fire for horizontal exits. It appears the lack of such implementing code language is an oversight in the current code.

Analysis: If approved, would this section conflict with duct and transfer opening requirements for fire walls Section 705.10 or fire barrier in Section 706.10?

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proponent has identified a missing item in the code that needs be addressed, however, the reference to Section 716 jumps over limitations in fire walls and fire barriers. This language would better located in Chapter 7.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Dennis Richardson, City of San Jose, Building Division, representing Tri-Chapter Code Committee (Peninsula, East Bay, and Monterey Bay Chapters of ICC) requests Approval as Modified by this public comment.

Replace proposal with the following:

716.5.1.1 Horizontal Exits. A listed smoke damper designed to resist the passage of smoke shall be provided at each point a duct or air transfer opening penetrates a fire wall or fire barrier that serves as a horizontal exit.

716.5.2.1 Horizontal Exits. A listed smoke damper designed to resist the passage of smoke shall be provided at each point a duct or air transfer opening penetrates a fire wall or fire barrier that serves as a horizontal exit.

1022.2 Separation. The separation between buildings or refuge areas connected by a horizontal exit shall be provided by a fire wall complying with Section 705 or a fire barrier complying with Section 706 and having a fire-resistance rating of not less than 2 hours. Opening protectives in horizontal exit walls shall also comply with Section 715. Duct and air transfer openings in a fire wall or fire barrier that serves as a horizontal exit shall also comply with Section 716. The horizontal exit separation shall extend vertically through all levels of the building unless floor assemblies have a fire-resistance rating of not less than 2 hours with no unprotected openings.

Commenter's Reason: The committee acknowledged smoke dampers are missing for fire walls and fire barriers serving as horizontal exit walls in the present code language. This public comment addresses the concern raised by the committee that the original language in E146 creating a new section to address this issue jumped over references to Sections 705 and 706 found in Section 1022.2 of the present code language. By adding the reference to Section 716 in a similar manner as the reference to Section 715 found in Section 1022.2, the public comment language preserves the integrity of the references to Sections 705 and 706 found in Section 1022.2. Sections 716.5.1.1 and 716.5.2.1 are added in Chapter 7 to clarify smoke dampers are required in addition to fire dampers for fire walls and fire barriers serving as a horizontal exit wall but not in other fire walls and fire barriers.

Final Hearing Results

E146-06/07

AMPC1

Code Change No: E147-06/07

Original Proposal

Sections: 1023.2 (IFC [B] 1023.2)

Proponent: Tim Pate, City and County of Broomfield, Colorado Building Department, representing Colorado Chapter ICC

Revise as follows:

1023.2 Use in a means of egress. Exterior exit ~~ramps and~~ stairways shall not be used as an element of a required means of egress for Group I-2 occupancies. For occupancies in other than Group I-2, exterior exit ramps and stairways shall be permitted as an element of a required means of egress for buildings not exceeding six stories above grade plane or having occupied floors more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access.

Reason: This proposal will delete the requirement that does not allow an exterior exit ramp to be used as a part of the means of egress (exit discharge) for an I-2 occupancy. The code would allow an exit ramp to be used within the building to access the exit so it does not make sense to not allow the same type of exit ramp to be used at the exterior discharge. The ramp would be constructed with the proper maximum slope, handrails, edge protection, etc. so that it would be just as safe on the exterior as it is on interior. The code also regulates outdoor conditions as per Section 1010.7.2 which would make sure water would not accumulate on the walking surface.

The change that put this in – E60/02, was adding 'ramps and' to multiple sections that addressed 'stairways'. The reason states "This proposal is to recognize that exterior exit elements can also include ramps. The same protection criteria applied to stairways is also applicable to ramps when used as part of the exit system." It appears this change, especially when a high percentage of the people could be in wheelchairs or even in beds, inadvertently resulted in a prohibition for exterior ramps for Group I-2 occupancies.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: While the committee agreed that ramps should be permitted as part of the means of egress from Group I-2 facilities at some level, with the current deletion, the second sentence of the section would then allow a Group I-2 to have an exit ramp of any height.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Tim Pate, City and County of Broomfield, Colorado, representing himself, requests Approval as Modified by this public comment.

Replace proposal as follows:

1023.2 Use in a means of egress. Exterior exit ramps with a rise of more than one story and stairways shall not be used as an element of a required means of egress for Group I-2 occupancies. For occupancies in other than Group I-2, exterior exit ramps and stairways shall be permitted as an element of a required means of egress for buildings not exceeding six stories above grade plane or having occupied floors more than 75 feet (22 860 mm) above the lowest level of fire department vehicle access.

Commenter's Reason: The intent of the original code change was to allow exterior ramps to serve as part of required means of egress for Group I-2 occupancies since ramps could also be used as part of the exit access within the same occupancy. The committee agreed that an exterior ramp should be allowed. They had concern that the original wording would then allow an exterior ramp of any height. This modification would restrict the height of the exterior ramp to one story or less. This modified change would then allow I-2 occupancies to be built on sites where the required exits are not always at grade.

Final Hearing Results

E147-06/07

AS

Code Change No: E150-06/07

Original Proposal

Sections: 1024.1 (IFC [B] 1024.1)

Proponent: Jason T. Thompson, National Concrete Masonry Alliance (NCMA), representing Masonry Alliance for Codes and Standards (MACS)

Revise as follows:

1024.1 General. Exits shall discharge directly to the exterior of the building. The exit discharge shall be at grade or shall provide direct access to grade. The exit discharge shall not reenter a building.

Exceptions:

1. A maximum of 50 percent of the number and capacity of the exit enclosures is permitted to egress through areas on the level of discharge provided all of the following are met:
 - 1.1. Such exit enclosures egress to a free and unobstructed way to the exterior of the building, which way is readily visible and identifiable from the point of termination of the exit enclosure.
 - 1.2. The entire area of the level of discharge is separated from areas below by construction conforming to the fire-resistance rating for the exit enclosure.
 - 1.3. The egress path from the exit enclosure on the level of discharge is protected throughout by an approved automatic sprinkler system. All portions of the level of discharge with access to the egress path shall either be protected throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2, or separated from the egress path in accordance with the requirements for the enclosure of exits.
2. A maximum of 50 percent of the number and capacity of the exit enclosures is permitted to egress through a vestibule provided all of the following are met:
 - 2.1. The entire area of the vestibule is separated from areas below by construction conforming to the fire-resistance rating for the exit enclosure.
 - 2.2. The depth from the exterior of the building is not greater than 10 feet (3048 mm) and the length is not greater than 30 feet (9144 mm).
 - 2.3. The area is separated from the remainder of the level of exit discharge by construction providing protection at least the equivalent of approved wired glass in steel frames.
 - 2.4. The area is used only for means of egress and exits directly to the outside.

3. Stairways in open parking garages complying with Section 1020.1, Exception 5, are permitted to egress through the open parking garage at the level of exit discharge.
4. Horizontal exits complying with Section 1022 shall not be required to discharge directly to the exterior of the building.

Reason: This proposed code change corrects an oversight in the International Building Code (IBC). A horizontal exit complying with Section 1022 is a unique type of exit that is located generally within the middle of a story. It subdivides the story into separate areas by 2-hour fire-resistive wall construction to create refuge areas on either side of the horizontal exit wall. The code allows the doors in the horizontal exit to serve as one of the required exits provided there is at least one exit stairway or exterior exit door on each side of the horizontal exit. This allows for the occupants to eventually discharge to the exterior of the building without having to pass through another horizontal exit. Obviously, horizontal exits cannot discharge directly to the exterior of the building by virtue of their design. Yet they are recognized as acceptable exits by the code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal clarifies that horizontal exits can exit into another building rather than directly to the exterior.

Assembly Action:

None

Final Hearing Results

E150-06/07

AS

Code Change No: E152-06/07

Original Proposal

Sections: 1025.1, 1025.2, 1025.3, 1025.9, 1010.2, 1012.5, 1014.3 (IFC [B]1025.1, [B]1025.2, [B]1025.3, [B]1025.9, [B]1010.2, [B]1012.5, [B]1014.3)

Proponent: Arlan Smith, Idaho Division of Building Safety, representing Idaho Association of Building Officials

Revise as follows:

1025.1 General. Occupancies in Group A and assembly occupancies accessory to Group E which contain seats, tables, displays, equipment or other material shall comply with this section.

1025.2 Assembly main exit. Group A occupancies and assembly occupancies accessory to Group E occupancies that have an occupant load of greater than 300 shall be provided with a main exit. The main exit shall be of sufficient width to accommodate not less than one-half of the occupant load, but such width shall not be less than the total required width of all means of egress leading to the exit. Where the building is classified as a Group A occupancy, the main exit shall front on at least one street or an unoccupied space of not less than 10 feet (3048 mm) in width that adjoins a street or public way.

Exception: In assembly occupancies where there is no well-defined main exit or where multiple main exits are provided, exits shall be permitted to be distributed around the perimeter of the building provided that the total width of egress is not less than 100 percent of the required width.

1025.3 Assembly other exits. In addition to having access to a main exit, each level in a Group A or assembly occupancies accessory to Group E occupancies ~~occupancy~~ having an occupant load greater than 300 shall be provided with additional means of egress that shall provide an egress capacity for at least one-half of the total occupant load served by that level and comply with Section 1015.2.

Exception: In assembly occupancies where there is no well-defined main exit or where multiple main exits are provided, exits shall be permitted to be distributed around the perimeter of the building, provided that the total width of egress is not less than 100 percent of the required width.

1025.9 Assembly aisles are required. Every occupied portion of any occupancy in Group A or assembly occupancies accessory to Group E that contains seats, tables, displays, similar fixtures or equipment shall be provided with aisles leading to exits or exit access doorways in accordance with this section. Aisle accessways for tables and seating shall comply with Section 1014.4.3.

1010.2 Slope. Ramps used as part of a means of egress shall have a running slope not steeper than one unit vertical in 12 units horizontal (8-percent slope). The slope of other pedestrian ramps shall not be steeper than one unit vertical in eight units horizontal (12.5-percent slope).

Exception: Aisle ramp slope in occupancies of Group A or assembly occupancies accessory to Group E occupancies shall comply with Section 1025.11.

1012.5 Handrail extensions. Handrails shall return to a wall, guard or the walking surface or shall be continuous to the handrail of an adjacent stair flight or ramp run. At stairways where handrails are not continuous between flights, the handrails shall extend horizontally at least 12 inches (305 mm) beyond the top riser and continue to slope for the depth of one tread beyond the bottom riser. At ramps where handrails are not continuous between runs, the handrail shall extend horizontally above the landing 12 inches (305 mm) minimum beyond the top and bottom ramps.

Exceptions:

1. Handrails within a dwelling unit that is not required to be accessible need extend only from the top riser to the bottom riser.
2. Aisle handrails in Group A and E occupancies in accordance with Section 1025.13.

1014.3 Common path of egress travel. In occupancies other than Groups H-1, H-2 and H-3, the common path of egress travel shall not exceed 75 feet (22 860 mm). In Group H-1, H-2, and H-3 occupancies, the common path of egress travel shall not exceed 25 feet (7620 mm). For common path of egress travel in Group A occupancies and assembly occupancies accessory to Group E occupancies having fixed seating, see Section 1025.8.

Exceptions:

1. The length of a common path of egress travel in Group B, F and S occupancies shall not be more than 100 feet (30 480 mm), provided that the building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1.
2. Where a tenant space in Group B, S and U occupancies has an occupant load of not more than 30, the length of a common path of egress travel shall not be more than 100 feet (30 480 mm).
3. The length of a common path of egress travel in a Group I-3 occupancy shall not be more than 100 feet (30 480 mm).
4. The length of a common path of egress travel in a Group R-2 occupancy shall not be more than 125 feet (38 100 mm), provided that the building is protected throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1.

Reason: Without this change we are left with no provisions to govern assembly seating as found in school auditoriums, cafeterias and gymnasiums. These areas are not Group A Occupancies because they are specifically Group E occupancies as per IBC Section 302.2.1 and 303.1.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal provides equivalent levels of egress safety for educational occupancies that may have assembly areas (e.g. cafeterias, libraries).

Assembly Action:

None

Final Hearing Results

E152-06/07

AS

Code Change No: E153-06/07

Original Proposal

Sections: 1025.4 (IFC [B] 1025.4)

Proponent: Gene Boecker, Code Consultants, Inc.

Revise as follows:

1025.4 Foyers and lobbies. In Group A-1 occupancies, where persons are admitted to the building at times when seats are not available and are allowed to wait in a lobby or similar space, provided such use of lobby or similar space shall not encroach upon the required clear width of the means of egress. ~~Such waiting areas shall be separated from the required means of egress by substantial permanent partitions or by fixed rigid railings not less than 42 inches (1067 mm) high.~~ Such foyer, if not directly connected to a public street by all the main entrances or exits, shall have a straight and unobstructed corridor or path of travel to every such main entrance or exit.

Reason: To eliminate an unnecessary code requirement from the IBC.

This provision does not address egress but the use of the space. It does not belong in the code. The only time that the separation is needed is when there is no emergency in the theater. In practice, these railed separations are unnecessary. The means of egress from a lobby must take into consideration the queuing population, making this requirement redundant.

It is a misunderstanding, therefore, to consider persons in waiting areas as potential obstructions to egress. Whether queuing or seated, these persons are occupants, and must be accommodated by the means of egress. Unfortunately, this requirement is widely interpreted to require rails or partitions, even when (as the code requires) the waiting load is already accommodated by the means of egress.

In addition, these rails or partitions can themselves constitute obstructions to egress.

As an example, a theater has 1,000 seats, 50 employees and a queuing (waiting) load of 300. This results in a total occupant load of 1,350. Egress capacity from the entire occupancy must at least equal this occupant load. More importantly to this proposal, the egress capacity of the main exit from the lobby must accommodate ½ of this load (675). The queuing load is already included in this calculation, and the egress width required to serve the queuing population as well as the theater occupants leaving the seating areas would be required by the code to be accommodated by the main exit and other exits from the occupancy.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The language should not be deleted. A separation is required for waiting areas in order to keep them from creeping into the path for means of egress.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Gene Boecker, Code Consultants, Inc., requests Approval as Submitted.

Commenter's Reason: Several comments by the committee seem to indicate that the issue was not well understood. The issue raised by the committee does not validate the concern. Why is it necessary to keep the people in the waiting area from creeping into the path of egress? What is the threat or danger? There was no reason stated because there is none. All the occupants will need to egress in an emergency so the egress path will be "occupied" regardless.

The people in the waiting area and the people in the theater(s) are used to determine the total width of egress at the main entrance. It is not required to distribute the widths according to where they are located in the lobby. The entire set of doors is used for egress. If (for example) the doors are sized for 1500 people in the theater and 500 people in the waiting, the total width must be based upon 2000 occupants – regardless of where they are coming from. If a physical barrier is placed between the people waiting to egress (whether from the theaters or from the lobby) and the egress doors, people will be forced to either wait while their side egresses or climb over the barrier to reach the available egress doors. The entire main egress is designed for the 2000 occupants whether on one side or the other of the fixed barrier. If there were no barrier and people moved over to the path of egress from the theater, they would still be in queue waiting to leave. It takes the same amount of time to

egress 2000 people whether some are “within the path of egress” or not. On the other hand, with the physical barrier in place, it is possible to cause some occupants to be delayed based on which side of the barrier they chose to egress. Given a choice, people typically pick the shortest line but if they are restricted in so doing by a fixed barrier, they cannot opt for the alternate route.

It makes no sense to restrict the occupants from access to egress elements. This provision has been in one of the legacy codes but not the others; nor in the Life Safety Code®. If there is evidence of a problem with the design that has no physical barriers then that should be presented as evidence of a need for the barriers. To date, no entity has presented such evidence. It is illogical to place a restriction on egress in this manner.

The provision appears to be solely based on circulation related concerns – allowing people to leave the theater while not interfering with those waiting for the next event. If that is the case, there are no provisions within the code to determine the width, nor does that fall into the realm of life safety. Hence, it has no place within the code – it is a convenience issue.

As noted above, the fixed barrier is actually less safe than allowing a free and open area from which to select an egress path. Without substantiating data showing that this is a viable concern – and with historical evidence showing that some legacy codes (and other current codes) do not require the barrier this provision should be removed as a potential impediment to egress.

Final Hearing Results

E153-06/07
AS

Code Change No: E155-06/07

Original Proposal

Sections: 1025.5, 1025.5.1, 1020.1 (IFC [B] 1025.5, [B] 1025.5.1, [B] 1020.1)

Proponent: Tom Wandrie, ICC 300 Development Committee

Revise as follows:

1025.5 Interior balcony, ~~and gallery and press box~~ means of egress. For balconies, ~~or galleries or press boxes~~ having a seating capacity of 50 or more located in Group A occupancies, at least two means of egress shall be provided, with one from each side of every balcony, ~~or gallery or press boxes~~ and at least one leading directly to an exit.

1025.5.1 Enclosure of balcony openings. Interior stairways and other vertical openings shall be enclosed in an exit enclosure as provided in Section 1020.1, except that stairways are permitted to be open between the balcony, ~~gallery or press box~~ and the main assembly floor in occupancies such as theaters, places of religious worship, ~~and auditoriums and sports facilities~~. At least one accessible means of egress is required from a balcony, ~~or gallery or press boxes~~ level containing accessible seating locations in accordance with Section 1007.3 or 1007.4.

1020.1 Enclosures required. Interior exit stairways and interior exit ramps shall be enclosed with fire barriers constructed in accordance with Section 706 or horizontal assemblies constructed in accordance with Section 711, or both. Exit enclosures shall have a fire-resistance rating of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories. The number of stories connected by the exit enclosure shall include any basements but not any mezzanines. An exit enclosure shall not be used for any purpose other than means of egress.

Exceptions:

1. In all occupancies, other than Group H and I occupancies, a stairway is not required to be enclosed when the stairway serves an occupant load of less than 10 and the stairway complies with either Item 1.1 or 1.2. In all cases, the maximum number of connecting open stories shall not exceed two.
 - 1.1. The stairway is open to not more than one story above the story at the level of exit discharge; or
 - 1.2. The stairway is open to not more than one story below the story at the level of exit discharge.
2. Exits in buildings of Group A-5 where all portions of the means of egress are essentially open to the outside need not be enclosed.
3. Stairways serving and contained within a single residential dwelling unit or sleeping unit in Group R-1, R-2 or R-3 occupancies are not required to be enclosed.

4. Stairways that are not a required means of egress element are not required to be enclosed where such stairways comply with Section 707.2.
5. Stairways in open parking structures that serve only the parking structure are not required to be enclosed.
6. Stairways in Group I-3 occupancies, as provided for in Section 408.3.6, are not required to be enclosed.
7. Means of egress stairways as required by Section 410.5.3 are not required to be enclosed.
8. Means of egress stairways from balconies, galleries and press boxes as provided for in Section 1025.5.1, are not required to be enclosed.
- 8- 9. In other than Group H and I occupancies, a maximum of 50 percent of egress stairways serving one adjacent floor are not required to be enclosed, provided at least two means of egress are provided from both floors served by the unenclosed stairways. Any two such interconnected floors shall not be open to other floors. Unenclosed exit stairways shall be remotely located as required in Section 1015.2.
- 9- 10. In other than Group H and I occupancies, interior egress stairways serving only the first and second stories of a building equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 are not required to be enclosed, provided at least two means of egress are provided from both floors served by the unenclosed stairways. Such interconnected stories shall not be open to other stories. Unenclosed exit stairways shall be remotely located as required in Section 1015.2.

Reason: The intent of this proposal is to clarify when press boxes can use a single means of egress. Open stairways are permitted between the press box and the main floor or ground similar to balconies. Changes to Section 1020.1 are for coordination only. If the committee decision is that press boxes do not need to be included, the exception for open exit stairways at balconies and galleries should still be referenced in Section 1020.1.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: While the committee agreed with the intent of the proposal, there can be a great diversity in what might be considered a press box. A definition for press boxes is needed in order to define where this special means of egress would be permitted. It should be clarified if the occupant load would be determined for each room in a press box or the whole level. Press boxes are addressed in IBC 903, 1025 and 1104.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Tom Wandrie, ICC 300 Development Committee, requests Approval as Submitted.

Commenter's Reason: The reason "Press Boxes" were included in our proposed revision was to be certain they would be regulated under the IBC and not the ICC 300 standard. A press box is simply a space which is very similar to a balcony or gallery (both of which are not defined in the IBC). The press box is typically partially or fully enclosed for sound proofing purposes. If fully enclosed, at least one side facing the playing area is glazed. Therefore a fire in the press box would be noticed, similar to a balcony, gallery, or mezzanine. IBC sections 903, 1025, and 1104 already identify press boxes as accessory use areas, and provide sprinkler thresholds and accessible route requirements. We believe it makes the most sense to include press boxes with balconies and galleries in the IBC sections identified in this change proposal. These changes would clearly identify that; a seating capacity of 50 or more requires at least two exits and when exit enclosures are required.

Final Hearing Results

E155-06/07

AS

Code Change No: E158-06/07

Original Proposal

Sections: 1025.10 (IFC [B] 1025.10)

Proponent: Ed Roether, HOK SVE

Add new text as follows:

1025.10 Clear width of aisle accessways serving seating. Where seating rows have 14 or fewer seats, the minimum clear aisle accessway width shall not be less than 12 inches (305 mm) measured as the clear horizontal distance from the back of the row ahead and the nearest projection of the row behind. Where chairs have automatic or self-rising seats, the measurement shall be made with seats in the raised position. Where any chair in the row does not have an automatic or self-rising seat, the measurements shall be made with the seat in the down position. For seats with folding tablet arms, row spacing shall be determined with the tablet arm ~~down~~ in the used position.

Exception: For seats with folding tablet arms, row spacing is permitted to be determined with the tablet arm in the stored position where the tablet arm when raised manually to vertical position in one motion automatically returns to the stored position by force of gravity.

Reason: The current language is not clear if the arm is in the used position or folded down on the side. Means of egress should be evaluated using the most conservative approach for aisle accessway width.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: Seats with folding tablets are a common condition that occurs in many higher education lecture halls. The proposal provides specific criteria to maintain the aisle accessways where tablets are used.

Assembly Action:

None

Code Change No: E160-06/07

Original Proposal

Sections: 1025.14.2 (IFC [B] 1025.14.2)

Proponent: Tom Wandrie, ICC 300 Development Committee

Revise as follows:

1025.14.2 Sightline-constrained guard heights. Unless subject to the requirements of Section 1025.14.3, a fascia or railing system in accordance with the guard requirements of Section 1013 and having a minimum height of 26 inches (660 mm) shall be provided where the floor or footboard elevation is more than 30 inches (762 mm) above

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

the floor or grade below and the fascia or railing would otherwise interfere with the sightlines of immediately adjacent seating. At bleachers, a guard must be provided ~~where the floor or footboard elevation is more than 24 inches (610 mm) above the floor or grade below and the fascia or railing would otherwise interfere with the sightlines of the immediately adjacent seating~~ where required by ICC 300.

Reason: Code change E73-02 which added this language into the IBC was approved as a coordination item with ICC 300. This 24" drop off requirement is not in the ICC 300 Section 408.1 which deals with guards.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal will coordinate with the ICC 300 and should be addressed in that standard.

Assembly Action:

None

Final Hearing Results

E160-06/07

AS

Code Change No: E163-06/07

Original Proposal

Chapter 35

Proponent: Tom Wandrie, ICC 300 Development Committee

Revise standard as follows:

ICC

ICC 300 – ~~02~~ 06 Standard on Bleachers, Folding and Telescopic Seating and Grandstands

Reason: The work plan for the bleacher standard should result in a completed document before the September hearings.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposal was disapproved because although the development of the 2006 edition is complete, the standard is not yet printed and generally available.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Tom Wandrie, ICC 300 Development Committee, requests Approval as Submitted.

Commenter's Reason: The committee disapproved this proposal because while the final draft for the 2007 edition off ICC 300 was available, the document was not available for sale. The ICC 300, 2007 edition will be published and available for sale before the Final Action Hearings in 2007.

Final Hearing Results

E163-06/07

AS

Code Change No: E164-06/07

Original Proposal

Chapter 35

Proponent: Standards writing organizations as listed below.

Revise standards as follows:

BHMA	Builders Hardware Manufacturers Association 355 Lexington Avenue, 17 th Floor New York, NY 10017-6603
Standard reference number	Title
A 156.10-2005 4999	Power Operated Pedestrian Doors
NFPA	National Fire Protection Association 1 Batterymarch Park Quincy, MA 02269-9101
Standard reference number	Title
101-06 03	Life Safety Code

Reason: The *ICC Code Development Process for the International Codes* (Procedures) Section 4.5* requires the updating of referenced standards to be accomplished administratively, and be processed as a Code Proposal. In May 2005, a letter was sent to each developer of standards that are referenced in the I-Codes, asking them to provide ICC with a list of their standards in order to update to the current edition. Above is the list received of the referenced standards under the maintenance responsibility of the IBC Means of Egress Committee.

* **4.5 Updating Standards:** The updating of standards referenced by the Codes shall be accomplished administratively by the appropriate code development committee in accordance with these full procedures except that multiple standards to be updated may be included in a single proposal.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The latest editions of BMHA A156.10 and NFPA 101 were approved for inclusion in the referenced standards.

Assembly Action:

None

AS

Code Change No: **E165-06/07**

Original Proposal

Section: 1103.2.3

Proponent: Ed Roether, HOK SVE

Revise as follows:

1103.2.3 Employee work areas. Spaces and elements within employee work areas shall only be required to comply with Sections 907.9.1.2, 1007 and 1104.3.1 and shall be designed and constructed so that individuals with disabilities can approach, enter and exit the work area. Work areas, or portions of work areas, other than raised courtroom stations, that are less than 450 300 square feet (44 30 m²) in area and elevated 7 inches (178 mm) or more above the ground or finish floor where the elevation is essential to the function of the space shall be exempt from all requirements.

Reason: The purpose of this proposed change is twofold, first to clarify that raised courtroom stations are to be accessible and second to amend the allowance for the area of raised work areas in order to coordinate with ADAAG revised July 2004. Without this proposed change raised courtroom stations might typically be exempt even though it is questionable whether such elevation is essential to the function and raised platforms greater than 150 square feet but less than 300 would be required to be accessible even though they would not by ADAAG.

The question at hand is what degree of accessibility is appropriate for raised courtroom stations and raised platforms in general. ADAAG is recognized for establishing such limits. As such, the requirements of ADAAG regarding this issue should be reflected in IBC. However, ADAAG would permit the accessible route to be installed at a later date. This proposal would not given a previous action by the means of egress committee which rejected a proposal to permit courtroom stations to be “adaptable” consistent with ADAAG because of concerns regarding enforceability.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal language will help small business employee areas. This is also consistent with the new ADA/ABA Accessibility Guidelines for employee work areas. The language for court rooms is addressed in E183-06/07.

Assembly Action:

None

E165-06/07

AS

Code Change No: **E168-06/07**

Original Proposal

Section: 1103.2.14

Proponent: Bill Conner, Bill Conner Associates LLC, representing himself

Revise as follows:

1109.14 1103.2.14 Fuel-dispensing systems. Fuel-dispensing systems ~~The operable parts on fuel-dispensing devices shall comply with ICC A117.1, Section 308.2.4 or 308.3.4.~~

Reason: Technical provisions specific for accessibility for fuel dispensing systems are addressed in ICC A117.1. There is no reason to repeat the technical requirements/limitations in the IBC. As proposed, this requirement is no longer an exception (Section 1103.2, General Exceptions), so the section should be relocated to Section 1109, Other Features and Facilities. The proposed language also coordinates the provisions in the IBC with the latest ADAAG requirements.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal will coordinate with the technical requirements for fuel dispensing devices in ICC A117.1-2003. Specific sections of a standard should not be referenced in the building code.

Assembly Action:

None

Final Hearing Results

E168-06/07

AS

Code Change No: E169-06/07

Original Proposal

Sections: 1104.3, 1108.2.4

Proponent: Ed Roether, HOK SVE

Revise as follows:

1104.3 Connected spaces. When a building or portion of a building is required to be accessible, an accessible route shall be provided to each portion of the building, to accessible building entrances connecting accessible pedestrian walkways and the public way.

Exception: In assembly areas with fixed seating ~~required to be accessible~~, an accessible route shall not be required to serve ~~fixed seating levels~~ where wheelchair spaces ~~or designated aisle seats required to be on an accessible route~~ are not provided.

1108.2.4 Designated aisle seats. At least 5 percent, but not less than one, of the total number of aisle seats provided shall be designated aisle seats and shall be the aisle seats located closest to accessible routes.

Exception: Designated aisle seats are not required in team or player seating serving areas of sport activity.

Reason: The purpose of this proposed change is to coordinate with the revised ADAAG issued July 2004. Designated aisle seats are not required on an accessible route by the new ADAAG. Therefore, the proposed language is necessary to coordinate with the revised ADAAG.

The applicable provision in the new ADAAG states: "At least 5 percent of the total number of aisle seats provided shall comply with 802.4 and shall be the aisle seats located closest to accessible routes." Without the proposed revisions, the designated aisle seats could be located up or down a series of steps, which would make their purpose much less effective. This proposed change would coordinate IBC with the new ADAAG.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal clarifies the limits of the exception in Section 1104.3. The proposed language in Section 1108.2.4 coordinates the location of the designated aisle seats with the new ADA/ABA Accessibility Guidelines.

Assembly Action:

None

AS

Code Change No: **E170-06/07**

Original Proposal

Section: 1104.4

Proponent: Dave Frable, U.S. General Services Administration

Revise as follows:

1104.4 Multilevel buildings and facilities. At least one accessible route shall connect each accessible level, including mezzanines, in multilevel buildings and facilities.

Exceptions:

1. An accessible route is not required to stories and mezzanines above and below accessible levels that have an aggregate area of not more than 3,000 square feet (278.7 m2). This exception shall not apply to:
 - 1.1. Multiple tenant facilities of Group M occupancies containing five or more tenant spaces;
 - 1.2. Levels containing offices of health care providers (Group B or I); or
 - 1.3. Passenger transportation facilities and airports (Group A-3 or B).
2. ~~In Group A, I, R and S occupancies,~~ levels that do not contain accessible elements or other spaces required by Section 1107 or 1108 are not required to be served by an accessible route from an accessible level.
3. In air traffic control towers, an accessible route is not required to serve the cab and the floor immediately below the cab.
4. Where a two-story building or facility has one story with an occupant load of five or fewer persons that does not contain public use space, that story shall not be required to be connected by an accessible route to the story above or below.
5. The vertical portion of the accessible route to elevated employee work stations within a courtroom is not required at the time of initial construction, provided a ramp, lift or elevator complying with ICC A117.1 can be installed without requiring reconfiguration or extension of the courtroom or extension of the electrical system.

Reason: We believe that the IBC requirements for accessible route to elevated workstations in a courtroom do not need to be more restrictive than the Federal ADA/ABA guidelines. While requiring access in a single courtroom building would be a good idea, requiring the installation of a platform lift or ramp in all courtrooms in a multi-courtroom building would be cost-prohibitive. The proposed language is consistent with the Federal ADA/ABA guidelines. Please note that the exception does not apply to elevated courtroom areas that are likely to be used by members of the public who are not employees of the court such as jury areas, attorney areas, or witness stands. In addition, GSA as well as other Federal agencies adhere to the Federal ADA/ABA guidelines and having the IBC accessibility requirements in courtrooms being more restrictive than the Federal ADA/ABA guidelines will lead to confusion among architects designing Federal Courthouses.

The revision to Exception 2 is editorial in nature. Groups A and S are addressed in Section 1108. Groups I and R are addressed in Section 1107. This exception has currently been misinterpreted as a general exception to all Group A, I, R and S occupancies, especially in jurisdictions that had exceptions for storage levels in previous accessibility requirements. A straight reference to Sections 1107 and 1108 would allow the same exception without the confusion.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

1104.4 Multilevel buildings and facilities. At least one accessible route shall connect each accessible level, including mezzanines, in multilevel buildings and facilities.

Exceptions:

1. An accessible route is not required to stories and mezzanines above and below accessible levels that have an aggregate area of not more than 3,000 square feet (278.7 m²). This exception shall not apply to:
 - 1.1. Multiple tenant facilities of Group M occupancies containing five or more tenant spaces;
 - 1.2. Levels containing offices of health care providers (Group B or I); or 1.3. Passenger transportation facilities and airports (Group A-3 or B).
2. Levels that do not contain accessible elements or other spaces required by Section 1107 or 1108 are not required to be served by an accessible route from an accessible level.
3. In air traffic control towers, an accessible route is not required to serve the cab and the floor immediately below the cab.
4. Where a two-story building or facility has one story with an occupant load of five or fewer persons that does not contain public use space, that story shall not be required to be connected by an accessible route to the story above or below.
5. ~~The Vertical portion of the accessible route~~ access to elevated employee work stations within a courtroom is not required at the time of initial construction, provided a ramp, lift or elevator complying with ICC A117.1 can be installed without requiring reconfiguration or extension of the courtroom or extension of the electrical system.

Committee Reason: The IBC should include provisions for accessibility into courtrooms that are consistent with the new ADA/ABA Accessibility Guidelines. The modification to Exception 5 would be more consistent with the terminology found in the Guidelines. The proposed language in Exception 5 regarding the route has implications that are not appropriate for this section.

Assembly Action:**None**

Final Hearing Results

E170-06/07

AM

Code Change No: E173-06/07

Original Proposal

Sections: 1106.2, 1106.3, 1106.4**Proponent:** Philip Brazil, Reid Middleton, Inc., representing himself**Revise as follows:**

1106.2 Groups R-2 and R-3. At least two percent, but not less than one, of each type of parking space provided for occupancies in Groups R-2 and R-3, which are required to have Accessible, Type A or Type B dwelling or sleeping units, shall be accessible. Where parking is provided within or beneath a building, accessible parking spaces shall also be provided within or beneath the building.

1106.3 Hospital outpatient facilities. At least ten percent, but not less than one, of patient and visitor parking spaces provided to serve hospital outpatient facilities shall be accessible.

1106.4 Rehabilitation facilities and outpatient physical therapy facilities. At least twenty percent, but not less than one, of the portion of patient and visitor parking spaces serving rehabilitation facilities specializing in treating conditions that affect mobility and outpatient physical therapy facilities shall be accessible.

Reason: The purpose of this proposal is to clarify the requirements for minimum numbers of accessible parking spaces in Groups R-2 and R-3 occupancies, and at hospital outpatient, rehabilitation and outpatient physical therapy facilities. It is also being done for consistency with similar language in Sections 1106.5, 1107.5.1.1, 1107.5.2.1, 1107.5.3.1, 1107.5.5.1, 1107.6.2.1.1, 1107.6.4.1. There is the impression that a threshold of 2 percent, for example, is reached when the number of parking spaces reaches 76, which is not the intent. A second parking space is required when the number of parking spaces reaches 51.

In Section 1106.3, the phrase "but not less than one" is inserted for consistency with Sections 1106.2 and 1106.4 on accessible parking spaces, and for consistency with similar provisions in Sections 1107.5.1.1, 1107.5.2.1, 1107.5.3.1, 1107.5.5.1 and 1107.6.2.1.1. Without the added phrase, code users may conclude that an accessible parking space is not required until the number of parking spaces reaches 5.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

In Section 1106.4, the phrase “specializing in treating conditions that affect mobility” is inserted for consistency with the current ADAAG provisions. Refer to Section 208.2.2 of the 2004 ADA “Accessibility Guidelines for Buildings and Facilities.” Note that the editorial corrections to these provisions published in the Federal Register, Vol.70, No. 150 (August 5, 2005) do not affect Section 208.2.2 as published in the 2004 Guidelines.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal clarifies that the numbers for parking spaces are not absolutes, but minimums. Clarifies the extent of the parking for rehabilitation facilities and is consistent with the new ADA/ABA Accessibility Guidelines.

Assembly Action:

None

Final Hearing Results

E173-06/07

AS

Code Change No: E174-06/07

Original Proposal

Section: 1106.7.4 (New)

Proponent: Linda Volpe, United Spinal Association

Add new text as follows:

1106.7.4 Mechanical access parking garages. Mechanical access parking garages shall provide at least one passenger loading zone at vehicle drop-off and vehicle pick-up areas.

Reason: Mechanical access parking garages provide services similar to valet parking arrangements, which are required to be provided with a passenger loading zone. In addition, this new requirement would coordinate IBC with Section 209.5 of ADAAG.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal for valet parking at mechanical parking garages makes sense for the user and is consistent with the new ADA/ABA Guidelines.

Code Change No: E176-06/07

Original Proposal

Table 1107.6.1.1

Proponent: Joe Reich, New York State Commission on Quality of Care and Advocacy for Persons with Disabilities; Dominic Marinelli, United Spinal Association

Revise table as follows:

**TABLE 1107.6.1.1
ACCESSIBLE DWELLING AND SLEEPING UNITS**

TOTAL NUMBER OF UNITS PROVIDED	MINIMUM REQUIRED NUMBER OF ACCESSIBLE UNITS WITHOUT ROLL-IN SHOWERS	MINIMUM REQUIRED NUMBER OF ACCESSIBLE UNITS ASSOCIATED WITH ROLL-IN SHOWERS	TOTAL NUMBER OF REQUIRED ACCESSIBLE UNITS
1 to 25	1	0	1
26 to 50	2	0	2
51 to 75	3	1	4
76 to 100	4	1	5
101 to 150	5	2	7
151 to 200	6	2	8
201 to 300	7	3	10
301 to 400	8	4	12
401 to 500	9	4	13
501 to 1,000	2% of total	1% of total	3% of total
Over 1, 001	<u>20, plus 1 for each 100, or fraction thereof, over 1000</u>	10 plus 1 for each 100, or fraction thereof, over 1,000	30 plus 2 for each 100, or fraction thereof, over 1,000

Reason: This proposed modification will clarify and ensure, that the accessible units will offer the same bathing options, as found in the standard rooms.

This change also meets the intent of the Americans with Disabilities Act Accessibility Guidelines (ADAAG) Section 9.1.4 (1) which requires these facilities to offer persons with disabilities a range of options equivalent to those available to other persons served by the facility. Finally, the modified table is identical to the ADA Draft, "Table 224.2 Guest Rooms with Mobility Features". This draft, published July 23, 2004 awaits final approval from the Department of Justice.

The current IBC Table 1107.6.1.1 uses the term "MINIMUM" when referring to the number of rooms associated with roll-in showers. Minimums can always be surpassed, thus allowing roll-in showers to be incorporated in all the accessible units. Some design professionals and hotel chains have done just that, in the belief that roll-in showers were favored by the disabled population. Nothing could be further from the truth. CHOICE and options equivalent to those available without disabilities is the basic premise found in the ADA.

Roll-in showers were never intended to replace transfer showers or tubs in accessible rooms. Once again, this is made clear under 9.1.4 (1) of ADA Title III.

In order to provide persons with disabilities a range of options equivalent to those available to other persons served by the facility,it continues.

"Factors to be considered include room size, cost, amenities provided and the number of beds."

If the standard rooms have tubs, then the accessible rooms would also have tubs, with a small percentage of rooms incorporated roll-in showers. The same would hold true if all the standard rooms had transfer showers, the accessible rooms would have transfer showers, with a small percentage of rooms having roll-in showers.

Providing roll-in showers in all the accessible rooms is problematic for persons who do not weight-bear or have poor sitting balance, yet are independent. Roll-in showers, do not provide the same protection as a 36" x 36" transfer shower stall. Roll-in showers do not have grab bars positioned to prevent a person from falling forward, as found in the transfer shower stall. Tubs provide 360° protection once seated, and is preferred by many people with mobility impairments for both security when sitting and the therapeutic relief from a warm bath.

The proposed modification of IBC Table 1107.6.1.1 provides for both roll-in showers and bathing fixtures equivalent to those offered in standard rooms be incorporated in the accessible rooms. The proposed table meets the intent of ADAAG section 9.1.4 in providing equal amenities, and is identical to the table found in the ADA draft, currently being reviewed by the Department of Justice.

Bibliography:

28 CFR Part 36 Section 9.1.4

Americans with Disabilities Act and Architectural Barriers Act Accessibility Guidelines July 23, 2004 Table 224.2 Guest Rooms with Mobility features

Cost Impact: The code change proposal will not increase the cost of construction. The bathing fixtures placed in the accessible room are the same fixtures found in the standard rooms.

Public Hearing Results

Committee Action:

Approved as Modified

Modify table heading as follows:

TABLE 1107.6.1.1
ACCESSIBLE DWELLING AND SLEEPING UNITS

TOTAL NUMBER OF UNITS PROVIDED	MINIMUM REQUIRED NUMBER OF ACCESSIBLE UNITS WITHOUT ROLL-IN SHOWERS	MINIMUM REQUIRED NUMBER OF ACCESSIBLE UNITS ASSOCIATED WITH ROLL-IN SHOWERS	TOTAL NUMBER OF REQUIRED ACCESSIBLE UNITS
--------------------------------	---	---	---

(Portions of proposal not shown remain unchanged)

Committee Reason: Adding the column would clarify that some Accessible Units should be provided with bathtubs or transfer showers to allow consumers increased options. A concern would be if the text in Section 1107.6.1.1 should be revised to clarify the options. This proposal is consistent with the new ADA/ABA Accessibility Guidelines. The title of the third column should be revised for consistency with the other titles.

Assembly Action:

None

Final Hearing Results

E176-06/07

AM

Code Change No: E181-06/07

Original Proposal

Section: 1108.2.8.1

Proponent: Ed Roether, HOK SVE

Revise as follows:

1108.2.8.1 Dining surfaces. Where dining surfaces for the consumption of food or drink are provided, at least 5 percent, but not less than one, of the ~~seating and standing spaces at the dining surfaces~~ for the seating and standing spaces shall be accessible and be distributed throughout the facility.

Reason: The purpose of this proposed change is to clarify that dining surfaces are to be accessible since the seating and standing spaces are not fixed elements. The proposed language puts the emphasis on the dining surface rather than the seating and standing spaces. Without this change the only thing required to be accessible could be the seating and standing surfaces and not their related dining surface.

There is confusion regarding which is required to be accessible. The only thing determining whether the dining area is accessible is the dining surface itself since the seating and standing spaces may not have any identifying demarcation.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposed language focuses on the surfaces rather than the seating and therefore clarifies the code.

Assembly Action:

Final Hearing Results

E181-06/07

AS

Code Change No: E182-06/07

Original Proposal

Section: 1108.2.8.1**Proponent:** Ed Roether, HOK SVE**Revise as follows:**

1108.2.8.1 Dining surfaces. Where dining surfaces for the consumption of food or drink are provided, at least 5 percent, but not less than one, of the seating and standing spaces at the dining surfaces shall be accessible, ~~and~~ be distributed throughout the facility and located on a level accessed by an accessible route.

Reason: The purpose of this proposed change is to clarify that accessible dining surfaces are not required to be located in spaces that are not required to have an accessible route. There are several limited locations where an accessible route is not required in the building code that would have dining surfaces. Not providing accessible dining surfaces in these limited locations would not diminish accessibility since these spaces are not provided an accessible route.

Specifically, Section 1108 would not require an accessible route to a mezzanine seating area, provided that the mezzanine contains less than 25 percent of the total area and the same services are provided in the accessible area. These limited applications would also not require an accessible route in the new ADAAG issued July 2004. Therefore, accessibility is not diminished regardless of how dining surfaces are provided these limited locations.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Approved as Submitted**

Committee Reason: The proposal clarifies that the accessible dining surfaces should be located on levels that have an accessible route to them. Dining areas can have non-accessible mezzanines.

Assembly Action:**None**

Final Hearing Results

E182-06/07**AS**

Code Change No: E183-06/07

Original Proposal

Section: 1108.4.1 (New)**Proponent:** Ed Roether, HOK SVE**1. Revise as follows:**

1108.4.1 Courtrooms. Each courtroom shall be accessible and comply with Sections 1108.4.1.1 through 1108.4.1.5.

2. Add new text as follows:

1108.4.1.1 Jury box. A wheelchair space complying with ICC A117.1 shall be provided within the jury box.

Exception: An adjacent companion seating is not required.

1108.4.1.2 Gallery seating. Wheelchair spaces complying with ICC A117.1 shall be provided in accordance with Table 1108.2.2.1. Designated aisle seats shall be provided in accordance with Section 1108.2.4.

1108.4.1.3 Assistive listening systems. An assistive listening system must be provided. Receivers shall be provided for the assistive listening system in accordance with Section 1108.2.6.1.

1108.4.1.4 Employee work stations. The judges' bench, clerks' station, bailiffs' station, deputy clerk's station, and court reporter's station shall be located on an accessible route. The vertical portion of the accessible route to elevated employee work stations within a courtroom is not required at the time of initial construction, provided a ramp, lift or elevator complying with ICC A117.1 can be installed without requiring reconfiguration or extension of the courtroom or extension of the electrical system.

1108.4.1.5 Other work stations. The litigant's and counsel stations, including the lectern, shall be accessible in accordance with ICC A117.1.

Reason: The intent of the proposal is to provide specifics to comply with the accessibility provisions for courtrooms.

Jury boxes are a unique form of fixed seating in assembly spaces and should be addressed separately. The intent is consistent with the ADA/ABA Guidelines. The exception is necessary to override the current ICC A117.1 requirement for an adjacent companion seat to all wheelchair spaces.

Gallery seating is addressed the same as any fixed seating arrangements. All courtrooms are required to have assistive listening systems. This is consistent with the ADA/ABA Guidelines.

The proposed language for employee work areas is consistent with the intent in the ADA/ABA Guidelines, Sections 231 and 808. The ADA/ABA guidelines allow for planning for the accessible route to raised employee work areas within courtrooms. In the public comment phase of the 2004/2005 code change cycle, the membership decided that there should not be a generic exception for the raised employee work stations within courtrooms (E141-04/05). While this is understandable in a single courtroom in a courthouse situation, this is an undue burden for the taxpayers when more than one courtroom of the different types (e.g., panel courtroom, jury courtroom and no jury courtroom) are provided.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

1108.4.1.1 Jury box. A wheelchair space complying with ICC A117.1 shall be provided within the jury box.

Exception: ~~An~~ Adjacent companion seating is not required.

1108.4.1.4 Employee work stations. The judges- bench, clerks- station, bailiffs- station, deputy clerk-s station, and court reporter-s station shall be located on an accessible route. The vertical ~~portion of the accessible route~~ access to elevated employee work stations within a courtroom is not required at the time of initial construction, provided a ramp, lift or elevator complying with ICC A117.1 can be installed without requiring reconfiguration or extension of the courtroom or extension of the electrical system.

(Portions of proposal not shown remain unchanged)

Committee Reason: This proposal would be consistent with the change made to employee work stations in E165-06/07. The new provisions indicate the level of accessibility required in courtrooms. The modification is for consistency with the modification made to similar language in E170-06/07.

Assembly Action:

None

Final Hearing Results

E183-06/07

AM

Code Change No: E185-06/07

Original Proposal

Sections: 1109.2.1 through 1109.2.1.7, [P] 2902.1.1 (IPC 403.1.1), 3409.8.9 (IEBC [B] 308.8.9, 605.1.9), 3409.9.4 (IEBC [B] 308.9.4, 1104.1.4)

Proponent: David Viola, Plumbing Manufacturers Institute

Revise as follows:

1109.2.1 ~~Unisex~~ Family or assisted-use toilet and bathing rooms. In assembly and mercantile occupancies, an accessible ~~unisex family or assisted-use~~ toilet room shall be provided where an aggregate of six or more male and female water closets is required. In buildings of mixed occupancy, only those water closets required for the assembly or mercantile occupancy shall be used to determine the ~~unisex family or assisted-use~~ toilet room requirement. In recreational facilities where separate-sex bathing rooms are provided, an accessible ~~unisex family or assisted-use~~ bathing room shall be provided. Fixtures located within ~~unisex family or assisted-use~~ toilet and bathing rooms shall be included in determining the number of fixtures provided in an occupancy.

Exception: Where each separate-sex bathing room has only one shower or bathtub fixture, a ~~unisex family or assisted-use~~ bathing room is not required.

1109.2.1.1 Standard. ~~Unisex Family or assisted-use~~ toilet and bathing rooms shall comply with Sections 1109.2.1.2 through 1109.2.1.7 and ICC A117.1.

1109.2.1.2 ~~Unisex~~ Family or assisted-use toilet rooms. ~~Unisex Family or assisted-use~~ toilet rooms shall include only one water closet and only one lavatory. A ~~unisex family or assisted-use~~ bathing room in accordance with Section 1109.2.1.3 shall be considered a ~~unisex family or assisted-use~~ toilet room.

Exception: A urinal is permitted to be provided in addition to the water closet in a ~~unisex family or assisted-use~~ toilet room.

1109.2.1.3 ~~Unisex~~ Family or assisted-use bathing rooms. ~~Unisex Family or assisted-use~~ bathing rooms shall include only one shower or bathtub fixture. ~~Unisex Family or assisted-use~~ bathing rooms shall also include one water closet and one lavatory. Where storage facilities are provided for separate-sex bathing rooms, accessible storage facilities shall be provided for ~~unisex family or assisted-use~~ bathing rooms.

1109.2.1.4 Location. ~~Unisex Family or assisted-use~~ toilet and bathing rooms shall be located on an accessible route. ~~Unisex Family or assisted-use~~ toilet rooms shall be located not more than one story above or below separate-sex toilet rooms. The accessible route from any separate-sex toilet room to a ~~unisex family or assisted-use~~ toilet room shall not exceed 500 feet (152 m).

1109.2.1.5 Prohibited location. In passenger transportation facilities and airports, the accessible route from separate-sex toilet rooms to a ~~unisex family or assisted-use~~ toilet room shall not pass through security checkpoints.

1109.2.1.6 Clear floor space. Where doors swing into a ~~unisex family or assisted-use~~ toilet or bathing room, a clear floor space not less than 30 inches by 48 inches (762 mm by 1219 mm) shall be provided, within the room, beyond the area of the door swing.

1109.2.1.7 Privacy. Doors to ~~unisex family or assisted-use~~ toilet and bathing rooms shall be securable from within the room.

[P] 2902.1.1 (IPC 403.1.1) ~~Unisex~~ Family or assisted-use toilet and bath fixtures. Fixtures located within ~~unisex family or assisted-use~~ toilet bathing rooms complying with Section 1109.2.1 404 of the ~~International Plumbing Code~~ are permitted to be included in determining the minimum required number of fixtures for assembly and mercantile occupancies.

3409.8.9 (IEBC [B]308.8.9, 605.1.9) Toilet rooms. Where it is technically infeasible to alter existing toilet and bathing facilities to be accessible, an accessible ~~unisex~~ family or assisted-use toilet or bathing facility constructed in accordance with Section 1109.2.1 is permitted. The ~~unisex~~ family or assisted-use facility shall be located on the same floor and in the same area as the existing facilities.

3409.9.4 (IEBC [B]308.9.4, 1104.1.4) Toilet and bathing facilities. Where toilet rooms are provided, at least one accessible family or assisted-use toilet room complying with Section 1109.2.1 shall be provided.

Reason: The “unisex” room required in large mercantile and assembly spaces by IBC Section 1109.2.1 is confused with the unisex toilet room permitted in tenants with fewer than 15 occupants as permitted by the IPC. The change in the name to ‘Family’ or ‘Assisted Use’ will make the original intent for this facility clear. A reference to Section 1109.2.1 of the IBC in the plumbing and existing building sections will clarify what toilet/bathing room requirements are expected within this room.

In addition, the new ADA uses the term “Unisex/Single-Use or Family” differently than IBC. The new ADA refers to toilet rooms with two water closets or a water closet and a urinal as a ‘unisex’ toilet room. The change in terminology should keep them separated.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: The action on the proposed change to Sections 2902.1.1, 3409.8.9 and 3409.9.4 (as well as the associated IPC and IEBC) is dependent on the decision of the Means of Egress Committee to the remainder of the proposal, therefore, for consistency, the MEO Committee will make the determination for these section instead of the General, IPC and IEBC Committees.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The change in the language from >Unisex= to >Family or assisted use= will clarify the intent of these bathrooms (required in large mercantile and assembly facilities) is to serve anyone that needs assistance and is traveling with an opposite sex attendant. It is recommended that there should be a public comment to address the travel distance concerns between the 500' travel distance in Section 1109.2.1.5 and the >same area= language in Section 3409.8.9.

Assembly Action:

None

Final Hearing Results

E185-06/07

AS

Code Change No: E187-06/07

Original Proposal

Section: 1109.10

Proponent: Ed Roether, HOK SVE

Delete without substitution:

1109.10 Assembly area seating. ~~Assembly areas with fixed seating shall comply with Section 1108.2 for accessible seating and assistive listening devices.~~

Reason: This section is redundant and is unnecessary. It should be removed. Section 1108.2 already covers any assembly seating with fixed seats.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal deletes redundant language in the code.

Code Change No: **E188-06/07**

Original Proposal

Section: 1109.11.1

Proponent: Ed Roether, HOK SVE

Revise as follows:

1109.11.1 Dispersion. Accessible fixed or built-in seating at tables, counters or work surfaces shall be distributed throughout the space or facility containing such elements and located on a level accessed by an accessible route.

Reason: The purpose of this proposed change is to clarify that accessible tables, counters or work surfaces are not required to be located in spaces that are not required to have an accessible route. There are several limited locations where an accessible route is not required in the building code that would have tables, counters or work surfaces. Not providing accessible tables, counters or work surfaces in these limited locations would not diminish accessibility since these spaces are not provided an accessible route.

Specifically, Section 1108 would not require an accessible route to a mezzanine seating area, provided that the mezzanine contains less than 25 percent of the total area and the same services are provided in the accessible area. There are other similar limited applications where an accessible route is not required yet could have tables, counters or work surfaces, such as the cab in an air traffic control tower. These limited applications would also not require an accessible route in the new ADAAG issued July 2004. Therefore, accessibility is not diminished regardless of how tables, counters or work surfaces are provided these limited locations.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposed language would clarify that accessible tables and counters should be located in areas with an accessible route. This would be consistent with E182-06/07.

Assembly Action:

None

Final Hearing Results

AS

Code Change No: E190-06/07

Original Proposal

Section: 1109.13.1

Proponent: Tim Pate, City and County of Broomfield, Colorado Building Department, representing himself

Revise as follows:

1109.13.1 Operable windows. Where operable windows are provided in rooms that are required to be accessible in accordance with Sections 1107.5.1.1, 1107.5.2.1, 1107.5.3.1, 1107.5.4, 1107.6.1.1, 1107.6.2.1.1, 1107.6.2.2.1, and 1107.7.6.4.1, at least one window in each room shall be accessible and each required operable window shall be accessible.

Exception: Accessible windows are not required in bathrooms and kitchens.

Reason: The ICC Code Correlating Committee added all the individual section numbers to Section 1109.13.1 and failed to include Section 1107.6.2.1.1. IBC Section 1107.6.2.1 requires that all apartment houses, monasteries, and convents have the minimum number of Type A units as listed in this section. The IBC then requires all Type A units to be constructed as per ICC A117.1. The 2003 edition of ICC A117.1, Section 1003.13 requires that "Where operable windows are provided, at least one window in each sleeping, living, or dining space shall have operable parts complying with Section 1003.9." The intent of the IBC is to tell us when things need to be accessible and the ICC A117.1 Standard is to be used to tell us how to build things to be accessible. Therefore adding Section 1107.6.2.1.1 to Section 1109.13.1 would help reduce any confusion as to when operable windows would need to be accessible.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The addition of Type A units into the list for accessible windows would be consistent with ICC A117.1.

Assembly Action:

IBC – STRUCTURAL

Code Change No: **S1-06/07**

Original Proposal

Table 1604.5

Proponent: Philip Brazil, P.E., Reid Middleton, Inc., representing himself

Revise table as follows:

**TABLE 1604.5
OCCUPANCY CATEGORY OF BUILDINGS AND OTHER STRUCTURES**

OCCUPANCY CATEGORY	NATURE OF OCCUPANCY
I	Buildings and other structures that represent a low hazard to human life in the event of failure, including but not limited to: <ul style="list-style-type: none"> • Agricultural facilities. • Certain temporary facilities. • Minor storage facilities.
II	Buildings and other structures except those listed in Occupancy Categories I, III and IV
III	Buildings and other structures that represent a substantial hazard to human life in the event of failure, including but not limited to: <ul style="list-style-type: none"> • Covered structures whose primary occupancy is public assembly with an occupant load greater than 300. • Buildings and other structures with <u>containing</u> elementary school, secondary school or day care facilities with an occupant load greater than 250. • Buildings and other structures with an occupant load greater than 500 for <u>containing adult education facilities, such as colleges or adult education facilities and universities, with an occupant load greater than 500.</u> • Health care facilities <u>Group I-2 occupancies</u> with an occupant load of 50 or more resident patients, but not having surgery or emergency treatment facilities. • Jails and detention facilities <u>Group I-3 occupancies.</u> • Any other occupancy with an occupant load greater than 5,000. • Power-generating stations, water treatment for potable water, waste water treatment facilities and other public utility facilities not included in Occupancy Category IV. • Buildings and other structures not included in Occupancy Category IV containing sufficient quantities of toxic or explosive substances to be dangerous to the public if released.
IV	Buildings and other structures designated as essential facilities, including but not limited to: <ul style="list-style-type: none"> • Hospitals and other health care facilities <u>Group I-2 occupancies</u> having surgery or emergency treatment facilities. • Fire, rescue and police stations and emergency vehicle garages. • Designated earthquake, hurricane or other emergency shelters. • Designated emergency preparedness, communications, and operations centers and other facilities required for emergency response. • Power-generating stations and other public utility facilities required as emergency backup facilities for Occupancy Category IV structures. • Structures containing highly toxic materials as defined by Section 307 where the quantity of the material exceeds the maximum allowable quantities of Table 307.1(2). • Aviation control towers, air traffic control centers and emergency aircraft hangars. • Buildings and other structures having critical national defense functions. • Water treatment facilities required to maintain water pressure for fire suppression.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

Reason: The purpose of this proposal is to align the structural occupancy categories in Table 1604.5 more closely with the nonstructural occupancy classifications elsewhere in the IBC. Under Occupancy Category III, jails and detention facilities are currently listed. Section 308.4 for Group I-3 occupancies, however, also lists prisons, reformatories, correctional centers and prerelease centers as Group I-3 occupancies.

Also, under Occupancy Category III, health care facilities with an occupant load of 50 or more resident patients but not having surgery or emergency treatment facilities are currently listed. Instead of health care facilities, Section 308.3 for Group I-2 occupancies lists hospitals, nursing homes, mental hospitals and detoxification facilities as Group I-2 occupancies. It is conceivable that any of these facilities could provide services for 50 or more resident patients without having surgery or emergency treatment facilities. Similarly under Occupancy Category IV, hospitals and health care facilities having surgery or emergency treatment facilities are currently listed.

In all the cases illustrated above, the absence from Table 1604.5 of the uses listed in the occupancy classifications of Sections 308.3 and 308.4 for Groups I-2 and I-3 occupancies, respectively, may lead code users to conclude that such uses are exempt from the requirements for a higher occupancy category.

The change from health care facilities to Group I-2 occupancies is also intended to avoid classification of a building or structure as Occupancy Category III where it is not warranted. The higher classification is intended to apply to buildings and other structures that represent a substantial hazard to human life in the event of a failure. This is the case for buildings where large numbers of children or adults congregate in one area (e.g., assembly rooms, day care facilities, elementary and secondary schools, etc.). It is also the case for Group I-2 occupancies with resident patients receiving treatment other than surgery or emergency treatment (see Occupancy Category IV).

A health care facility with resident patients, however, could be perceived by some as applying to Group I-1 occupancies. These occupancies provide personal care (i.e., not health care) services to residents (i.e., not patients) in a supervised residential environment. The residents seek the services of a Group I-1 occupancy because of age, mental disability and other reasons but they are assumed to not require chronic or convalescent medical or nursing care. They are also assumed to be capable of responding to an emergency situation without physical assistance from staff.

These occupancies do not represent a substantial hazard to human life.

A change from “colleges or adult education facilities” with an occupant load greater than 500 to “adult education facilities, including colleges and universities” is intended to clarify that the higher level of structural performance associated with Occupancy Category III is warranted at facilities for adult education with high occupant loads. Such facilities can be located at universities as well as colleges, and at facilities not traditionally referred to universities or colleges. The revision will also reduce the possibility of a code user concluding that Occupancy Category III is required at buildings on college and university campuses that do not contain facilities for adult education with high occupant loads, which is not the intent.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: Agreement with the proponent-s reason which indicates that the proposal provides editorial cleanup as well as important coordination with the occupancy classifications in Chapter 3 of the IBC.

Assembly Action:

None

Final Hearing Results

S1-06/07

AS

Code Change No: **S3-06/07**

Original Proposal

Table 1604.5

Proponent: Edwin T. Huston, Smith & Huston Inc., representing National Council of Structural Engineering Associations

Revise table as follows:

**TABLE 1604.5
OCCUPANCY CATEGORY OF BUILDINGS AND OTHER STRUCTURES**

OCCUPANCY CATEGORY	NATURE OF OCCUPANCY
I	Buildings and other structures that represent a low hazard to human life in the event of failure, including but not limited to: <ul style="list-style-type: none"> • Agricultural facilities. • Certain temporary facilities. • Minor storage facilities.
II	Buildings and other structures except those listed in Occupancy Categories I, III and IV
III	Buildings and other structures that represent a substantial hazard to human life in the event of failure, including but not limited to: <ul style="list-style-type: none"> • Covered Buildings and other structures whose primary occupancy is public assembly with an occupant load greater than 300. • Buildings and other structures with elementary school, secondary school or day care facilities with an occupant load greater than 250. • Buildings and other structures with an occupant load greater than 500 for colleges or adult education facilities. • Health care facilities with an occupant load of 50 or more resident patients, but not having surgery or emergency treatment facilities. • Jails and detention facilities. • Any other occupancy with an occupant load greater than 5,000. • Power-generating stations, water treatment for potable water, waste water treatment <u>facilities</u> and other public utility facilities not included in Occupancy Category IV. • Buildings and other structures not included in Occupancy Category IV containing sufficient quantities of toxic or explosive substances to be dangerous to the public if released.
IV	Buildings and other structures designated as essential facilities, including but not limited to: <ul style="list-style-type: none"> • Hospitals and other health care facilities having surgery or emergency treatment facilities. • Fire, rescue, <u>ambulance</u> and police stations and emergency vehicle garages. • Designated earthquake, hurricane or other emergency shelters. • Designated emergency preparedness, communication, and operation centers and other facilities required for emergency response. • Power-generating stations and other public utility facilities required as emergency backup facilities for Occupancy Category IV structures. • Structures containing highly toxic materials as defined by Section 307 where the quantity of the material exceeds the maximum allowable quantities of Table 307.1.(2). • Aviation control towers, air traffic control centers and emergency aircraft hangars. • Buildings and other structures having critical national defense functions. • Water treatment <u>storage</u> facilities <u>and pump structures</u> required to maintain water pressure for fire suppression.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

Reason: Substitute revised material for current provision of the Code.

The purpose of the proposal is to align IBC Table 1604.5 more closely with corresponding Table 1-1 of ASCE 7-05, which contains certain terms not included in Table 1604.5. Their absence from Table 1604.5 may lead code users to conclude that the uses stipulated in Table 1-1 of ASCE 7-05 for a higher occupancy category are exempt from the same requirement in the IBC due to their absence in Table 1604.5.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Errata: Under Occupancy Category III, change the seventh bulleted item to read as follows:

Power-generating stations, water treatment facilities for potable water, waste water treatment facilities and other public utility facilities not included in Occupancy Category IV.

Committee Action:

Approved as Submitted

Committee Reason: The proposal makes a minor change in the wording of the Occupancy Category table to provide agreement with the ASCE 7 load standard.

AS

Code Change No: S4-06/07

Original Proposal

Table 1604.5

Proponent: Thomas Kinsman, T.A. Kinsman Consulting Company

1. Revise table as follows:

**TABLE 1604.5
OCCUPANCY CATEGORY OF BUILDINGS AND OTHER STRUCTURES**

OCCUPANCY CATEGORY	NATURE OF OCCUPANCY
III	Buildings and other structures that represent a substantial hazard to human life in the event of failure including, but not limited to: <ul style="list-style-type: none"> • Covered Buildings and other structures whose primary occupancy is public assembly <u>Group A1, A2, A3, or A4</u> with an occupant load greater than 300 • Buildings and other structures with containing <u>Group E occupancies elementary school, secondary school or day care facilities</u> with an occupant load of greater than 250 • Buildings and other structures containing <u>Group B educational facilities</u> with an occupant load of greater than 500 for colleges or adult education • <u>Buildings and other structures containing Group I-2 Hhealthcare facilities which provide care on a 24 hour basis for more than with an occupant load of 50 or more resident patients but which do not having contain surgery or emergency treatment facilities</u> • <u>Buildings and other structures containing Group I-3 Jails and detention facilities</u> • <u>Buildings and other structures containing an occupancy, other than those listed above, Any other occupancy</u> with an occupant load of greater than 5000 • Power-generating stations, water treatment for potable water, waste water treatment facilities and other public utility facilities not included in Category IV • Buildings and other structures not included in Category IV containing sufficient quantities of toxic or explosive substances to be dangerous to the public if released

(Portions of table not shown do not change)

2.

**TABLE 1604.5
OCCUPANCY CATEGORY OF BUILDINGS AND OTHER STRUCTURES**

OCCUPANCY CATEGORY	NATURE OF OCCUPANCY
III	Buildings and other structures that represent a substantial hazard to human life in the event of failure including, but not limited to: <ul style="list-style-type: none"> • Any other occupancy with an occupant load of greater than 5000^a

(Portions of table not shown do not change)

a. For purposes of occupant load calculation, occupancies required by Table 1004.1.1 to use gross floor area calculations shall be permitted to use net areas to determine the total occupant load.

Reason: The intent of the code change is two fold: improve clarity and specificity of the Category III terms, and to provide some reasonable adjustment in the threshold relating to an occupant load of 5000 in any one occupancy.

In order to determine occupant loads, the user is forced to use methods outlined in Section 1004. There is no clear rationale that connects occupant loads used to calculate minimum means of egress standards to risks associated with structural design standards. This is particularly the case for the 5000 threshold trigger in multi-story high-rise buildings.

Chapter 10 sets forth standards that provide a reasonably conservative number of occupants for all spaces, and while actual loads are commonly less than the design amount, it is not unusual in the life of a space in a building to have periods when high actual occupant loads exist. From a whole building perspective in multistory building, Chapter 10 does not require the occupant load of the whole building to be determined; rather the egress design is determined on a floor to floor basis with the floor containing the largest design occupant load controlling the design from that floor to grade.

Table 1604.5 requires that the total occupant load of an occupancy be calculated in a building – if the occupancy is spread over 30 stories, then all 30 stories are added. Based on Chapter 10, this assumes a maximum occupant load on every floor, and may result in an excessive assumption.

It seems that some method similar to live load reductions would be more reasonable. In the interim, the proposed footnote is suggesting a code based method that would provide a more reasonable approach for occupancies such as office, mercantile, and residential that are required to base occupant load on gross area – an area that includes corridors, stairways, elevators, closets, accessory areas, structural walls and columns, etc.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

**TABLE 1604.5
OCCUPANCY CATEGORY OF BUILDINGS AND OTHER STRUCTURES**

OCCUPANCY CATEGORY	NATURE OF OCCUPANCY
III	Buildings and other structures that represent a substantial hazard to human life in the event of failure including, but not limited to: <ul style="list-style-type: none"> • Covered Buildings and other structures whose primary occupancy is <u>public assembly Group A1, A2, A3, or A4</u> with an occupant load greater than 300 • Buildings and other structures <u>with containing Group E occupancies elementary school, secondary school or day care facilities</u> with an occupant load of greater than 250 • Buildings and other structures containing Group B educational facilities with an occupant load of greater than 500 <u>for colleges or adult education</u> • Buildings and other structures containing Group I-2 Healthcare facilities <u>which provide care on a 24-hour basis for more than with an occupant load of 50 or more resident patients but which do not having contain</u> surgery or emergency treatment facilities • Buildings and other structures containing Group I-3 Jails and detention facilities • Buildings and other structures containing an occupancy, other than those listed above. Any other occupancy with an occupant load of greater than 5000 • Power-generating stations, water treatment for potable water, waste water treatment facilities and other public utility facilities not included in Category IV • Buildings and other structures not included in Category IV containing sufficient quantities of toxic or explosive substances to be dangerous to the public if released

(Portions of table not shown do not change)

a. For purposes of occupant load calculation, occupancies required by Table 1004.1.1 to use gross floor area calculations shall be permitted to use net areas to determine the total occupant load.

Committee Reason: The proposal clarifies the calculation of occupant load for the purpose of Occupancy Category III determination where an occupant load exceeds 5000. The modification retains the current code text in favor of the other proposed clarifications to Occupancy Category III thresholds.

Assembly Action:

None

Final Hearing Results

S4-06/07

AM

Code Change No: S7-06/07

Original Proposal

Section: 1605.3.1.1

Proponent: Jeffrey B. Stone, American Forest & Paper Association

Revise as follows:

1605.3.1.1 Stress increases. Increases in allowable stresses specified in the appropriate material chapter or the referenced standards shall not be used with the load combinations of Section 1605.3.1, except that ~~a duration of load increases~~ shall be permitted in accordance with Chapter 23.

Reason: The change will eliminate confusion. A literal interpretation of current language would imply prohibition on the use of other increases such as the repetitive member factor, flat-use factors, size factors, etc.

Cost Impact: The code change proposal will not increase the cost of construction. This change merely clarifies the use of applicable adjustment factors contained in the NDS.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This change clarifies the application of wood stress adjustments that are permitted when using the basic allowable stress load combinations.

Original Proposal

Sections: 1605.1, 1605.4

Proponent: W. Lee Shoemaker, Metal Building Manufacturers Association, Inc. (MBMA)

Revise as follows:

1605.1 General. Buildings and other structures and portions thereof shall be designed to resist the load combinations specified in Sections 1605.2 or 1605.3 and Chapters 18 through 23, and the special seismic load combinations of ~~Section 1605.4~~ Section 12.4.3.2 of ASCE 7 where required by Section 12.3.3.3 or 12.10.2.1 of ASCE 7. Applicable loads shall be considered, including both earthquake and wind, in accordance with the specified load combinations. Each load combination shall also be investigated with one or more of the variable loads set to zero.

Delete without substitution:

~~**1605.4 Special seismic load combinations.** For both allowable stress design and strength design methods where specifically required by Section 1605.1 or by Chapters 18 through 23, elements and components shall be designed to resist the forces calculated using Equation 16-22 when the effects of the seismic ground motion are additive to gravity forces and those calculated using Equation 16-23 when the effects of the seismic ground motion counteract gravity forces.~~

~~$$1.2D + f_4L + E_m \quad \text{(Equation 16-22)}$$~~

~~$$0.9D + E_m \quad \text{(Equation 16-23)}$$~~

where:

~~E_m = The maximum effect of horizontal and vertical forces as set forth in Section 12.4.3 of ASCE 7.~~

~~f_4 = 1 for floors in places of public assembly, for live loads in excess of 100 psf (4.79 kN/m²) and for parking garage live load, or = 0.5 for other live loads.~~

Reason: The purpose of this change is to remove the inconsistencies between ASCE 7 and IBC with regard to the special seismic load combinations.

There needs to be a correct set of special seismic load combinations to be used with Allowable Stress Design. The existing IBC Section 1605.4 is really only correct for strength design methods (even though it says it can be used for both).

The proposed revision invokes ASCE 7 for the special seismic load combinations, because ASCE 7 correctly has two distinct sets of load combinations – one for strength design and one for allowable stress design. Alternatively, IBC could reproduce the load combinations listed in ASCE 7, Section 12.4.3.2, but it seems better to just reference them.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: If approved, the proposal would result in a terminology difference between the IBC and ASCE 7 since that document does not use the term “special seismic load combinations.” The IBC also contains several references to Section 1605.4 which is proposed for deletion.

Public Hearing Results

Committee Action:**Approved as Modified****Modify proposal as follows:**

1605.1 General. Buildings and other structures and portions thereof shall be designed to resist the load combinations specified in Sections 1605.2 or 1605.3, 1605.3.1 or 1605.3.2 and Chapters 18 through 23, and the special seismic overstrength factor load combinations of Section 12.4.3.2 of ASCE 7 where required by Section 12.3.3.3 or 12.10.2.1 of ASCE 7. With the simplified procedure of ASCE 7 Section 12.14, the overstrength factor load combinations of Section 12.14.3.2 of ASCE 7 shall be used. Applicable loads shall be considered, including both earthquake and wind, in accordance with the specified load combinations. Each load combination shall also be investigated with one or more of the variable loads set to zero.

Committee Reason: This proposal clarifies application of the special seismic load combinations when using allowable stress design by referring to ASCE 7. The modification substitutes the ASCE 7 term “overstrength factor load combinations” for consistency with that document.

Assembly Action:**None**

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted.

Public Comment 2:

Philip Brazil, P.E., S.E., Reid Middleton, Inc, representing himself, requests Approval as Modified by this public comment.

Modify proposal as follows:

1605.1 General. Buildings and other structures and portions thereof shall be designed to resist:

1. The load combinations specified in Section 1605.2, 1605.3.1 or 1605.3.2, and

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

2. The load combinations specified in Chapters 18 through 23, and
3. The ~~overstrength factor~~ load combinations of ~~with overstrength factor~~ specified in Section 12.4.3.2 of ASCE 7 where required by Section 12.3.3.3 or 12.10.2.1 of ASCE 7.

With the simplified procedure of ASCE 7 Section 12.14, the overstrength factor load combinations of Section 12.14.3.2 of ASCE 7 shall be used. Applicable loads shall be considered, including both earthquake and wind, in accordance with the specified load combinations. Each load combination shall also be investigated with one or more of the variable loads set to zero.

The load combinations with overstrength factor in Section 12.4.3.2 of ASCE 7 shall be used in lieu of the following:

1. The load combinations for strength design in lieu of Equations 16-5 and 16-7 in Section 1605.2.1.
2. The load combinations for allowable stress design in lieu of Equations 16-12, 16-13 and 16-15 in Section 1605.3.1.
3. The load combinations for allowable stress design in lieu of Equations 16-20 and 16-21 in Section 1605.3.2.

Commenter's Reason: The purpose for this public comment is the same as for Public Comment #1 except it takes into account the apparent intent of the proponent that the load combinations for allowable stress design with overstrength factor in Section 12.4.3.2 of ASCE 7 shall substitute for the seismic load combinations in IBC Section 1605.3.2 (Alternative ASD) as well as IBC Section 1605.3.1 (Basic ASD).

Public Comment 3:

W. Lee Shoemaker, P.E., Thomas Associates, Inc, representing Metal Building Manufacturers Association Inc, requests Approval as Modified by this public comment.

Modify proposal as follows:

1605.1 General. Buildings and other structures and portions thereof shall be designed to resist the load combinations specified in Sections 1605.2, 1605.3.1, or 1605.3.2 and Chapters 18 through 23, and the overstrength factor load combinations of Section 12.4.3.2 of ASCE 7 where required by Section 12.2.5.2, 12.3.3.3 or 12.10.2.1 of ASCE 7. With the simplified procedure of ASCE 7 Section 12.14, the overstrength factor load combinations of Section 12.14.3.2 of ASCE 7 shall be used. Applicable loads shall be considered, including both earthquake and wind, in accordance with the specified load combinations. Each load combination shall also be investigated with one or more of the variable loads set to zero.

Commenter's Reason: After the Public Hearings in Florida, it was realized that there was one additional Section in ASCE 7 where the special load combinations are referenced. For consistency and completeness, Section 12.2.5.2 should also be added as noted above.

Final Hearing Results

S8-06/07

AMPC 2, 3

Code Change No: S9-06/07

Original Proposal

Sections: 1602, 202, Table 1607.1; IRC R202, Table R 301.5

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Jonathan C. Siu, City of Seattle, representing Washington Association of Building Officials

PART I – IBC

1. Delete definitions without substitution:

SECTION 202 DEFINITIONS

BALCONY, EXTERIOR. See Section 1602.1.

DECK. See Section 1602.1.

**SECTION 1602
DEFINITIONS AND NOTATIONS**

1602.1 Definitions. The following words and terms shall, for the purposes of this chapter, have the meanings shown herein.

~~**BALCONY, EXTERIOR.** An exterior floor projecting from and supported by a structure without additional independent supports.~~

~~**DECK.** An exterior floor supported on at least two opposing sides by an adjacent structure, and/or posts, piers or other independent supports.~~

2. Revise table as follows:

**TABLE 1607.1
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS AND MINIMUM CONCENTRATED LIVE LOADS**

OCCUPANCY OR USE	UNIFORM (psf)	CONCENTRATED (lbs.)
4. Assembly areas and theaters Fixed seats (fastened to floor) Follow spot, projections, and control rooms Lobbies Movable seats Stages and platforms <u>Other assembly areas</u>	60 50 100 100 125 <u>100</u>	—
5. <u>Balconies (exterior) and decks^h</u> On one- and two-family residences only, and not exceeding 100 sq ft	400 60 <u>Same as occupancy served</u>	—
9. Decks	Same as occupancy served^h	—
28. Residential One- and two-family dwellings Uninhabitable attics without storage ⁱ Uninhabitable attics with storage ^{i, j, k} Habitable attics and sleeping areas All other areas except balconies and decks Hotels and multifamily dwellings Private rooms and corridors serving them Public rooms and corridors serving them	10 20 30 40 40 100	—

h. See Section 1604.8.3 for decks attached to exterior walls.

(Portions of table and footnotes not shown do not change)

PART II – IRC

1. Delete definitions without substitution:

SECTION R202

~~**[B] BALCONY, EXTERIOR.** An exterior floor projecting from and supported by a structure without additional independent supports.~~

~~**[B] DECK.** An exterior floor system supported on at least two opposing sides by an adjoining structure and/or posts, piers, or other independent supports.~~

2. Revise table as follows:

**TABLE R301.5
MINIMUM UNIFORMLY DISTRIBUTED LIVE LOADS
(in pounds per square foot)**

USE	LIVE LOAD
Balconies (exterior) and decks ^e	40
Exterior balconies	60

e. See Section R502.2.1 for decks attached to exterior walls.

(Portions of table and footnotes not shown do not change)

Reason: This proposal is one of four dealing with changing Table 1607.1, Minimum Uniformly Distributed Live Loads and Minimum Concentrated Live Loads. The main intent of all these code change proposals is to remove the illogical distinction between deck and balcony live loads. In order to do that in the code, one must determine the design live loads for these elements. However, for the purposes of these proposals, that is secondary to removing the distinction. Each of the four proposals eliminates the distinction in the same way (delete the definitions and combine the items in Table 1607.1), but each proposes a different live load. While the reasoning below focuses on the proposed changes to the IBC, the same arguments apply to the proposed changes to the IRC.

The supporting information has been broken into two parts. The first part is repeated on all four proposals, and relates to removing the distinction between balconies and decks. The second part is unique to each proposal, as it gives reasons for the particular live load being proposed.

BALCONY VS. DECK

The current situation was set up in the 1996-1997 timeframe, when two of the three legacy organizations adopted definitions for decks and balconies into their codes. The definitions were then carried forward into the IBC. This error has now been propagated from the IBC into the 2005 edition of ASCE 7, which previously did not define the terms and had different live load requirements from the IBC and legacy codes. There are several reasons, explained below, why the original change made 10 years ago was incorrect, and the distinction between balconies and decks should be eliminated.

Technical Justification: There is no engineering justification for having different live loads for different support conditions, if the use is the same. Either the loads are there, or they aren't, and changing how the element is supported doesn't change the loads. If there are inherent problems with a particular type of structure or with a particular structural material, then the solution should be dealt with on the "resistance" side by increasing the required factor of safety or through additional requirements in the materials chapters, rather than by increasing the loads.

Having participated in the debate at one of the organizations' hearings in 1996, we believe no logical or technical justification was presented to make this distinction—only that the "feeling" was that cantilevers are less redundant than supported structures, and thus, should have a higher live load requirement. Again, if this is the case (which is doubtful), then the solution should be to increase the factor of safety, rather than to increase the live load.

Redundancy: Essentially all of the balcony/deck structures we see are either cantilevered or simply-supported structures. Some engineers will argue that a cantilever is less redundant than simply-supported systems. That is, a single failure could lead to collapse. However, from an engineering standpoint as applied to these structures, a simply-supported structure has no added redundancy compared to a cantilever.

Safety Record: The safety record of cantilevers is better than decks. If simply-supported systems are more redundant than cantilevers, one would expect to see increased safety as reflected by fewer collapses. However, in a Google search for "deck/balcony/failure/collapse", we were only able to find one instance of cantilevered balconies that failed, in Australia. In contrast to that single case of a cantilevered balcony failure, there were many reports of deck failures.

With most of the reports of failures, it could not be distinguished whether the structure was cantilevered or not. However, where it could be distinguished that the failed structure was a "deck" or a "balcony" per the definitions in the code, the vast majority were "deck" failures. Usually, the deck failures occurred at the connection of the deck to the building due to incorrect or poor design (e.g., nails in withdrawal, incorrect type of joist hanger) or by deterioration of the connection components. In the reports for some cases, it was questioned whether proper permits had been obtained. In one recent case in the state of Washington, the posts supporting the structure were not connected to anything at the ground level, and they "kicked out". In the one balcony failure case, the concrete balconies apparently developed a crack at the support allowing moisture to rust the rebar. Neither of these causes of failure (poor design or deterioration) can be attributed to a lack of redundancy. It is notable that where the reports discussed loading conditions, it was to state the failures were not caused by overload conditions.

Consistency: The live loads for balconies and decks are inconsistent with all the other loads in the Live Load table (IBC Table, 1607.1, ASCE 7-05 Table 4-1), in that no other loads are based on the structural support conditions. All others are based on occupancy or use (which is the heading in the table). Logically, if cantilevers are inherently dangerous, then all other items in the table should have separate loads for cantilevers versus other support conditions.

Definitions: The definitions were inserted into the two legacy codes because the live load tables required different loads for balconies versus decks, similar to ASCE 7. Once it has been demonstrated there is not a reason to apply different loading conditions to balconies versus decks, there is no need to define the terms.

It is to be noted, however, there is not an exact match between the legacy code definitions and what appears to be the intended application in ASCE 7. Table 4-1 of earlier editions of ASCE 7 has an item for "Balconies (exterior)" (live load = 100 psf, or 60 psf for small residential balconies), and an item for "Decks (patio and roof)" (live load = "same as area served, or for the type of occupancy accommodated"). One legacy code deleted the parenthetical "patio and roof" from the "deck" item. The second retained it, but inserted the same definitions. It appears the definitions inserted into the legacy codes were in error as compared to ASCE 7, because "decks" were supposed to be patios (decks on grade?) or roof decks.

However, even if one were to redefine "balcony" and "deck" to fit with what appears to be the intent of ASCE 7, there does not appear to be justification for having different loads for them, as they will most likely be used similarly.

IBC versus ASCE 7:

Some will argue that IBC and ASCE 7 should not be different, and that it is really the province of ASCE 7 to determine appropriate live loads. In general, we agree with this philosophy, and it is our intent to submit similar proposals to the ASCE 7 process. There are two reasons why we believe ICC should act now:

1. It is our understanding that the primary reason for the deck and balcony modification to the live load table of ASCE 7-05 was so it would match the organization contained in the 2003 IBC. As stated above, this just means that errors made in legacy codes have been propagated now into ASCE 7. Therefore, if ASCE 7 has been changed once to match the IBC, there is no reason why the IBC can't lead the way again.

2. It is our understanding that the next edition of ASCE 7 is not scheduled to come out until 2010. If one assumes that ASCE 7 fixes this problem in their process in that cycle (and there is no guarantee that it will), this means it will not be until the 2012 edition of the IBC that the fix will be included in the code, which will mean it will be 2013 before many jurisdictions actually adopt the code. That is too long to be propagating this error.

DESIGN LIVE LOAD FOR BALCONIES AND DECKS:

Once the premise has been accepted that the loads should not differ based on structural support conditions, the question is, what is the appropriate design live load for these structures?

The premise behind this option is if a deck can be designed to the same load as the occupancy it serves (as the code currently allows), the same should be allowed for balconies. If the balcony/deck serves a one-family dwelling, the minimum live load will be 40 psf. If it serves a private office, the live load is 50 psf. If it is an assembly area such as a roof deck, then it can be argued that it should be designed for 100 psf. The addition proposed to the Assembly item in Table 1607.1 will clarify this requirement, as well as for other assembly areas not currently covered by the table. It is significant to note that where the reports turned up in the Google search discussed loading conditions, it was to state that the decks did not fail due to overload conditions.

The callout for Footnote h in Table 1607.2 has been moved (attached to "decks" instead of the load), since it only applies to decks.

The changes being proposed in Part II for the IRC are for consistency with the terminology used in the IBC and with the live loads in the Part I proposal.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I – IBC STRUCTURAL

Committee Action:

Disapproved

Committee Reason: This code change was disapproved because the revision made by S10-06/07 was preferred.

Assembly Action:

None

PART II - IRC

Committee Action:

Approved as Submitted

Committee Reason: This change serves to eliminate the differences between balcony and deck live loads and adds needed clarity to the code language.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted for Part I.

Public Comment:

Gary Ehrlich, P.E., National Association of Home Builders, requests Approval as Submitted for Part I.

Commenter's Reason: As discussed at the hearings in Orlando, there has not been substantial evidence of deck or balcony failures due to overloading of the floor joists, girders, or piers. In fact, the evidence presented by NCSEA suggests that decks and balconies only see a live load of 20 psf even in a heavily-loaded state. The documented failures have been at the deck ledger connection to the floor framing and would likely have happened regardless of the design live load for decks and balconies. This proposal would allow decks in R-3 and R-4 occupancies and IRC dwellings forced to use the IBC provisions to be designed for a 40psf live load just as they would under the IRC. This would allow an engineer to make use of design aids developed for 40psf deck live loads such as the residential ledger table being implemented in the IRC. NAHB asks for your support in approving this proposal as submitted and reversing the committee's action.

Final Hearing Results

**S9-06/07, Part I
S9-06/07, Part II**

**AS
AS**

Code Change No: S14-06/07

Original Proposal

Section: 1607.7.1.3

Proponents: Edwin T. Huston, Smith & Huston, Inc., representing National Council of Structural Engineering Associations and John V. Loscheider; P.E., Loscheider Engineering Company

Delete without substitution:

~~**1607.7.1.3 Stress increase.** Where handrails and guards are designed in accordance with the provisions for allowable stress design (working stress design) exclusively for the loads specified in Section 1607.7.1, the allowable stress for the members and their attachments are permitted to be increased by one-third.~~

Reason: To delete an outdated provision.

(Loscheider) The structural safety of handrails and guards is predominantly governed by strength. When this provision was created during the drafting of the IBC, strength-based (LRFD) material standards were neither widely used nor readily available for all materials. Furthermore, for the design of steel handrails and guards, allowable stress design (ASD) consistently provided substantially lower unfactored load capacities than LRFD, and AISC had no plans to update its ASD standard correct this situation. When the IBC was drafted, the sole purpose of the allowable stress increase for handrails and guards was to provide nominal design parity between LRFD and the much more widely used ASD.

In recent years, however, there have been several important changes in our structural codes. LRFD standards are now more commonly available, and their adoption by reference in the IBC allows designers to rationally evaluate strength-critical elements such as handrails and guards. Furthermore, AISC has finally issued updated ASD provisions, which have been adopted by reference in the 2006 IBC. AISC 360-2005 is an integrated ASD/LRFD design standard that provides consistent parity between the two design methods, so designers are no longer penalized for using ASD. In fact, for many types of members commonly used for handrails and guards, ASD now actually provides unfactored load capacities that are slightly higher than LRFD, without the use of a one-third increase. For this reason, a one-third increase for ASD is no longer appropriate, and continuing to allow its use may result in unsafe handrails and guards.

(Huston) The stress increase is no longer appropriate given the latest editions of the referenced standards that more properly coordinate allowable stress design with load and resistance factor design through a unified design process. The continued use of the one-third stress increase for handrails could lead to unconservative results.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal deleted the permitted stress increases for guards and handrails because they are no longer needed with the unified ASD/LRFD formats provided in the material standards.

Assembly Action:

None

Final Hearing Results

S14-06/07

AS

Code Change No: **S15-06/07**

Original Proposal

Sections: 1609.1.1, 3108, Chapter 35

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL AND THE IBC GENERAL CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Thomas Hoenninger, Stainless LLC, representing the TIA Subcommittee TR14.7

PART I – IBC STRUCTURAL

1. Revise as follows:

1609.1.1 Determination of wind loads. Wind loads on every building or structure shall be determined in accordance with Chapter 6 of ASCE 7. The type of opening protection required, the basic wind speed and the exposure category for a site is permitted to be determined in accordance with Section 1609 or ASCE 7. Wind shall be assumed to come from any horizontal direction and wind pressures shall be assumed to act normal to the surface considered.

Exceptions:

1. Subject to the limitations of Section 1609.1.1.1, the provisions of SBCCI SSTD 10 shall be permitted for applicable Group R-2 and R-3 buildings.
2. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of the AF&PA WFCM.
3. Designs using NAAMM FP 1001.
4. Designs using ~~TIA/EIA-222~~ TIA-222 for antenna-supporting structures and antennas.

3108.4 Loads. Towers shall be designed to resist wind loads in accordance with ~~TIA/EIA-222~~ TIA-222. Consideration shall be given to conditions involving wind load on ice-covered sections in localities subject to sustained freezing temperatures.

2. Delete and substitute standard in Chapter 35 as follows:

~~TIA/EIA-222-F-96 Structural Standard for Antenna Supporting Structures and Antennas~~

TIA-222-G-2005 Structural Standard for Antenna Supporting Structures and Antennas

PART II – IBC GENERAL

Delete and substitute as follows:

SECTION 3108 RADIO AND TELEVISION TOWERS

~~**3108.1 General.** Subject to the provisions of Chapter 16 and the requirements of Chapter 15 governing the fire-resistance ratings of buildings for the support of roof structures, radio and television towers shall be designed and constructed as herein provided.~~

~~**3108.2 Location and access.** Towers shall be located and equipped with step bolts and ladders so as to provide ready access for inspection purposes. Guy wires or other accessories shall not cross or encroach upon any street or other public space, or over above ground electric utility lines, or encroach upon any privately owned property without written consent of the owner of the encroached upon property, space or above ground electric utility lines.~~

~~**3108.3 Construction.** Towers shall be constructed of approved corrosion resistant noncombustible material. The minimum type of construction of isolated radio towers not more than 100 feet (30 480 mm) in height shall be Type IIB.~~

~~**3108.4 Loads.** Towers shall be designed to resist wind loads in accordance with TIA/EIA-222. Consideration shall be given to conditions involving wind load on ice-covered sections in localities subject to sustained freezing temperatures.~~

~~**3108.4.1 Dead load.** Towers shall be designed for the dead load plus the ice load in regions where ice formation occurs.~~

~~**3108.4.2 Wind load.** Adequate foundations and anchorage shall be provided to resist two times the calculated wind load.~~

~~**3108.5 Grounding.** Towers shall be permanently and effectively grounded.~~

SECTION 3108
TELECOMMUNICATION AND BROADCAST TOWERS

3108.1 General. Towers shall be designed and constructed in accordance with the provisions of TIA-222.

3108.2 Location and access. Towers shall be located such that guy wires and other accessories shall not cross or encroach upon any street or other public space, or over above-ground electric utility lines, or encroach upon any privately owned property without the written consent of the owner of the encroached-upon property, space or above-ground electric utility lines. Towers shall be equipped with climbing and working facilities in compliance with TIA-222. Access to the tower sites shall be limited as required by applicable OSHA, FCC and EPA regulations.

Reason: (Part I) Revise outdated material.

TIA-222-G was published in August 2005 and was made effective January 1, 2006. It replaces TIA/EIA-222-F, which is no longer maintained or supported by the Telecommunications Industry Association (TIA). TIA-222-G is an ANSI approved standard.

The major changes from 222-F that are incorporated in 222-G are:

222-G is based on the ASCE 7-05 three-second gust basic wind speed map. 222-F is based on the ASCE 7-93 fastest mile basic wind speed map and results in confusion when comparing to the ASCE 7-05 and IBC2006.

222-G includes reliability classes for telecommunication and broadcast structures that correspond to the building and structure categories of ASCE 7-05. 222-F does not include reliability classes.

222-G incorporates the same exposure categories and provisions for topographic features as ASCE 7-05. 222-F does not include multiple exposure categories and provisions for topographic features.

222-G incorporates appropriate provisions for the latest AISC and ACI standards that pertain to telecommunication and broadcast structures.

222-G incorporates the ASCE 7-05 ice maps. 222-F does not include ice map data.

222-G contains a section for proper earthquake analysis and design for telecommunication and broadcast structures. 222-F does not include earthquake provisions.

222-G contains updated, comprehensive provisions for climbing and working facilities.

(Part II) TIA-222-G is the current standard and was published in August 2005 and was made effective January 1, 2006. This is the structural standard for antenna supporting structures and antennas and is ANSI approved. IBC2006 references TIA/EIA-222-F, which is an outdated TIA standard.

The title "Telecommunication and Broadcast Towers" was substituted for "Radio and Television towers" because TIA-222 applies to more than just radio and television towers.

Section 3108.1 was substituted because it is clearer and more concise language. Deleted the reference to Chapter 15 because it does not apply.

Section 3108.2 was substituted because it is clearer and more concise language.

Sections 3108.3, 3108.4 and 3108.5 were deleted because the language in the sections either does not apply or it is covered in TIA-222.

Cost Impact: In general, the code change proposal will not increase the cost of construction. However, some specific tower projects may experience an increase in construction cost.

Analysis: Results of review of the proposed standard(s) will be posted on the ICC website by August 20, 2006.

Public Hearing Results

Note: The following analysis was not in the Code Change Proposal book but was published in the "Errata to the 2006/2007 Proposed Changes to the International Codes and Analysis of Proposed Referenced Standards" provided at the code development hearings:

Analysis: Review of proposed standard indicated that, in the opinion of ICC staff, the standard did comply with ICC criteria for referenced standards.

PART I — IBC STRUCTURAL

Committee Action:

Approved as Submitted

Committee Reason: This code change makes an appropriate update to the latest edition of TIA-222 for antenna-supporting structures.

Assembly Action:

None

PART II — IBC GENERAL**Committee Action:**

Approved as Submitted

Committee Reason: The revision of Section 3108 as proposed correlates with what is actually being applied in the field. In addition the proposal removes non building code related issues and leaves such issues to the standard itself.

Assembly Action:

None

Original Proposal

Sections: 1609.1.1, 1609.1.1.2 through 1609.1.1.2.2 (New)

Proponent: T. Eric Stafford, Institute for Business and Home Safety

1. Revise as follows:

1609.1.1 Determination of wind loads. Wind loads on every building or structure shall be determined in accordance with Chapter 6 of ASCE 7. The type of opening protection required, the basic wind speed and the exposure category for a site is permitted to be determined in accordance with Section 1609 or ASCE 7. Wind shall be assumed to come from any horizontal direction and wind pressures shall be assumed to act normal to the surface considered.

Exceptions:

1. Subject to the limitations of Section 1609.1.1.1, the provisions of SBCCI SSTD 10 shall be permitted for applicable Group R-2 and R-3 buildings.
2. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of the AF&PA WFCM.
3. Designs using NAAMM FP 1001.
4. Designs using TIA/EIA-222 for antenna-supporting structures and antennas.
5. Wind Tunnel tests in accordance with Section 6.6 of ASCE 7, subject to the limitations in Section 1609.1.1.2.

2. Add new text as follows:

1609.1.1.2 Wind tunnel test limitations. The lower limit on pressures for main wind-force resisting systems and components and cladding shall be in accordance with Sections 1609.1.1.2.1 and 1609.1.1.2.2.

1609.1.1.2.1 Lower limits on main wind-force-resisting system. Pressures determined from wind tunnel testing shall be limited to not less than 80 percent of the design pressures determined in accordance with Section 6.5 of ASCE 7, unless specific testing is performed that demonstrates it is the aerodynamic coefficient of the building, rather than shielding from other structures, that is responsible for the lower values. The 80 percent limit may be adjusted by the ratio of the frame load at critical wind directions as determined from wind tunnel testing without specific adjacent buildings, but including appropriate upwind roughness, to that determined in Section 6.5 of ASCE 7.

1609.1.1.2.2 Lower limits on components and cladding. The design pressures for components and cladding on walls or roofs shall be selected as the greater of the wind tunnel test results or 80 percent of the pressure obtained for Zone 4 for walls and Zone 1 for roofs as determined in Section 6.5 of ASCE 7, unless specific testing is performed that demonstrates it is the aerodynamic coefficient of the building, rather than shielding from nearby

structures, that is responsible for the lower values. Alternatively, limited tests at a few wind directions without specific adjacent buildings, but in the presence of an appropriate upwind roughness, shall be permitted to be used to demonstrate that the lower pressures are due to the shape of the building and not to shielding.

Reason: This code change brings forward recommendations currently in the ASCE 7-05 commentary and gives the limitations the force of code provisions. Recent comparisons between wind tunnel studies for the same building have demonstrated a difference of up to 40% in results between laboratories. These provisions will provide a limit on reductions that will provide a baseline threshold value. This is being proposed in the IBC at this time because it is our understanding that ASCE 7 will not be revised again until 2010.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1609.1.1 Determination of wind loads. Wind loads on every building or structure shall be determined in accordance with Chapter 6 of ASCE 7. The type of opening protection required, the basic wind speed and the exposure category for a site is permitted to be determined in accordance with Section 1609 or ASCE 7. Wind shall be assumed to come from any horizontal direction and wind pressures shall be assumed to act normal to the surface considered.

Exceptions:

1. Subject to the limitations of Section 1609.1.1.1, the provisions of SBCCI SSTD 10 shall be permitted for applicable Group R2 and R-3 buildings.
2. Subject to the limitations of Section 1609.1.1.1, residential structures using the provisions of the AF&PA WFCM.
3. Designs using NAAMM FP 1001.
4. Designs using TIA/EIA-222 for antenna-supporting structures and antennas.
5. Wind Tunnel tests in accordance with Section 6.6 of ASCE 7, subject to the limitations in Section 1609.1.1.2.

1609.1.1.2 Wind tunnel test limitations. The lower limit on pressures for main wind-force resisting systems and components and cladding shall be in accordance with Sections 1609.1.1.2.1 and 1609.1.1.2.2.

1609.1.1.2.1 Lower limits on main wind-force-resisting system.

Pressures ~~Base overturning moments~~ determined from wind tunnel testing shall be limited to not less than 80 percent of the design ~~pressures~~ base overturning moment determined in accordance with Section 6.5 of ASCE 7, unless specific testing is performed that demonstrates it is the aerodynamic coefficient of the building, rather than shielding from other structures, that is responsible for the lower values. The 80 percent limit may be adjusted by the ratio of the frame load at critical wind directions as determined from wind tunnel testing without specific adjacent buildings, but including appropriate upwind roughness, to that determined in Section 6.5 of ASCE 7.

1609.1.1.2.2 Lower limits on components and cladding. The design pressures for components and cladding on walls or roofs shall be selected as the greater of the wind tunnel test results or 80 percent or the pressure obtained for Zone 4 for walls and Zone 1 for roofs as determined in Section 6.5 of ASCE 7, unless specific testing is performed that demonstrates it is the aerodynamic coefficient of the building, rather than shielding from nearby structures, that is responsible for the lower values. Alternatively, limited tests at a few wind directions without specific adjacent buildings, but in the presence of an appropriate upwind roughness, shall be permitted to be used to demonstrate that the lower pressures are due to the shape of the building and not to shielding.

Committee Reason: This proposal implements in the code the limitations on wind load testing that are currently noted in the commentary to ASCE 7. The modification changes wind pressure to overturning moment to address that specific requirement.

Code Change No: **S18-06/07**

Original Proposal

Section: 1609.1.2

Proponent: Edwin T. Huston, Smith & Huston Inc., representing National Council of Structural Engineering Associations

Revise as follows:

1609.1.2 Protection of openings. In wind-borne debris regions, glazing in buildings shall be impact-resistant or protected with an impact-resistant covering meeting the requirements of an approved impact-resistant standard or ASTM E 1996 and ASTM E 1886 referenced herein as follows:

1. *Glazed openings located within 30 feet (9144 mm) of grade shall meet the requirements of the Large Missile Test of ASTM E 1996.*
2. *Glazed openings located more than 30 feet (9144 mm) above grade shall meet the provisions of the Small Missile Test of ASTM E 1996.*

Exceptions:

1. Wood structural panels with a minimum thickness of 7/16 inch (11.1 mm) and maximum panel span of 8 feet (2438 mm) shall be permitted for opening protection in one- and two-story buildings classified as Group R-3 or R-4 occupancy. Panels shall be precut so that they shall be attached to the framing surrounding the opening containing the product with the glazed opening. Panels shall be secured with the attachment hardware provided. Attachments shall be designed to resist the components and cladding loads determined in accordance with the provisions of ASCE 7. Attachment in accordance with Table 1609.1.2 is permitted for buildings with a mean roof height of 33 feet (10058 mm) or less where wind speeds do not exceed 130 mph (57.2 m/s).
2. Glazing in Occupancy Category I buildings as defined in Section 1604.5, including greenhouses that are occupied for growing plants on a production or research basis, without public access shall be permitted to be unprotected.
3. Glazing in Occupancy Category II, III or IV buildings located over 60 feet (18 288 mm) above the ground and over 30 feet (9144 mm) above aggregate surface roofs located within 1,500 feet (458 m) of the building shall be permitted to be unprotected.

Reason: Substitute revised material for current provision of the Code.

ASCE 7-98 and ASCE 7-02 require that "Glazing in the lower 60 ft. of Category II, III, or IV buildings sited in wind borne debris regions be impact resistant glazing or protected with an impact resistant covering. Alternatively, if these criteria are not met, the glazed opening must be considered to be "open" (not having any covering) if it receives positive external pressure, thus potentially changing the design of the building from an "enclosed building" to one that is "open" or "partially enclosed", depending on the size and number of openings. Generally this would mean that the interior walls would be designed for nearly the same wind pressures as the external walls. More importantly, even though the building can be designed to sustain the higher wind pressures, the interior of the building and its contents are subject to major damage from wind and wind-driven rain should the glazing be broken.

In the 2002 edition of ASCE 7, the language was changed to recognize the higher importance of certain structures. In all Category IV structures, and in Category II or III buildings used for health care, jail and detention facilities, power generating and other public utility facilities, glazing in the lower 60 ft. of the structure sited in wind borne debris regions was required to have either impact resistant glazing or be protected with an impact resistant covering, meeting the test requirements of ASTM E 1996. For glazed openings less than 30 feet above the ground, the Large Missile Test requirements apply. For Category II or III buildings with uses other than those enumerated above, openings in the lower 60 feet of the building could be left unprotected, provided that an unprotected opening that received positive external pressure was considered an opening for purposes of determining the building's enclosure classification.

ASCE 7-05 has been further changed to require glazing in all Category II, III or IV buildings to be impact-resistant glazing or protected with an impact-resistant covering if it is located as follows: in the lower 60 feet of the building, and equal to or less than 30 feet above an aggregate surfaced roof within 1500 feet of the building. The provision of ASCE 7-02 that permitted the glazed opening to be considered an opening for purposes of determining the enclosure classification of the building has been removed.

During the development of the IBC 2000 when the provisions of ASCE 7-98 were being considered, the home building industry successfully lobbied for an exception that allowed any one- or two-story building, regardless of Occupancy Category, to be constructed with neither non-impact resistant glazing nor a non-impact resistant covering provided the non-impact resistant glazing is covered with 7/16" thick wood structural panels. These panels are not required to meet either the Large or Small Missile test requirements of ASTM E 1996. The attachment of the panels are required only to meet the component and cladding wind load provisions of ASCE 7, but there is no such requirement for the panels themselves.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

In addition, the panels are allowed to span as far as 8 ft. without any stiffeners if the panel itself cannot meet the component and cladding wind pressure provisions of ASCE 7 for the design wind speed. The only additional requirement for the panels is that they are fastened at the edges.

These wood structural panels do not afford the same level of protection as impact resistant coverings (i.e., hurricane shutters), which have met the Large Missile Impact requirements of ASTM E 1996. Further, there is no recognition of the higher importance of health care facilities, jails, public utility facilities, etc. in the IBC requirements. While the use of wood structural panels (e.g., plywood and OSB) may be adequate for the protection of openings in one- and two-family dwellings; the use of these panels, without more stringent requirements for their attachment and intervals of support, is not adequate for health care facilities, facilities where the occupants have limited mobility, and other facilities where the panels may not be installed prior to arrival of the hurricane.

For these reasons, the proposed change limits the use of the wood structural panels to Group R-3 and R-4 buildings, so that the intent of ASCE 7 to provide a higher level of protection for all other building occupancy groups is maintained.

Cost Impact: The code change proposal will increase the cost of construction

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This code change places an appropriate limit on the prescriptive opening protection option utilizing wood structural panels by limiting their use to Groups R-3 and R-4.

Assembly Action:

None

Original Proposal

Sections: 1609.1.2, Table 1602.1.2; IRC R301.2.1.2, Table R301.2.1.2

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: T. Eric Stafford, Institute for Business and Home Safety

PART I – IBC

Revise as follows:

1609.1.2 Protection of openings. In wind-borne debris regions, glazing in buildings shall be impact-resistant or protected with an impact-resistant covering meeting the requirements of an approved impact-resisting standard or ASTM E 1996 and ASTM E 1886 referenced therein as follows:

1. Glazed openings located within 30 feet (9144 mm) of grade shall meet the requirements of the Large Missile Test of ASTM E 1996.
2. Glazed openings located more than 30 feet (9144 mm) above grade shall meet the provisions of the Small Missile Test of ASTM E 1996.

Exceptions:

1. Wood structural panels with a minimum thickness of 7/16 inch (11 mm) and a maximum span of 8 feet (2438 mm) shall be permitted for opening protection in one- and two-story buildings. Panels shall be pre-cut so that they shall be attached to the framing surrounding the opening containing the product with the

glazed opening. Panels shall be predrilled as required for the anchorage method and shall be secured with the attachment hardware provided. Attachments shall be designed to resist the component and cladding loads determined in accordance with ASCE 7, with permanent corrosion resistant attachment hardware provided and anchors permanently installed on the building. Attachment in accordance with Table 1609.1.2 with permanent corrosion resistant attachment hardware provided and anchors permanently installed on the building is permitted for buildings with a mean roof height of 33 feet (10 058 mm) or less where wind speeds do not exceed 130 miles per hour (58 m/s).

2. Glazing in Occupancy Category I buildings as defined in Section 1604.5, including greenhouses that are occupied for growing plants on a production or research basis, without public access shall be permitted to be unprotected.
3. Glazing in Occupancy Category II, III or IV buildings located over 60 feet (18 288 mm) above the ground and over 30 feet (9144 mm) above aggregate surface roofs located within 1,500 feet (458 m) of the building shall be permitted to be unprotected

TABLE 1609.1.2
WIND-BORNE DEBRIS PROTECTION FASTENING SCHEDULE
FOR WOOD STRUCTURAL PANELS^{a,b,c,d}

FASTENER TYPE	FASTENER SPACING (in.)		
	Panel span ≤ 4 foot	4 feet < panel span ≤ 6 feet	6 feet < panel span ≤ 8 feet
No. 6 Screws	16	12	9
No. 8 Wood Screw based anchor with 2-inch embedment length	16	10	8
No. 8 Screws	16	16	12
No. 10 Wood Srew based anchor with 2-inch embedment length	16	12	9
¼ Lag screw based anchor with 2-inch embedment length	16	16	16

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound = 4.448N,
1 mile per hour = 0.447 m/s.

- a. This table is based on 130 mph wind speeds and a 33-foot mean roof height.
- b. Fasteners shall be installed at opposing ends of the wood structural panel. Fasteners shall be located a minimum of 1 inch from the edge of the panel.
- c. Anchors shall penetrate through the exterior wall covering with an embedment length of 2 inches minimum into the building frame. ~~Fasteners shall be long enough to penetrate through the exterior wall covering and a minimum of 1 ¼ inches into wood wall framing and a minimum of 1 ¼ inches into concrete block or concrete, and into steel framing a minimum of 3 exposed threads.~~ Fasteners shall be located a minimum of 2 ½ inches from the edge of concrete block or concrete.
- d. Where ~~panels screws~~ are attached to masonry or masonry/stucco, they shall be attached using vibration-resistant anchors having a minimum ultimate withdrawal capacity of ~~1500~~ 490 pounds.

PART II – IRC

Revise as follows:

R301.2.1.2 Protection of openings. Windows in buildings located in windborne debris regions shall have glazed openings protected from windborne debris. Glazed opening protection for windborne debris shall meet the requirements of the Large Missile Test of an approved impact resisting standard or ASTM E 1996 and ASTM E 1886 referenced therein.

Exception: Wood structural panels with a minimum thickness of 7/16 inch (11 mm) and a maximum span of 8 feet (2438 mm) shall be permitted for opening protection in one- and two-story buildings. Panels shall be pre-cut so that they shall be attached to the framing surrounding the opening containing the product with the glazed opening. Panels shall be predrilled as required for the anchorage method and shall be secured with the attachment hardware provided. Attachments shall be designed to resist the component and cladding loads determined in accordance with either Table R301.2(2) or Section 1609.6.5 of the *International Building Code*, with permanent corrosion resistant attachment hardware provided and anchors permanently installed on the building. Attachment in accordance with Table R301.2.1.2 is permitted for buildings with a mean roof height of 33 feet (10 058 mm) or less where wind speeds do not exceed 130 miles per hour (58 m/s).

**TABLE R301.2.1.2
WIND-BORNE DEBRIS PROTECTION FASTENING SCHEDULE
FOR WOOD STRUCTURAL PANELS^{a,b,c,d}**

FASTENER TYPE	FASTENER SPACING (in.) ^{1,2}		
	Panel span ≤ 4 foot	4 feet < panel span ≤ 6 feet	6 feet < panel span ≤ 8 feet
No. 6 Screws		42	9
<u>No. 8 Wood Screw based anchor with 2-inch embedment length</u>	16	<u>10</u>	<u>8</u>
No. 8 Screws		46	42
<u>No. 10 Wood Srew based anchor with 2-inch embedment length</u>	16	<u>12</u>	<u>9</u>
<u>¼ Lag screw based anchor with 2-inch embedment length</u>	<u>16</u>	<u>16</u>	<u>16</u>

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound = 4.448N,
1 mile per hour = 0.447 m/s.

- This table is based on 130 mph wind speeds and a 33-foot mean roof height.
- Fasteners shall be installed at opposing ends of the wood structural panel. Fasteners shall be located a minimum of 1 inch from the edge of the panel.
- Anchors shall penetrate through the exterior wall covering with an embedment length of 2 inches minimum into the building frame. ~~Fasteners shall be long enough to penetrate through the exterior wall covering and a minimum of 1 ¼ inches into wood wall framing and a minimum of 1 ¼ inches into concrete block or concrete, and into steel framing a minimum of 3 exposed threads.~~ Fasteners shall be located a minimum of 2 ½ inches from the edge of concrete block or concrete.
- Where panels ~~screws~~ are attached to masonry or masonry/stucco, they shall be attached using vibration-resistant anchors having a minimum ultimate withdrawal capacity of 1500 ~~490~~ pounds.

Reason: The purpose of this code change is primarily to require permanently mounted hardware when using wood structural panel shutters for window protection for new construction. It is our belief that using wood structural panels as window protection in the manner currently prescribed by the code, is basically an emergency option for protection of existing buildings where the homeowner does not have some permanent shutter system in place.

While the code requires the panels to be precut and the attachment hardware provided, there are potentially many logistical problems with homeowners actually installing the panels as required by the code. It's not clear that the homeowners will be sufficiently instructed on (or remember at a later date) how to attach the panels, in particular using the prescribed minimum spacing. Additionally, it can be extremely cumbersome to attempt to nail a sheet of plywood over a window, particularly on the second story of a building. Additionally, we are concerned about the capacity of nailed connections where the nails are installed in the same hole repeatedly.

This proposed change also increases the minimum required capacity of masonry anchors from 490 lbs to 1500 lbs. Evaluation reports (ICC, NES, and SBCCI) for masonry anchors require a Factor of Safety (FS) of 4.0 if a special inspection is performed on the anchor installation. Without a special inspection, the reports require a FS of 8.0. Based on the load conditions specified, the 490 lb required capacity implies a FS of 2.5. We do not believe that special inspections are or will be performed on these anchors. Therefore, raising the required capacity of the masonry anchors to 1500 lbs provides a FS more in line with the evaluation reports for masonry anchors.

At the time of preparation of this proposal, the Florida Building Commission Structural Technical Advisory Committee unanimously approved this code change for the 2006 glitch amendment cycle.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing Results

PART I – IBC

Committee Action:

Approved as Modified

Modify proposal as follows:

1609.1.2 Protection of openings. In wind-borne debris regions, glazing in buildings shall be impact-resistant or protected with an impact-resistant covering meeting the requirements of an approved impact-resisting standard or ASTM E 1996 and ASTM E 1886 referenced therein as follows:

- Glazed openings located within 30 feet (9144 mm) of grade shall meet the requirements of the Large Missile Test of ASTM E 1996.
- Glazed openings located more than 30 feet (9144 mm) above grade shall meet the provisions of the Small Missile Test of ASTM E 1996.

Exceptions:

- Wood structural panels with a minimum thickness of 7/16 inch (11 mm) and a maximum span of 8 feet (2438 mm) shall be permitted for opening protection in one- and two-story buildings. Panels shall be pre-cut so that they shall be attached to the framing surrounding the opening containing the product with the glazed opening. Panels shall be predrilled as required for the anchorage method and shall be secured with the attachment hardware provided. Attachments shall be designed to resist the

- component and cladding loads determined in accordance with ASCE 7, with ~~permanent~~-corrosion resistant attachment hardware provided and anchors permanently installed on the building. Attachment in accordance with Table 1609.1.2 with ~~permanent~~ corrosion resistant attachment hardware provided and anchors permanently installed on the building is permitted for buildings with a mean roof height of ~~33 45~~ feet (40-068 mm) or less where wind speeds do not exceed ~~430 140~~ miles per hour (68 m/s).
2. Glazing in Occupancy Category I buildings as defined in Section 1604.5, including greenhouses that are occupied for growing plants on a production or research basis, without public access shall be permitted to be unprotected.
 3. Glazing in Occupancy Category II, III or IV buildings located over 60 feet (18 288 mm) above the ground and over 30 feet (9144 mm) above aggregate surface roofs located within 1,500 feet (458 m) of the building shall be permitted to be unprotected.

**TABLE 1609.1.2
WIND-BORNE DEBRIS PROTECTION FASTENING SCHEDULE
FOR WOOD STRUCTURAL PANELS^{a,b,c,d}**

FASTENER TYPE	FASTENER SPACING (in.)		
	Panel span, 4 foot	4 feet < panel span, 6 feet	6 feet < panel span, 8 feet
No. 8 Wood Screw based anchor with 2-inch embedment length	16	10	8
No. 10 Wood Screw based anchor with 2-inch embedment length	16	12	9
¼ Lag screw based anchor with 2-inch embedment length	16	16	16

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound = 4.448N,
1 mile per hour = 0.447 m/s.

- a. This table is based on ~~430 140~~ mph wind speeds and a ~~33 45~~-foot mean roof height.
- b. Fasteners shall be installed at opposing ends of the wood structural panel. Fasteners shall be located a minimum of 1 inch from the edge of the panel.
- c. Anchors shall penetrate through the exterior wall covering with an embedment length of 2 inches minimum into the building frame. ~~into wood wall framing and concrete block or concrete.~~ Fasteners shall be located a minimum of 2 ½ inches from the edge of concrete block or concrete.
- d. Where panels are attached to masonry or masonry/stucco, they shall be attached using vibration-resistant anchors having a minimum ultimate withdrawal capacity of 1500 pounds.

Committee Reason: The proposal makes clarifications to the prescriptive option for protection of glazed openings and specifically requires permanent anchorage to be provided. The modification extends the wind speed and roof height limits to be consistent with the revised fastener spacing. The word permanent immediately preceding "corrosion resistant" was also deleted to avoid confusion.

Assembly Action:

None

PART II – IRC

Committee Action:

Disapproved

Committee Reason: There was insufficient technical data to support this change. A safety factor of 8 would be excessive. If this proposal were passed it would no longer allow the use of masonry screws. In addition, the increase in cost predicted to be from 33 to 53 percent was not justified.

Assembly Action:

None

AS

Code Change No: S20-06/07

Original Proposal

Section: 1609.1.2.2, Chapter 35

Proponent: Joseph R. Hetzel, P.E., Door & Access Systems Manufacturers Association

1. Add new text as follows:

1609.1.2.2 Garage doors. Garage door glazed opening protection for wind-borne debris shall meet the requirements of an approved impact resisting standard or ANSI/DASMA 115.

2. Add standard to Chapter 35 as follows:

DASMA

ANSI/DASMA 115-03, Standard Method for Testing Garage Doors: Determination of Structural Performance Under Missile Impact and Cyclic Wind Pressure

Reason: The purpose of this proposed code change is to reference an ANSI standard published specifically for the windborne debris resistance testing of garage doors. ANSI/DASMA 115 should be the primary standard referenced for this purpose. Other standards exist that could be deemed “approved impact resisting standards”, including ASTM E 1886 / ASTM E 1996 and TAS 201 / TAS 203. It should be noted that ASTM E 1886 and ASTM E 1996 require interpretation regarding their use with garage doors. ASTM E6.51.17 (impact resistance task group) has not developed specific references to garage doors in those standards because of their awareness of the existence of, and industry use of, ANSI/DASMA 115.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Results of review of the proposed standard(s) will be posted on the ICC website by August 20, 2006.

Public Hearing Results

Note: The following analysis was not in the Code Change Proposal book but was published in the “Errata to the 2006/2007 Proposed Changes to the International Codes and Analysis of Proposed Referenced Standards” provided at the code development hearings:

Analysis: Review of proposed new standard indicated that, in the opinion of ICC staff, the standard did comply with ICC criteria for referenced standards.

Committee Action:

Approved as Submitted

Committee Reason: This code change adds a needed reference standard for protection of garage door openings.

Assembly Action:

None

Final Hearing Results

S20-06/07

AS

Code Change No: S22-06/07

Original Proposal

Sections: 1612.3.1 (New), 106.2.1 (New)

Proponent: Rebecca C. Quinn, RCQuinn Consulting, Inc., representing US Dept. of Homeland Security, Federal Emergency Management Agency

Revise as follows:

1612.3 Establishment of flood hazard areas. To establish flood hazard areas, the governing body shall adopt a flood hazard map and supporting data. The flood hazard map shall include, at a minimum, areas of special flood hazard as identified by the Federal Emergency Management Agency in an engineering report entitled “The Flood Insurance Study for (insert Name of Jurisdiction),” dated (insert date of issuance), as amended or revised with the accompanying Flood Insurance Rate Map (FIRM) and Flood Boundary and Floodway Map (FBFM) and related supporting data along with any revisions thereto. The adopted flood hazard map and supporting data are hereby adopted by reference and declared to be part of this Section.

1612.3.1 Design flood elevations. Where design flood elevations are not included in the flood hazard areas established in Section 1612.3, or where floodways are not designated, the code official is authorized to require the applicant to:

1. Obtain and reasonably utilize any design flood elevation and floodway data available from a federal, state, or other source, or
2. Determine the design flood elevation and/or floodway in accordance with accepted hydrologic and hydraulic engineering practices used to define special flood hazard areas. Determinations shall be undertaken by a registered design professional who shall document that the technical methods used reflect currently accepted engineering practice.

106.2 Site plan. The construction documents submitted with the application for permit shall be accompanied by a site plan showing to scale the size and location of new construction and existing structures on the site, distances from lot lines, the established street grades and the proposed finished grades and, as applicable, flood hazard areas, floodways, and design flood elevations; and it shall be drawn in accordance with an accurate boundary line survey. In the case of demolition, the site plan shall show construction to be demolished and the location and size of existing structures and construction that are to remain on the site or plot. The building official is authorized to waive or modify the requirement for a site plan when the application for permit is for alteration or repair or when otherwise warranted.

106.2.1 Design flood elevations. Where design flood elevations are not specified, they shall be established in accordance with Section 1612.3.1.

Reason: The purpose of this code change proposal is to clarify how design flood elevations are to be obtained or determined for those flood hazard areas shown on community flood hazard maps that do not have such flood elevation already specified.

This proposed code change to Section 1612.3 clarifies the authority of the code official to require use of other data which may be obtained from other sources, or to require the applicant to develop flood hazard data. Section 106.2 requires that the construction documents submitted are to be accompanied by a site plan. The site plan is to show, as applicable "flood hazard areas, floodways, and design flood elevations." As written, there appears to be an assumption in Sec. 106.2 and in Section 1612 that flood elevations and floodway designations are available on all flood hazard maps. A large percentage of areas that are mapped as special flood hazard area by the National Flood Insurance Program do not have flood elevations and/or do not have floodway designations (floodways are areas along riverine bodies of water that convey the bulk of floodwaters). The language in this code change proposal parallels language in the IRC at R106.1.3 and R324.1.3.1 (Determination of design flood elevations).

The technical information used to substantiate this proposal is the NFIP regulation §60.3(b)(4).

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: Where design flood elevations are not established, this proposal gives the needed guidance for making that determination and grants the building official the necessary authority to require that determination to be made.

Assembly Action:

None

Final Hearing Results

S22-06/07

AS

Code Change No: S23-06/07

Original Proposal

Section: 1613.1

Proponent: Phillip A. Brown, American Fire Sprinkler Association

Revise as follows:

1613.1 Scope. Every structure, and portion thereof, including nonstructural components that are permanently attached to structures and their supports and attachments, shall be designed and constructed to resist the effects of earthquake motions in accordance with ASCE 7, excluding Chapter 14 and Appendix 11A. The seismic design category for a structure is permitted to be determined in accordance with Section 1613 or ASCE 7.

Exceptions:

1. Detached one- and two-family dwellings, assigned to Seismic Design Category A, B or C, or located where the mapped short-period spectral response acceleration, S_s , is less than 0.4 g.
2. The seismic-force-resisting system of wood-frame buildings that conform to the provisions of Section 2308 are not required to be analyzed as specified in this section.
3. Agricultural storage structures intended only for incidental human occupancy.
4. Structures that require special consideration of their response characteristics and environment that are not addressed by this code or ASCE 7 and for which other regulations provide seismic criteria, such as vehicular bridges, electrical transmission towers, hydraulic structures, buried utility lines and their appurtenances and nuclear reactors.
5. Automatic fire sprinkler systems, designed and constructed in accordance with NFPA 13 shall be deemed to meet the requirements of ASCE 7.

Reason: The purpose of the code change proposal is to add a new exception to the code. The proposed exception will bring the IBC to the forefront of the latest developments in earthquake protection for automatic fire sprinkler systems. With the help of professionals involved with the NEHRP and ASCE 7, NFPA 13 has undergone extensive enhancements to its earthquake protection criteria, as is evident in the tentative interim amendment to the 2002 edition and the forthcoming 2006 edition criteria. The new criteria meet or exceed ASCE 7 requirements with regard to force and displacement. As such, ASCE 7, in its interim update process, will defer to NFPA 13 without caveat for earthquake protection of fire sprinkler systems.

The NFPA Technical Committee on Hanging and Bracing of Water-Based Fire Protection Systems made several modifications to Section 9.3.5 to ensure that the seismic brace criteria within NFPA 13 would properly align with the requirements and permitted limits of ASCE 7. These changes, in combination with the initial TIA, and the Report on Proposals will ensure that NFPA 13 is applicable for all seismic applications. In addition, the changes provide a simplified method to meet the requirements of ASCE 7 without having to develop a complete engineering analysis. These requirements do not prohibit an engineer from doing a complete design and analysis in compliance with ASCE 7 requirements, but have been developed to address the requirements of ASCE 7 and present the material in a way that allows for the requirements to remain in NFPA 13 for seismic design of sprinkler systems. Additionally, these requirements have been developed to provide as much material as possible in NFPA 13 while limiting the amount of required information needed from outside sources.

Bibliography: 13-259a Log #CC101 AUT-HBS NFPA 13 Report on Comments A2006 – Copyright NFPA

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Replace proposal with the following:

1613.6.3 Automatic fire sprinkler systems. Automatic fire sprinkler systems designed and installed in accordance with NFPA 13 shall be deemed to meet the requirements of Section 13.6.8 of ASCE 7.

Chapter 35 NFPA

13-02_07 Installation of Sprinkler Systems

Committee Reason: The proposal recognizes automatic sprinkler systems installed under the 2007 edition of NFPA 13 as complying with the ASCE 7 seismic load provisions. The modification places this provision in a more appropriate code section.

Assembly Action:

None

Code Change No: **S24-06/07**

Original Proposal

Sections: 1613.6, 2101.2.2

Proponent: Ronald E. Barnett, AERCON Florida, LLC, representing Autoclaved Aerated Concrete Products Association

1. Add new text as follows:

1613.6.3 Autoclaved aerated concrete (AAC) masonry shear wall design coefficients and system limitations. Add the following text at the end of Section 12.2.1 of ASCE 7:

For ordinary reinforced AAC masonry shear walls used in the seismic force-resisting system of structures, the response modification factor, R , shall be permitted to be taken as 3, the deflection application factor, C_d , shall be permitted to be taken as 3, and the system overstrength factor, Ω_o , shall be permitted to be taken as $2\frac{1}{2}$. The maximum height for ordinary reinforced AAC masonry shear walls shall not be limited for buildings assigned to Seismic Design Category B, shall be limited to 160 feet (48768 mm) for buildings assigned to Seismic Design Category C, shall be limited to 65 feet (19812 mm) for buildings assigned to Seismic Design Category D, and is not permitted for buildings assigned to Seismic Design Categories E and F.

For ordinary plain (unreinforced) AAC masonry shear walls used in the seismic force-resisting system of structures, the response modification factor, R , shall be permitted to be taken as $1\frac{1}{2}$, the deflection application factor, C_d , shall be permitted to be taken as $1\frac{1}{2}$, and the system overstrength factor, Ω_o , shall be permitted to be taken as $2\frac{1}{2}$. The maximum height for ordinary plain (unreinforced) AAC masonry shear walls shall not be limited for buildings assigned to Seismic Design Category B and is not permitted for buildings assigned to Seismic Design Category B and is not permitted for buildings assigned to Seismic Design Categories C, D, E and F..

2. Revise as follows:

2101.2.2 Strength design. Masonry designed by the strength design method shall comply with the provisions of Sections 2106 and 2108, except that AAC masonry shall comply with the provisions of Section 2106, Section 1613.6.3, and Chapter 1 and Appendix A of ACI 530/ASCE 5/TMS 402. ~~AAC Masonry shall not be used in the seismic force-resisting system of structures classified as Seismic Design Category B, C, D, E or F.~~

Reason: The sentence "AAC Masonry shall not be used in the seismic force resisting system of structures classified as Seismic Design Category B, C, D, E or F." is not in the 2005 MSJC *Code and Specification*. It was added during the 2005 ICC Structural Hearings in Cincinnati through a floor amendment proposed by the Code Resource Support Committee (CRSC) of the Building Seismic Safety Council (BSSC). This amendment was presented due to CRSC's concerns that the seismic provisions had not been reviewed by BSSC, as well as a specific concern over the lack of height limitations in the 2005 MSJC provisions. We bring this modified proposal to you at these hearings after amicable and productive dialog with many key members of BSSC, CRSC, and ASCE 7. Based on those discussions, this modified proposal includes prescriptive height limitations; it limits ductile reinforced AAC masonry shear-wall systems to SDC A through D; it limits unreinforced AAC masonry shear-wall systems to SDC A and B; and it prescribes seismic design factors for each system. The adoption of this proposal will permit this well-established and well-documented structural system to be used in the U.S.A. as it is in Europe, Japan and elsewhere. Since the ASCE 7 cycle is not complete, we are proposing to add information on the seismic factors to Section 1613.6 Alternatives to ASCE 7 as a temporary measure until they can be incorporated into ASCE 7. This is not a unique situation; the proposed exception would join two other exceptions to ASCE 7 in that section. Through ASCE 7 itself, and through the BSSC PUC working group charged with coordination with ASCE 7, we intend to work for direct inclusion of these seismic design factors into ASCE 7 as soon as the ASCE 7 cycle permits.

The proposed modification is based on the results of the ANSI-consensus provisions of the 2005 MSJC *Code and Specification*, including its provisions for AAC masonry and considerable review and discussion with other committees charged with protection of the seismic safety of the public. This is a far better solution than the current prohibition outside of SDC A, which was made on procedural rather than technical grounds. Also, the proposed values of R and C_d , which were determined in accordance with AC215 and already approved by ICC-ES, are consistent with the stated intentions of the Code Resource Support Committee (CRSC) of the Building Seismic Safety Council (BSSC) for development of acceptance criteria for new materials.

The first basis for our proposed modification is technical. No technical data was advanced in support of the current exclusion -- only that the intervening group had not had time to study it. They have now undertaken that study. Ample technical justification confirming the seismic reliability of AAC masonry, and supporting the proposed seismic design factors, has been published in refereed conference proceedings since June 2003. The 2005 MSJC provisions for AAC masonry are supported by three refereed journal papers, many refereed conference proceedings, and a coherent and rigorously applied body of uncontested technical information. The refereed journal papers are listed below:

Tanner, J.E., Varela, J.L., Klingner, R.E., "Design and Seismic Testing of a Two-story Full-scale Autoclaved Aerated Concrete (AAC) Assemblage Specimen," *Structures Journal*, American Concrete Institute, Farmington Hills, Michigan, vol. 102, no. 1, January - February 2005, pp. 114-119.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

Tanner, J.E., Varela, J.L., Klingner, R.E., Brightman M. J. and Cancino, U., "Seismic Testing of Autoclaved Aerated Concrete (AAC) Shear Walls: A Comprehensive Review," *Structures Journal*, American Concrete Institute, Farmington Hills, Michigan, vol. 102, no. 3, May - June 2005, pp. 374-382.

Varela, J. L., Tanner, J. E. and Klingner, R. E., "Development of Seismic Force-Reduction and Displacement Amplification Factors for AAC Structures," *EERI Spectra* (accepted for publication, May 2005).

Prior to our work in developing the procedure for AAC as described in the ICC-ES AC215 document entitled "ACCEPTANCE CRITERIA FOR SEISMIC DESIGN FACTORS AND COEFFICIENTS FOR SEISMIC-FORCE-RESISTING SYSTEMS OF AUTOCLAVED AERATED CONCRETE (AAC)", approved in October 2003, there had not been any procedure developed for the establishment of R and CD values for new materials. The values proposed in this modification for AAC were developed in accordance with the acceptance criteria approved in AC215 and are consistent with the stated intentions of the Code Resource Support Committee (CRSC) of the Building Seismic Safety Council (BSSC) for development of acceptance criteria for new materials.

As can be seen in that research, for ductile reinforced AAC masonry shear walls the requested values of 3 for the response modification factor, R and the deflection application factor, CD, are conservative, which provides an additional factor of safety beyond that which would normally be expected for any building material or system. In addition, for unreinforced AAC masonry shear walls, the requested values of 1.5 for the response modification factor, R and the deflection application factor, CD, are consistent with the values currently prescribed for unreinforced masonry.

The second basis for our proposed modification is the life safety of the public that the ICC is charged with protecting. There is no justification for denying to that public a building system that was introduced in 1929; that is demonstrably safe, environmentally friendly, energy-efficient, and comfortable to live in; and that is recognized throughout the world, including many areas of high seismic risk and strict design and construction standards.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Errata: Revise Item 1 of proposal to read as follows:

1613.6.3 Autoclaved aerated concrete (AAC) masonry shear wall design coefficients and system limitations. Add the following text at the end of Section 12.2.1 of ASCE 7:

For ordinary reinforced AAC masonry shear walls used in the seismic force-resisting system of structures, the response modification factor, R, shall be permitted to be taken as 3, the deflection amplification factor, C_d, shall be permitted to be taken as 3, and the system overstrength factor, ω , shall be permitted to be taken as 2½. The maximum height for ordinary reinforced AAC masonry shear walls shall not be limited for buildings assigned to Seismic Design Category B, shall be limited to 160 feet (48768 mm) for buildings assigned to Seismic Design Category C, shall be limited to 65 feet (19812 mm) for buildings assigned to Seismic Design Category D, and is not permitted for buildings assigned to Seismic Design Categories E and F.

For ordinary plain (unreinforced) AAC masonry shear walls used in the seismic force-resisting system of structures, the response modification factor, R, shall be permitted to be taken as 1½, the deflection amplification factor, C_d, shall be permitted to be taken as 1½, and the system overstrength factor, ω , shall be permitted to be taken as 2½. The maximum height for ordinary plain (unreinforced) AAC masonry shear walls shall not be limited for buildings assigned to Seismic Design Category B and is not permitted for buildings assigned to Seismic Design Categories C, D, E and F.

Committee Action:

Approved as Modified

Modify proposal as follows:

1613.6.3 Autoclaved aerated concrete (AAC) masonry shear wall design coefficients and system limitations. Add the following text at the end of Section 12.2.1 of ASCE 7:

For ordinary reinforced AAC masonry shear walls used in the seismic force-resisting system of structures, the response modification factor, R, shall be permitted to be taken as ~~3~~ 2, the deflection amplification factor, C_d, shall be permitted to be taken as ~~3~~ 2, and the system overstrength factor, ω , shall be permitted to be taken as 2½. ~~The maximum height for ordinary reinforced AAC masonry shear walls shall not be limited in height for buildings assigned to Seismic Design Category B, shall be limited in height to 160 feet (48768 mm) for buildings assigned to Seismic Design Category C, shall be limited to 65 feet (19812 mm) for buildings assigned to Seismic Design Category D, and is not permitted for buildings assigned to Seismic Design Categories D, E and F.~~

For ordinary plain (unreinforced) AAC masonry shear walls used in the seismic force-resisting system of structures, the response modification factor, R, shall be permitted to be taken as 1½, the deflection amplification factor, C_d, shall be permitted to be taken as 1½, and the system overstrength factor, ω , shall be permitted to be taken as 2½. ~~The maximum height for ordinary plain (unreinforced) AAC masonry shear walls shall not be limited in height for buildings assigned to Seismic Design Category B and is not permitted for buildings assigned to Seismic Design Categories C, D, E and F.~~

2101.2.2 Strength design. Masonry designed by the strength design method shall comply with the provisions of Sections 2106 and 2108, except that AAC masonry shall comply with the provisions of Section 2106, Section 1613.6.3, and Chapter 1 and Appendix A of ACI 530/ASCE 5/TMS 402.

Committee Reason: This code change adds seismic design coefficients and limitations for autoclaved aerated masonry shear wall systems, thus extending the use of these systems in seismic applications. The modification provides that these systems will not be used in Seismic Design Category D, E or F buildings.

Assembly Action:

None

Code Change No: **S26-06/07**

Original Proposal

Section: 1613.7 (New)

Proponent: Edward A. Donoghue, Edward A. Donoghue Associates Inc., representing National Elevator Industry, Inc.

Add new text as follows:

1613.7 Modifications to ASCE 7.

1613.7.1 ASCE 7, Section 13.6.10.3 Seismic Controls. Modify ASCE 7, Section 13.6.10.3 to read as follows:

13.6.10.3 Seismic Controls. Seismic switches shall be in accordance with Section 8.4.10 of ASME A17.1.

Reason: Delete duplicate requirements.

Seismic switches and elevator operation, after switch activation, are already defined in A17.1-2004, Section 8.4.10, Emergency Operation and Signaling Devices. A17.1 and ASCE 7 seismic switch and mounting requirements are different and inconsistent. A17.1 requires mounting the switch, when exclusively to control elevators, in the machine room and, where possible, adjacent to a vertical load bearing building structural member with its axis of sensitivity in the vertical direction and set to trigger at 0.15g. Placing the switch near a vertical structural support member will prevent significant amplification of vertical motions between the foundation and seismic trigger. At small and moderate ground motions, buildings often exhibit horizontal amplifications at the top of 3 or more. Thus, with horizontal ground motions of 0.1 g, a value commonly experienced in California, the ASCE 7 seismic switch shall trigger elevator shutdowns. This requires the elevator be inspected by an elevator mechanic, adding unnecessary disruption and cost. The seismic switch used by A17.1 is designed to trigger on the P wave so that, in many cases, it will provide adequate time to stop the elevator and allow passengers to exit the elevator before severe shaking in the building starts. This earlier trigger is also more likely to allow passengers to exit the elevator prior to loss of building power, a common occurrence in moderate earthquakes. This early exit would avoid having passengers trapped in an elevator during an earthquake and the need for first responders to rescue them from the elevator.

Movement of the elevator after the seismic switch has triggered, even in "life-safety" facilities, is a significant elevator operation. It is felt that ASCE 7 does not go into enough detail of procedures for this operation. A17.1-2004, 8.4.10, has a prescribed elevator operation in the event a seismic switch or counterweight (CWT) derailment switch is activated. An activated CWT derailment switch indicates that the CWT is out of its normal running position and may be totally out of its guide rails. Upon activation of the CWT derailment switch, A17.1 does not allow movement of the car towards the CWT, in order to prevent the possible collision of the elevator car and CWT. There could be great risk of injury and death to elevator passengers and damage to building structures by having an elevator running while its CWT derailment switch is activated. A17.1 Earthquake Safety Committee is currently working on a post-earthquake procedure/operation guideline to expedite returning elevator service to key buildings.

Reference ASME A17.1 – 2004, 8.4.10.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Replace proposal with the following:

1613.6.3 Seismic controls for elevators. Seismic switches in accordance with Section 8.4.10 of ASME A17.1 shall be deemed to comply with Section 13.6.10.3 of ASCE 7.

Committee Reason: This proposal clarifies the application of multiple provisions in referenced standards for seismic controls on elevators. The modification adds an IBC provision, recognizing seismic switches in accordance with ASME A17.1 as deemed to comply with the ASCE 7 requirements for seismic controls.

Assembly Action:

None

S26-06/07

AM

Code Change No: **S28-06/07**

Original Proposal

Section: 1702.1

Proponent: Sam Francis, American Forest & Paper Association

Revise as follows:

**SECTION 1702
DEFINITIONS**

FABRICATED ITEM. Structural, load-bearing or lateral load-resisting assemblies consisting of materials assembled prior to installation in a building or structure, or subjected to operations such as heat treatment, thermal cutting, cold working or reforming after manufacture and prior to installation in a building or structure. Materials produced in accordance with ~~standard specifications referenced by this code, such as rolled structural steel shapes, steel-reinforcing bars, masonry units, and wood structural panels~~ a standard, listed in Chapter 35, that requires quality control to be provided under the supervision of a third party quality control agency shall not be considered “fabricated items.”

Reason: This proposal is intended to clarify the code requirements for special inspections. Many common items are fabricated under standards cited in the IBC. Many of those items are fabricated with strict quality assurance done under third party supervision. In addition, the proposal also eliminates laundry lists from the code text. Such lists make interpretation and maintenance of the code awkward at best but potentially very, very difficult.

The reason for this change is to eliminate what amounts to a duplicate requirement in the code. Special Inspections are exactly analogous to the QC program required by some standards listed in the code. This change makes it clear that the code is not intended to require a redundant set of inspection requirements for those items. They have been produced satisfactorily for many years under the code mandated third party QC and inspection.

Cost Impact: The code change proposal will not increase the cost of construction. Elimination of unnecessary and redundant requirements lower costs of various amounts.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

FABRICATED ITEM. Structural, load-bearing or lateral load-resisting assemblies consisting of materials assembled prior to installation in a building or structure, or subjected to operations such as heat treatment, thermal cutting, cold working or reforming after manufacture and prior to installation in a building or structure. Materials produced in accordance with standard specifications referenced by this code, such as rolled structural steel shapes, steel-reinforcing bars, masonry units, and wood structural panels or in accordance with a standard, listed in Chapter 35, ~~that requires which provides requirements for~~ quality control to be provided done under the supervision of a third party quality control agency shall not be considered “fabricated items.”

Committee Reason: The proposal clarifies the definition of fabricated item so that the special inspection requirements can be applied more uniformly. The modification retains the current list of specific items that are excluded from the definition of fabricated items.

Assembly Action:

None

Final Hearing Results

S28-06/07

AM

Code Change No: **S29-06/07**

Original Proposal

Sections: 1702, 202

Proponent: William W. Stewart, FAIA, Chesterfield, MO, representing himself

1. Add new definitions as follows:

SECTION 202 DEFINITIONS

LABEL. ~~See Section 1702.1. An identification applied on a product by the manufacturer that contains the name of the manufacturer, the function and performance characteristics of the product or material, and the name and identification of an approved agency and that indicates that the representative sample of the product or material has been tested and evaluated by an approved agency (see Section 1703.5 and "Inspection certificate," "Manufacturer's designation" and "Mark").~~

MANUFACTURER'S DESIGNATION. ~~See Section 1702.1. An identification applied on a product by the manufacturer indicating that a product or material complies with a specified standard or set of rules (see also "Inspection certificate," "Label" and "Mark").~~

MARK. ~~See Section 1702.1. An identification applied on a product by the manufacturer indicating the name of the manufacturer and the function of a product or material (see also "Inspection certificate," "Label" and "Manufacturer's designation").~~

2. Delete definitions without substitution:

SECTION 1702 DEFINITIONS

~~**LABEL.** An identification applied on a product by the manufacturer that contains the name of the manufacturer, the function and performance characteristics of the product or material, and the name and identification of an approved agency and that indicates that the representative sample of the product or material has been tested and evaluated by an approved agency (see Section 1703.5 and "Inspection certificate," "Manufacturer's designation" and "Mark").~~

~~**MANUFACTURER'S DESIGNATION.** An identification applied on a product by the manufacturer indicating that a product or material complies with a specified standard or set of rules (see also "Inspection certificate," "Label" and "Mark").~~

~~**MARK.** An identification applied on a product by the manufacturer indicating the name of the manufacturer and the function of a product or material (see also "Inspection certificate," "Label" and "Manufacturer's designation").~~

Reason: Since label is a term used in many sections (715.3.5, 1404.10, 2303.21 and 2405.5 for example) the definition should be in Chapter 2 not Chapter 17. I have not changed any text, just moved it to 202. The same is true for Manufacturer's Designation and Mark. They are rarely used in the code but they appear more often in other chapters than in Chapter 17. If moved then they should then be deleted from Chapter 17.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This code change clarifies applicability for the definitions of "mark" and "label" by more appropriately locating them in Chapter 2.

Assembly Action:

None

Final Hearing Results

S29-06/07

AS

Code Change No: **S30-06/07**

Original Proposal

Sections: 1703.6, 2403.1.1 (New) [IEBC 302.1.1 (New)]

Proponent: William W. Stewart, FAIA, Chesterfield, MO, representing himself

1. Delete without substitution:

~~**1703.6 Heretofore approved materials.** The use of any material already fabricated or of any construction already erected, which conformed to requirements or approvals heretofore in effect, shall be permitted to continue, if not detrimental to life, health or safety to the public.~~

(Renumber subsequent sections)

2. Add new text as follows:

3403.1.1 (IEBC 302.1.1) Heretofore approved materials. The use of any material already fabricated or of any construction already erected, which conformed to requirements or approvals heretofore in effect, shall be permitted to continue, if not detrimental to life, health or safety to the public.

Reason: This section covers all existing materials and belongs in Chapter 34 Existing Structures. Section 1703.6 has been moved, with no changes to Chapter 34.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: Rather than relocate to Chapter 34, it is felt that the provision for "heretofore approved materials" is appropriate in its current location, since it would apply to work under construction.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

William W. Stewart, FAIA, Chesterfield, MO, representing himself, requests Approval as Submitted.

Commenter's Reason: The committee disapproved this change because they felt it would affect materials in buildings under construction. The commentary makes it clear that this section refers to code complying materials in buildings that have been completed. The commentary says, "If a material or system had been approved before the code took effect, it can continue to be used as long as it can be shown that the material or system is not detrimental to the health or safety of the building occupants or the public. In other words the code is not retroactive."

Therefore this section is more appropriately located in Chapter 34 since Chapter 34 addresses existing buildings. Additionally this stipulation is lost in a section entitled Structural Design since it covers all the materials in a building, not just structural materials.

Final Hearing Results

S30-06/07

AS

Code Change No: **S31-06/07**

Original Proposal

Section: 1704.1

Proponent: Philip Brazil, P.E., Reid Middleton, Inc., representing himself

Revise as follows:

1704.1 General. Where application is made for construction as described in this section, the owner or the registered design professional in responsible charge acting as the owner's agent shall employ one or more special inspectors to provide inspections during construction on the types of work listed under Section 1704. The special inspector shall be a qualified person who shall demonstrate competence, to the satisfaction of the building official, for inspection of the particular type of construction or operation requiring special inspection. These inspections are in addition to the inspections specified in Section 109.

Exceptions:

1. Special inspections are not required for work of a minor nature or as warranted by conditions in the jurisdiction as approved by the building official.
2. Special inspections are not required for building components unless the design involves the practice of professional engineering or architecture as defined by applicable state statutes and regulations governing the professional registration and certification of engineers or architects.
3. Unless otherwise required by the building official, special inspections are not required for occupancies in ~~Group R-3 as applicable in Section 101.2 and occupancies in Group U~~ that are accessory to a residential occupancy including, but not limited to, those listed in Section 312.1.

Reason: In the 2003 IBC, there were approximately 45 provisions applicable to "Group R-3 as applicable in Section 101.2." Section 101.2 requires application of the provisions of the IBC to every building or structure or any appurtenances connected to or attached to such buildings or structures. Detached one- and two-family dwellings and multiple single-family dwellings not more than three stories above grade with a separate means of egress and their accessory structures, however, are required to comply with the IRC. Existing buildings undergoing repair, alteration or additions and changes of occupancy are permitted to comply with the IEBC.

In the 2006 IBC, the phrase, "as applicable in Section 101.2," has been deleted in virtually all cases except for Exception 3 to Section 1704.1. Currently, Exception 3 exempts Group R-3 occupancies complying with the IRC from the requirements for special inspection in the IBC. If deletion of the phrase, "as applicable in Section 101.2," in Section 1704.1 were to occur, Group R-3 occupancies complying with the IBC would be exempt from the requirements for special inspection in the IBC.

The proposal deletes the exemption for Group R-3 occupancies. The structural systems of Group R-3 buildings can just as complex and challenging as those of commercial structures. The use of high-strength concrete, structural steel, high-strength bolting, complete-penetration groove welds, engineered masonry, pile foundations and other materials, components and systems that typically receive special inspection in commercial structures are often seen in Group R-3 buildings. In Seismic Design Categories C, D, E and F, engineered seismic-force-resisting systems are also common.

The requirement for special inspection of Group R-3 occupancies in the IBC is warranted and should be retained. Exception 1 to Section 1704.1 will continue to provide the building official with the discretion to exempt work of a minor nature or as warranted by conditions in the jurisdiction from the requirement for special inspection.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: Removing the special inspection exemption for Group R-3 is an improvement that is also consistent with action taken in previous code development cycle.

Assembly Action:

None

Final Hearing Results

S31-06/07

AS

Code Change No: **S32-06/07****Original Proposal****Section: 1704.1**

Proponent: Brian Scot Tollisen, P.E., New York Department of State Division of Code Enforcement and Administration

Revise as follows:

1704.1 General. Where application is made for construction as described in this section, the owner or the registered design professional in responsible charge acting as the owner's agent shall employ one or more special inspectors to provide inspections during construction on the types of work listed under Section 1704. ~~The special inspector shall be a qualified person who shall demonstrate competence, to the satisfaction of the building official, for the inspection of the particular type of construction or operation requiring special inspection.~~ These inspections are in addition to the inspections identified in Section 109.

The special inspector shall be a qualified person who shall demonstrate competence, to the satisfaction of the building official, for the inspection of the particular type of construction or operation requiring special inspection. The special inspector shall provide written documentation to the building official demonstrating their competence and relevant experience. Experience shall be considered relevant when the documented experience is related in complexity to the same type of special inspection activities for projects of similar complexity and material qualities. These qualifications are in addition to qualifications specified in other sections of this code.

Exceptions:

1. Special inspections are not required for work of a minor nature or as warranted by conditions in the jurisdiction as approved by the building official.
2. Special inspections are not required for building components unless the design involves the practice of professional engineering or architecture as defined by applicable state statutes and regulations governing the professional registration and certification of engineers or architects.
3. Unless otherwise required by the building official, special inspections are not required for occupancies in Group R-3 as applicable in Section 101.2 and occupancies in Group U that are accessory to a residential occupancy including, but not limited to, those listed in Section 312.1.

Reason: The purpose of this proposal is to provide an adequate pool of qualified and knowledgeable special inspectors. The additions to IBC Section 1704.1 are proposed with the intention to standardize special inspection qualifications within the model code.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results**Committee Action:****Approved as Modified****Modify proposal as follows:**

1704.1 General. Where application is made for construction as described in this section, the owner or the registered design professional in responsible charge acting as the owner's agent shall employ one or more special inspectors to provide inspections during construction on the types of work listed under Section 1704. These inspections are in addition to the inspections identified in Section 109. The special inspector shall be a qualified person who shall demonstrate competence, to the satisfaction of the building official, for the inspection of the particular type of construction or operation requiring special inspection. The special inspector shall provide written documentation to the building official demonstrating their competence and relevant experience or training. Experience or training shall be considered relevant when the documented experience or training is related in complexity to the same type of special inspection activities for projects of similar complexity and material qualities. These qualifications are in addition to qualifications specified in other sections of this code.

Exceptions:

1. Special inspections are not required for work of a minor nature or as warranted by conditions in the jurisdiction as approved by the building official.

2. Special inspections are not required for building components unless the design involves the practice of professional engineering or architecture as defined by applicable state statutes and regulations governing the professional registration and certification of engineers or architects.
3. Unless otherwise required by the building official, special inspections are not required for occupancies in Group R-3 as applicable in Section 101.2 and occupancies in Group U that are accessory to a residential occupancy including, but not limited to, those listed in Section 312.1.

Committee Reason: This proposal will promote standardized special inspector qualifications. It is felt that poorly trained special inspectors have impacted construction in some areas. The modification adds training as a qualification that would be equivalent to relevant experience.

Code Change No: S35-06/07

Original Proposal

Sections: 1704.4, 1705.3, 1709.2, 1805.5.7, 1805.9, 1808.2.5, 1808.2.23.2, 1904.2.2, 1909.4, 1915.5, 2308.3.3, 2308.11.1, 2308.12.1

Proponent: Philip Brazil, P.E., Reid Middleton, Inc., representing himself

Revise as follows:

1704.4 Concrete construction. The special inspections and verifications for concrete construction shall be as required by this section and Table 1704.4.

Exception: Special inspections shall not be required for:

1. Isolated spread concrete footings of buildings three stories or less ~~in height~~ above grade plane that are fully supported on earth or rock.
2. Continuous concrete footings supporting walls of buildings three stories or less ~~in height~~ above grade plane that are fully supported on earth or rock where:
 - 2.1. The footings support walls of light frame construction;
 - 2.2. The footings are designed in accordance with Table 1805.4.2; or
 - 2.3. The structural design of the footing is based on a specified compressive strength, f'_c , no greater than 2,500 pounds per square inch (psi) (17.2 Mpa), regardless of the compressive strength specified in the construction documents or used in the footing construction.
3. Nonstructural concrete slabs supported directly on the ground, including prestressed slabs on grade, where the effective prestress in the concrete is less than 150 psi (1.03 Mpa).
4. Concrete foundation walls constructed in accordance with Table 1805.5(5).
5. Concrete patios, driveways and sidewalks, on grade.

1705.3 Seismic resistance. The statement of special inspections shall include seismic requirements for the following cases:

1. The seismic-force-resisting systems in structures assigned to Seismic Design Category C, D, E or F, in accordance with Section 1613.
2. Designated seismic systems in structures assigned to Seismic Design Category D, E or F.
3. The following additional systems and components in structures assigned to Seismic Design Category C:
 - 3.1. Heating, ventilating and air-conditioning (HVAC) ductwork containing hazardous materials and anchorage of such ductwork.
 - 3.2. Piping systems and mechanical units containing flammable, combustible or highly toxic materials.

- 3.3. Anchorage of electrical equipment used for emergency or standby power systems.
4. The following additional systems and components in structures assigned to Seismic Design Category D:
 - 4.1. Systems required for Seismic Design Category C.
 - 4.2. Exterior wall panels and their anchorage.
 - 4.3. Suspended ceiling systems and their anchorage.
 - 4.4. Access floors and their anchorage.
 - 4.5. Steel storage racks and their anchorage, where the importance factor is equal to 1.5 in accordance with Section 15.5.3 of ASCE 7.
5. The following additional systems and components in structures assigned to Seismic Design Category E or F:
 - 5.1. Systems required for Seismic Design Categories C and D.
 - 5.2. Electrical equipment.

Exception: Seismic requirements are permitted to be excluded from the statement of special inspections for structures designed and constructed in accordance with the following:

1. The structure consists of light-frame construction; the design spectral response acceleration at short periods, S_{DS} , as determined in Section 1613.5.4, does not exceed 0.5g; and the height of the structure does not exceed 35 feet (10 668 mm) above grade plane; or
2. The structure is constructed using a reinforced masonry structural system or reinforced concrete structural system; the design spectral response acceleration at short periods, S_{DS} , as determined in Section 1613.5.4, does not exceed 0.5g, and the height of the structure does not exceed 25 feet (7620 mm) above grade plane; or
3. Detached one- or two-family dwellings not exceeding two stories ~~in height above grade plane~~, provided the structure does not have any of the following plan or vertical irregularities in accordance with Section 12.3.2 of ASCE 7:
 - 3.1. Torsional irregularity.
 - 3.2. Nonparallel systems.
 - 3.3. Stiffness irregularity—extreme soft story and soft story.
 - 3.4. Discontinuity in capacity—weak story.

1709.2 Structural observations for seismic resistance. Structural observations shall be provided for those structures included in Seismic Design Category D, E or F, as determined in Section 1613.5.6, where one or more of the following conditions exist:

1. The structure is classified as Occupancy Category III or IV in accordance with Table 1604.5.
2. The height of the structure is greater than 75 feet (22 860 mm) above the base.
3. The structure is assigned to Seismic Design Category E, is classified as Occupancy Category I or II in accordance with Table 1604.5, and is greater than two stories ~~in height above grade plane~~.
4. When so designated by the registered design professional in responsible charge of the design.
5. When such observation is specifically required by the building official.

1805.5.7 Pier and curtain wall foundations. Except in Seismic Design Categories D, E and F, pier and curtain wall foundations are permitted to be used to support light-frame construction not more than two stories ~~in height above grade plane~~, provided the following requirements are met:

1. All load-bearing walls shall be placed on continuous concrete footings bonded integrally with the exterior wall footings.
2. The minimum actual thickness of a load-bearing masonry wall shall not be less than 4 inches (102 mm) nominal or 3-5/8 inches (92 mm) actual thickness, and shall be bonded integrally with piers spaced 6 feet (1829 mm) on center (o.c.).
3. Piers shall be constructed in accordance with Chapter 21 and the following:
 - 3.1. The unsupported height of the masonry piers shall not exceed 10 times their least dimension.
 - 3.2. Where structural clay tile or hollow concrete masonry units are used for piers supporting beams and girders, the cellular spaces shall be filled solidly with concrete or Type M or S mortar.

Exception: Unfilled hollow piers are permitted where the unsupported height of the pier is not more than four times its least dimension.

- 3.3. Hollow piers shall be capped with 4 inches (102 mm) of solid masonry or concrete or the cavities of the top course shall be filled with concrete or grout.

4. The maximum height of a 4-inch (102mm) load-bearing masonry foundation wall supporting wood frame walls and floors shall not be more than 4 feet (1219 mm) in height.
5. The unbalanced fill for 4-inch (102 mm) foundation walls shall not exceed 24 inches (610 mm) for solid masonry, nor 12 inches (305mm) for hollow masonry.

1805.9 Seismic requirements. See Section 1908 for additional requirements for footings and foundations of structures assigned to Seismic Design Category C, D, E or F.

For structures assigned to Seismic Design Category D, E or F, provisions of ACI 318, Sections 21.10.1 to 21.10.3, shall apply when not in conflict with the provisions of Section 1805. Concrete shall have a specified compressive strength of not less than 3,000 psi (20.68 MPa) at 28 days.

Exceptions:

1. Group R or U occupancies of light-framed construction and two stories or less in height above grade plane are permitted to use concrete with a specified compressive strength of not less than 2,500 psi (17.2 MPa) at 28 days.
2. Detached one- and two-family dwellings of light-frame construction and two stories or less in height above grade plane are not required to comply with the provisions of ACI 318, Sections 21.10.1 to 21.10.3.

1808.2.5 Stability. Piers or piles shall be braced to provide lateral stability in all directions. Three or more piles connected by a rigid cap shall be considered braced, provided that the piles are located in radial directions from the centroid of the group not less than 60 degrees (1 rad) apart. A two-pile group in a rigid cap shall be considered to be braced along the axis connecting the two piles. Methods used to brace piers or piles shall be subject to the approval of the building official.

Piles supporting walls shall be driven alternately in lines spaced at least 1 foot (305 mm) apart and located symmetrically under the center of gravity of the wall load carried, unless effective measures are taken to provide for eccentricity and lateral forces, or the wall piles are adequately braced to provide for lateral stability. A single row of piles without lateral bracing is permitted for one- and two-family dwellings and lightweight construction not exceeding two stories above grade plane or 35 feet (10 668 mm) in height, provided the centers of the piles are located within the width of the foundation wall.

1808.2.23.2 Seismic Design Category D, E or F. Where a structure is assigned to Seismic Design Category D, E or F in accordance with Section 1613, the requirements for Seismic Design Category C given in Section 1808.2.23.1 shall be met, in addition to the following. Provisions of ACI 318, Section 21.10.4, shall apply when not in conflict with the provisions of Sections 1808 through 1812. Concrete shall have a specified compressive strength of not less than 3,000 psi (20.68 MPa) at 28 days.

Exceptions:

1. Group R or U occupancies of light-framed construction and two stories or less in height above grade plane are permitted to use concrete with a specified compressive strength of not less than 2,500 psi (17.2 MPa) at 28 days.
2. Detached one- and two-family dwellings of light-frame construction and two stories or less in height are not required to comply with the provisions of ACI 318, Section 21.10.4.
3. Section 21.10.4.4(a) of ACI 318 need not apply to concrete piles.

1904.2.2 Concrete properties. Concrete that will be subject to the following exposures shall conform to the corresponding maximum water-cementitious materials ratios and minimum specified concrete compressive strength requirements of ACI 318, Section 4.2.2.

1. Concrete intended to have low permeability where exposed to water;
2. Concrete exposed to freezing and thawing in a moist condition or deicer chemicals; or
3. Corrosion protection of reinforcement in concrete exposed to chlorides from deicing chemicals, salt, salt water, brackish water, seawater, or spray from these sources.

Exception: For occupancies and appurtenances thereto in Group R occupancies that are in buildings less than four stories in height above grade plane, normal-weight aggregate concrete shall comply with the requirements of Table 1904.2.2(2) based on the weathering classification (freezing and thawing) determined from Figure 1904.2.2.

In addition, concrete that will be exposed to deicing chemicals shall conform to the limitation of Section 1904.2.3.

1909.4 Design. Structural plain concrete walls, footings and pedestals shall be designed for adequate strength in accordance with ACI 318, Sections 22.4 through 22.8.

Exception: For Group R-3 occupancies and buildings of other occupancies less than two stories ~~in height~~ above grade plane of light-frame construction, the required edge thickness of ACI 318 is permitted to be reduced to 6 inches (152 mm), provided that the footing does not extend more than 4 inches (102 mm) on either side of the supported wall.

1915.5 Fire-resistance-rating protection. Pipe columns shall be of such size or so protected as to develop the required fire-resistance ratings specified in Table 601. Where an outer steel shell is used to enclose the fire protective covering, the shell shall not be included in the calculations for strength of the column section. The minimum diameter of pipe columns shall be 4 inches (102 mm) except that in structures of Type V construction not exceeding three stories above grade plane or 40 feet (12 192 mm) in height, pipe columns used in the basement and as secondary steel members shall have a minimum diameter of 3 inches (76 mm).

2308.3.3 Sill anchorage. Where foundations are required by Section 2308.3.4, braced wall line sills shall be anchored to concrete or masonry foundations. Such anchorage shall conform to the requirements of Section 2308.6 except that such anchors shall be spaced at not more than 4 feet (1219 mm) o.c. for structures over two stories ~~in height~~ above grade plane. The anchors shall be distributed along the length of the braced wall line. Other anchorage devices having equivalent capacity are permitted.

2308.11.1 Number of stories. Structures of conventional light-frame construction shall not exceed two stories ~~in height~~ above grade plane in Seismic Design Category C.

2308.12.1 Number of stories. Structures of conventional light-frame construction shall not exceed one story ~~in height~~ above grade plane in Seismic Design Category D or E.

Reason: All of the code sections in this proposal have one thing in common. They specify requirements for a building based on its number of stories. A story is defined in Sections 202 and 502.1 as “that portion of a building included between the upper surface of a floor and the upper surface of the floor or roof next above,” which includes portions of a building below grade plane (i.e., basements). Consequently, the number of stories specified in of these code sections would be determined beginning at the bottommost level in the building, which could be several levels (stories) below grade plane. The proposal will establish that the determination begins at the first story above grade plane, which is the probable intent in each case.

This proposal does not include each code section in the IBC that specifies requirements for a building based on its number of stories. There are cases where the determination of the number of stories in a building beginning at the bottommost level is warranted. Please refer to Sections 406.1.1, 415.4, 415.5, 415.7.3.3, 903.2.8.1(1), 1015.2, 2305.1.5, 2305.2.5, 2603.5, 3310.1 and 3311.1.

There are also several code sections in the IBC that currently specify requirements for a building based on its number of stories above grade plane. Please refer to Sections 101.2 (Exception 1), 402.1, 402.7.3, 415.7.3.5, 415.9.2.3, 903.2.3(2), 903.2.6(2), 903.2.8(2), 1009.12, 1002.6 (Exception 1), 1018.2 (Item 1), 1025.1, 1407.11.1, 1407.11.2, 1705.1 (Exceptions 1 and 2), 1509.5, 1807.1.1, 2308.2(1), 2308.2.2 (Exception 2), 2308.11.2 (Exception 1), 2308.12.2 (Exception 1), 2607.3, 2608.2 (Item 1) and 3002.4. See code change proposal G44-04/05 (AM) for further information.

This proposal is partly a continuation of code change proposal G44-04/05 (AM), which successfully distinguished between requirements based on the height or number of stories of a building by measuring from grade plane versus the height of a component of a building by measuring from grade. There is also a similar proposal before the IBC General Committee.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This code change will clarify the determination of a building's height in stories in the structural chapters by referring to grade plane.

Assembly Action:

None

Final Hearing Results

Code Change No: **S37-06/07**

Original Proposal

Sections: 1704.7, 1704.8, 1704.9, 1708.4, 1708.5, 1709.2, 1709.3

Proponent: Philip Brazil, P.E., Reid Middleton, Inc., representing himself

Revise as follows:

1704.7 Soils. Special inspections for existing site soil conditions, fill placement and load-bearing requirements shall be as required by this section and Table 1704.7. The approved soils report, required by Section 1802.2, and the documents prepared by the registered design professional ~~in responsible charge~~ shall be used to determine compliance. During fill placement, the special inspector shall determine that proper materials and procedures are used in accordance with the provisions of the approved soils report, as specified in Section 1803.5.

Exception: Special inspection is not required during placement of controlled fill having a total depth of 12 inches (305 mm) or less.

1704.8 Pile foundations. Special inspections shall be performed during installation and testing of pile foundations as required by Table 1704.8. The approved soils report, required by Section 1802.2, and the documents prepared by the registered design professional ~~in responsible charge~~ shall be used to determine compliance.

1704.9 Pier foundations. Special inspections shall be performed during installation and testing of pier foundations as required by Table 1704.9. The approved soils report, required by Section 1802.2, and the documents prepared by the registered design professional ~~in responsible charge~~ shall be used to determine compliance.

1708.4 Structural steel. The testing contained in the quality assurance plan shall be as required by AISC 341 and the additional requirements herein. The acceptance criteria for nondestructive testing shall be as required in AWS D1.1 as specified by the registered design professional.

Base metal thicker than 1.5 inches (38 mm), where subject to through-thickness weld shrinkage strains, shall be ultrasonically tested for discontinuities behind and adjacent to such welds after joint completion. Any material discontinuities shall be accepted or rejected on the basis of ASTM A 435 or ASTM A 898 (Level 1 criteria) and criteria as established by the registered design professional~~(s)~~ in responsible charge and the construction documents.

1708.5 Seismic qualification of mechanical and electrical equipment. The registered design professional ~~in responsible charge~~ shall state the applicable seismic qualification requirements for designated seismic systems on the construction documents. Each manufacturer of designated seismic system components shall test or analyze the component and its mounting system or anchorage and submit a certificate of compliance for review and acceptance by the registered design professional ~~in responsible charge~~ of for the design of the designated seismic system and for approval by the building official. Qualification shall be by actual test on a shake table, by three-dimensional shock tests, by an analytical method using dynamic characteristics and forces, by the use of experience data (i.e., historical data demonstrating acceptable seismic performance) or by more rigorous analysis providing for equivalent safety.

1709.2 Structural observations for seismic resistance. Structural observations shall be provided for those structures included in Seismic Design Category D, E or F, as determined in Section 1613, where one or more of the following conditions exist:

1. The structure is classified as Occupancy Category III or IV in accordance with Section 1604.5.
2. The height of the structure is greater than 75 feet (22 860 mm) above the base.
3. The structure is assigned to Seismic Design Category E, is classified as Occupancy Category I or II in accordance with Section 1604.5 and is greater than two stories in height.
4. When so designated by the registered design professional in responsible charge ~~of the design~~.
5. When such observation is specifically required by the building official.

1709.3 Structural observations for wind requirements. Structural observations shall be provided for those structures sited where the basic wind speed exceeds 110 mph (49 m/sec) determined from Figure 1609, where one or more of the following conditions exist:

1. The structure is classified as Occupancy Category III or IV in accordance with Table 1604.5.
2. The building height of the structure is greater than 75 feet (22 860 mm).
3. When so designated by the registered design professional in responsible charge of the design,
4. When such observation is specifically required by the building official.

Reason: This proposal is in response to Recommendation 28 of the “Final Report on the Collapse of the World Trade Center Towers” (NIST NCSTAR 1). The recommendation assumes that the IBC already defines “design professional in responsible charge,” which is not the case. A related proposal before the General Code Committee will provide a definition in the IBC as well as the IEBC. Note that the term “registered design professional in responsible charge” is used throughout the IBC (i.e., Sections 106.3.4.1, 106.3.4.2, 1704.1, 1704.1.1, 1704.1.2, 1704.7, 1704.8, 1704.9, 1705.1, 1708.4, 1708.5, 1709.2 and 1709.3) as well as the IEBC. Note also that the term is typically not used in other codes published by the International Code Council. Specially, there are no instances of the term “registered design professional in responsible charge” in the 2003 IECC, IFC, IFGC, IMC, IPC or IRC.

The proposed definition in the related proposal before the General Code Committee is consistent with the role the IBC and IEBC currently specify for the registered design professional in responsible charge, which is typically the review and coordination of submittal documents prepared by others, deferred submittal documents and phased submittal documents for compatibility with the design of the building or structure. Refer to Section 106.3.4 in the IBC and IEBC for specific language.

This proposal revises references to “registered design professional in responsible charge” in the structural chapters of the IBC to eliminate conflicts with Section 106.3.4. Sections 1704.7, 1704.8 and 1704.9 use “registered design professional in responsible charge” when referring to the registered design professional responsible for the structural design of a building or structure. Section 1708.5 uses the same term when referring to the registered design professional responsible for the structural design of a designated seismic system in at a building or structure. Section 106.3.4.1, however, states that the registered design professional in responsible charge is “responsible for reviewing and coordinating submittal documents prepared by others, including phased and deferred submittal items, for compatibility with the design of the building.” Sections 1704.7, 1704.8, 1704.9 and 1708.5 are in conflict with Section 106.3.4.1 by using the same term for registered design professionals with responsibilities other than as specified in Section 106.3.4.1.

The IBC currently uses the term “registered design professional” in approximately 50 code sections, in addition to the code sections using the term “registered design professional in responsible charge.” “Registered design professional” refers to an individual responsible for an aspect of the design of a building or structure. Typical examples are the architect, structural engineer, mechanical engineer, electrical engineer, civil engineer, fire protection engineer and others. Referring, instead, to such an individual as a registered design professional in responsible charge is an exercise in stating the obvious. Such individuals are in responsible charge of their individual responsibilities in the design of the building or structure. The term “in responsible charge” is implicit in the term “registered design professional.”

The proposal will eliminate the conflict between Section 106.3.4, which assigns responsibilities to a registered design professional acting as the registered design professional in responsible charge of a project, and other sections of the IBC, which use the same term but do not intend that the responsibilities in Section 106.3.4 also apply.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1704.7 Soils. Special inspections for existing site soil conditions, fill placement and load-bearing requirements shall be as required by this section and Table 1704.7. The approved soils report, required by Section 1802.2, and the documents prepared by the registered design professional shall be used to determine compliance. During fill placement, the special inspector shall determine that proper materials and procedures are used in accordance with the provisions of the approved soils report, as specified in Section 1803.5.

Exception: Special inspection is not required during placement of controlled fill having a total depth of 12 inches (305 mm) or less.

1704.8 Pile foundations. Special inspections shall be performed during installation and testing of pile foundations as required by Table 1704.8. The approved soils report, required by Section 1802.2, and the documents prepared by the registered design professional shall be used to determine compliance.

1704.9 Pier foundations. Special inspections shall be performed during installation and testing of pier foundations as required by Table 1704.9. The approved soils report, required by Section 1802.2, and the documents prepared by the registered design professional shall be used to determine compliance.

1708.4 Structural steel. The testing contained in the quality assurance plan shall be as required by AISC 341 and the additional requirements herein. The acceptance criteria for nondestructive testing shall be as required in AWS D1.1 as specified by the registered design professional. Base metal thicker than 1.5 inches (38 mm), where subject to through-thickness weld shrinkage strains, shall be ultrasonically tested for discontinuities behind and adjacent to such welds after joint completion. Any material discontinuities shall be accepted or rejected on the basis of ASTM A 435 or ASTM A 898 (Level 1 criteria) and criteria as established by the registered design professional in responsible charge and the construction documents.

1708.5 Seismic qualification of mechanical and electrical equipment. The registered design professional shall state the applicable seismic qualification requirements for designated seismic systems on the construction documents. Each manufacturer of designated seismic system components shall test or analyze the component and its mounting system or anchorage and submit a certificate of compliance for review and

acceptance by the registered design professional for the design of the designated seismic system and for approval by the building official. Qualification shall be by actual test on a shake table, by three-dimensional shock tests, by an analytical method using dynamic characteristics and forces, by the use of experience data (i.e., historical data demonstrating acceptable seismic performance) or by more rigorous analysis providing for equivalent safety.

1709.2 Structural observations for seismic resistance. Structural observations shall be provided for those structures included in Seismic Design Category D, E or F, as determined in Section 1613, where one or more of the following conditions exist: The structure is classified as Occupancy Category III or IV in accordance with Section 1604.5.

1. The height of the structure is greater than 75 feet (22 860 mm) above the base.
2. The structure is assigned to Seismic Design Category E, is classified as Occupancy Category I or II in accordance with Section 1604.5 and is greater than two stories in height.
3. When so designated by the registered design professional ~~in responsible charge~~ for the structural design.
4. When such observation is specifically required by the building official.

1709.3 Structural observations for wind requirements. Structural observations shall be provided for those structures sited where the basic wind speed exceeds 110 mph (49 m/sec) determined from Figure 1609, where one or more of the following conditions exist:

1. The structure is classified as Occupancy Category III or IV in accordance with Table 1604.5.
2. The building height of the structure is greater than 75 feet (22 860 mm).
3. When so designated by the registered design professional ~~in responsible charge~~ for the structural design.
4. When such observation is specifically required by the building official.

Committee Reason: The proposal helps to distinguish between the various registered design professionals that are involved in a project by eliminating the phrase "in responsible charge" from Chapter 17. The modification clarifies that it is the registered design professional responsible for the structural design who may require structural observations in structures having higher wind or seismic risks.

Code Change No: **S39-06/07**

Original Proposal

Section: 1704.10

Proponent: Paul K. Heilstedt, P.E., representing ICC Code Technology Committee (CTC)

Revise as follows:

1704.10 Sprayed fire-resistant materials. Special inspections for sprayed fire-resistant materials applied to structural elements and decks shall be in accordance with Sections 1704.10.1 through 1704.10.5 6 Special inspections shall be based on the fire-resistance design as designated in the approved construction documents. The tests described in this section shall be based on samplings of specific floor, roof and wall assemblies, and structural framing members. Special inspections shall be performed after the rough installation of electrical, sprinkler, mechanical and plumbing systems and suspension for ceiling systems, where applicable.

1704.10.1 Physical and visual tests. The following physical and visual tests are required to demonstrate compliance with the listing and the fire-resistance rating:

1. Condition of substrates.
2. Thickness of application.
3. Density in pounds per cubic foot (kgs per m³).
4. Bond strength -adhesion/cohesion.
5. Condition of finished application.

~~1704.10.1~~ **1704.10.2 Structural member surface conditions.** The surfaces shall be prepared in accordance with the approved fire-resistance design and the approved manufacturer's written instructions. The prepared surface of structural members to be sprayed shall be inspected before the application of the sprayed fire-resistant material.

~~1704.10.2~~ **1704.10.3 Application.** The substrate shall have a minimum ambient temperature before and after application as specified in the approved manufacturer's written instructions. The area for application shall be ventilated during and after application as required by the approved manufacturer's written instructions.

~~1704.10.3~~ **1704.10.4 Thickness.** The average thickness minus two times the standard deviation of the thickness measurements of the sprayed fire-resistant materials applied to structural elements shall not be less than the thickness required by the approved fire-resistant design. Individual measured thickness, which exceeds the thickness specified in a design by 1/4 inch (6.4 mm) or more, shall be recorded as the thickness specified in the design plus 1/4 inch (6.4 mm). For design thicknesses 1 inch (25 mm) or greater, the minimum allowable individual thickness shall be the design thickness minus 1/4 inch (6.4 mm). For design thicknesses less than 1 inch (25 mm), the minimum allowable individual thickness shall be the design thickness minus 25 percent. Thickness shall be determined in accordance with ASTM E 605. Samples of the sprayed fire-resistant materials shall be selected in accordance with Sections ~~1704.10.3~~ 1704.10.4.1 and ~~1704.10.3.2~~ 1704.10.4.2.

~~1704.10.3.1~~ **1704.10.4.1 Floor, roof and wall assemblies.** The thickness of the sprayed fire-resistant material applied to floor, roof and wall assemblies shall be determined in accordance with ASTM E 605, taking the average minus two times the standard deviation of the thickness measurements of not less than four measurements for each 1,000 square feet (93m²) of the sprayed area on each floor or part thereof.

1704.10.4.1.1 Flat decks. Thickness measurements shall be taken from a 12 inches (305 mm) square with a minimum of four measurements, symmetrically.

1704.10.4.1.2 Fluted decks. Thickness measurements shall be taken from a 12 inches (305 mm) square with four random, symmetrical measurements within the square, including one each of the following: valley, crest and sides and report as an average.

~~1704.10.3.2~~ **1704.10.4.2 Structural framing members.** The thickness of the sprayed fire-resistant material applied to structural members shall be determined in accordance with ASTM E 605. Thickness testing shall be performed on not less than 25 percent of the structural members on each floor.

1704.10.4.2.1 Beams. Thickness measurements shall be made at nine locations around the beam at each end of a 12 inches (305 mm) length.

1704.10.4.2.2 Joists and trusses. Thickness measurements shall be made at seven locations around the joist or truss at each end of a 12 inches (305 mm) length.

1704.10.4.2.3 W-shape columns. Thickness measurements shall be made at 12 locations around the column at each end of a 12 inches (305 mm) length.

1704.10.4.2.4 Tube and pipe columns. Thickness measurements shall be made at a minimum of four locations around the column at each end of a 12 inches (305 mm) length.

~~1704.10.4~~ **1704.10.5 Density.** The density of the sprayed fire-resistant material shall not be less than the density specified in the approved fire-resistant design. Density of the sprayed fire-resistant material shall be determined in accordance with ASTM E 605. The test samples for determining the density of the sprayed fire-resistant materials shall be selected as follows:

1. From each floor, roof and wall assembly at the rate of not less than one sample for every 2,500 square feet (232 m²) or part thereof of the sprayed area in each story.
2. From beams, girders, joists, trusses and columns at the rate of not less than one sample for each type of structural framing member for each 2,500 square feet (232 m²) of floor area or part thereof in each story.

~~1704.10.5~~ **1704.10.6 Bond strength.** The cohesive/adhesive bond strength of the cured sprayed fire-resistant material applied to structural elements shall not be less than 150 pounds per square foot (psf) (7.18 kN/m²). The cohesive/adhesive bond strength shall be determined in accordance with the field test specified in ASTM E 736 by testing in-place samples of the sprayed fire-resistant material selected in accordance with Sections ~~1704.10.5.1~~ and ~~1704.10.5.2~~ 1704.10.6.1 through 1704.10.6.3.

~~1704.10.5.1~~ **1704.10.6.1 Floor, roof and wall assemblies.** The test samples for determining the cohesive/adhesive bond strength of the sprayed fire-resistant materials shall be selected from each floor, roof and wall assembly at the rate of not less than one sample for every 40,000 2,500 square feet (~~929~~ 232 m²) or part thereof of the sprayed area in each story.

~~1704.10.5.2~~ **1704.10.6.2 Structural framing members.** The test samples for determining the cohesive/adhesive bond strength of the sprayed fire-resistant materials shall be selected from beams, girders, joists, trusses and columns at the rate of not less than one sample for each type of structural framing member for each 40,000 2,500 square feet (~~929~~ 232 m²) of floor area or part thereof in each story.

1704.10.6.3 Primer, paint and encapsulant bond tests. Bond tests to qualify a primer, paint or encapsulant shall be conducted only when the fire-resistive coating is applied to a primed, painted or encapsulated surface for which acceptable bond-strength performance between these coatings and the fire resistive material has not been measured. A bonding agent approved by the SFRM manufacturer shall to be applied to a primed, painted or encapsulated surface where the bond strengths are found to be below minimum required values.

Reason: The ICC Board established the ICC Code Technology Committee (CTC) as the venue to discuss contemporary code issues in a committee setting which provides the necessary time and flexibility to allow for full participation and input by any interested party. The code issues are assigned to the CTC by the ICC Board as "areas of study". Information on the CTC, including: meeting agendas; minutes; reports; resource documents; presentations; and all other materials developed in conjunction with the CTC effort can be downloaded from the following website: <http://www.iccsafe.org/cs/cc/ctc/index.html> Since its inception, the CTC has held six meetings - all open to the public.

This proposed change is a result of the CTC's investigation of the area of study entitled "Review of NIST WTC Recommendations". The scope of the activity is noted as:

Review the recommendations issued by NIST in its report entitled "Final Report on the Collapse of the World Trade Center Towers", issued September 2005, for applicability to the building environment as regulated by the I-Codes.

This proposal is intended to address only a portion of NIST recommendation 6. For this specific proposed change, CTC is working in cooperation with the NIBS/MMC Committee to Translate the NIST World Trade Center Investigation Recommendations for the Model Codes. The CTC notes in their investigation that many of the recommendations contained in the NIST report require additional information for the CTC to further investigate. As such, CTC intends to continue to study the other NIST recommendations.

NIST Recommendation 6 recommends the development of criteria, test methods and standards: (1) for the in-service performance of sprayed fire-resistance materials (SFRM, also commonly referred to as fireproofing or insulation) used to protect structural components; and (2) to ensure that these materials, as-installed, conform to conditions in tests used to establish the fire resistance rating of components, assemblies, and systems.

As noted above, this proposed change does not address all aspects of NIST recommendation #6. This proposed change is limited to the necessary inspection parameters for spray applied fire resistant materials after installation and renovation of mechanical, plumbing, electrical and other similar systems.

The proposed revisions are intended to coordinate the text of the IBC with the two standards currently referenced in the code- ASTM 605 and ASTM 736, and also AWCI Technical Manual 12-A Standard Practice for the Testing and Inspection of Filed Applied Sprayed Fire-resistive Materials which is a guide and as such, is not referenced in the code. This proposal also adds sampling criteria for density measurements (proposed Section 1704.10.5) in addition to the current sampling criteria for bond measurements. However, it is noted that there are two significant differences between this proposal and the standards noted. The first is the determination of thickness in proposed Section 1704.10.4 which is not in the standards. By using the standard deviation method, the test samples must fall within a specified range, otherwise, the combination of very thin samples of spray applied coatings with thick samples may lead to the application passing the test when in reality, the thin sections represent an insufficient amount of fire proofing. The second is the sample size. Currently, ASTM E 605 stipulates the 10,000 square foot sample size that is also in the code. Given the critical nature of spray-applied fire proofing, as noted in the NIST report, this sampling size is viewed as too large, resulting in an increased probability of inadequate protection. This proposal uses a value of 2,500 square feet.

Recommendation #6 also addresses the in-service performance (criteria for performance and durability such as bond strength) of spray applied fire resistance which requires further substantiation.

Bibliography:

Interim Report No. 1 of the CTC, Area of Study – Review of NIST WTC Recommendations, March 9, 2006.

National Institute of Standards and Technology. Final Report of the National Construction Safety Team on the Collapses of the World Trade Center Towers. United States Government Printing Office: Washington, D.C. September 2005.

Cost Impact: The code change proposal will increase the cost of construction due to more frequent sampling of spray applied material.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

1704.10 Sprayed fire-resistant materials. Special inspections for sprayed fire-resistant materials applied to structural elements and decks shall be in accordance with Sections 1704.10.1 through 1704.10.6 Special inspections shall be based on the fire-resistance design as designated in the approved construction documents. The tests described in this section shall be based on samplings of specific floor, roof and wall assemblies, and structural framing members. Special inspections shall be performed after the rough installation of electrical, sprinkler, mechanical and plumbing systems and suspension for ceiling systems, where applicable.

1704.10.1 Physical and visual tests. The following physical and visual tests are required to demonstrate compliance with the listing and the fire-resistance rating:

1. Condition of substrates.
2. Thickness of application.
3. Density in pounds per cubic foot (kgs per m³).
4. Bond strength -adhesion/cohesion.
5. Condition of finished application.

1704.10.2 Structural member surface conditions. The surfaces shall be prepared in accordance with the approved fire-resistance design and the approved manufacturer's written instructions. The prepared surface of structural members to be sprayed shall be inspected before the application of the sprayed fire-resistant material.

1704.10.3 Application. The substrate shall have a minimum ambient temperature before and after application as specified in the approved manufacturer's written instructions. The area for application shall be ventilated during and after application as required by the approved manufacturer's written instructions.

1704.10.4 Thickness. ~~The average thickness minus two times the standard deviation of the thickness measurements~~ ~~No more than 10 percent of the thickness measurements~~ of the sprayed fire-resistant materials applied to structural elements shall ~~not~~ be less than the thickness required by the approved fire-resistant design ~~but in no case less than the minimum allowable thickness required by Section 1704.10.4.1. Individual measured thickness, which exceeds the thickness specified in a design by 1/4 inch (6.4 mm) or more, shall be recorded as the thickness specified in the design plus 1/4 inch (6.4 mm).~~

1704.10.4.1 Minimum allowable thickness. For design thicknesses 1 inch (25 mm) or greater, the minimum allowable individual thickness shall be the design thickness minus 1/4 inch (6.4 mm). For design thicknesses less than 1 inch (25 mm), the minimum allowable individual thickness shall be the design thickness minus 25 percent. Thickness shall be determined in accordance with ASTM E 605. Samples of the sprayed fire-resistant materials shall be selected in accordance with Sections ~~1704.10.4.1~~ 1704.10.4.2 and ~~1704.10.4.2~~ 1704.10.4.3.

~~1704.10.4.1~~ **1704.10.4.2 Floor, roof and wall assemblies.** The thickness of the sprayed fire-resistant material applied to floor, roof and wall assemblies shall be determined in accordance with ASTM E 605, taking ~~the average minus two times the standard deviation of the thickness measurements~~ of not less than four measurements for each 1,000 square feet (93m²) of the sprayed area on each floor or part thereof.

~~1704.10.4.1.1~~ **1704.10.4.2.1 Flat decks.** Thickness measurements shall be taken from a 12 inches (305 mm) square with a minimum of four measurements, symmetrically.

~~1704.10.4.1.2~~ **1704.10.4.2.2 Fluted decks.** Thickness measurements shall be taken from a 12 inches (305 mm) square with four random, symmetrical measurements within the square, including one each of the following: valley, crest and sides and report as an average.

~~1704.10.4.2~~ **1704.10.4.3 Structural framing members.** The thickness of the sprayed fire-resistant material applied to structural members shall be determined in accordance with ASTM E 605. Thickness testing shall be performed on not less than 25 percent of the structural members on each floor.

~~1704.10.4.2.1~~ **1704.10.4.3.1 Beams.** Thickness measurements shall be made at nine locations around the beam at each end of a 12 inches (305 mm) length.

~~1704.10.4.2.2~~ **1704.10.4.3.2 Joists and trusses.** Thickness measurements shall be made at seven locations around the joist or truss at each end of a 12 inches (305 mm) length.

~~1704.10.4.2.3~~ **1704.10.4.3.3 W-shape columns.** Thickness measurements shall be made at 12 locations around the column at each end of a 12 inches (305 mm) length.

~~1704.10.4.2.4~~ **1704.10.4.3.4 Tube and pipe columns.** Thickness measurements shall be made at a minimum of four locations around the column at each end of a 12 inches (305 mm) length.

1704.10.5 Density. The density of the sprayed fire-resistant material shall not be less than the density specified in the approved fire-resistant design. Density of the sprayed fire-resistant material shall be determined in accordance with ASTM E 605. The test samples for determining the density of the sprayed fire-resistant materials shall be selected as follows:

1. From each floor, roof and wall assembly at the rate of not less than one sample for every 2,500 square feet (232 m²) or part thereof of the sprayed area in each story.
2. From beams, girders, joists, trusses and columns at the rate of not less than one sample for each type of structural framing member for each 2,500 square feet (232 m²) of floor area or part thereof in each story.

1704.10.6 Bond strength. The cohesive/adhesive bond strength of the cured sprayed fire-resistant material applied to structural elements shall not be less than 150 pounds per square foot (psf) (7.18 kN/m²). The cohesive/adhesive bond strength shall be determined in accordance with the field test specified in ASTM E 736 by testing in-place samples of the sprayed fire-resistant material selected in accordance with Sections 1704.10.6.1 through 1704.10.6.3.

1704.10.6.1 Floor, roof and wall assemblies. The test samples for determining the cohesive/adhesive bond strength of the sprayed fire-resistant materials shall be selected from each floor, roof and wall assembly at the rate of not less than one sample for every 2,500 square feet (232 m²) or part thereof of the sprayed area in each story.

1704.10.6.2 Structural framing members. The test samples for determining the cohesive/adhesive bond strength of the sprayed fire-resistant materials shall be selected from beams, girders, joists, trusses and columns at the rate of not less than one sample for each type of structural framing member for each 2,500 square feet (232 m²) of floor area or part thereof in each story.

1704.10.6.3 Primer, paint and encapsulant bond tests. Bond tests to qualify a primer, paint or encapsulant shall be conducted only when the fire-resistive coating is applied to a primed, painted or encapsulated surface for which acceptable bond-strength performance between these coatings and the fire resistive material has not been measured. A bonding agent approved by the SFRM manufacturer shall be applied to a primed, painted or encapsulated surface where the bond strengths are found to be below minimum required values.

Committee Reason: This proposal provides the details to allow for verification that the sprayed fire-resistant material is properly installed. Given the actions the committee has previously taken to assure that the materials are appropriately applied (FS100-06/07) and that the conditions during the application are appropriate (G68-06/07), the inspection is important to verify installation and to help assure proper performance. The modifications deleted the requirements that the acceptance of the inspection measurements be based upon the "standard deviation." Since this is intended as a means of field inspection, the connection to "standard deviation" was deleted and replaced by the 10 percent limitation. The intent of both the original and this revised text is to provide a 95 percent confidence level that the installed material exceeds the requirements. The committee did note that Section 1704.10.6 of the proposal does refer to the bond strength of 150 pounds. Based on the action taken with code change G68-06/07 a public comment which directs code users to the new Table 403.15 is needed for the high-rise buildings which require a greater bond strength.

Assembly Action:

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Philip Brazil, P.E., Reid Middleton, Inc, representing himself, requests Approval as Modified by this public comment.

Modify proposal as follows:

1704.10 Sprayed fire-resistant materials. Special inspections for sprayed fire-resistant materials applied to floor, roof and wall assemblies and structural elements members and decks shall be in accordance with Sections 1704.10.1 through 1704.10.6. Special inspections shall be based on the fire-resistance design as designated in the approved construction documents. The tests ~~described set forth~~ in this section shall be based on samplings of from specific floor, roof and wall assemblies, and structural framing members. Special inspections shall be performed after the rough installation of electrical, automatic sprinkler, mechanical and plumbing systems and suspension systems for ceilings systems, where applicable.

1704.10.1 Physical and visual tests. The special inspections shall include the following physical and visual tests and observations are required to demonstrate compliance with the listing and the fire-resistance rating:

1. Condition of substrates.
2. Thickness of application.
3. Density in pounds per cubic foot (~~lbs per m³~~ kg/m³).
4. Bond strength-adhesion/cohesion.
5. Condition of finished application.

1704.10.2 Structural member surface conditions. The surfaces shall be prepared in accordance with the approved fire-resistance design and the ~~approved manufacturer's~~ written instructions of approved manufacturers. The prepared surface of structural members to be sprayed shall be inspected before the application of the sprayed fire-resistant material.

1704.10.3 Application. The substrate shall have a minimum ambient temperature before and after application as specified in the ~~approved manufacturer's~~ written instructions of approved manufacturers. The area for application shall be ventilated during and after application as required by the ~~approved manufacturer's~~ written instructions of approved manufacturers.

1704.10.4 Thickness. No more than 10 percent of the thickness measurements of the sprayed fire-resistant materials applied to floor, roof and wall assemblies and structural elements members shall be less than the thickness required by the approved fire-resistant resistance design but in no case less than the minimum allowable thickness required by Section 1704.10.4.1.

1704.10.4.1 Minimum allowable thickness. For design thicknesses 1 inch (25 mm) or greater, the minimum allowable individual thickness shall be the design thickness minus 1/4 inch (6.4 mm). For design thicknesses less than 1 inch (25 mm), the minimum allowable individual thickness shall be the design thickness minus 25 percent. Thickness shall be determined in accordance with ASTM E 605. Samples of the sprayed fire-resistant materials shall be selected in accordance with Sections 1704.10.4.2 and 1704.10.4.3.

1704.10.4.2 Floor, roof and wall assemblies. The thickness of the sprayed fire-resistant material applied to floor, roof and wall assemblies shall be determined in accordance with ASTM E 605, taking making not less than four measurements for each 1,000 square feet (93 m²) of the sprayed area ~~on each floor in each story or part portion thereof~~.

1704.10.4.2.1 Flat Cellular decks. Thickness measurements shall be ~~taken~~ selected from a square area, 12 inches (305 mm) square with a by 12 inches (305 mm) in size. A minimum of four measurements shall be made, located symmetrically within the square area.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

1704.10.4.2.2 Fluted decks. Thickness measurements shall be ~~taken~~ selected from a square area, 12 inches (305 mm) ~~square with by 12 inches (305 mm) in size.~~ A minimum of four ~~random, symmetrical~~ measurements shall be made, located symmetrically within the square area, including one each of the following: valley, crest and sides and report as an average.

1704.10.4.3 Structural framing members. The thickness of the sprayed fire-resistant material applied to structural members shall be determined in accordance with ASTM E 605. Thickness testing shall be performed on not less than 25 percent of the structural members on each floor.

1704.10.4.3.1 Beams and girders. At beams and girders, thickness measurements shall be made at nine locations around the beam or girder at each end of a ~~42 inches~~ 12-inch (305 mm) length.

1704.10.4.3.2 Joists and trusses. At joists and trusses, thickness measurements shall be made at seven locations around the joist or truss at each end of a ~~42 inches~~ 12-inch (305 mm) length.

1704.10.4.3.3 W-shape Wide-flanged columns. At wide-flanged columns, thickness measurements shall be made at 12 locations around the column at each end of a ~~42 inches~~ 12-inch (305 mm) length.

1704.10.4.3.4 Tube Hollow structural section and pipe columns. At hollow structural section and pipe columns, thickness measurements shall be made at a minimum of four locations around the column at each end of a ~~42 inches~~ 12-inch (305 mm) length.

1704.10.5 Density. The density of the sprayed fire-resistant material shall not be less than the density specified in the approved fire-~~resistant~~ resistance design. Density of the sprayed fire-resistant material shall be determined in accordance with ASTM E 605. The test samples for determining the density of the sprayed fire-resistant materials shall be selected as follows:

1. From each floor, roof and wall assembly at the rate of not less than one sample for every 2,500 square feet (232 m²) or part portion thereof of the sprayed area in each story.
2. From beams, girders, ~~joists,~~ trusses and columns at the rate of not less than one sample for each type of structural ~~framing~~ member for each 2,500 square feet (232 m²) of floor area or part portion thereof in each story.

1704.10.6 Bond strength. The cohesive/adhesive bond strength of the cured sprayed fire-resistant material applied to floor, roof and wall assemblies and structural elements members shall not be less than 150 pounds per square foot (psf) (7.18 kN/m²). The cohesive/adhesive bond strength shall be determined in accordance with the field test specified in ASTM E 736 by testing in-place samples of the sprayed fire-resistant material selected in accordance with Sections 1704.10.6.1 through 1704.10.6.3.

1704.10.6.1 Floor, roof and wall assemblies. The test samples for determining the cohesive/adhesive bond strength of the sprayed fire-resistant materials shall be selected from each floor, roof and wall assembly at the rate of not less than one sample for every 2,500 square feet (232 m²) ~~or part thereof~~ of the sprayed area in each story or portion thereof.

1704.10.6.2 Structural framing members. The test samples for determining the cohesive/adhesive bond strength of the sprayed fire-resistant materials shall be selected from beams, girders, ~~joists,~~ trusses, and columns and other structural members at the rate of not less than one sample for each type of structural ~~framing~~ member for each 2,500 square feet (232 m²) of floor area or part portion thereof in each story.

1704.10.6.3 Primer, paint and encapsulant bond tests. Bond tests to qualify a primer, paint or encapsulant shall be conducted ~~only~~ when the ~~fire-resistive coating~~ sprayed fire-resistant material is applied to a primed, painted or encapsulated surface for which acceptable bond-strength performance between these coatings and the fire ~~resistive~~ resistant material has not been ~~measured~~ determined. A bonding agent approved by the SFRM manufacturer shall ~~be~~ applied to a primed, painted or encapsulated surface where the bond strengths are found to be ~~below~~ minimum less than required values.

Commenter's Reason: The purpose for this public comment is to make editorial revisions to Proposal S38. "Structural elements and decks" in Section 1704.10 and "structural elements" in Sections 1704.10.4 and 1704.10.6 are changed to "floor, roof and wall assemblies and structural members" for consistency with Section 714 on the fire-resistance rating of structural members and for consistency with Sections 1704.10, 1704.10.4.2, 1704.10.3 and 1704.10.6.1 on "floor, roof and wall assemblies." "Structural framing members" are changed to "structural members" in Sections 1704.10 and 1704.10.6.2 for the same reason. Replacing "decks" with "floor, roof and wall assemblies" is also more comprehensive and takes into account special steel plate shear walls (i.e., Table 12.2-1 of ASCE 7-05).

Several other changes to Section 1704.10 are proposed. "Described" is changed to "set forth" to avoid non-mandatory language. "Sprinkler" is changed to "automatic sprinkler" for consistency with the terminology in Section 903 on automatic sprinkler systems. "Suspension for ceiling systems" is changed to "suspension systems for ceilings" for consistency with ASTM C 635 and C 636 on suspension systems for acoustical tile and lay-in panel ceilings, which are referenced in Section 803.9.1.1.

In Section 1704.10.1, "physical and visual tests" are replaced with "tests and observations" because Items #1 and #5 of Section 1704.10.1 are not accomplished by tests, but by the observations of the special inspector. In Section 1704.10.4, "fire-resistant design" is changed to "fire-resistance design" for consistency with Item #1 of Section 703.3, "fire-resistance designs documented in approved sources." In Section 1704.10.4.2, "on each floor" is changed to "in each story" for consistency with Section 1704.10.6.1. In Section 1704.10.4.3.1, "beams" is changed to "beams and girders" for consistency with the use of "beams" and "girders" in Section 1704.10.6.2. In Sections 1704.10.4.2, 1704.10.6.1 and 1704.10.6.2, "part" is changed to "portion" because area, not a structural element, is typically referenced.

The proposed revisions to Sections 1704.10.4.2.1, 1704.10.4.2.2 and 1704.10.4.3.1 through 1704.10.4.3.4 are intended to bring technical soundness to the provisions and to employ terms more commonly used by the structural engineering profession for the design of structural steel and by nationally recognized testing laboratories in their listings of fire-resistance-rated designs containing sprayed fire-resistant materials. "Flat deck" is changed to "cellular deck" for consistency with the same term used for fluted steel decks with steel sheet added to form flat bottom surfaces. "Random, symmetrical" is replaced by "symmetrical" because symmetrical measurements are not random, they are intentional. References to the subject of Sections 1704.10.4.3.1 through 1704.10.4.3.4 are added to the text because these sections, as written, rely on the title of each section for their charging language. "Tube columns" are changed to "hollow structural section columns" for consistency with current AISC terminology. The language is revised to consistently "select" measurements from specific areas and "make," not "take," the measurements in these areas. "Taking measurements implies sampling whereas measurements (i.e., thickness) are typically nondestructive.

In Section 1704.10.4.3.3, "W-shape columns" are changed to "wide-flanged columns" for consistency with Section 714.8.3.2 in Proposal FS100-06/07. Note that W-shaped, M-shaped, S-shaped and HP-shaped structural steel columns are manufactured. The current AISC Specification (AISC 360-05) typically refers to "I-shaped members" (i.e., Chapter F). The 2005 AISC Steel Construction Manual, however, typically refers to W-shapes, M-shapes, S-shapes and HP-shapes, which are described collectively as "H-shaped" and "I-shaped" (i.e., Scope).

Because of this level of detail, relying on "W-shape columns" in Section 1704.10.4.3.3 can lead to considerable confusion that can be avoided by use of the more generic "wide-flanged columns."

Several other changes to Section 1704.10.6.3 are proposed. "Fire-resistive coating" is changed to "sprayed fire-resistant material" for consistency with the other provisions in Section 1704.10. Note that special inspection of mastic and intumescent fire-resistant coatings is specified in Section 1704.11. "Fire-resistive material" is changed to "fire-resistant material," also for consistency with the other provisions in Section 1704.10. "Measured" is changed to "determined" because it refers to "acceptable bond strength performance," not the results of tests.

Final Hearing Results

S39-06/07

AMPC1

Code Change No: **S42-06/07**

Original Proposal

Section: 1707.7

Proponent: Philip Brazil, P.E., Reid Middleton, Inc., representing himself

Revise as follows:

1707.7 Architectural components. Periodic special inspection during the erection and fastening of exterior cladding, interior and exterior nonbearing walls and interior and exterior veneer in structures assigned to Seismic Design Category D, E or F.

Exceptions:

1. Special inspection is not required for architectural components in structures 30 feet (9144 mm) or less in height.
2. Special inspection is not required for cladding and veneer weighing 5 psf (24.5N/m²) or less.
3. Special inspection is not required for interior nonbearing walls weighing 15 psf (73.5 N/m²) or less.
4. Special inspection is not required for exterior cladding and exterior veneer 30 feet (9144 mm) or less in height above grade.

Reason: In Seismic Design Categories, D, E and F, Section 1707.7 specifies periodic special inspection during the erection and fastening of certain types of architectural components provided certain thresholds are reached. Currently, the charging statement specifies special inspection for exterior cladding, interior and exterior nonbearing walls and interior and exterior veneer. Exception 1, however, exempts architectural components, which are not specified in the charging statement. Presumably, referring to architectural components does not imply that Section 1707.7 applies to architectural components other than exterior cladding, interior and exterior nonbearing walls and interior and exterior veneer (i.e., interior cladding). Exception 2 exempts cladding and veneer weighing 5 psf or less from special inspection. Presumably, referring to cladding and veneer does not imply that Section 1707.7 applies to interior cladding. Exception 3 exempts interior nonbearing walls, but not exterior nonbearing walls, weighing 15 psf or less from special inspection. In summary, for all structures more than 30 feet in height, periodic special inspection is required for the erection and fastening of (1) all exterior nonbearing walls, (2) all exterior cladding and interior and exterior veneer weighing more than 5 psf, and (3) all interior nonbearing walls weighing more than 15 psf.

The current provisions create several unintended consequences. For example, at a structure more than 30 feet in height, special inspection is required, for example, at anchored brick masonry veneer supported by a concrete foundation and extending from finish grade to a few feet above grade (i.e., wainscot). For the same structure, special inspection is not required for any exterior cladding, interior veneer or exterior veneer weighing less than 5 psf, or for any interior nonbearing walls weighing less than 15 psf, but it is required for all of the exterior nonbearing walls. Special inspection is also required for all exterior cladding, interior veneer and exterior veneer weighing more than 5 psf, and for all interior nonbearing walls weighing more than 15 psf, no matter how close the component is to the ground surface (exterior cladding and veneer) or to the floor surface (interior veneer and nonbearing walls). The current requirements for periodic special inspection are summarized in the table below.

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

	Exterior Cladding	Nonbearing Walls		Veneer	
		Interior	Exterior	Interior	Exterior
Structure ≤ 30'0"	No	No	No	No	No
Structure > 30'0" and Exterior Component ≤ 30'0":					
Component ≤ 5 psf	No	No	No	No	No
5 psf < Component ≤ 15 psf	Yes	No	Yes	Yes	Yes
Component > 15 psf	Yes	Yes	Yes	Yes	Yes
Structure > 30'0" and Exterior Component > 30'0":					
Component ≤ 5 psf	No	No	No	No	No
5 psf < Component ≤ 15 psf	Yes	No	Yes	Yes	Yes
Component > 15 psf	Yes	Yes	Yes	Yes	Yes

The proposed changes will establish thresholds for requiring special inspection that are more consistent with the relative risk posed by exterior cladding, interior and exterior nonbearing walls and interior and exterior veneer in Seismic Design Categories, D, E and F. As modified by the proposal, the requirements for periodic special inspection are summarized in the table below. Differences with the current requirements are highlighted in bold.

	Exterior Cladding	Nonbearing Walls		Veneer	
		Interior	Exterior	Interior	Exterior
Structure ≤ 30'0"	No	No	No	No	No
Structure > 30'0" and Exterior Component ≤ 30'0":					
Component ≤ 5 psf	No	No	No	No	No
5 psf < Component ≤ 15 psf	No	No	No	Yes	No
Component > 15 psf	No	Yes	Yes	Yes	No
Structure > 30'0" and Exterior Component > 30'0":					
Component ≤ 5 psf	No	No	No	No	No
5 psf < Component ≤ 15 psf	Yes	No	No	Yes	Yes
Component > 15 psf	Yes	Yes	Yes	Yes	Yes

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: The proposed change was disapproved at the request of the proponent who intends to submit a modified proposal.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Philip Brazil, P.E., S.E., Reid Middleton, Inc., representing himself, requests Approval as Modified by this public comment.

Replace proposal with the following:

1707.7 Architectural components. Periodic special inspection during the erection and fastening of exterior cladding, interior and exterior nonbearing walls and interior and exterior veneer in structures assigned to Seismic Design Category D, E or F.

Exceptions:

1. Special inspection is not required for ~~architectural components in structures~~ cladding, nonbearing walls and veneer 30 feet (9144 mm) or less in height above grade or walking surface.
2. Special inspection is not required for cladding and veneer weighing 5 psf (24.5N/m²) or less.
3. Special inspection is not required for interior nonbearing walls weighing 15 psf (73.5 N/m²) or less.

Commenter's Reason: The public comment will align Section 1707.7 with Section 2.3.9 of the NEHRP Recommended Provisions for Seismic Regulations for New Buildings and Other Structures (FEMA 450) and achieve better consistency with Section 11A.1.3.9 of ASCE 7-05. As modified by this public comment, the requirements for periodic special inspection are summarized in the table below. Differences between the public comment and the current proposal are highlighted in **bold**.

	Exterior Cladding	Nonbearing Walls		Veneer	
		Interior	Exterior	Interior	Exterior
Structure ≤ 30'0"	No	No	No	No	No
Structure > 30'0" and Exterior Component ≤ 30'0":					
Component ≤ 5 psf	No	No	No	No	No
5 psf < Component ≤ 15 psf	No	No	No	No	No
Component > 15 psf	No	No	No	No	No
Structure > 30'0" and Exterior Component > 30'0":					
Component ≤ 5 psf	No	No	Yes	No	No
5 psf < Component ≤ 15 psf	Yes	No	Yes	Yes	Yes
Component > 15 psf	Yes	Yes	Yes	Yes	Yes

Although the title of Section 1707.7 is "architectural components," the charging language of Section 1707.7 does not specify architectural components. Rather, it specifies exterior cladding, interior and exterior nonbearing walls and interior and exterior veneer, which are examples of architectural components but are not the only types of architectural components. Architectural components other than exterior cladding, interior and exterior nonbearing walls and interior and exterior veneer are not subject to the requirements of Section 1707.7.

Code Change No: S44-06/07

Original Proposal

Section: 1708 (New)**Proponent:** Philip Brazil, P.E., Reid Middleton, Inc., representing himself**Add new text as follows:**

SECTION 1708
SPECIAL INSPECTIONS FOR WIND REQUIREMENTS

1708.1 Special inspections for wind requirements. Special inspections itemized in Sections 1708.2 and 1708.3, unless exempted by the exceptions to Section 1704.1, are required for buildings and structures constructed in the following areas:

1. In wind Exposure Category B, where the 3-second-gust basic wind speed is 120 miles per hour (52.8 m/sec) or greater.
2. In wind Exposure Categories C or D, where the 3-second-gust basic wind speed is 110 mph (49 m/sec) or greater.

1708.2 Structural wood. Continuous special inspection is required during field gluing operations of elements of the main wind-force-resisting system. Periodic special inspection is required for nailing, bolting, anchoring and other fastening of components within the main wind-force-resisting system, including wood shear walls, wood diaphragms, drag struts, braces and hold-downs.

Exception: Special inspection is not required for wood shear walls, shear panels and diaphragms, including nailing, bolting, anchoring and other fastening to other components of the main wind-force-resisting system, where the fastener spacing of the sheathing is more than 4 inches (102 mm) on center.

1708.3 Cold-formed steel framing. Periodic special inspection is required during welding operations of elements of the main wind-force-resisting system. Periodic special inspection is required for screw attachment, bolting, anchoring and other fastening of components within the main wind-force-resisting system, including struts, braces, and hold-downs.

(Renumber subsequent sections)

Reason: In areas of high seismic risk (i.e., Seismic Design Categories C, D, E and F), the IBC currently requires special inspection of seismic-force-resisting systems in buildings of light-frame construction (wood framing and cold-formed steel framing). The risk addressed by these requirements is equally present in areas of high wind forces and special inspection of main wind-force-resisting systems in buildings of light-frame construction is equally warranted. The purpose of this proposal is to establish these requirements in areas of high wind forces. This proposal is, in part, a response to comments made by the proponent during floor discussion of code change proposal S72-04/05 at the 2004/2005 code development hearings in Cincinnati.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This code change is consistent with the current wind requirements in the statement of special inspection. It closes the loop and meets the intent of Section 1705.4.2.

Assembly Action:

None

Original Proposal

Section: 1708 (New)

Proponent: Philip Brazil, P.E., Reid Middleton, Inc., representing himself

Add new text as follows:

SECTION 1708
SPECIAL INSPECTIONS FOR WIND REQUIREMENTS

1708.1 Special inspections for wind requirements. Special inspections itemized in Section 1708.2, unless exempted by the exceptions to Section 1704.1, are required for buildings and structures constructed in the following areas:

1. In wind Exposure Category B, where the 3-second-gust basic wind speed is 120 miles per hour (52.8 m/sec) or greater.
2. In wind Exposure Categories C or D, where the 3-second-gust basic wind speed is 110 mph (49 m/sec) or greater.

1708.2 Wind-resisting components. Periodic special inspection is required for the following systems and components:

1. Roof cladding.
2. Wall cladding.

Reason: In areas of high seismic risk (i.e., Seismic Design Categories C, D, E and F), the IBC currently requires special inspection of seismic-force-resisting systems in buildings of light-frame construction (wood framing and cold-formed steel framing). The risk addressed by these requirements is equally present in areas of high wind forces and special inspection of main wind-force-resisting systems in buildings of light-frame construction is equally warranted. A related proposal addresses main wind-force-resisting systems. This proposal addresses the cladding on buildings and structures in areas of high wind forces. Damage to buildings due to high wind forces often begins with failure of the cladding system, which often exposes the main wind-force-resisting system to damage from wind-driven rain and other forces that the wind-force-resisting system is typically not designed to withstand.

Cost Impact: The code change proposal will increase the cost of construction.

Public Hearing Results

Committee Action:**Approved as Submitted****Committee Reason:** This proposal completes the wind resistance special inspections and is consistent with the approval of S44-06/07.**Assembly Action:****None**

Final Hearing Results

S45-06/07

AS

Code Change No: S46-06/07

Original Proposal

Section: 1708.2**Proponent:** William W. Stewart, FAIA, Chesterfield, MO, representing himself**Revise as follows:****1708.2 Testing for seismic resistance.** The tests specified in sections 1708.3 through 1708.6 are required for the following:

1. The seismic-force-resisting systems in structures assigned to Seismic Design Category C, D, E or F, as determined in Section 1613.
2. ~~Designated seismic-Vibration isolated systems in structures assigned to Seismic Design Category C, D, E or F where the construction documents require a nominal clearance of 0.25 inches or less between the equipment support frame and restraint.~~
3. ~~Architectural, mechanical and electrical components in structures assigned to Seismic Design Category C, D, E or F that are required in Section 1708.5.~~

Reason: Based on the definition of designated seismic system in 1702, item 3 is redundant and can be deleted since it is a duplication of item 2.

There is a major fault with the pointer in the deleted item 3. Per item 3, 1708.5 is supposed to identify which designated seismic systems need Structural Testing. 1708.5 does not identify any components, therefore no designated seismic systems need Structural Testing. Based on Section 1708.5 I believe that the intent of item 3 was to cover mechanical equipment (mainly air handlers) that have spring mounted vibration isolators with snubbers. I have inserted text from item 5 of 1707.8 that describes those components.

Another way of looking at items 2 & 3; Item 2 currently says Structural Tests are necessary for all Designated Seismic Systems, which by definition are all architectural, mechanical and electrical components. Item 3, as explained above says no structural tests are necessary. Thus items 2 & 3 in conflict. If item 2 were correct, every partition, ceiling, light fixture, etc. that has an I_p greater than 1.0 would need Structural Testing. . This is obviously overkill. Item 3 is the intent of the code.

Seismic Design Category C was added to the retained exception since it was in deleted item 3.

Section 1708.1 and 1707.1 seem to have the same origin. You will see a similar change to 1707.1. The pointer in item 3 of 1707.1 did point to systems that needed special inspections. This change to Section 1708.1 will put the systems that need structural testing directly in 1708.1 and then refer to the qualification and testing as outlined in 1708.5.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:**Approved as Modified****Modify the proposal as follows:****1708.2 Testing and qualification for seismic resistance.** The ~~tests testing and qualification~~ specified in sections 1708.3 through 1708.6 are required ~~for the following as follows:~~

1. The seismic-force-resisting systems in structures assigned to Seismic Design Category C, D, E or F, as determined in Section 1613 shall meet the requirements of Sections 1708.3 and 1708.4, as applicable.

2. Designated seismic systems in structures assigned to Seismic Design Category D, E or F in Section 13.2.2 of ASCE 7 shall meet the requirements of Section 1708.5.
3. Architectural, mechanical and electrical components in structures assigned to Seismic Design Category C, D, E or F with an $I_p = 1.0$ shall be permitted to be seismically qualified by meeting the requirements of that are required in Section 1708.5.
4. The seismic isolation system in seismically isolated structures shall meet the testing requirements of Section 1708.6.

Committee Reason: This code change makes corrections to the organization of Section 1708.2 which lists items that require testing for seismic resistance. The modification provides consistency with the following sections that are referenced by Section 1708.2.

Code Change No: **S47-06/07**

Original Proposal

Sections: 1702.1, 1709.1

Proponent: Philip Brazil, P.E., Reid Middleton, Inc., representing himself

Revise as follows:

1702.1 General. The following words and terms shall, for the purposes of this chapter and as used elsewhere in this code, have the meanings shown herein.

STRUCTURAL OBSERVATION. The visual observation of the structural system by a registered design professional for general conformance to the approved construction documents ~~at significant construction stages and at completion of the structural system.~~ Structural observation does not include or waive the responsibility for the inspection required by Section 109, 1704 or other sections of this code.

1709.1 General. Where required by the provisions of Section 1709.2 or 1709.3, the owner shall employ a registered design professional to perform structural observations as defined in Section 1702.

Prior to the commencement of observations, the structural observer shall submit to the building official a written statement identifying the frequency and extent of structural observations.

At the conclusion of the work included in the permit, the structural observer shall submit to the building official a written statement that the site visits have been made and identify any reported deficiencies which, to the best of the structural observer's knowledge, have not been resolved.

Reason: The purpose of this proposal is to delete an inappropriate phrase from the definition of structural observation. A definition should specify the meaning of the term being defined. If there are technical requirements associated with use of the term, they should be located elsewhere. The current definition of structural observation includes when visual observation by the structural observer shall occur: at significant construction stages and at completion of the structural system. These are technical requirements related to the frequency of observations, which should be placed elsewhere in the IBC. But if such requirements were located elsewhere, they should be substantially altered from their present form. A requirement for visual observation to occur at "significant construction stages" is vague and unenforceable, which is not appropriate for a regulatory document such as the IBC. The determination of the frequency of structural observations by the structural observer is best left to the structural observer and the owner in consultation with the local building official.

In place of the deleted language from the definition for structural observation, the proposal adds a requirement in Section 1709.1 for submittal of a written statement by the structural observer to the building official prior to the commencement of observations identifying the frequency and extent of structural observations. Requiring the submittal prior to commencement of construction authorized by the building permit is avoided because the structural observer will not necessarily know when construction begins and should not be expected to meet a deadline established by others beyond his or her control.

Note that the owner is required to employ a registered design professional to perform structural observation when required by Section 1709.2 or 1709.3. The structural observer, in turn, is required to submit a written statement to the building official at the conclusion of the work included in the permit (see Section 1709.1). Note also that one of the conditions for structural observation by a registered design professional is when so designated by the registered design professional in responsible charge of the design, which is typically the architect of record. See condition #4 in Sections 1709.2 and 1709.3.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This code change will improve construction quality by requiring identification of the frequency and extent of structural observations.

Assembly Action:

None

AS

Code Change No: S48-06/07

Original Proposal

Section: 1714.5.2, Chapter 35

Proponent: Joseph R. Hetzel, P.E., Door & Access Systems Manufacturers Association

1. Revise as follows:

1714.5.2 Exterior windows and door assemblies not provided for in Section 1714.5.1. Exterior window and door assemblies shall be tested in accordance with ASTM E 330. Structural performance of garage doors shall be determined in accordance with either ASTM E 330 or ANSI/DASMA 108, and shall meet the acceptance criteria of ANSI/DASMA 108. Exterior window and door assemblies containing glass shall comply with Section 2403. The design pressure for testing shall be calculated in accordance with Chapter 16. Each assembly shall be tested for 10 seconds at a load equal to 1.5 times the design pressure.

2. Add standard to Chapter 35 as follows:

DASMA

ANSI/DASMA 108-02, Standard Method for Testing Sectional Garage Doors: Determination of Structural Performance Under Uniform Static Air Pressure Difference

Reason: The purpose of this proposed code change is to reference an ANSI standard published specifically for the static air pressure testing of garage doors. ANSI/DASMA 108 includes garage door acceptance criteria, which is not contained within ASTM E 330. Similar language to what is being proposed is contained in 2006 IRC Section R613.5.

Cost Impact: The code change proposal will not increase the cost of construction.

Analysis: Results of review of the proposed standard(s) will be posted on the ICC website by August 20, 2006.

Public Hearing Results

Note: The following analysis was not in the Code Change Proposal book but was published in the "Errata to the 2006/2007 Proposed Changes to the International Codes and Analysis of Proposed Referenced Standards" provided at the code development hearings:

Analysis: Review of proposed new standard indicated that, in the opinion of ICC staff, the standard did comply with ICC criteria for referenced standards.

Committee Action:

Approved as Submitted

Committee Reason: The proposal appropriately adds an additional test standard that is specific to garage doors.

Assembly Action:

None

Final Hearing Results

S48-06/07

AS

Code Change No: **S51-06/07**

Original Proposal

Section: 1808.2.23.1

Proponent: Philip Brazil, P.E., Reid Middleton, Inc., representing himself

Revise as follows:

1808.2.23.1 Seismic Design Category C. Where a structure is assigned to Seismic Design Category C in accordance with Section 1613, the following shall apply. Individual pile caps, piers or piles shall be interconnected by ties. Ties shall be capable of carrying, in tension and compression, a force equal to the product of the larger pile cap or column load times the seismic coefficient, S_{DS} , divided by 10 unless it can be demonstrated that equivalent restraint is provided by reinforced concrete beams within slabs on grade or reinforced concrete slabs on grade or confinement by competent rock, hard cohesive soils or very dense granular soils.

Exception: ~~In Group R-3 and U occupancies of light-frame construction, piers foundations supporting foundation walls, isolated interior posts detailed so the pier is not subject to lateral loads, or lightly loaded exterior decks and patios, of Group R-3 and U occupancies not exceeding two stories of light frame construction,~~ are not subject to interconnection if it can be shown the soils are of adequate stiffness, subject to the approval of the building official.

Reason: The current language was approved as submitted by code change proposal 1807.2.23.1 at the IBC First Draft Public Hearings in April, 1998. The staff analysis following the reason statement indicated that the "exception to Section 1807.2.23.1 is not understandable in its current format. Itemizing each individual condition is suggested." I agree. The purpose of this proposal is to modify the exception to Section 1808.2.23.1 so that it is understandable to the average code user and to the proponent of this proposal. The change from "piers" to "pier foundations" is for consistency with the definition of "pier foundation" in Section 1808.1. The phrase "lightly loaded" is deleted because the language is vague and unenforceable.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This code change makes the exception to interconnecting pier foundations in Group R-3 occupancies more understandable.

Assembly Action:

None

Final Hearing Results

S51-06/07

AS

Code Change No: **S52-06/07**

Original Proposal

Section: 1808.2.23.2.1

Proponent: Michael Valley, Magnusson Klemencic Associates representing Structural Engineers Association of Washington Earthquake Engineering Committee

Revise as follows:

1808.2.23.2.1 Design details for piers, piles and grade beams. Piers or piles shall be designed and constructed to withstand maximum imposed curvatures from earthquake ground motions and structure response. Curvatures shall include free-field soil strains modified for soil-pile-structure interaction coupled with pier or pile deformations induced by lateral pier or pile resistance to structure seismic forces. Concrete piers or piles on Site Class E or F sites, as determined in Section 1613.5.2, shall be designed and detailed in accordance with Sections 21.4.4.1, 21.4.4.2 and 21.4.4.3 of ACI 318 within seven pile diameters of the pile cap and the interfaces of soft to medium stiff clay or liquefiable strata. For precast prestressed concrete piles, detailing provisions as given in Section 1809.2.3.2.1 and 1809.2.3.2.2 shall apply.

~~Grade beams shall be designed as beams in accordance with~~ comply with the provisions in Section 21.10.3 of ACI 318 for grade beams, except where they, Chapter 21. ~~When grade beams have the capacity to resist the forces from the load combinations in Section 1605.4, they need not conform to ACI 318, Chapter 21.~~

Reason: Clarify the Code. This change clarifies the intent of the design requirement for grade beams in the last paragraph of the section. The provision currently requires grade beams to be designed as "beams" (not "grade beams") in accordance with Chapter 21 of ACI 318. Chapter 21 of ACI 318 has design provisions for grade beams (21.10.3), beams in special moment frames (21.3), coupling beams (21.7.7), and beams in intermediate moment frames (21.12.4). The revised text indicates which requirements apply.

This clarification makes the text similar to that in Section 14.2.7.2.2 of ASCE 7-05.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: The proposal clarifies where grade beams need to comply with the referenced provision in ACI 318.

Assembly Action:

None

Final Hearing Results

S52-06/07

AS

Code Change No: **S53-06/07**

Original Proposal

Section: 1808.2.23.2.1

Proponent: Michael Valley, Magnusson Klemencic Associates, representing Structural Engineers Association of Washington Earthquake Engineering Committee

Revise as follows:

1808.2.23.2.1 Design details for piers, piles and grade beams. Piers or piles on Site Class E or F sites, as determined in Section 1613.5.2, shall be designed and constructed to withstand maximum imposed curvatures from earthquake ground motions and structure response. Curvatures shall include free-field soil strains modified for soil-

pile-structure interaction coupled with pier or pile deformations induced by lateral pier or pile resistance to structure seismic forces. ~~Where constructed of nonprestressed Cconcrete, such piers or piles on Site Class E or F sites, as determined in Section 1613.5.2,~~ shall be designed and detailed in accordance with Sections 21.4.4.1, 21.4.4.2 and 21.4.4.3 of ACI 318 within seven pile diameters of the pile cap and within seven pile diameters of the interfaces of strata that are hard or stiff and soft to medium stiff clay or strata that are liquefiable or are composed of soft to medium stiff clay strata.

Exception: Piers or piles that satisfy the following additional detailing requirements shall be deemed to comply with the curvature capacity requirements of this section.

1. ~~For~~ Precast prestressed concrete piles, ~~detailed in provisions as given in accordance with Section 1809.2.3.2.1 and 1809.2.3.2.2 shall apply.~~
2. Cast-in-place concrete piles with a minimum longitudinal reinforcement ratio of 0.005 extending throughout the region detailed in accordance with Sections 21.4.4.1, 21.4.4.2 and 21.4.4.3 of ACI 318, but not less than the length required in Section 1810.1.2.2.

Grade beams shall be designed as beams in accordance with ACI 318, Chapter 21. When grade beams have the capacity to resist the forces from the load combinations in Section 1605.4, they need not conform to ACI 318, Chapter 21.

Reason: Revise the scope of these additional pile analysis requirements. Clarify the portions of piles affected. Clarify the exception for precast prestressed piles. Add an exception for prescriptively detailed cast-in-place concrete piles.

Design for "pier or pile moments, shears and lateral deflections" is already required by Section 1808.2.23.1.2, and ductile detailing within three pile diameters of the pile cap is already required by Sections 1809.2.2.2.2 and 1810.1.2.2. The requirements of Section 1808.2.23.2.1, which add to those requirements, are taken from the NEHRP *Recommended Provisions* and are motivated by concern with pile response in soft or liquefiable soils (extended hinging region and kinematic interaction), as indicated in the NEHRP *Commentary* copied below. Such soils are assigned to Site Class E or F, as indicated in IBC Table 1615.1.1, so the corresponding additional requirements should be scoped accordingly.

At present this section applies to all buildings on piers or piles for all site classes, but that scope is inconsistent with both the rationale for the requirement and the state-of-the-practice. Requiring all geotechnical engineers to address the kinematic interaction issue for all projects will result in a large range of response ranging from nothing to potential recommendations for more expensive foundation types that don't significantly reduce societal risk.

As indicated in the NEHRP *Commentary* copied below, properly detailed piles provide the desired performance. For nonprestressed concrete piles, such proper detailing is defined in Sections 21.4.4.1, 21.4.4.2 and 21.4.4.3 of ACI 318. For precast prestressed piles, such proper detailing is defined in Section 1809.2.3.2.2 (which adds to the requirements in 1809.2.3.2.1). The section as modified maintains those detailing requirements and clarifies that this special detailing addresses the requirement related to "maximum imposed curvature."

The text defining the soil interfaces of concern is revised for clarity based on Section 14.2.7.2.1 of ASCE 7-05.

Commentary to the 2003 NEHRP *Recommended Provisions* Section 7.5.4 [emphasis added]:

Special consideration is required in the design of concrete piles subject to significant bending during earthquake shaking. Bending can become crucial to pile design where portions of the foundation piles are supported in soils such as **loose granular materials and/or soft soils** that are susceptible to large deformations and/or strength degradation. Severe pile bending problems may result from various combinations of soil conditions during strong ground shaking, for example:

1. Soil settlement at the pile-cap interface either from consolidation of **soft soil** prior to the earthquake or from soil compaction during the earthquake can create a free-standing short column adjacent to the pile cap.
2. Large deformations and/or reduction in strength resulting from **liquefaction of loose granular materials** can cause bending and/or conditions of free-standing columns.
3. Large deformations in **soft soils** can cause varying degrees of pile bending. The degree of pile bending will depend upon thickness and strength of the soft soil layer(s) and/or the properties of the soft/stiff soil interface(s).

Such conditions can produce shears and/or curvatures in piles that may exceed the bending capacity of conventionally designed piles and result in severe damage. ...

The desired foundation performance can be accomplished by **proper selection and detailing** of the pile foundation system. Such design should accommodate bending from both reaction to the building's inertial loads and those induced by the motions of the soils themselves. Examples of designs of concrete piles include:

1. Use of a **heavy spiral reinforcement** and
2. Use of exterior steel liners to confine the concrete in the zones with large curvatures or shear stresses.

These provide proper confinement to ensure adequate ductility and maintenance of functionality of the confined core of the pile during and after the earthquake.

Precast prestressed concrete piles are exempted from the concrete special moment frame detailing requirements adapted for concrete piles since these provisions were never intended for slender precast prestressed concrete elements and will result in unbuildable piles. Piles with substantially less confinement reinforcement than required by ACI 318 equation 10-6 have been proven through cyclic testing to have adequate performance (Park and Hoat Joen, 1990).

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal provides guidance to engineers on the additional pile analysis requirements for structures that are classified as Seismic Design Category D, E or F.

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

John Diebold, Structural Engineers Association of California, SEAOC Seismology Committee, requests Approval as Modified by this public comment.

Modify proposal as follows:

1808.2.23.2.1 Design details for piers, piles and grade beams. Piers or piles on Site Class E or F sites, as determined in Section 1613.5.2, shall be designed and constructed to withstand maximum imposed curvatures from earthquake ground motions and structure response. Curvatures shall include free-field soil strains modified for soil-pile-structure interaction coupled with pier or pile deformations induced by lateral pier or pile resistance to structure seismic forces. ~~Where constructed of nonprestressed concrete such piers or piles shall be designed and detailed in accordance with Sections 21.4.4.1, 21.4.4.2 and 21.4.4.3 of ACI 318 within seven pile diameters of the pile cap and within seven pile diameters of the interfaces of strata that are hard or stiff and strata that are liquefiable or are composed of soft to medium stiff clay.~~

Exception: Piers or piles that satisfy the following additional detailing requirements shall be deemed to comply with the curvature capacity requirements of this section.

1. Precast prestressed concrete piles detailed in accordance with Section 1809.2.3.2.2.
2. Cast-in-place concrete piles with a minimum longitudinal reinforcement ratio of 0.005 ~~extending the full length of the pile extending throughout the region and detailed in accordance with Sections 21.4.4.1, 21.4.4.2 and 21.4.4.3 of ACI 318 as required by this section, but not less than the length required in Section 1810.1.2.2.~~

~~Where constructed of nonprestressed concrete such piers or piles shall be designed and detailed in accordance with Sections 21.4.4.1, 21.4.4.2 and 21.4.4.3 of ACI 318 within seven pile diameters of the pile cap and within seven pile diameters of the interfaces of strata that are hard or stiff and strata that are liquefiable or are composed of soft to medium stiff clay.~~

Commenter-s Reason: The Structural Engineers Association of California Seismology Committee agrees with the intent and spirit of the original proposal.

There are two points of concern that our Structural Engineers of California Seismology Committee believes are valid and need to be addressed as indicated in this modification. They are as follows:

1. The 0.005 longitudinal reinforcing ratio for the pile should be for the full length of the pile and not just for the "area detailed". The reason for this is that without the curvature analysis, the actual required flexural length of the pile has not been determined - so the point where this reinforcing could be reduced is unclear. Placing this reinforcement throughout the pile length compensates for what is unknown. The original proposal does not adequately address this. See Further Elaboration of Point #1 below for further discussion.
2. The closer tie spacing requirement for the 7 pile diameters above and below the interface and below the pile cap should be stated such that it clearly also applies to Exception 2. Otherwise, our concern is that the way the original S53 proposal reads could be misinterpreted to mean that the exception takes away the requirement for the stricter tie spacing within the 7 pile diameter distance of the interface and the bottom of the pile cap.

This can be clarified by moving the following phrase after the exception, or placing the exception prior to this phrase:

"Where constructed of nonprestressed concrete, such piers or piles shall be designed and detailed in accordance with Sections 21.4.4.1, 21.4.4.2 and 21.4.4.3 of ACI 318 within seven pile diameters of the pile cap and within seven pile diameters of the interfaces of strata that are hard or stiff and strata that are liquefiable or are composed of soft to medium stiff clay."

Further Elaboration of Point #1:

The exception is intended to provide equivalence to the curvature analysis and curvature capacity requirements. Therefore, the intent to require the .005 reinforcement the entire length of the pile is to address the imposed curvatures, which would have been calculated by the kinematic analysis but is being "waived" by this exception.

The original proposal points to extending the longitudinal reinforcing a length that "should be not less than the length required in Section 1810.1.2.2". The original proposal does not provide clarity regarding the length of the vertical reinforcing, nor does it provide any added detailing requirement to justify not performing the curvature analysis. 1810.1.2.2 requires that the "flexural length" be known - which could be determinable for Site Class D, but requires the more complicated kinematic analysis for multiple strata associated with Site Class E or F.

Because we are attempting to address a complex field condition where there are differing soil strata that will impose curvatures on the pile, it makes sense to provide this minimum amount (.005) of "flexural" longitudinal reinforcement to provide a level of structural integrity. It should run the full length of the pile, because the analysis to determine the extent of the curvature has not been done per the exception.

Code Change No: **S54-06/07**

Original Proposal

Section: 1810.8

Proponent: Edwin T. Huston, Smith & Huston, Inc., representing National Council of Structural Engineering Associations

Revise as follows:

1810.8 Micropiles. Micropiles shall ~~conform to~~ comply with the requirements of Sections 1810.8.1 through 1810.8.5.

1810.8.1 Construction. Micropiles shall consist of a grouted section reinforced with steel pipe or steel ~~reinforcing reinforcement~~. Micropiles shall develop their load-carrying capacity through a bond zone in soil, bedrock or a combination of soil and bedrock. ~~The full length of the micropile shall contain either a steel pipe or steel reinforcement shall extend the full length of the micropile.~~

1810.8.2 Materials. Grout shall have a ~~28-day~~ specified compressive strength (f'_c) of not less than 4,000 psi (27.58 Mpa). The grout mix shall be designed and proportioned so as to produce a pumpable mixture. Reinforcement ~~steel~~ shall ~~be~~ consist of deformed reinforcing bars in accordance with ASTM A 615 Grade 60 or Grade 75 or ASTM A 722 Grade 150.

~~Pipe/casing The steel pipe shall have a minimum wall thickness of 3/16 inch (4.8 mm) and as required to meet. Splices shall comply with Section 1808.2.7. Pipe/casing The steel pipe shall meet the tensile requirements of be in accordance with ASTM A 252 Grade 3, except the minimum yield strength shall be as used in the design submittal [typically 50,000 psi to 80,000 psi (345 MPa to 552 MPa)] and minimum elongation shall be 15 percent.~~

1810.8.3 Allowable stresses. The allowable ~~design~~ compressive stress ~~on in the~~ grout shall not exceed 0.33 f'_c . The allowable ~~design~~ compressive stress ~~on in the~~ steel pipe and steel reinforcement shall not exceed the lesser of 0.4 F_y , ~~or and~~ 32,000 psi (220 Mpa). The allowable ~~design~~ tensile stress ~~for in the~~ steel reinforcement shall not exceed 0.60 F_y . The allowable ~~design~~ tensile stress ~~for in~~ the cement grout shall be zero.

1810.8.4 Reinforcement. For piles or portions of piles grouted inside a temporary or permanent casing or inside a hole drilled into bedrock or a hole drilled with grout, the steel pipe or steel reinforcement shall be designed to carry at least 40 percent of the design compression load. Piles or portions of piles grouted in an open hole in soil without temporary or permanent casing and without suitable means of verifying the hole diameter during grouting shall be designed to carry the entire compression load in the reinforcing steel. Where a steel pipe is used for reinforcement, the portion of the ~~cement~~ grout enclosed within the pipe is permitted to be included ~~at~~ in the determination of the allowable stress ~~of in~~ the grout.

1810.8.4.1 Seismic reinforcement. Where a structure is assigned to Seismic Design Category C, a permanent steel casing shall be provided from the top of the pile down a minimum of 120 percent times of the flexural length. ~~The flexural length shall be determined in accordance with Section 1808.4.~~ Where a structure is assigned to Seismic Design D, E or F, the pile shall be considered as an alternative system. ~~In~~ in accordance with Section 104.11, ~~the~~ The alternative pile system design, supporting documentation and test data shall be submitted to the building official for review and approval.

1810.8.5 Installation. The pile shall be permitted to be formed in a hole advanced by rotary or percussive drilling methods, with or without casing. The pile shall be grouted with a fluid cement grout. The grout shall be pumped through a tremie pipe extending to the bottom of the pile until grout of suitable quality returns at the top of the pile. The following requirements apply to specific installation methods:

1. For piles grouted inside a temporary casing, the reinforcing steel bars shall be inserted prior to withdrawal of the casing. The casing shall be withdrawn in a controlled manner with the grout level maintained at the top of the pile to ensure that the grout completely fills the drill hole. During withdrawal of the casing, the grout level inside the casing shall be monitored to check that the flow of grout inside the casing is not obstructed.
2. For a pile or portion of a pile grouted in an open drill hole in soil without temporary casing, the minimum design diameter of the drill hole shall be verified by a suitable device during grouting.
3. For piles designed for end bearing, a suitable means shall be employed to verify that the bearing surface is properly cleaned prior to grouting.

4. Subsequent piles shall not be drilled near piles that have been grouted until the grout has had sufficient time to harden.
5. Piles shall be grouted as soon as possible after drilling is completed.
6. For piles designed with casing a full length casing, the casing must shall be pulled back to the top of the bond zone and reinserted or some by other suitable means employed to assure grout coverage outside the casing.

Reason: Substitute revised material for current provision of the Code.

The purpose of this proposal is to make editorial improvements to the language, which was approved by code change proposal S121-04/05(AM). In Section 1810.8.2, compliance with Section 1808.2.7 is specified for the splices of the steel pipe, which is the subject of Section 1808.2.7. The current language requires the steel pipe, not the splices of the steel pipe, to comply with Section 1808.2.7.

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

1810.8 Micropiles. Micropiles shall comply with the requirements of Sections 1810.8.1 through 1810.8.5.

1810.8.1 Construction. Micropiles shall consist of a grouted section reinforced with steel pipe or steel reinforcement. Micropiles shall develop their load-carrying capacity through a bond zone in soil, bedrock or a combination of soil and bedrock. The steel pipe or steel reinforcement shall extend the full length of the micropile.

1810.8.2 Materials. Grout shall have a specified compressive strength (f'c) of not less than 4,000 psi (27.58 Mpa). The grout mix shall be designed and proportioned so as to produce a pumpable mixture. Reinforcement shall consist of deformed reinforcing bars in accordance with ASTM A 615 Grade 60 or Grade 75 or ASTM A 722 Grade 150.

The steel pipe shall have a minimum wall thickness of 3/16 inch (4.8 mm). Splices shall comply with Section 1808.2.7. The steel pipe shall be in accordance with ASTM A 252 Grade 3, ~~except they have a minimum yield strength shall be as used in the design submittal exceeding 45,000 p.s.i. (310 MPa) and a minimum elongation shall be of 15 percent as shown by mill certifications or two coupon test samples per 40 000 pounds (kg) of pipe.~~

1810.8.3 Allowable stresses. The allowable compressive stress in the grout shall not exceed 0.33 f'c. The allowable compressive stress in the steel pipe and steel reinforcement shall not exceed the lesser of 0.4 Fy, and 32,000 psi (220 Mpa). The allowable tensile stress in the steel reinforcement shall not exceed 0.60 Fy. The allowable tensile stress in the cement grout shall be zero.

1810.8.4 Reinforcement. For piles or portions of piles grouted inside a temporary or permanent casing or inside a hole drilled into bedrock or a hole drilled with grout, the steel pipe or steel reinforcement shall be designed to carry at least 40 percent of the design compression load. Piles or portions of piles grouted in an open hole in soil without temporary or permanent casing and without suitable means of verifying the hole diameter during grouting shall be designed to carry the entire compression load in the reinforcing steel. Where a steel pipe is used for reinforcement, the portion of the grout enclosed within the pipe is permitted to be included in the determination of the allowable stress in the grout.

1810.8.4.1 Seismic reinforcement. Where a structure is assigned to Seismic Design Category C, a permanent steel casing shall be provided from the top of the pile down a minimum of 120 percent of the flexural length. Where a structure is assigned to Seismic Design D, E or F, the pile shall be considered as an alternative system in accordance with Section 104.11. The alternative pile system design, supporting documentation and test data shall be submitted to the building official for review and approval.

1810.8.5 Installation. The pile shall be permitted to be formed in a hole advanced by rotary or percussive drilling methods, with or without casing. The pile shall be grouted with a fluid cement grout. The grout shall be pumped through a tremie pipe extending to the bottom of the pile until grout of suitable quality returns at the top of the pile. The following requirements apply to specific installation methods:

1. For piles grouted inside a temporary casing, the reinforcing bars shall be inserted prior to withdrawal of the casing. The casing shall be withdrawn in a controlled manner with the grout level maintained at the top of the pile to ensure that the grout completely fills the drill hole. During withdrawal of the casing, the grout level inside the casing shall be monitored to check that the flow of grout inside the casing is not obstructed.
2. For a pile or portion of a pile grouted in an open drill hole in soil without temporary casing, the minimum design diameter of the drill hole shall be verified by a suitable device during grouting.
3. For piles designed for end bearing, a suitable means shall be employed to verify that the bearing surface is properly cleaned prior to grouting.
4. Subsequent piles shall not be drilled near piles that have been grouted until the grout has had sufficient time to harden.
5. Piles shall be grouted as soon as possible after drilling is completed.
6. For piles designed with a full length casing, the casing shall be pulled back to the top of the bond zone and reinserted or some by other suitable means employed to assure grout coverage outside the casing.

Committee Reason: The proposal makes editorial improvements so that the provisions for micropiles are clearer. The modification further clarifies the minimum material requirements for steel pipe.

AM

Code Change No: **S56-06/07**

Original Proposal

Section: 1908.1.16

Proponent: John F. Silva, SE, Hilti, Inc.

Revise as follows:

1908.1.16 ACI 318, Section D.3.3. Modify ACI 318, Sections D.3.3.2 through D.3.3.5 to read as follows:

D.3.3.2 – *In structures assigned to Seismic Design Category C, D, E or F, post-installed anchors for use under D.2.3 shall have passed the Simulated Seismic Tests of ACI 355.2.*

D.3.3.3 – *In structures assigned to Seismic Design Category C, D, E or F, the design strength of anchors shall be taken as $0.75 N_n$ and $0.75 V_n$, where ϕ is given in D.4.4 or D.4.5, and N_n and V_n are determined in accordance with D.4.1.*

D.3.3.4 – *In structures assigned to Seismic Design Category C, D, E or F, anchors shall be designed to be governed by tensile or shear strength of a ductile steel element, unless D.3.3.5 is satisfied.*

Exception: *Anchors in concrete designed to support non-structural components in accordance with ASCE 7 Section 13.4.2 need not satisfy Section D.3.3.4.*

D.3.3.5 – *Instead of D.3.3.4, the attachment that the anchor is connecting to the structure shall be designed so that the attachment will undergo ductile yielding at a load level corresponding to anchor forces not greater than the design strength of anchor specified in D.3.3.3, or the minimum design strength of the anchor shall be at least 2.5 times the factored forces transmitted by the attachment.*

Exception: *Anchors in concrete designed to support non-structural components in accordance with ASCE 7 Section 13.4.2 need not satisfy Section D.3.3.5.*

Reason: The purpose of the proposed code change is to correct an error that arises from the multiple provisions that address the design of non-ductile anchors.

This code change proposal corrects an inadvertent problem in coordination between the NEHRP Provisions and the ACI code in anchorage force requirements for the seismic design of nonstructural components. Currently, both ASCE 7 Section 13.4.2, which regulates the design of non-structural components for earthquake loading, and Section 1908.1.16, which addresses the design of anchors in concrete, impose additional load factors on anchors in SDC C and above. Increases for non-ductile anchorage forces are provided in ASCE 7-05 Section 13.4.2 and the changes to ACI 318-05 provided in IBC Section 1908.1.16 provide similar increases. It was never intended that non-ductile anchor force increase factors for nonstructural components be applied twice.

Cost Impact: This change is expected to reduce the cost of anchorage of nonstructural components attached to concrete.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This code change adds exceptions to correct a duplication in the penalty on non-ductile anchors supporting non-structural components.

Assembly Action:

None

AS

Code Change No: **S57-06/07**

Original Proposal

Sections: 2101.3.1, 2305.1.3

Proponent: Edwin T. Huston, Smith & Huston Inc., representing National Council of Structural Engineering Associations

Revise as follows:

2101.3.1 Fireplace drawings. The construction documents shall describe in sufficient detail the location, size and construction of masonry fireplaces. The thickness and characteristics of materials and the clearances from walls, partitions and ceilings shall be ~~clearly~~ indicated.

2305.1.3 Openings in shear panels. Openings in shear panels that materially affect their strength shall be ~~fully~~ detailed on the plans, and shall have their edges adequately reinforced to transfer all shearing stresses.

Reason: Substitute revised material for current provision of the code. This proposal is a continuation of code change proposal S3-04/05 (AM), which proposed revisions similar to those in this proposal. The purpose of the proposal is to clarify the provisions of IBC Sections 2101.3.1 and 2305.1.3 for documentation on construction documents. The term "clearly" is deleted from Section 2101.3.1 because it is superfluous to require clearances to be clearly indicated on construction documents. Requiring clearances to be indicated on construction documents is sufficiently clear. The term "fully" is deleted from Section 2205.1.3 because it is not possible to fully detail openings on plans. What is needed is a sufficient number of details so that the building or structure can be constructed as intended by the design team, which is conveyed by requiring that the openings be detailed.

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal makes editorial changes to provisions that require information to be included in construction documents. The revised wording is more concise.

AS

Code Change No: **S64-06/07**

Original Proposal

Section: 2302.1

Proponent: Sam Francis, American Forest & Paper Association

Revise as follows:

SECTION 2302 DEFINITIONS

NATURALLY DURABLE WOOD. The heartwood of the following species with the exception that an occasional piece with corner sapwood is permitted if 90 percent or more of the width of each side on which it occurs is heartwood.

Decay resistant. Redwood, cedar, black locust and black walnut.

Termite resistant. Redwood, Alaska yellow cedar, Eastern red cedar and both heartwood and all sapwood of western red cedar.

Reason: This proposal is intended to clarify the code requirements for special inspections. Many common items are fabricated under standards cited in the IBC. Many of those items are fabricated with strict quality assurance done under third party supervision. In addition, the proposal also eliminates laundry lists from the code text. Such lists make interpretation and maintenance of the code awkward at best but potentially very, very difficult.

This change introduces species recently found to be termite resistant. Special emphasis of the study was Formosan termite resistance which is of great importance to gulf coast states trying to rebuild following recent hurricanes. These states are particularly susceptible to the Formosan termite.

Cost Impact: In areas suffering widespread damage, construction materials can become scarce and, thus, costly. More choices typically lead to less cost pressure.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This code change identifies termite resistant properties in order to clarify the definition of naturally durable wood.

Assembly Action:

None

Final Hearing Results

S64-06/07

AS

Code Change No: S65-06/07

Original Proposal

Section: 2302.1

Proponent: Joseph Holland, Hoover Treated Wood Products

Revise as follows:

**SECTION 2302
DEFINITIONS**

~~**PRESERVATIVE-TREATED WOOD.** Wood (including plywood) pressure-treated with preservatives in accordance with Section 2303.1.8.~~

~~**TREATED WOOD.** Wood impregnated under pressure with compounds that reduce its susceptibility to flame spread or to deterioration caused by fungi, insects or marine borers. Wood and wood based materials that use vacuum-pressure impregnation processes to enhance fire retardant or preservative properties.~~

Fire-retardant-treated wood. Pressure-treated lumber and plywood that exhibit reduced surface burning characteristics and resist (prevent) propagation of fire.

Preservative-treated wood. Pressure-treated wood products that exhibit reduced susceptibility to damage by fungi, termites, or marine borers.

Reason: Add additional required information for user in determining what treated wood is. Revise definition of preservative treated wood. Add definition for fire-retardant-treated wood. Make preservative and fire-retardant treated wood a subset of treated wood.

Currently there are two types of treated wood: fire-retardant-treated wood and preservative-treated wood. The current definition only speaks on one of the attributes for the fire-retardant-treated wood. The ability of the wood to extinguish itself once the source of ignition is consumed or removed is an important element of the material. The definition of preservative treated wood is not a definition; it's merely a reference to another section of the code. In addition, preservative treated wood will not reduce susceptibility to all insects, only those that actually eat the wood.

Section 2303.2 requires testing in accordance with ASTM E84. The section requires the test to be continued 20 minutes beyond the 10 minutes required to establish the flame spread. According to Section 2303.2, there can be no significant progressive combustion.

Cost Impact: The code change proposal will not increase the cost of construction. Material in marketplace already meets the requirements of Section 2303.2 IBC.

Public Hearing Results

Committee Action:
Modify proposal as follows:

Approved as Modified

**SECTION 2302
DEFINITIONS**

TREATED WOOD. Wood and wood based materials that use vacuum-pressure impregnation processes to enhance fire retardant or preservative properties.

Fire-retardant-treated wood. Pressure-treated lumber and plywood that exhibit reduced surface burning characteristics and resist ~~(prevent)~~ propagation of fire.

Preservative-treated wood. Pressure-treated wood products that exhibit reduced susceptibility to damage by fungi, ~~termites~~ insects, or marine borers.

Committee Reason: The proposal provides appropriate editorial clarifications in the definitions relating to treated wood. The modification retains insects rather than referring exclusively to termites under preservative-treated wood.

Original Proposal

Section: 2303.4

Proponent: Kirk Grundahl, P.E., Wood Truss Council of America representing the Structural Building Components Industry

Revise as follows:

2303.4 Trusses.

2303.4.1 Design. Wood trusses shall be designed in accordance with the provisions of this code and accepted engineering practice. Members are permitted to be joined by nails, glue, bolts, timber connectors, metal connector plates or other approved framing devices.

~~**2303.4.1.1 Truss designer.** The individual or organization responsible for the design of trusses.~~

~~**2303.4.1.2**~~ **2303.4.1.1 Truss design drawings.** The written, graphic and pictorial depiction of each individual truss shall be provided to the building official ~~and for approval~~ approved prior to installation. Truss design drawings shall also be provided with the shipment of trusses delivered to the job site. Truss design drawings shall include, at a minimum, the information specified below:

1. Slope or depth, span and spacing;
2. Location of all joints;
3. Required bearing widths;
4. Design loads as applicable;
 - ~~54.1.~~ Top chord live load (including snow loads);
 - ~~64.2.~~ Top chord dead load;
 - ~~74.3.~~ Bottom chord live load;
 - ~~84.4.~~ Bottom chord dead load;
 - ~~94.5.~~ Concentrated loads and their points of application as applicable;
 - ~~104.6.~~ Controlling wind and earthquake loads as applicable;
- ~~145.~~ Adjustments to wood member ~~lumber~~ and metal connector plate design value for conditions of use;
- ~~126.~~ Each reaction force and direction;
- ~~137.~~ Metal connector plate type, size, and thickness or gage, and the dimensioned location of each metal connector plate except where symmetrically located relative to the joint interface;
- ~~148.~~ Lumber's Size, species and grade for each wood member;
- ~~159.~~ Connection capacities for:
 - ~~15.19.1.~~ Truss to truss;
 - ~~15.29.2.~~ Truss ply to ply; and
 - ~~15.39.3.~~ Field splices.
- ~~1610.~~ Calculated deflection ratio and maximum vertical and horizontal deflection for live and total load as applicable;
- ~~1711.~~ Maximum axial ~~tensile~~ tension and compression forces in the truss members; and
- ~~1812.~~ Required permanent individual truss member bracing and method per Section 2303.4.1.5, unless a specific truss member permanent bracing plan for the roof or floor structural system is provided by a registered design professional.

Where required by one of the following, ~~each individual truss design drawing shall bear the seal and signature of the truss designer:~~

- ~~1. Registered design professional; or~~
- ~~2. Building official; or~~
- ~~3. Statutes of the jurisdiction in which the project is to be constructed.~~

Exceptions:

- ~~1. When a cover sheet/truss index sheet combined into a single cover sheet is attached to the set of truss design drawings for the project, the single sheet/truss index sheet is the only document that needs to be signed and sealed within the truss submittal package.~~
- ~~2. When a cover sheet and a truss index sheet are separately provided and attached to the set of truss design drawings for the project, both the cover sheet and the truss index sheet are the only documents that need to be signed and sealed within the truss submittal package.~~

~~2303.4.1.3 Truss placement diagram.~~ ~~The truss manufacturer shall provide a truss placement diagram that identifies the proposed location for each individually designated truss and references the corresponding truss design drawing. The truss placement diagram shall be provided as part of the truss submittal package, and with the shipment of trusses delivered to the job site. Truss placement diagrams shall not be required to bear the seal or signature of the truss designer.~~

~~Exception:~~ ~~When the truss placement diagram is prepared under the direct supervision of a registered design professional, it is required to be signed and sealed.~~

~~2303.4.1.4 Truss submittal package.~~ ~~The truss submittal package shall consist of each individual truss design drawing, the truss placement diagram for the project, the truss member permanent bracing specification and, as applicable, the cover sheet/truss index sheet.~~

~~2303.4.1.5~~ 2303.4.1.2 Truss member permanent bracing. Where permanent bracing of truss members is required on the truss design drawings, it shall be accomplished by one of the following methods:

1. The trusses shall be designed so that the buckling of any individual truss member ~~can be~~ is resisted internally by the structure (e.g. buckling member T-bracing, L-bracing, etc.) of the individual truss through suitable means (i.e., buckling reinforcement by T-bracing or L-bracing). The truss individual member buckling reinforcement of individual members of the trusses shall be installed as shown on the truss design drawing or on supplemental truss member buckling reinforcement diagrams details provided by the truss designer.

2. Permanent bracing shall be installed using standard industry lateral bracing details that conform in accordance with generally accepted engineering practice. Individual truss member continuous Locations for lateral bracing location(s) shall be shown identified on the truss design drawing.

2303.4.1.3 Truss designer. The individual or organization responsible for the design of trusses.

2303.4.1.3.1 Truss design drawings. Where required by the registered design professional, the building official, or the statutes of the jurisdiction in which the project is to be constructed, each individual truss design drawing shall bear the seal and signature of the truss designer:

Exceptions:

1. Where a cover sheet and truss index sheet are combined into a single sheet and attached to the set of truss design drawings the single cover/truss index sheet is the only document required to be signed and sealed by the truss designer.
2. When a cover sheet and a truss index sheet are separately provided and attached to the set of truss design drawings the cover sheet and the truss index sheet are the only documents required to be signed and sealed by the truss designer.

2303.4.2 Truss placement diagram. The truss manufacturer shall provide a truss placement diagram that identifies the proposed location for each individually designated truss and references the corresponding truss design drawing. The truss placement diagram shall be provided as part of the truss submittal package, and with the shipment of trusses delivered to the job site. Truss placement diagrams shall not be required to bear the seal or signature of the truss designer.

Exception: When the truss placement diagram is prepared under the direct supervision of a registered design professional, it is required to be signed and sealed.

2303.4.3 Truss submittal package. The truss submittal package shall consist of each individual truss design drawing, the truss placement diagram, the truss member permanent bracing details and, as applicable, the cover/truss index sheet.

~~2303.4.1.6~~ **2303.4.4 Anchorage.** All transfer Transfer of loads and anchorage of each truss to the supporting structure is the responsibility of the registered design professional.

~~2303.4.1.7~~ **2303.4.5 Alterations to trusses.** Truss members and components shall not be cut, notched, drilled, spliced or otherwise altered in any way without written concurrence and approval of a registered design professional. Alterations resulting in the addition of loads to any member (e.g., HVAC equipment, water heater) shall not be permitted without verification that the truss is capable of supporting such additional loading.

~~2303.4.2~~ **2303.4.6 Metal-plate-connected trusses.** In addition to Sections 2303.4.1 through ~~2303.4.1.7~~ 2303.4.5, the design, manufacture and quality assurance of metal-plate-connected wood trusses shall be in accordance with TPI 1. Manufactured trusses shall comply with Section 1704.6 as applicable.

Reason: To make editorial improvements to the language and arrangement approved by code change S165-04/05. The language improvements are to provide more precision in the code. The restructuring of the section provides clearer presentation of the concepts.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

2303.4 Trusses.

2303.4.1 Design. Wood trusses shall be designed in accordance with the provisions of this code and accepted engineering practice. Members are permitted to be joined by nails, glue, bolts, timber connectors, metal connector plates or other approved framing devices.

2303.4.1.1 Truss design drawings. The written, graphic and pictorial depiction of each individual truss shall be provided to the building official for approval prior to installation. Truss design drawings shall also be provided with the shipment of trusses delivered to the job site. Truss design drawings shall include, at a minimum, the information specified below:

1. Slope or depth, span and spacing;
2. Location of all joints;
3. Required bearing widths;
4. Design loads as applicable;
 - 4.1. Top chord live load (including snow loads);
 - 4.2. Top chord dead load;
 - 4.3. Bottom chord live load; 4.4. Bottom chord dead load;
 - 4.4. Concentrated loads and their points of application as applicable;
 - 4.6. Controlling wind and earthquake loads as applicable;
5. Adjustments to wood member and metal connector plate design value for conditions of use;
6. Each reaction force and direction;
7. Metal connector plate type, size, and thickness or gage, and the dimensioned location of each metal connector plate except where symmetrically located relative to the joint interface;
8. Size, species and grade for each wood member;
9. Specific connection capacities or G connection capacities required for:
 - 9.1. Truss to truss girder;
 - 9.2. Truss ply to ply; and
 - 9.3. Field splices assembly of a truss when the truss shown on the individual Truss Design Drawing is supplied in separate pieces that will be field connected.
10. Calculated deflection ratio and maximum vertical and horizontal deflection for live and total load as applicable;
11. Maximum axial tension and compression forces in the truss members; and
12. Required permanent individual truss member bracing restraint and method per Section 2303.4.1.2, unless a specific truss member permanent bracing plan for the roof or floor structural system is provided by a registered design professional.

2303.4.1.2 Permanent individual T truss member restraint permanent bracing. Where permanent bracing restraint of truss members is required on the truss design drawings, it shall be accomplished by one of the following methods:

1. The trusses shall be designed so that the buckling of any individual truss member is resisted internally by the individual truss through suitable means (i.e., buckling reinforcement by T-reinforcement bracing or L-reinforcement bracing). The buckling reinforcement of individual members of the trusses shall be installed as shown on the truss design drawing or on supplemental truss member buckling reinforcement details provided by the truss designer.
2. Permanent individual truss member restraint and diagonal bracing shall be installed using standard industry lateral restraint and diagonal bracing details in accordance with generally accepted engineering practice. Locations for lateral bracing restraint shall be identified on the truss design drawing.

2303.4.1.3 Truss designer. The individual or organization responsible for the design of trusses.

2303.4.1.3.1 Truss design drawings. Where required by the registered design professional, the building official, or the statutes of the jurisdiction in which the project is to be constructed, each individual truss design drawing shall bear the seal and signature of the truss designer:

Exceptions:

1. Where a cover sheet and truss index sheet are combined into a single sheet and attached to the set of truss design drawings the single cover/truss index sheet is the only document required to be signed and sealed by the truss designer.
2. When a cover sheet and a truss index sheet are separately provided and attached to the set of truss design drawings the cover sheet and the truss index sheet are the only documents required to be signed and sealed by the truss designer.

2303.4.2 Truss placement diagram. The truss manufacturer shall provide a truss placement diagram that identifies the proposed location for each individually designated truss and references the corresponding truss design drawing. The truss placement diagram shall be provided as part of the truss submittal package, and with the shipment of trusses delivered to the job site. Truss placement diagrams shall not be required to bear the seal or signature of the truss designer.

Exception: When the truss placement diagram is prepared under the direct supervision of a registered design professional, it is required to be signed and sealed.

2303.4.3 Truss submittal package. The truss submittal package shall consist of each individual truss design drawing, the truss placement diagram, the truss member permanent bracing details and, as applicable, the cover/truss index sheet.

2303.4.4 Anchorage. Transfer of loads and anchorage of each truss to the supporting structure is the responsibility of the registered design professional.

2303.4.5 Alterations to trusses. Truss members and components shall not be cut, notched, drilled, spliced or otherwise altered in any way without written concurrence and approval of a registered design professional. Alterations resulting in the addition of loads to any member (e.g., HVAC equipment, water heater) shall not be permitted without verification that the truss is capable of supporting such additional loading.

2303.4.6 Metal-plate-connected trusses. In addition to Sections 2303.4.1 through 2303.4.5, the design, manufacture and quality assurance of metal-plate-connected wood trusses shall be in accordance with TPI 1. Manufactured trusses shall comply with Section 1704.6 as applicable.

Committee Reason: The proposal provides better organization for wood truss design requirements. The truss placement plan should be part of the design drawings and should be reviewed by the engineer of record. The modification to Section 2304.1.1 clarifies the requirements applicable to truss connections. The modification to Section 2303.4.1.2 coordinates the code text with that of the ANSI/TPI 1 standard.

Assembly Action:

None

Final Hearing Results

S66-06/07

AM

Code Change No: S68-06/07

Original Proposal

Section: 2303.4.2

Proponent: Kirk Grundahl, P.E., Wood Truss Council of America, representing the Structural Building Components Industry

Revise as follows:

2303.4.2 Metal-plate-connected trusses. In addition to Sections 2303.4.1 through 2303.4.1.7, the design, manufacture and quality assurance of metal-plate-connected wood trusses shall be in accordance with TPI 1. Manufactured trusses shall comply with Sections 106 and 109 ~~1704.6~~ as applicable.

Reason: The purpose of the proposed revision is to more clearly indicate:

1. That it is acceptable for a building code official to accept the requirements of TPI 1, as they pertain to 3rd party inspection and in-plant quality control, as meeting the requirements for approved inspections.
2. That the requirement for special inspections is job specific and is only imposed if special inspections are required per the construction documents as part of the submittal process to gain a permit.
The provisions in Sections 104.4 Inspections, 106 Construction Documents and 109 Inspections lay out how the construction project process functions in terms of permits, construction documents, and general inspections and is the implementing language for when Chapter 17 applies.
3. Per 109.3, the building official is responsible for building construction inspections.
4. Per 109.3.4, the building official is responsible for providing the frame inspection.
5. Per 104.4 & 109.4, the building official is authorized to accept reports of an approved inspection agency.
6. As part of this frame inspection in 109.3.4, products that are manufactured in accordance with a referenced standard, under a quality assurance program audited by an approved inspection agency in accordance with 109.4 have typically been allowed for use in the construction process.
7. The inspection of truss manufacturing operations is required by ANSI/TPI 1-2002, the standard referenced for trusses, in Section 2303.4.2, ANSI/TPI 1 includes the following requirement:
3.1.3 Truss Manufacturers and inspection agencies shall establish methods that document the application of these quality assurance procedures throughout the manufacturing process. The Truss Manufacturers' methods shall be subject to periodic audit for compliance with the requirements of this standard by an approved inspection agency, where required by local authorities having jurisdiction, or other means.
The use of an approved third party inspection agency for the inspection of truss manufacturing operations meets the general inspection requirements of Section 109.4.

Special Inspections are required only if specifically required for a project as part of the submittal process to gain a permit for the building to be constructed (Sections 106.1 and 1704.1.1). A Special Inspection may be called for by one of three parties: the owner, the registered design professional, or the building official that reviews the application for a permit.

Section 1704.6 specifies that Special Inspections of the fabrication process of prefabricated wood structural elements and assemblies shall be in accordance with 1704.2.

Metal plate-connected wood truss manufacturers meet the requirements of Section 1704.2.2, Fabricator Approval, as referenced in the Exception in Section 1704.2.1:

Exception: Special inspections as required by Section 1704.2 shall not be required where the fabricator is approved in accordance with Section 1704.2.2.

A metal plate-connected wood truss manufacturer may be approved to perform fabrication per the requirements of Section 1704.2.2 as follows:

1. An approved fabricator is one that has written procedural and quality control manuals and periodic auditing of fabrication practices by an approved special inspection agency, both of which are required by ANSI/TPI 1-2002:
3.1.3 Truss Manufacturers and inspection agencies shall establish methods that document the application of these quality assurance procedures throughout the manufacturing process. The Truss Manufacturers' methods shall be subject to periodic audit for compliance with the requirements of this standard by an approved inspection agency, where required by local authorities having jurisdiction, or other means.
3.2.1 An in-plant quality control manual shall be maintained for each truss manufacturing facility, which will include the requirements for daily quality control and any audits that will be performed."
2. An approved special inspection agency is certified by the International Accreditation Service (IAS) under the Accreditation Criteria for Inspection Agencies (AC98) or other approvals as accepted by the building official overseeing code compliance. It is our understanding that all the third party inspection agencies performing inspections in our industry are accredited by IAS.
3. The structural building components that are fabricated for the specific project are demonstrated to be compliant with the construction documents by the information provided on the Truss Design Drawings as required in Section 2303.4.1.2. It is still the responsibility of the building designer to review the Truss Design Drawings for compatibility with the design of the building per Section 106.3.4.

In addition to the reasoning provided above, we do not believe that metal plate connected wood trusses require special inspection. The definition for Special Inspection as provided in 1702.1 indicates that special inspections are required when "special expertise is needed to ensure compliance with approved construction documents and referenced standards." Inspection of the materials used in the manufacturing of metal plate connected wood trusses does require any special qualifications. The truss design drawing as defined in Section 2303.4.1.2 provides all the information that the building inspector or his or her designee needs to inspect the trusses at the job site as part of the framing inspection.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

2303.4.2 Metal-plate-connected trusses. In addition to Sections 2303.4.1 through 2303.4.1.7, the design, manufacture and quality assurance of metal-plate-connected wood trusses shall be in accordance with TPI 1. ~~Manufactured trusses shall comply~~ Jobsite inspections shall be in compliance with Sections 106 and 109.4 as applicable.

Committee Reason: This code change clarifies the inspections of metal-plate-connected trusses. The modification provides a specific reference to the job site inspections that are typically required for these trusses.

Assembly Action:

None

S68-06/07

AM

Code Change No: S69-06/07

Original Proposal

Section: 2304.6.1

Proponent: Zeno Martin, P.E., APA-The Engineered Wood Association

Revise as follows:

2304.6.1 Wood structural panel sheathing. Where wood structural panel sheathing is used as the exposed finish on the exterior of outside walls, it shall have an exterior exposure durability classification. Where wood structural panel sheathing is used elsewhere, ~~on the exterior of outside walls~~ but not as the exposed finish, it shall be of a type manufactured with exterior glue (Exposure 1 or Exterior). ~~Where wood structural panel sheathing is used elsewhere, it shall be of a type manufactured with intermediate or exterior glue.~~

Reason: Delete reference to obsolete adhesive. Intermediate glue is no longer used in the manufacturing of structural panel sheathings trademarked to PS 1 or PS 2. This change improves the code by simplifying the provisions to reflect the product availability in the marketplace.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal appropriately deletes reference to an obsolete material.

Original Proposal

Sections: 2304.6.1, Table 2304.6.1 (New); IRC R602.3, Table R602.3(3), R602.10.3

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Zeno Martin, P.E., APA-The Engineered Wood Association

PART I – IBC

1. Revise as follows:

2304.6.1 Wood structural panel sheathing. Where wood structural panel sheathing is used as the exposed finish on the exterior of outside walls, it shall have an exterior exposure durability classification. Where wood structural panel sheathing is used on the exterior of outside walls but not as the exposed finish, it shall be of a type manufactured with exterior glue (Exposure 1 or Exterior). Where wood structural panel sheathing is used elsewhere, it shall be of a type manufactured with intermediate or exterior glue. Wood structural panel wall sheathing or siding used as structural sheathing shall be capable of resisting wind pressures in accordance with Section 1609. Maximum wind speeds for wood structural panel sheathing used to resist wind pressures shall be in accordance with Table 2304.6.1.

2. Add new table as follows:

**TABLE 2304.6.1
MAXIMUM BASIC WIND SPEED (mph – 3 SECOND GUST) PERMITTED
FOR WOOD STRUCTURAL PANEL WALL SHEATHING USED TO RESIST WIND PRESSURES^{a,b,c}**

MINIMUM NAIL		MINIMUM WOOD STRUCTURAL PANEL SPAN RATING	MINIMUM NOMINAL PANEL THICKNESS (INCHES)	MAXIMUM WALL STUD SPACING (INCHES)	PANEL NAIL SPACING		MAXIMUM WIND SPEED (MPH)		
SIZE	PENETRATION (inches)				EDGES (INCHES O.C.)	FIELD (INCHES O.C.)	WIND EXPOSURE CATEGORY		
							B	C	D
6d Common (0.113" x 2.0")	1.5	24/0	3/8	16	6	12	110	90	85
		24/16	7/16	16	6	12	110	100	90
8d Common (0.131" x 2.5")	1.75	24/16	7/16	16	6	12	130	110	105
				16	6	6	150	125	110
				24	6	12	110	90	85
				24	6	6	110	90	85

- a. Panel strength axis parallel or perpendicular to supports. Three-ply plywood sheathing with studs spaced more than 16 inches on center shall be applied with panel strength axis perpendicular to supports.
- b. Table is based on wind pressures acting toward and away from building surfaces in accordance with Section 6.4.2.2 of ASCE 7. Lateral requirements shall be in accordance with Section 2305 or Section 2308.
- c. Wood Structural Panels with span ratings of Wall-16 or Wall-24 shall be permitted as an alternate to panels with a 24/0 span rating. Plywood Siding rated 16 oc or 24 oc shall be permitted as an alternate to panels with a 24/16 span rating. Wall-16 and Plywood Siding 16 oc shall be used with studs spaced a maximum of 16 inches on center.

PART II – IRC

1. Revise as follows:

R602.3 Design and Construction. Exterior walls of wood-frame construction shall be designed and constructed in accordance with the provisions of this chapter and Figures R602.3(1) and R602.3(2) or in accordance with AF&PA's NDS. Components of exterior walls shall be fastened in accordance with Table R602.3(1) through R602.3(4).

Exterior walls covered with foam plastic sheathing shall be braced in accordance with Section R602.10. Structural sheathing shall be fastened directly to structural framing members. Wall sheathing or siding shall be capable of resisting wind pressures listed in Table R301.2(2). Maximum wind speeds permitted for exterior walls covered with wood structural panel sheathing are listed in Table R602.3(3).

2. Delete Table R602.3(3) and substitute as follows:

TABLE R602.3(3)
MAXIMUM WIND SPEED (mph – 3 SECOND GUST) PERMITTED FOR
WOOD STRUCTURAL PANEL WALL SHEATHING USED TO RESIST WIND PRESSURES^{a, b, c}

Minimum Nail		Minimum Wood Structural Panel Span Rating	Minimum Nominal Panel Thickness (inches)	Maximum Wall Stud Spacing (inches)	Panel Nail Spacing		Maximum Wind Speed (mph)		
Size	Penetration (inches)				Edges (inches o.c.)	Field (inches o.c.)	Wind Exposure Category		
							B	C	D
6d Common (0.113" x 2.0")	1.5	24/0	3/8	16	6	12	110	90	85
				16	6	12	130	110	105
8d Common (0.131" x 2.5")	1.75	24/16	7/16	24	6	12	110	90	85

- a. Panel strength axis parallel or perpendicular to supports. Three-ply plywood sheathing with studs spaced more than 16 inches on center shall be applied with panel strength axis perpendicular to supports.
- b. Table is based on wind pressures acting toward and away from building surfaces in accordance with Section R301.2. Lateral bracing requirements shall be in accordance with R602.10.
- c. Wood Structural Panels with span ratings of Wall-16 or Wall-24 shall be permitted as an alternate to panels with a 24/0 span rating. Plywood Siding rated 16 oc or 24 oc shall be permitted as an alternate to panels with a 24/16 span rating. Wall-16 and Plywood Siding 16 oc shall be used with studs spaced a maximum of 16 inches on center.

R602.10.3 Braced wall panel construction methods. The construction of braced wall panels shall be in accordance with one of the following methods:

1. Nominal 1-inch-by-4-inch (25mm by 102 mm) continuous diagonal braces let in to the top and bottom plates and the intervening studs or approved metal strap devices installed in accordance with the manufacturer's specifications. The let-in bracing shall be placed at an angle not more than 60 degrees (1.06 rad) or less than 45 degrees (0.79 rad) from the horizontal.
2. Wood boards of 5/8 inch (16 mm) net minimum thickness applied diagonally on studs spaced a maximum of 24 inches (610 mm). Diagonal boards shall be attached to studs in accordance with Table R602.3(1).
3. Wood structural panel sheathing with a thickness not less than 5/16 inch (8 mm) for 16-inch (406 mm) stud spacing and not less than 3/8 inch (9 mm) for 24-inch (610 mm) stud spacing. Wood structural panels shall be installed in accordance with Table R602.3(3) (1).
4. One-half-inch (13 mm) or 25/32-inch (20 mm) thick structural fiberboard sheathing applied vertically or horizontally on studs spaced a maximum of 16 inches (406 mm) on center. Structural fiberboard sheathing shall be installed in accordance with Table R602.3(1).
5. Gypsum board with minimum 1/2-inch (13 mm) thickness placed on studs spaced a maximum of 24 inches (610 mm) on center and fastened at 7 inches (178 mm) on center with the size nails specified in Table R602.3(1) for sheathing and Table R702.3.5 for interior gypsum board.
6. Particleboard wall sheathing panels installed in accordance with Table R602.3(4).
7. Portland cement plaster on studs spaced a maximum of 16 inches (406 mm) on center and installed in accordance with Section R703.6.
8. Hardboard panel siding when installed in accordance with Table R703.4.

Exception: Alternate braced wall panels constructed in accordance with Section R602.10.6.1 or R602.10.6.2 shall be permitted to replace any of the above methods of braced wall panels.

Reason: The code change provides guidelines for using wood structural panel wall sheathing to resist wind loads.

Recent high wind events including Hurricane Katrina and several tornado storms have shown that failure of wall sheathing, in winds as low as 60 mph, has caused significant damage due to breaching of the wall envelope. This code change proposal provides wall sheathing solutions using wood structural panels to resist wind pressures. The code change proposal provides a new table 2304.6.1 which clearly shows the capabilities of wood structural panel cladding at varying wind speeds and exposures.

The proposed IBC Table 2304.6.1 was developed by comparing the wind pressures (wind speed) required by Section 1609.3 given in ASCE 7-05 Figure 6-3 (formerly 2003 IBC Table 1609.6.2.1(2)) with the wood structural panel capacities based on US DOC PS 2 standard, engineering calculations, and the Panel Design Specification referenced in 2006 IBC Section 2306.1. The proposed IRC Table R602.3(3) was developed by comparing the wind pressures (wind speed) given in Table R301.2(2) with the wood structural panel capacities based on US DOC PS 2 standard, engineering calculations, and the Panel Design Specification referenced in 2006 IBC Section 2306.1. Nail head pull through and withdrawal was also considered in addition to the panel stiffness and bending strength. The panel-fastener capacity was based on tributary to a single critical nail.

This code change proposal improves the code because it clearly defines the maximum wind speed permitted for wood structural panel wall sheathing.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I — IBC**Committee Action:****Approved as Modified**

Modify proposal as follows:

2304.6.1 Wood structural panel sheathing. Where wood structural panel sheathing is used as the exposed finish on the exterior of outside walls, it shall have an exterior exposure durability classification. Where wood structural panel sheathing is used on the exterior of outside walls but not as the exposed finish, it shall be of a type manufactured with exterior glue (Exposure 1 or Exterior). Where wood structural panel sheathing is used elsewhere, it shall be of a type manufactured with intermediate or exterior glue. Wood structural panel wall sheathing or siding used as structural sheathing shall be capable of resisting wind pressures in accordance with Section 1609. Maximum wind speeds for wood structural panel sheathing used to resist wind pressures shall be in accordance with Table 2304.6.1 for enclosed buildings with a mean roof height not greater than 30 feet (9144 mm) importance factor (I) of 1.0 and topographic factor (Kzt) of 1.0.

**TABLE 2304.6.1
MAXIMUM BASIC WIND SPEED (mph – 3 SECOND GUST) PERMITTED FOR WOOD STRUCTURAL PANEL
WALL SHEATHING USED TO RESIST WIND PRESSURES^{a,b,c}**

MINIMUM NAIL		MINIMUM WOOD STRUCTURAL PANEL SPAN RATING	MINIMUM NOMINAL PANEL THICKNESS (INCHES)	MAXIMUM WALL STUD SPACING (INCHES)	PANEL NAIL SPACING		MAXIMUM WIND SPEED (MPH)		
SIZE	PENETRATION (INCHES)				EDGES (INCHES O.C.)	FIELD (INCHES O.C.)	WIND EXPOSURE CATEGORY		
							B	C	D
6d Common (0.113" x 2.0")	1.5	24/0	3/8	16	6	12	110	90	85
		24/16	7/16	16	6	12	110	100	90
8d Common (0.131" x 2.5")	1.75	24/16	7/16	16	6	12	130	110	105
						6	150	125	110
				24	6	12	110	90	85
						6	110	90	85

- Panel strength axis parallel or perpendicular to supports. Three-ply plywood sheathing with studs spaced more than 16 inches on center shall be applied with panel strength axis perpendicular to supports.
- Table is based on wind pressures acting toward and away from building surfaces in accordance with Section 6.4.2.2 of ASCE 7. Lateral requirements shall be in accordance with Section 2305 or Section 2308.
- Wood Structural Panels with span ratings of Wall-16 or Wall-24 shall be permitted as an alternate to panels with a 24/0 span rating. Plywood Siding rated 16 oc or 24 oc shall be permitted as an alternate to panels with a 24/16 span rating. Wall-16 and Plywood Siding 16 oc shall be used with studs spaced a maximum of 16 inches on center.

Committee Reason: This code change adds requirements for wood structural panel wall sheathing that addresses concerns associated with high wind speeds. The modification places limitations on the tabulated values that are consistent with the assumptions used to calculate them.

Assembly Action:

None**PART II – IRC****Committee Action:****Disapproved**

Committee Reason: This code change is confusing as to when it is referencing sheathing or siding. Siding is wall covering and is not appropriate to be referenced in this section. This has the appearance of proprietary.

Assembly Action:

None

(Portions of table not shown do not change)

a. and b. (No change to current text)

c. 3/8-inch panel thickness or siding with a span rating of 16 inches on center is the minimum recommended where applied direct to framing as exterior siding. For grooved panel siding, the nominal panel thickness is the thickness of the panel measured at the point of nailing.

d. through i. (No change to current text)

2308.9.3 Bracing. Braced wall lines shall consist of braced wall panels that meet the requirements for location, type and amount of bracing as shown in Figure 2308.9.3, specified in Table 2308.9.3(1) and are in line or offset from each other by not more than 4 feet (1219 mm). Braced wall panels shall start not more than 12 1/2-feet (3810 mm) from each end of a braced wall line. Braced wall panels shall be clearly indicated on the plans. Construction of braced wall panels shall be by one of the following methods:

1. Nominal 1-inch by 4-inch (25 mm by 102 mm) continuous diagonal braces let into top and bottom plates and intervening studs, placed at an angle not more than 60 degrees (1.0 rad) or less than 45 degrees (0.79 rad) from the horizontal and attached to the framing in conformance with Table 2304.9.1.
2. Wood boards of 5/8 inch (15.9 mm) net minimum thickness applied diagonally on studs spaced not over 24 inches (610 mm) o.c.
3. Wood structural panel sheathing with a thickness not less than 5/16-3/8 inch (7.9 mm-9.5 mm) for 16-inch (406 mm) stud spacing and not less than 3/8 inch (9.5 mm) for 24-inch (610 mm) stud spacing in accordance with Tables 2308.9.3(2) and 2308.9.3(3).

(Remainder of section unchanged)

(Notes unchanged)

R602.10.3 Braced wall panel construction methods. The construction of braced wall panels shall be in accordance with one of the following methods:

1. Nominal 1-inch-by-4-inch (25mmby 102 mm) continuous diagonal braces let in to the top and bottom plates and the intervening studs or approved metal strap devices installed in accordance with the manufacturer's specifications. The let-in bracing shall be placed at an angle not more than 60 degrees (1.06 rad) or less than 45 degrees (0.79 rad) from the horizontal.

2. Wood boards of 5/8 inch (16 mm) net minimum thickness applied diagonally on studs spaced a maximum of 24 inches (610 mm). Diagonal boards shall be attached to studs in accordance with Table R602.3(1).
3. Wood structural panel sheathing with a thickness not less than ~~5/16~~ 3/8 inch (89.5 mm) for 16-inch (406 mm) stud spacing and not less than ~~3/8~~ 9 mm for or 24-inch (610 mm) stud spacing. Wood structural panels shall be installed in accordance with Table R602.3(3).
4. One-half-inch (13 mm) or 25/32-inch (20 mm) thick structural fiberboard sheathing applied vertically or horizontally on studs spaced a maximum of 16 inches (406 mm) on center. Structural fiberboard sheathing shall be installed in accordance with Table R602.3(1).
5. Gypsum board with minimum 1/2-inch (13 mm) thickness placed on studs spaced a maximum of 24 inches (610 mm) on center and fastened at 7 inches (178 mm) on center with the size nails specified in Table R602.3(1) for sheathing and Table R702.3.5 for interior gypsum board.
6. Particleboard wall sheathing panels installed in accordance with Table R602.3(4).
7. Portland cement plaster on studs spaced a maximum of 16 inches (406 mm) on center and installed in accordance with Section R703.6.
8. Hardboard panel siding when installed in accordance with Table R703.4.

Exception: Alternate braced wall panels constructed in accordance with Section R602.10.6.1 or R602.10.6.2 shall be permitted to replace any of the above methods of braced wall panels.

Reason: Delete from code products no longer produced.

The 5/16" wood structural panels are currently a very small fraction of the panels produced today. While they have been the minimum panel thickness specified for many applications over the years, the building industry has shifted away from them due to manufacturing efficiencies and marketplace demand. The de facto minimum has become 3/8".

Note that the thickness of the panel at the point of nailing is what determines its shear capacity. A statement reflecting this was added to Footnote c in Table 2306.4.1. As such, panels as thick as 19/32" can have 3/8" to 5/16" remaining at the base of a groove. This is why the 5/16" minimum nominal was maintained for panels attached with siding nails. The annotation for Footnote c and f were added to Table 2306.4.1 as an editorial change.

Cost Impact: The code change proposal will not increase the cost of construction, as the current minimums are effectively no longer produced for structural purposes.

Public Hearing Results

PART I — IBC

Committee Action:

Approved as Submitted

Committee Reason: This code change appropriately removes obsolete wood structural panel sizes from Chapter 23.

Assembly Action:

None

PART II — IRC

Committee Action:

Approved as Submitted

Committee Reason: This change deletes the 5/16" thick wood structural panel that is no longer widely available. The 3/8" thick wood structural panel is the proper thickness to be used for the bracing requirements.

Assembly Action:

None

Original Proposal

Section: 2304.8

Proponent: Edwin T. Huston, Smith & Huston Inc., representing National Council of Structural Engineering Associations

Revise as follows:**2304.8 Lumber decking.**

2304.8.1 General. Lumber decking shall be designed and installed in accordance with the general provisions of this code and ~~the provisions of this Section 2304.8.~~ Each piece shall be square end-trimmed. When random lengths are furnished, each piece shall be square end trimmed across the face so that at least 90 percent of the pieces ~~will be~~ are within 0.5 degrees (0.00873 rad) of square. The ends of the pieces shall be permitted to be beveled up to 2 degrees (0.0349 rad) from ~~the~~ vertical with the exposed face of the piece slightly longer than the ~~back~~ opposite face of the piece. Tongue-and-groove decking shall be installed with the tongues up on sloped or pitched roofs with pattern faces down.

2304.8.2 Layup patterns. Lumber decking is permitted to be laid up following one of five standard patterns as defined in Sections 2304.8.2.1 through 2304.8.2.5. Other patterns are permitted to be used ~~if justified by~~ provided they are substantiated through engineering analysis.

2304.8.2.1 Simple span pattern. All pieces shall be supported on their ends (i.e., by two supports).

2304.8.2.2 Two-span continuous pattern. All pieces shall be supported by three supports, and all end joints shall occur in line on ~~every other~~ alternating supports. Supporting members shall be designed to accommodate the load redistribution caused by this pattern.

2304.8.2.3 Combination simple and two-span continuous pattern. Courses in end spans shall be alternating simple span pattern and two-span continuous pattern. End joints ~~are~~ shall be staggered in adjacent courses and ~~occur only over~~ shall bear on supports.

2304.8.2.4 Cantilevered pieces intermixed pattern. The decking shall ~~cover~~ extend across a minimum of three spans. Pieces in the each starter course and every third course shall be simple span pattern. Pieces in other courses shall be cantilevered over the supports with end joints at ~~alternate~~ alternating quarter or third points of the spans. ~~and~~ Each piece shall bear on at least one support.

2304.8.2.5 Controlled random pattern. The decking shall ~~cover~~ extend across a minimum of three spans. End joints of pieces within six inches (152 mm) of ~~being in line~~ the end joints of the adjacent pieces in either direction shall be separated by at least two intervening courses. In the end bays, each piece shall bear on at least one support. Where an end joint occurs in an end bay, the next piece in the same course shall continue over the first inner support for at least 24 inches (610 mm). The details of the controlled random pattern shall be as ~~described~~ specified for each decking material in Sections 2304.8.3.3, 2308.4.3 or 2304.8.5.3.

For cantilevered spans with the controlled random pattern, special considerations shall be made when the overhang exceeds Decking that cantilevers beyond a support for a horizontal distance greater than 18 inches (457 mm), 24 inches (610 mm) or 36 inches (914 mm) for two-inch (51 mm), three-inch (76 mm), and four-inch (102 mm) nominal thickness decking, respectively, shall comply with the following:

1. The maximum cantilevered length ~~for the controlled random pattern~~ shall be 30 percent of the length of the first adjacent interior span.
2. For cantilever overhangs within these limits, A structural fascia shall be fastened to each decking piece to maintain a continuous, straight ~~roof~~ line.
3. There shall be no end joints in the ~~cantilevered portion or within one-half~~ decking between the cantilevered end of the decking and the centerline of the first adjacent interior span.

2304.8.3 Mechanically laminated decking.

2304.8.3.1 General. Mechanically laminated decking consists of square edged dimension lumber laminations set on edge and nailed to the adjacent pieces and to the supports.

2304.8.3.2 Nailing. The length of nails connecting laminations shall not be less than two and one-half times the net thickness of each lamination. Where decking supports are 48 inches (1219 mm) on center (o.c.) or less, side nails shall be spaced installed not more than 30 inches (762 mm) o.c. alternately near alternating between top and bottom edges, and staggered one third of the spacing in adjacent laminations. Where supports are spaced more than 48 inches (1219 mm) o.c., side nails shall be spaced installed not more than 18 inches (457 mm) o.c. alternately near alternating between top and bottom edges and staggered one-third of the spacing in adjacent laminations. Two side nails shall be used installed at each end of butt-jointed pieces.

Laminations shall be toenailed to supports with 20d or larger common nails. Where the supports are 48 inches (1219 mm) o.c. or less, alternate laminations shall be toenailed to alternate supports; where supports are spaced more than 48 inches (1219 mm) o.c., alternate laminations shall be toenailed to every support.

2304.8.3.3 Controlled random pattern. There shall be a minimum distance of 24 inches (610 mm) between end joints in adjacent courses. The pieces in the first and second courses shall bear on at least two supports with end joints in these two courses occurring on alternate supports. A maximum of seven intervening courses shall be permitted before this pattern is repeated.

2304.8.4 Two-inch sawn tongue-and-groove decking.

2304.8.4.1 General. Two-inch (51 mm) decking shall have a maximum moisture content of 15 percent. Decking shall be machined with a single tongue-and-groove pattern. Each decking piece shall be nailed to each support as required.

2304.8.4.2 Nailing. Each piece of decking shall be toenailed at each support with one 16d common nail through the tongue and face-nailed with one 16d common nail.

2304.8.4.3 Controlled random pattern. There shall be a minimum distance of 24 inches (610 mm) between end joints in adjacent courses. The pieces in the first and second courses shall bear on at least two supports with end joints in these two courses occurring on alternate supports. A maximum of seven intervening courses shall be permitted before this pattern is repeated.

2304.8.5 Three- and four-inch sawn tongue-and-groove decking.

2304.8.5.1 General. Three-inch (76 mm) and four-inch (102 mm) decking shall have a maximum moisture content of 19 percent. Decking shall be machined with a double tongue-and-groove pattern. Decking pieces shall be interconnected and fastened nailed to the supports as required.

2304.8.5.2 Nailing. Each piece shall be toenailed at each support with one 40d common nail and face-nailed with one 60d common nail. Courses shall be spiked to each other with 8 inch (203 mm) spikes at maximum intervals not to exceed of 30 inches (762 mm) through predrilled edge holes penetrating to a depth of approximately 4 inches (102 mm), and with one spike shall be installed at a distance not exceeding 10 inches (254 mm) from the end of each piece.

2304.8.5.3 Controlled random pattern. There shall be a minimum distance of 48 inches (1219 mm) between end joints in adjacent courses. Pieces not bearing over on a support are permitted to occur be located in interior bays provided the adjacent pieces in the same course continue over the support for at least 24 inches (610 mm). This condition shall not occur more than once in every six courses in each interior bay.

Reason: Substitute revised material for current provision of the code.

The purpose of this proposal is to make editorial improvements to the language, which was approved by code change proposal S170-04/05(AMPC1).

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify the proposal as follows:

2304.8 Lumber decking.

2304.8.1 General. Lumber decking shall be designed and installed in accordance with the general provisions of this code and Section 2304.8. Each piece shall be square end-trimmed. When random lengths are furnished, each piece shall be square end trimmed across the face so that at least 90 percent of the pieces are within 0.5 degrees (0.00873 rad) of square. The ends of the pieces shall be permitted to be beveled up to 2 degrees (0.0349 rad) from the vertical with the exposed face of the piece slightly longer than the opposite face of the piece. Tongue-and-groove decking shall be installed with the tongues up on sloped or pitched roofs with pattern faces down.

2304.8.2 Layup patterns. Lumber decking is permitted to be laid up following one of five standard patterns as defined in Sections 2304.8.2.1 through 2304.8.2.5. Other patterns are permitted to be used provided they are substantiated through engineering analysis.

2304.8.2.1 Simple span pattern. All pieces shall be supported on their ends (i.e., by two supports).

2304.8.2.2 Two-span continuous pattern. All pieces shall be supported by three supports, and all end joints shall occur in line on alternating supports. Supporting members shall be designed to accommodate the load redistribution caused by this pattern.

2304.8.2.3 Combination simple and two-span continuous pattern. Courses in end spans shall be alternating simple span pattern and two-span continuous pattern. End joints shall be staggered in adjacent courses and shall bear on supports.

2304.8.2.4 Cantilevered pieces intermixed pattern. The decking shall extend across a minimum of three spans. Pieces in each starter course and every third course shall be simple span pattern. Pieces in other courses shall be cantilevered over the supports with end joints at alternating quarter or third points of the spans. Each piece shall bear on at least one support.

2304.8.2.5 Controlled random pattern. The decking shall extend across a minimum of three spans. End joints of pieces within six inches (152 mm) of the end joints of the adjacent pieces in either direction shall be separated by at least two intervening courses. In the end bays, each piece shall bear on at least one support. Where an end joint occurs in an end bay, the next piece in the same course shall continue over the first inner support for at least 24 inches (610 mm). The details of the controlled random pattern shall be as specified for each decking material in Section 2304.8.3.3, 2308.4.3 or 2304.8.5.3.

Decking that cantilevers beyond a support for a horizontal distance greater than 18 inches (457 mm), 24 inches (610 mm) or 36 inches (914 mm) for two-inch (51 mm), three-inch (76 mm), and four-inch (102 mm) nominal thickness decking, respectively, shall comply with the following:

1. The maximum cantilevered length shall be 30 percent of the length of the first adjacent interior span.
2. ~~For cantilever overhangs within these limits,~~ A structural fascia shall be fastened to each decking piece to maintain a continuous, straight line.
3. There shall be no end joints in the decking between the cantilevered end of the decking and the centerline of the first adjacent interior span.

2304.8.3 Mechanically laminated decking.

2304.8.3.1 General. Mechanically laminated decking consists of square edged dimension lumber laminations set on edge and nailed to adjacent pieces and to the supports.

2304.8.3.2 Nailing. The length of nails connecting laminations shall not be less than two and one-half times the net thickness of each lamination. Where decking supports are 48 inches (1219 mm) on center (o.c.) or less, side nails shall be installed not more than 30 inches (762 mm) o.c. alternating between top and bottom edges, and staggered one third of the spacing in adjacent laminations. Where supports are spaced more than 48 inches (1219 mm) o.c., side nails shall be installed not more than 18 inches (457 mm) o.c. alternating between top and bottom edges and staggered one-third of the spacing in adjacent laminations. Two side nails shall be installed at each end of butt-jointed pieces.

Laminations shall be toenailed to supports with 20d or larger common nails. Where the supports are 48 inches (1219 mm) o.c. or less, alternate laminations shall be toenailed to alternate supports; where supports are spaced more than 48 inches (1219 mm) o.c., alternate laminations shall be toenailed to every support.

2304.8.3.3 Controlled random pattern. There shall be a minimum distance of 24 inches (610 mm) between end joints in adjacent courses. The pieces in the first and second courses shall bear on at least two supports with end joints in these two courses occurring on alternate supports. A maximum of seven intervening courses shall be permitted before this pattern is repeated.

2304.8.4 Two-inch sawn tongue-and-groove decking.

2304.8.4.1 General. Two-inch (51 mm) decking shall have a maximum moisture content of 15 percent. Decking shall be machined with a single tongue-and-groove pattern. Each decking piece shall be nailed to each support.

2304.8.4.2 Nailing. Each piece of decking shall be toenailed at each support with one 16d common nail through the tongue and face-nailed with one 16d common nail.

2304.8.4.3 Controlled random pattern. There shall be a minimum distance of 24 inches (610 mm) between end joints in adjacent courses. The pieces in the first and second courses shall bear on at least two supports with end joints in these two courses occurring on alternate supports. A maximum of seven intervening courses shall be permitted before this pattern is repeated.

2304.8.5 Three- and four-inch sawn tongue-and-groove decking.

2304.8.5.1 General. Three-inch (76 mm) and four-inch (102 mm) decking shall have a maximum moisture content of 19 percent. Decking shall be machined with a double tongue-and-groove pattern. Decking pieces shall be interconnected and nailed to the supports.

2304.8.5.2 Nailing. Each piece shall be toenailed at each support with one 40d common nail and face-nailed with one 60d common nail. Courses shall be spiked to each other with 8 inch (203 mm) spikes at maximum intervals of 30 inches (762 mm) through predrilled edge holes penetrating to a depth of approximately 4 inches (102 mm). One spike shall be installed at a distance not exceeding 10 inches (254 mm) from the end of each piece.

2304.8.5.3 Controlled random pattern. There shall be a minimum distance of 48 inches (1219 mm) between end joints in adjacent courses. Pieces not bearing on a support are permitted to be located in interior bays provided the adjacent pieces in the same course continue over the support for at least 24 inches (610 mm). This condition shall not occur more than once in every six courses in each interior bay.

Committee Reason: This code change fixes the language of the lumber decking provisions that were incorporated into the IBC during the previous code development cycle. The modification makes an additional editorial correction.

AM

Code Change No: S74-06/07

Original Proposal

Table 2304.9.1

Proponent: Randall Shackelford, Simpson Strong-Tie Co.

Revise table as follows:

**TABLE 2304.9.1
FASTENING SCHEDULE**

CONNECTION	FASTENING^{a,m}	LOCATION
30. Ledger strip	3 - 16d common (3½" x 0.162") 4 - 3" x 0.131" nails 4 - 3" 14 gage staples	face nail <u>at each joist</u>

Reason: Clarify the code to show where nails must be applied. Fastening was added in the last code change cycle, but location of the fasteners was not added. Fasteners must be located under or near each joist. Legacy codes were silent on this, except for the Standard Building Code, which required "3 at each joist".

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal provides a useful clarification on the location of nails to be provided for ledger strips.

Assembly Action:

None

Code Change No: S75-06/07

Original Proposal

Table 2304.9.1; IRC Table R602.3(1)

Proponent: Louis Wagner, American Fiberboard Association

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

PART I – IBC

Revise as follows:

**TABLE 2304.9.1
FASTENING SCHEDULE**

- i. Corrosion resistant staples with nominal 7/16-inch crown or 1-inch crown and ~~4-1/8~~ 1 1/4-inch length for 1/2-inch sheathing and 1 1/2-inch length for 25/32-inch sheathing. Panel supports at 16 inches (20 inches if strength axis in the long direction of the panel, unless otherwise marked).

(Portions of table and footnotes not shown do not change)

PART II – IRC

Revise as follows:

**TABLE R602.3(1)
FASTENER SCHEDULE FOR STRUCTURAL MEMBERS**

DESCRIPTION OF BUILDING MATERIALS	DESCRIPTION OF FASTENER
1/2" structural cellulosic fiberboard sheathing	1 1/2" galvanized roofing nail, 8d common (2 1/2" X 0.131") nail ; <u>7/16" crown or 1" crown staple 16ga., 4-1/2 1 1/4" long</u>
25/32" structural cellulosic fiberboard sheathing	1 3/4" galvanized roofing nail, 8d common (2 1/2" X 0.131") nail ; <u>7/16" crown or 1" crown staple 16ga., 4-3/4 1 1/2" long</u>

(Portions of table not shown do not change)

Reason: (IBC) This change introduces new information on the use of staples with fiberboard structural sheathing and along with changes to Table 2304.4.4 and IRC Table R602.3(1) will make reference to use of staples with fiberboard consistent within the two codes.

Crown size makes a difference in shear capacity of fiberboard sheathing. See Report number PFS 96-60 available at www.fiberboard.org and being used to revise Table 2304.4.4. The 1 1/8-inch staple is no longer readily available at job sites and should be replaced 1 1/4"-inch staples.

(IRC) This change introduces new information on the use of staples with fiberboard structural sheathing and along with changes to IBC Tables 2304.1 and 2304.4.4 will make reference to fastening of fiberboard consistent within the two codes.

Crown size makes a difference in shear capacity of fiberboard sheathing. See Report number PFS 96-60 available at www.fiberboard.org and being used to revise Table 2304.4.4. 8p common nails are no longer recommended for use with structural sheathing. Staple leg lengths can be shortened based on available proprietary ASTM E72 tests and fastener withdrawal calculations.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I – IBC

Committee Action:

Approved as Submitted

Committee Reason: This code change revises requirements for the attachment of fiberboard sheathing using staples that makes the code more consistent with current industry practice.

Code Change No: S76-06/07

Original Proposal

Sections: 2304.9.5; IRC R319.3**THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.****PART I – IBC****Proponent:** Joseph Holland, Hoover Treated Wood Products, Inc.**Delete and substitute as follows:**

~~2304.9.5 Fasteners in preservative-treated and fire-retardant-treated wood.~~ Fasteners for preservative-treated and fire-retardant-treated wood shall be of hot-dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper. The coating weights for zinc-coated fasteners shall be in accordance with ASTM A 153.

~~Exception:~~ Fasteners other than nails, timber rivets, wood screws and lag screws shall be permitted to be of mechanically deposited zinc-coated steel with coating weights in accordance with ASTM B 695, Class 55 minimum.

Fastenings for wood foundations shall be as required in AF&PA Technical Report No. 7.

2304.9.5 Fasteners in preservative-treated and fire-retardant-treated wood. Fasteners in contact with preservative-treated wood and fire-retardant-treated wood shall be in accordance with this section.

2304.9.5.1 Fasteners for preservative treated wood. Fasteners for preservative-treated wood shall be of hot-dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper.

Exceptions:

1. One-half-inch (12.7 mm) diameter or greater steel bolts.
2. Fasteners other than nails, timber rivets, wood screws and lag screws shall be permitted to be of mechanically deposited zinc coated steel with coating weights in accordance with ASTM B 695, Class 55 minimum.

2304.9.5.2 Fastenings for wood foundations. Fastenings for wood foundations shall be as required in AF&PA Technical Report No. 7.

2304.9.5.3 Fasteners for fire-retardant-treated wood used in exterior applications or wet or damp locations. Fasteners for fire-retardant-treated wood used in exterior applications or wet or damp locations shall be of hot-dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper.

2304.9.5.4 Fasteners for fire-retardant-treated wood used in interior applications. Fasteners for fire-retardant-treated wood used in interior locations shall be in accordance with the manufacturer's recommendations. In the absence of manufacturer's recommendations Section 2304.9.5.3 shall apply.

PART II – IRC

Delete and substitute as follows:

R319.3 Fasteners. Fasteners for pressure preservative and fire-retardant-treated wood shall be of hot-dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper. The coating weights for zinc-coated fasteners shall be in accordance with ASTM A 153.

Exceptions:

1. One-half-inch (12.7mm) diameter or greater steel bolts.
2. Fasteners other than nails, timber rivets, wood screws and lag screws shall be permitted to be of mechanically deposited zinc-coated steel with coating weights in accordance with ASTM B 695, Class 55 minimum.

Fastenings for wood foundations shall be as required in AF&PA Technical Report No. 7.

R319.3 Fasteners in preservative-treated and fire-retardant-treated wood. Fasteners in contact with preservative-treated wood and fire-retardant-treated wood shall be in accordance with this section.

R319.3.1 Fasteners for Preservative Treated Wood. Fasteners for preservative-treated wood shall be of hot-dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper.

Exceptions:

1. One-half-inch (12.7 mm) diameter or greater steel bolts.
2. Fasteners other than nails, timber rivets, wood screws and lag screws shall be permitted to be of mechanically deposited zinc coated steel with coating weights in accordance with ASTM B 695, Class 55 minimum.

R319.3.2 Fastenings for wood foundations. Fastenings for wood foundations shall be as required in AF&PA Technical Report No. 7.

R319.3.3 Fasteners for fire-retardant-treated wood used in exterior applications or wet or damp locations. Fasteners for fire-retardant-treated wood used in exterior applications or wet or damp locations shall be of hot-dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper.

R319.3.4 Fasteners for fire-retardant-treated wood used in interior applications. Fasteners for fire-retardant-treated wood used in interior locations shall be in accordance with the manufacturer's recommendations. In the absence of manufacturer's recommendations Section R 319.3.3 shall apply.

Reason: 1. Bring in the exception for ½ bolts from the IRC into the IBC. 2. Recognize the different exposures for fire-retardant-treated wood and the fastener requirements for the exposure.

The interior exposure for FRTW is far less severe than the exposure for FRTW in wet, damp, or exterior locations. Until this year manufactures of FRTW used the code compliance report (BOCA, ICBO, NER, and SBCCI) to make their recommendations for the appropriate fastener for FRTW. With the consolidation of the code groups and the introduction of the ICC-ES system that is no longer allowed. The ICC-ES's position is the code over rules any testing a manufacturer has done for determining the appropriate fastener for FRTW.

Substantiation: FRTW for interior uses have not experienced problems with corrosion of fasteners used in contact with the wood. The manufacturers have satisfactorily used their recommendations for fasteners for more than 25 years. This change eliminates confusion between the code and the recommendations of the manufacturer.

Cost Impact: The code change proposal will not increase the cost of construction it will reduce the cost and allow the use of an appropriate fastener for the application.

Public Hearing Results

PART I — IBC
Committee Action:

Disapproved

Committee Reason: This code change was disapproved because the proposed splitting of fire-retardant-treated wood requirements into interior and exterior was not substantiated.

Assembly Action:

None

**PART II — IRC
Committee Action:**

Approved as Modified

Modify the proposal as follows:

R319.3 Fasteners in preservative-treated and fire-retardant-treated wood. Fasteners in contact with preservative-treated wood and fire-retardant-treated wood shall be in accordance with this section. The coating weights for zinc-coated fasteners shall be in accordance with ASTM A 153.

(Portions of proposal not shown remain unchanged)

Committee Reason: This new language provides clarity to the code user on fasteners and their application when utilizing fire-retardant treated wood. The modification provides a needed reference to ASTM A 153 which was deleted in the original code change.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because public comments were submitted for Part I.

Public Comment 1:

Joseph Holland, Hoover Treated Wood Products, requests Approval as Modified by this public comment for Part I.

Modify proposal as follows:

2304.9.5 Fasteners in preservative-treated and fire-retardant-treated wood. Fasteners for preservative treated and fire-retardant-treated wood shall be in accordance with Section 2304.9.5.1 through 2304.9.5.4. ~~4 of hot-dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper.~~ The coating weights for zinc-coated fasteners shall be in accordance with ASTM A 153.

Exception: ~~Fasteners other than nails, timber rivets, wood screws and lag screws shall be permitted to be of mechanically deposited zinc coated steel with coating weights in accordance with ASTM B695, Class 55 minimum.~~

~~Fastenings for wood foundations shall be as required in AF&PA Technical Report No. 7.~~

2304.9.5.1 Fasteners for preservative treated wood. Fasteners for preservative-treated wood shall be of hot-dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper. Fasteners other than nails, timber rivets, wood screws and lag screws shall be permitted to be of mechanically deposited zinc coated steel with coating weights in accordance with ASTM B695, Class 55 minimum.

2304.9.5.2 Fastenings for wood foundations. Fastenings for wood foundations shall be as required in AF&PA Technical Report No. 7.

2304.9.5.3 Fasteners for fire-retardant-treated wood used in exterior applications or wet or damp locations. Fasteners for fire-retardant-treated wood used in exterior applications or wet or damp locations shall be of hot-dipped zinc-coated galvanized steel, stainless steel, silicon bronze or copper. Fasteners other than nails, timber rivets, wood screws and lag screws shall be permitted to be of mechanically deposited zinc coated steel with coating weights in accordance with ASTM B695, Class 55 minimum.

2304.9.5.4 Fasteners for fire-retardant-treated wood used in interior applications. Fasteners for fire-retardant-treated wood used in interior locations shall be in accordance with the manufacturer's recommendations. In the absence of manufacturer's recommendations Section 2304.9.5.3 shall apply.

Commenter's Reason: The original submission was taken from the 2003 IBC and the exception in the 2003 IRC. There were changes made to the 2006 editions not incorporated into the submission. This modification incorporates the 2006 language and drops the exception from the IRC. In addition section 2304.9.5.3 incorporates the language from the exception for timber rivets, wood screws and lag screws for FRTW used in wet or damp locations and in exterior exposures.

This modification will recognize the fasteners being used for FRTW for more than 25 years.

Original Proposal

Sections: 2304.11.2.5; IRC R319.1

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Dennis Pitts, American Forest & Paper Association

PART I – IBC

Revise as follows:

2304.11.2.5 Wood siding. Clearance between wood siding and earth on the exterior of a building shall not be less than 6 inches (152 mm) or less than 2 inches (51 mm) from concrete steps, porch slabs, patio slabs, and similar horizontal surfaces exposed to the weather except where siding, sheathing, and wall framing are of naturally durable or preservative-treated wood.

PART II – IRC

Revise as follows:

R319.1 Location required. Protection from decay shall be provided in the following locations by the use of naturally durable wood or wood that is preservative treated in accordance with AWPA U1 for the species, product, preservative and end use. Preservatives shall be listed in Section 4 of AWPA U1.

1. Wood joists or the bottom of a wood structural floor when closer than 18 inches (457 mm) or wood girders when closer than 12 inches (305 mm) to the exposed ground in crawl spaces or unexcavated area located within the periphery of the building foundation.
2. All wood framing members that rest on concrete or masonry exterior foundation walls and are less than 8 inches (203 mm) from the exposed ground.
3. Sills and sleepers on a concrete or masonry slab that is in direct contact with the ground unless separated from such slab by an impervious moisture barrier.
4. The ends of wood girders entering exterior masonry or concrete walls having clearances of less than 0.5 inch (12.7 mm) on tops, sides and ends.
5. Wood siding, sheathing and wall framing on the exterior of a building having a clearance of less than 6 inches (152 mm) from the ground or less than 2 inches (51 mm) from concrete steps, porch slabs, patio slabs, and similar horizontal surfaces exposed to the weather.

No change to items 6 and 7.

Reason: The existing text should result in wood materials being at least 2" from the surface of typical 4"-thick concrete walks and porch slabs if the required minimum of 6" distance from the ground is maintained. In practice, however, it's not unusual to see less than 2" clearance. Without a minimum clearance water that may collect on the concrete can result in decay in the wood. Additionally, sufficient clearance to check for termite tubes may not be maintained.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I — IBC

Committee Action:

Approved as Modified

Modify the proposal as follows:

2304.11.2.5 Wood siding. Clearance between wood siding and earth on the exterior of a building shall not be less than 6 inches (152 mm) or less than 2 inches (51 mm) vertical from concrete steps, porch slabs, patio slabs, and similar horizontal surfaces exposed to the weather except where siding, sheathing, and wall framing are of naturally durable or preservative-treated wood.

Committee Reason: The proposal will minimize the exposure of wood siding to decay by elaborating on the minimum clearance requirements at horizontal concrete surfaces. The modification is intended to clarify that the clearance is measured vertically.

Assembly Action:

None

PART II — IRC

Committee Action:

Approved as Modified

Modify the proposal as follows:

R319.1 Location required. Protection from decay shall be provided in the following locations by the use of naturally durable wood or wood that is preservative treated in accordance with AWPAC U1 for the species, product, preservative and end use. Preservatives shall be listed in Section 4 of AWPAC U1.

1. through 4. (No change to current text)
5. Wood siding, sheathing and wall framing on the exterior of a building having a clearance of less than 6 inches (152 mm) from the ground or less than 2 inches (51 mm) measured vertically from concrete steps, porch slabs, patio slabs and similar horizontal surfaces exposed to the weather.

Committee Reason: This additional language helps provide a usable measure criteria for material clearances. Without a minimum clearance water that collects on the concrete can result in decay of the wood. The modification specifically calls out that the measurement must be made vertically from concrete steps.

Assembly Action:

None

Original Proposal

Sections: 2305, 1613.6.1, Table 2306.4.5

Proponent: Jeffrey B. Stone, American Forest & Paper Association

Revise as follows:

SECTION 2305 GENERAL DESIGN REQUIREMENTS FOR LATERAL-FORCE-RESISTING SYSTEMS

2305.1 General. Structures using wood shear walls and diaphragms to resist wind, seismic and other lateral loads shall be designed and constructed in accordance with AF&PA SDPWS and the provisions of Section 2305, 2306, and 2307, the provisions of this section. ~~Alternatively, compliance with the AF&PA SDPWS shall be permitted subject to the limitations therein and the limitations of this code.~~

2305.1.1 Shear resistance based on principles of mechanics. ~~Shear resistance of diaphragms and shear walls are permitted to be calculated by principles of mechanics using values of fastener strength and sheathing shear resistance.~~

2305.1.2 Framing. ~~Boundary elements shall be provided to transmit tension and compression forces. Perimeter members at openings shall be provided and shall be detailed to distribute the shearing stresses. Diaphragm and shear wall sheathing shall not be used to splice boundary elements. Diaphragm chords and collectors shall be placed in, or tangent to, the plane of the diaphragm framing unless it can be demonstrated that the moments, shears and deformations, considering eccentricities resulting from other configurations can be tolerated without exceeding the adjusted resistance and drift limits.~~

2305.1.2.1 Framing members. Framing members shall be at least 2 inch (51 mm) nominal width. In general, adjoining panel edges shall bear and be attached to the framing members and butt along their centerlines. Nails shall be placed not less than 3/8 inch (9.5 mm) from the panel edge, not more than 12 inches (305 mm) apart along intermediate supports, and 6 inches (152 mm) along panel edge bearings, and shall be firmly driven into the framing members.

2305.1.3 2305.1.1 Openings in shear panels. Openings in shear panels that materially affect their strength shall be fully detailed on the plans, and shall have their edges adequately reinforced to transfer all shearing stresses.

2305.1.4 Shear panel connections. Positive connections and anchorages capable of resisting the design forces shall be provided between the shear panel and the attached components. In Seismic Design Category D, E or F, the capacity of toenail connections shall not be used when calculating lateral load resistance to transfer lateral earthquake forces in excess of 150 pounds per foot (2189 N/m) from diaphragms to shear walls, drag struts (collectors) or other elements, or from shear walls to other elements.

2305.1.5 Wood members resisting horizontal seismic forces contributed by masonry and concrete walls. Wood shear walls, diaphragms, horizontal trusses and other members shall not be used to resist horizontal seismic forces contributed by masonry or concrete walls in structures over one story in height.

Exceptions:

1. Wood floor and roof members are permitted to be used in horizontal trusses and diaphragms to resist horizontal seismic forces contributed by masonry or concrete walls, provided such forces do not result in torsional force distribution through the truss or diaphragm.
2. Wood structural panel sheathed shear walls are permitted to be used to provide resistance to seismic forces contributed by masonry or concrete walls in two-story structures of masonry or concrete walls, provided the following requirements are met:
 - 2.1. Story-to-story wall heights shall not exceed 12 feet (3658 mm).
 - 2.2. Diaphragms shall not be designed to transmit lateral forces by rotation and shall not cantilever past the outermost supporting shear wall.
 - 2.3. Combined deflections of diaphragms and shear walls shall not permit story drift of supported masonry or concrete walls to exceed the limit of Section 12.12.1 in ASCE 7.
 - 2.4. Wood structural panel sheathing in diaphragms shall have unsupported edges blocked. Wood structural panel sheathing for both stories of shear walls shall have 2 unsupported edges blocked and, for the lower story, shall have a minimum thickness of 15/32 inch (11.9 mm).
 - 2.5. There shall be no out-of-plane horizontal offsets between the first and second stories of wood structural panel shear walls.

2305.1.6 Wood members resisting seismic forces from nonstructural concrete or masonry. Wood members shall be permitted to resist horizontal seismic forces from nonstructural concrete, masonry veneer or concrete floors.

2305.2 Design of wood diaphragms.

2305.2.1 General. Wood diaphragms are permitted to be used to resist horizontal forces provided the deflection in the plane of the diaphragm, as determined by calculations, tests or analogies drawn therefrom, does not exceed the permissible deflection of attached distributing or resisting elements. Connections shall extend into the diaphragm a sufficient distance to develop the force transferred into the diaphragm.

2305.2.2 2305.2 Diaphragm Deflection. Permissible deflection shall be that deflection up to which the diaphragm and any attached distributing or resisting element will maintain its structural integrity under design load conditions, such that the resisting element will continue to support design loads without danger to occupants of the structure. Calculations for diaphragm deflection shall account for the usual bending and shear components as well as any other factors, such as nail deformation, which will contribute to deflection. The deflection (Δ) of a blocked wood structural panel diaphragm uniformly nailed fastened throughout is permitted to be calculated by using the following equation. If not uniformly nailed fastened, the constant 0.188 (For SI: 1/1627) in the third term must be modified accordingly.

$$\Delta = \frac{5vL^3}{8EAb} + \frac{vL}{4Gt} + 0.188Le_n + \frac{\sum(\Delta_c X)}{2b} \quad \text{(Equation 23-1)}$$

$$\text{For SI: } \Delta = \frac{0.052vL^3}{EAb} + \frac{vL}{4Gt} + \frac{Le_n}{1627} + \frac{\sum(\Delta_c X)}{2b}$$

Where:

A = Area of chord cross section, in square inches (mm²).

B = Diaphragm width, in feet (mm).

E = Elastic modulus of chords, in pounds per square inch (N/mm²).

~~e_n = Nail or staple~~ ~~Staple~~ deformation, in inches (mm) [see Table 2305.2.2(1)].

Gt = Panel rigidity through the thickness, in pounds per inch (N/mm) of panel width or depth [see Table 2305.2.2(2)].

L = Diaphragm length, in feet (mm).

v = Maximum shear due to design loads in the direction under consideration, in pounds per linear foot (plf) (N/mm).

Δ = The calculated deflection, in inches (mm).

Σ(Δ_cX) = Sum of individual chord-splice slip values on both sides of the diaphragm, each multiplied by its distance to the nearest support.

TABLE 2305.2.2(1) 2305.2(1)
e_n VALUES (inches) FOR USE IN CALCULATING DIAPHRAGM DEFLECTION DUE TO FASTENER SLIP
(Structural I)^{ad}

LOAD PER FASTENER ^c (pounds)	FASTENER DESIGNATIONS ^b			
	6d	8d	10d	14-Ga staple x 2 inches long
60	0.04	0.00	0.00	0.011
80	0.02	0.01	0.01	0.018
100	0.03	0.01	0.01	0.028
120	0.04	0.02	0.01	0.04
140	0.06	0.03	0.02	0.053
160	0.10	0.04	0.02	0.068
180	-	0.05	0.03	-
200	-	0.07	0.47	-
220	-	0.09	0.06	-
240	-	-	0.07	-

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound = 4.448 N.

a. Increase e_n values 20 percent for plywood grades other than Structural I.

~~b. Nail values apply to common wire nails or staples identified.~~

c. Load per fastener = maximum shear per foot divided by the number of fasteners per foot at interior panel edges.

d. Decrease e_n values 50 percent for seasoned lumber (moisture content < 19 percent).

TABLE 2305.2.2(2) 2305.2(2)
VALUES OF Gt FOR USE IN CALCULATING DEFLECTION OF WOOD STRUCTURAL PANEL SHEAR WALLS AND DIAPHRAGMS

(No change to table entries)

2305.2.3 Diaphragm aspect ratios. Size and shape of diaphragms shall be limited as set forth in Table 2305.2.3.

TABLE 2305.2.3
MAXIMUM DIAPHRAGM DIMENSION RATIOS
HORIZONTAL AND SLOPED DIAPHRAGM

2305.2.4 Construction. Wood diaphragms shall be constructed of wood structural panels manufactured with exterior glue and not less than 4 feet by 8 feet (1219mm by 2438 mm), except at boundaries and changes in framing where minimum sheet dimension shall be 24 inches (610 mm) unless all edges of the undersized sheets are supported by and fastened to framing members or blocking. Wood structural panel thickness for horizontal diaphragms shall not be less than the values set forth in Tables 2304.7(3), 2304.7(4) and 2304.7(5) for corresponding joist spacing and loads.

2305.2.4.1 Seismic Design Category F. Structures assigned to Seismic Design Category F shall conform to the additional requirements of this section. Wood structural panel sheathing used for diaphragms and shear walls that are part of the seismic force-resisting system shall be applied directly to the framing members.

Exception: Wood structural panel sheathing in a diaphragm is permitted to be fastened over solid lumber planking or laminated decking, provided the panel joints and lumber planking or laminated decking joints do not coincide.

2305.2.5 Rigid diaphragms. Design of structures with rigid diaphragms shall conform to the structure configuration requirements of Section 12.3.2 of ASCE 7 and the horizontal shear distribution requirements of Section 12.8.4 of ASCE 7. Open front structures with rigid wood diaphragms resulting in torsional force distribution are permitted, provided the length, *l*, of the diaphragm normal to the open side does not exceed 25 feet (7620 mm), the diaphragm sheathing conforms to Section 2305.2.4 and the *l/w* ratio [as shown in Figure 2305.2.5(1)] is less than 1 for one-story structures or 0.67 for structures over one story in height. **Exception:** Where calculations show that diaphragm deflections can be tolerated, the length, *l*, normal to the open end is permitted to be increased to a *l/w* ratio not greater than 1.5 where sheathed in compliance with Section 2305.2.4 or to 1 where sheathed in compliance with Section 2306.3.4 or 2306.3.5.

Rigid wood diaphragms are permitted to cantilever past the outermost supporting shearwall (or other vertical resisting element) a length, *l*, of not more than 25 feet (7620 mm) or two-thirds of the diaphragm width, *w*, whichever is smaller. Figure 2305.2.5(2) illustrates the dimensions of *l* and *w* for a cantilevered diaphragm.

Structures with rigid wood diaphragms having a torsional irregularity in accordance with Table 12.3-1, Item 1, of ASCE 7 shall meet the following requirements: the *l/w* ratio shall not exceed 1 for one-story structures or 0.67 for structures over one story in height, where *l* is the dimension parallel to the load direction for which the irregularity exists.

Exception: Where calculations demonstrate that the diaphragm deflections can be tolerated, the width is permitted to be increased and the *l/w* ratio is permitted to be increased to 1.5 where sheathed in compliance with Section 2305.2.4 or 1 where sheathed in compliance with Section 2306.3.4 or 2306.3.5.

**FIGURE 2305.2.5(1)
DIAPHRAGM LENGTH AND WIDTH FOR PLAN VIEW OF OPEN FRONT BUILDING**

**FIGURE 2305.2.5(2)
DIAPHRAGM LENGTH AND WIDTH FOR PLAN VIEW OF CANTILEVERED DIAPHRAGM**

2305.3 Design of wood shear walls.

2305.3.1 General. Wood shear walls are permitted to resist horizontal forces in vertical distributing or resisting elements, provided the deflection in the plane of the shear wall, as determined by calculations, tests or analogies drawn there from, does not exceed the more restrictive of the permissible deflection of attached distributing or resisting elements or the drift limits of Section 12.12.1 of ASCE 7. Shear wall sheathing other than wood structural panels shall not be permitted in Seismic Design Category E or F (see Section 1613).

2305.3.2 2305.3 Shear wall Deflection. Permissible deflection shall be that deflection up to which the shear wall and any attached distributing or resisting element will maintain its structural integrity under design load conditions, i.e., continue to support design loads without danger to occupants of the structure. The deflection (Δ) of a blocked wood structural panel shear wall uniformly fastened throughout is permitted to be calculated by the use of the following equation:

$$\Delta = \frac{8vh^3}{EAb} + \frac{vh}{Gt} + 0.75he_n + d_a \frac{h}{b} \quad \text{(Equation 23-2)}$$

For SI:
$$\Delta = \frac{vh^3}{3EAb} + \frac{vh}{Gt} + \frac{he_n}{407.6} + d_a \frac{h}{b}$$

where:

- A = Area of boundary element cross section in square inches (mm²) (vertical member at shear wall boundary).
- b = Wall width, in feet (mm).
- d_a = Vertical elongation of overturning anchorage (including fastener slip, device elongation, anchor rod elongation, etc.) at the design shear load (*v*).
- E = Elastic modulus of boundary element (vertical member at shear wall boundary), in pounds per square inch (N/mm²).
- e_n = Nail or staple ~~Staple~~ deformation, in inches (mm) [see Table 2305.2.2(2)].
- Gt = Panel rigidity through the thickness, in pounds per inch (N/mm) of panel width or depth [see Table 2305.2.2(2)].

- H = Wall height, in feet (mm).
 v = Maximum shear due to design loads at the top of the wall, in pounds per linear foot (N/mm).
 Δ = The calculated deflection, in inches (mm).

2305.3.3 Construction. Wood shear walls shall be constructed of wood structural panels manufactured with exterior glue and not less than 4 feet by 8 feet (1219mm by 2438 mm), except at boundaries and at changes in framing. All edges of all panels shall be supported by and fastened to framing members or blocking. Wood structural panel thickness for shear walls shall not be less than set forth in Table 2304.6.1 for corresponding framing spacing and loads, except that 1/4 inch (6.4 mm) is permitted to be used where perpendicular loads permit.

2305.3.4 Shear wall aspect ratios. Size and shape of shear walls, perforated shear wall segments within perforated shear walls and wall piers within shear walls that are designed for force transfer around openings shall be limited as set forth in Table 2305.3.4. The height, h , and the width, w , shall be determined in accordance with Sections 2305.3.5 through 2305.3.5.2 and 2305.3.6 through 2305.3.6.2, respectively.

**TABLE 2305.3.4
 MAXIMUM SHEAR WALL DIMENSION RATIOS**

2305.3.5 Shear wall height definition. The height of a shear wall, h , shall be defined as:

1. The maximum clear height from the top of the foundation to the bottom of the diaphragm framing above; or
2. The maximum clear height from the top of the diaphragm to the bottom of the diaphragm framing above [see Figure 2305.3.5(a)].

2305.3.5.1 Perforated shear wall segment height definition. The height of a perforated shear wall segment, h , shall be defined as specified in Section 2305.3.5 for shear walls.

2305.3.5.2 Force transfer shear wall pier height definition. The height, h , of a wall pier in a shear wall with openings designed for force transfer around openings shall be defined as the clear height of the pier at the side of an opening [see Figure 2305.3.5(b)].

2305.3.6 Shear wall width definition. The width of a shear wall, w , shall be defined as the sheathed dimension of the shear wall in the direction of application of force [see Figure 2305.3.5(a)].

2305.3.6.1 Perforated shear wall segment width definition. The width of a perforated shear wall segment, w , shall be defined as the width of full-height sheathing adjacent to openings in the perforated shear wall [see Figure 2305.3.5(a)].

2305.3.6.2 Force transfer shear wall pier width definition. The width, w , of a wall pier in a shear wall with openings designed for force transfer around openings shall be defined as the sheathed width of the pier at the side of an opening [see Figure 2305.3.5(b)].

2305.3.7 Overturning restraint. Where the dead load stabilizing moment in accordance with Chapter 16 allowable stress design load combinations is not sufficient to prevent uplift due to overturning moments on the wall, an anchoring device shall be provided. Anchoring devices shall maintain a continuous load path to the foundation.

2305.3.8 Shear walls with openings. The provisions of this section shall apply to the design of shear walls with openings. Where framing and connections around the openings are designed for force transfer around the openings, the provisions of Section 2305.3.8.1 shall apply. Where framing and connections around the openings are not designed for force transfer around the openings, the provisions of Section 2305.3.8.2 shall apply.

2305.3.8.1 Force transfer around openings. Where shear walls with openings are designed for force transfer around the openings, the limitations of Table 2305.3.4 shall apply to the overall shear wall, including openings, and to each wall pier at the side of an opening. Design for force transfer shall be based on a rational analysis. Detailing of boundary elements around the opening shall be provided in accordance with the provisions of this section [see Figure 2305.3.5(b)].

2305.3.8.2 Perforated shear walls. The provisions of Section 2305.3.8.2 shall be permitted to be used for the design of perforated shear walls. For the determination of the height and width of perforated shear wall segments, see Sections 2305.3.5.1 and 2305.3.6.1, respectively.

2305.3.8.2.1 Limitations. The following limitations shall apply to the use of Section 2305.3.8.2:

1. A perforated shear wall segment shall be located at each end of a perforated shear wall. Openings shall be permitted to occur beyond the ends of the perforated shear wall, provided the width of such openings is not be included in the width of the perforated shear wall.
2. The allowable shear set forth in Table 2306.4.1 shall not exceed 490 plf (7150 N/m).
3. Where out-of-plane offsets occur, portions of the wall on each side of the offset shall be considered as separate perforated shear walls.
4. Collectors for shear transfer shall be provided through the full length of the perforated shear wall.
5. A perforated shear wall shall have uniform top-of-wall and bottom-of-wall elevations. Perforated shear walls not having uniform elevations shall be designed by other methods.
6. Perforated shear wall height, h , shall not exceed 20 feet (6096 mm).

2305.3.8.2.2 Perforated shear wall resistance. The resistance of a perforated shear wall shall be calculated in accordance with the following:

1. The percentage of full-height sheathing shall be calculated as the sum of the widths of perforated shear wall segments divided by the total width of the perforated shear wall, including openings.
2. The maximum opening height shall be taken as the maximum opening clear height. Where areas above and below an opening remain unsheathed, the height of the opening shall be defined as the height of the wall.
3. The unadjusted shear resistance shall be the allowable shear set forth in Table 2306.4.1 for height-to-width ratios of perforated shear wall segments that do not exceed 2:1 for seismic forces and 3 1/2:1 for other than seismic forces. For seismic forces, where the height-to-width ratio of any perforated shear wall segment used in the calculation of the sum of the widths of perforated shear wall segments, $\sum L_i$, is greater than 2:1 but does not exceed 3 1/2:1, the unadjusted shear resistance shall be multiplied by $2 w/h$.
4. The adjusted shear resistance shall be calculated by multiplying the unadjusted shear resistance by the shear resistance adjustment factors of Table 2305.3.8.2. For intermediate percentages of full-height sheathing, the values in Table 2305.3.8.2 are permitted to be interpolated.
5. The perforated shear wall resistance shall be equal to the adjusted shear resistance times the sum of the widths of the perforated shear wall segments.

2305.3.8.2.3 Anchorage and load path. Design of perforated shear wall anchorage and load path shall conform to the requirements of Sections 2305.3.8.2.4 through 2305.3.8.2.8, or shall be calculated using principles of mechanics. Except as modified by these sections, wall framing, sheathing, sheathing attachment and fastener schedules shall conform to the requirements of Section 2305.2.4 and Table 2306.4.1.

2305.3.8.2.4 Uplift anchorage at perforated shear wall ends. Anchorage for uplift forces due to overturning shall be provided at each end of the perforated shear wall. The uplift anchorage shall conform to the requirements of Section 2305.3.7, except that for each story the minimum tension chord uplift force, T , shall be calculated in accordance with the following:

(Equation 23-3)

**TABLE 2305.3.8.2
SHEAR RESISTANCE ADJUSTMENT FACTOR, C_o
WALL HEIGHT, H**

**FIGURE 2305.3.5
GENERAL DEFINITION OF SHEAR WALL HEIGHT, WIDTH AND HEIGHT-TO-WIDTH RATIO**

2305.3.8.2.5 Anchorage for in-plane shear. The unit shear force, v , transmitted into the top of a perforated shear wall, out of the base of the perforated shear wall at full height sheathing and into collectors connecting shear wall segments shall be calculated in accordance with the following:

(Equation 23-4)

2305.3.8.2.6 Uplift anchorage between perforated shear wall ends. In addition to the requirements of Section 2305.3.8.2.4, perforated shear wall bottom plates at full height sheathing shall be anchored for a uniform uplift force, t , equal to the unit shear force, v , determined in Section 2305.3.8.2.5.

2305.3.8.2.7 Compression chords. Each end of each perforated shear wall segment shall be designed for a compression chord force, C , equal to the tension chord uplift force, T , calculated in Section 2305.3.8.2.4.

2305.3.8.2.8 Load path. Load path. A load path to the foundation shall be provided for each uplift force, T and t , for each shear force, V and v , and for each compression chord force, C . Elements resisting shearwall forces contributed by multiple stories shall be designed for the sum of forces contributed by each story.

2305.3.8.2.9 Deflection of shear walls with openings. The controlling deflection of a blocked shearwall with openings uniformly fastened throughout shall be taken as the maximum individual deflection of the shear wall segments calculated in accordance with Section 2305.3.2, divided by the appropriate shear resistance adjustment factors of Table 2305.3.8.2.

2305.3.9 Summing shear capacities. The shear values for shear panels of different capacities applied to the same side of the wall are not cumulative except as allowed in Table 2306.4.1.

The shear values for material of the same type and capacity applied to both faces of the same wall are cumulative. Where the material capacities are not equal, the allowable shear shall be either two times the smaller shear capacity or the capacity of the stronger side, whichever is greater.

Summing shear capacities of dissimilar materials applied to opposite faces or to the same wall line is not allowed.

Exception: For wind design, the allowable shear capacity of shear wall segments sheathed with a combination of wood structural panels and gypsum wallboard on opposite faces, fiberboard structural sheathing and gypsum wallboard on opposite faces or hardboard panel siding and gypsum wallboard on opposite faces shall equal the sum of the sheathing capacities of each face separately.

2305.3.10 Adhesives. Adhesive attachment of shear wall sheathing is not permitted as a substitute for mechanical fasteners, and shall not be used in shear wall strength calculations alone, or in combination with mechanical fasteners in Seismic Design Category D, E or F.

2305.3.11 Sill plate size and anchorage in Seismic Design Category D, E or F. Anchor bolts for shear walls shall include steel plate washers, a minimum of 0.229 inch by 3 inches by 3 inches (5.82 mm by 76 mm by 76 mm) in size, between the sill plate and nut. The hole in the plate washer is permitted to be diagonally slotted with a width of up to 3/16 inch (4.76 mm) larger than the bolt diameter and a slot length not to exceed 13/4 inches (44 mm), provided a standard cut washer is placed between the plate washer and the nut. Sill plates resisting a design load greater than 490 plf (7154 N/m) using load and resistance factor design or 350 plf (5110 N/m) using allowable stress design shall not be less than a 3-inch (76 mm) nominal member. Where a single 3-inch (76 mm) nominal sill plate is used, 2-20d box end nails shall be substituted for 2-16d common end nails found in line 8 of Table 2304.9.1.

Exception: In shear walls where the design load is greater than 490 plf (7154 N/m) but less than 840 plf (12264 N/m) using load and resistance factor design or greater than 350 plf (5110 N/m) but less than 600 plf (8760 N/m) using allowable stress design, the sill plate is permitted to be a 2-inch (51 mm) nominal member if the sill plate is anchored by two times the number of bolts required by design and 0.229-inch by 3-inch by 3-inch (5.82mm by 76mm by 76mm) plate washers are used.

1613.6.1 Assumption of flexible diaphragm. Add the following text at the end of Section 12.3.1.1 of ASCE 7: Diaphragms constructed of wood structural panels or untopped steel decking shall also be permitted to be idealized as flexible, provided all of the following conditions are met:

1. Toppings of concrete or similar materials are not placed over wood structural panel diaphragms except for nonstructural toppings no greater than 1 1/2 inches (38 mm) thick.
2. Each line of vertical elements of the lateral-force-resisting system complies with the allowable story drift of Table 12.12-1.
3. Vertical elements of the lateral-force-resisting system are light-framed walls sheathed with wood structural panels rated for shear resistance or steel sheets.
4. Portions of wood structural panel diaphragms that cantilever beyond the vertical elements of the lateral-force-resisting system are designed in accordance with Section 2305.2.5 4.2.5.2 of AF & PA SDPWS the International Building Code.

TABLE 2306.4.5
ALLOWABLE SHEAR FOR WIND OR SEISMIC FORCES FOR SHEAR WALLS OF LATH
AND PLASTER OR GYPSUM BOARD WOOD FRAMED WALL ASSEMBLIES
(No change to table entries)

- a. These shear walls shall not be used to resist loads imposed by masonry or concrete construction (see Section 2305.1.5) walls (see Section 4.1.5 of AF & PA SDPWS). Values shown are for short-term loading due to wind or seismic loading. Walls resisting seismic loads shall be subject to the limitations in Section 12.2.1 of ASCE 7. Values shown shall be reduced 25 percent for normal loading.
- b. through k. (No change to current text)

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

Reason: Revision of Section 2305: Provisions being deleted from Section 2305 of the IBC are contained in *ANSI/AF&PA NDS Supplement “Special Design Provisions for Wind and Seismic” (SDPWS)* which is currently adopted by reference. These provisions are primarily for the building designer and duplication of the provisions not only is unnecessary, but duplication causes confusion. It is proper that all the design provisions be contained in a single document. Provisions of IBC-2006 Section 2305 are covered in the SDPWS-05 as shown in the following Table 2305.

Table 2305. Comparison of IBC-2006 Section 2305 and SDPWS-05

IBC-2006	SDPWS-05	Comment
2305.1.1	4.1.2	Same
2305.1.2	4.1.4	Same
2305.1.2.1	3.1.1, 4.2.7, 4.3.7	Same
2305.1.3	4.3.5	This sentence is retained because a specific requirement to detail on plans the reinforcing of holes in shear panels is not included in SDPWS. Requirements for force transfer for shear walls with openings are covered in SDPWS 4.3.5 and SDPWS includes general criteria by reference to NDS for ASD and LRFD which addresses effect of net section on design.
2305.1.4	4.1.7	Same
2305.1.5	4.1.5	Same
2305.1.6	4.1.6	Same
2305.2.1	4.2.1	Same
2305.2.2	4.2.2	Same in substance, however, SDPWS does not address deflection calculations for stapled diaphragms. Therefore, the diaphragm deflection equation and staple slip values are being retained. For nailed diaphragms, the SDPWS Simplified deflection equation has the same basis as Eq. 23-1. Use of Eq. 23-1 is permitted as an alternative and necessary equation inputs are provided in SDPWS Commentary. Stiffness properties for diaphragm construction other than wood structural panel are given in SDPWS for purposes of complying with drift and diaphragm flexibility requirements specified elsewhere in the building code.
2305.2.3	4.2.4	Same
Table 2305.2.3	Table 4.2.4	Same
2305.2.4	4.2.7	Same
2305.2.4.1	4.2.7.1	Same except attachment of sheathing directly to framing is generally required in SDPWS and not a special detail for SDC F. Expanded criteria are provided in SDPWS for wood structural panel over lumber decking.
2305.2.5	4.2.5	Same
2305.3.1	4.3.1	Same
2305.3.2	4.3.1, 4.3.2	Same in substance, however, SDPWS does not address deflection calculations for stapled shear walls. Therefore, the shear wall deflection equation and staple slip values are being retained. The SDPWS simplified deflection equation has the same basis as Eq. 23-2. Use of Eq. 23-2 is permitted as an alternative and necessary equation inputs are provided in SDPWS Commentary. Stiffness properties for shear wall construction other than wood structural panel are given in SDPWS for purposes of complying with drift and stiffness compatibility requirements specified elsewhere in the building code.
2305.3.3	4.3.7	Same
2305.3.4	4.3.4, 4.3.5	Same
Table 2305.3.4	Table 4.3.4	Same
2305.3.5	2.3	Same
2305.3.5.1	2.3	Same
2305.3.5.2	4.3.5.2	Same
2305.3.6	2.3	Same
2305.3.6.1	2.3	Same
2305.3.6.2	4.3.5.2	Same
2305.3.7	4.3.6.4.2	Same in substance except SDPWS language is applicable to designs in accordance with both ASD and LRFD methods.
2305.3.8	4.3.5	Same
2305.3.8.1	4.3.5.2	Same
2305.3.8.2	4.3.5.3	Same
2305.3.8.2.1	4.3.5.3	Same in substance except SDPWS language is applicable to designs in accordance with both ASD and LRFD methods. SDPWS language clarifies perforated shear wall sheathing limitations for one-sided and two-sided walls and for walls resisting wind and seismic.
2305.3.8.2.2	4.3.3.4, 4.3.4.1	Same
2305.3.8.2.3	4.3.6	Same
2305.3.8.2.4	4.3.6.1.2	Same
Table 2305.3.8.2	Table 4.3.2.1	Same
Figure 2305.3.5	Figure C4.3.5.1 and C4.3.5.2	Same
2305.3.8.2.5	4.3.6.4.1.1	Same
2305.3.8.2.6	4.3.6.4.2.1	Same
2305.3.8.2.7	4.3.6.1.2	Same
2305.3.8.2.8	4.3.6.4.4	Same
2305.3.8.2.9	4.3.2.1	Same in substance except SDPWS clarifies calculation method for perforated shear wall deflection.
2305.3.9	4.3.3.2,	Same in substance except SDPWS clarifies criteria for both ASD and LRFD methods. SDPWS also clarifies criteria for combination of materials on opposite sides of a two-sided wall for seismic. Currently, IBC states that they should not be summed.

2305.3.10	4.3.6.3.1	SDPWS limits use of adhesive shear wall systems to SDC A, B, and C and specifies R=1.5. In IBC, a reduced R is not specified for a system with adhesive.
2305.3.11	4.3.6.4.3	Same intent which is to minimize sill plate or bottom plate splitting; however, SDPWS specifies a minimum 2-1/2" square by 1/4" washer for anchor bolts in all seismic design categories. To account for different bottom plate width and potential for cross-grain bending, SDPWS also requires the plate washer to extend to within 1/2" of the sheathed edge of the bottom plate. For SDC D, E and F only, IBC specifies 3x nominal sill plate with 3" square x 0.229" unless twice the number of anchor bolts are used. Where twice the number of anchor bolts are used, a 2x nominal sill plate is permitted provided the ASD design load is less than 600 plf.

Revision of Section 1613.6.1: The reference to Section 2305.2.5 of the IBC is replaced by reference to Section 4.2.5.2 of SDPWS containing the same limitations for cantilever diaphragms.

Revision of Table 2306.4.5 footnote a: The reference to Section 2305.1.5 of the IBC is replaced by reference to Section 4.1.5 of SDPWS containing the same limitations for wood members and systems resisting seismic forces contributed by masonry and concrete walls. The word "construction" is changed to "walls" to match language in both IBC and SDPWS.

Cost Impact: The cost change proposal will not increase the cost of construction. Provisions being deleted from Section 2305 of the IBC are contained in ANSI/AF&PA NDS Supplement "Special Design Provisions for Wind and Seismic" (SDPWS) which is currently adopted by reference.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

SECTION 2305 GENERAL DESIGN REQUIREMENTS FOR LATERAL-FORCE-RESISTING SYSTEMS

2305.1 General. Structures using wood shear walls and diaphragms to resist wind, seismic and other lateral loads shall be designed and constructed in accordance with AF&PA SDPWS and the provisions of Section 2305, 2306, and 2307.

2305.1.1 Openings in shear panels. Openings in shear panels that materially affect their strength shall be fully detailed on the plans, and shall have their edges adequately reinforced to transfer all shearing stresses.

2305.2 Diaphragm deflection. The deflection (Δ) of a blocked wood structural panel diaphragm uniformly fastened throughout with staples is permitted to be calculated by using the following equation. If not uniformly fastened, the constant 0.188 (For SI: 1/1627) in the third term ~~must~~ shall be modified accordingly.

$$\Delta = \frac{5vL^3}{8EAb} + \frac{vL}{4Gt} + 0.188Le_n + \frac{\Sigma(\Delta_c X)}{2b} \quad \text{(Equation 23-1)}$$

$$\Delta = \frac{.052vL^3}{EAb} + \frac{vL}{4Gt} + \frac{Le_n}{1627} + \frac{\Sigma(\Delta_c X)}{2b} \quad \text{(Equation 23-2)}$$

For SI:

Where:

- A = Area of chord cross section, in square inches (mm²).
- b = Diaphragm width, in feet (mm).
- E = Elastic modulus of chords, in pounds per square inch (N/mm²).
- e_n = Staple deformation, in inches (mm) [see Table ~~2305.2.2(1)~~ 2305.2(1)].
- Gt = Panel rigidity through the thickness, in pounds per inch (N/mm) of panel width or depth [see Table ~~2305.2.2(2)~~ 2305.2(2)].
- L = Diaphragm length, in feet (mm).
- v = Maximum shear due to design loads in the direction under consideration, in pounds per linear foot (plf) (N/mm).
- Δ = The calculated deflection, in inches (mm).
- $\Sigma(\Delta_c X)$ = Sum of individual chord-splice slip values on both sides of the diaphragm, each multiplied by its distance to the nearest support.

TABLE 2305.2(1)
e_n VALUES (inches) FOR USE IN CALCULATING DIAPHRAGM AND SHEAR WALL DEFLECTION
DUE TO FASTENER SLIP (Structural I)^{ac}

LOAD PER FASTENER ^b (pounds)	FASTENER DESIGNATIONS
	14-Ga staple x 2 inches long
60	0.011
80	0.018
100	0.028
120	0.04
140	0.053
160	0.068
180	-
200	-
220	-
240	-

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 pound = 4.448 N.

- a. Increase e_n values 20 percent for plywood grades other than Structural I.
- b. Load per fastener = maximum shear per foot divided by the number of fasteners per foot at interior panel edges.
- c. Decrease e_n values 50 percent for seasoned lumber (moisture content < 19 percent).

TABLE 2305.2(2)

VALUES OF Gt FOR USE IN CALCULATING DEFLECTION OF WOOD STRUCTURAL PANEL SHEAR WALLS AND DIAPHRAGMS
 (No change to table contents)

2305.3 Shear wall deflection. The deflection (Δ) of a blocked wood structural panel shear wall uniformly fastened throughout with staples is permitted to be calculated by the use of the following equation:

$$\Delta = \frac{8vh^3}{EAb} + \frac{vh}{Gt} + 0.75he_n + d_a \frac{h}{b} \quad \text{(Equation 23-2)}$$

$$\Delta = \frac{vh^3}{3EAb} + \frac{vh}{Gt} + \frac{he_n}{407.6} + d_a \frac{h}{b}$$

For SI:

Where:

- A = Area of boundary element cross section in square inches (mm²) (vertical member at shear wall boundary).
- b = Wall width, in feet (mm).
- d_a = Vertical elongation of overturning anchorage (including fastener slip, device elongation, anchor rod elongation, etc.) at the design shear load (v).
- E = Elastic modulus of boundary element (vertical member at shear wall boundary), in pounds per square inch (N/mm²).
- e_n = Staple deformation, in inches (mm) [see Table ~~2305.2.2(1)~~ 2305.2(1)].
- Gt = Panel rigidity through the thickness, in pounds per inch (N/mm) of panel width or depth [see Table ~~2305.2.2(2)~~ 2305.2(2)].
- h = Wall height, in feet (mm).
- v = Maximum shear due to design loads at the top of the wall, in pounds per linear foot (N/mm).
- Δ = The calculated deflection, in inches (mm).

1613.6.1 Assumption of flexible diaphragm. Add the following text at the end of Section 12.3.1.1 of ASCE 7: Diaphragms constructed of wood structural panels or untopped steel decking shall also be permitted to be idealized as flexible, provided all of the following conditions are met:

1. Toppings of concrete or similar materials are not placed over wood structural panel diaphragms except for nonstructural toppings no greater than 1 1/2 inches (38 mm) thick.
2. Each line of vertical elements of the lateral-force-resisting system complies with the allowable story drift of Table 12.12-1.
3. Vertical elements of the lateral-force-resisting system are light-framed walls sheathed with wood structural panels rated for shear resistance or steel sheets.
4. Portions of wood structural panel diaphragms that cantilever beyond the vertical elements of the lateral-force-resisting system are designed in accordance with Section 4.2.5.2 of AF & PA SDPWS.

TABLE 2306.4.5
ALLOWABLE SHEAR FOR WIND OR SEISMIC FORCES FOR SHEAR WALLS OF LATH AND PLASTER OR GYPSUM BOARD WOOD FRAMED WALL ASSEMBLIES

(No change to table contents)

- a. These shear walls shall not be used to resist loads imposed by masonry or concrete walls (see Section 4.1.5 of AF & PA SDPWS). Values shown are for short-term loading due to wind or seismic loading. Walls resisting seismic loads shall be subject to the limitations in Section 12.2.1 of ASCE 7. Values shown shall be reduced 25 percent for normal loading.

b. through k. (No change to current text)

Committee Reason: This proposal substitutes a referenced standard for the provisions of Section 2305. The modification helps achieve the intent of the code change to retain IBC provisions pertaining to staple fasteners.

Assembly Action:

None

Final Hearing Results

AM

Code Change No: S83-06/07

Original Proposal

Section: 2306

Proponent: Jeffrey B. Stone, American Forest & Paper Association

Revise as follows:

**SECTION 2306
ALLOWABLE STRESS DESIGN**

2306.1 Allowable stress design. The structural analysis and construction of wood elements in structures using allowable stress design shall be in accordance with the following applicable standards:

American Forest & Paper Association.

NDS National Design Specification for Wood Construction
SDPWS Special Design Provisions for Wind and Seismic

American Institute of Timber Construction.

AITC 104 Typical Construction Details
AITC 110 Standard Appearance Grades for Structural Glued Laminated Timber
AITC 113 Standard for Dimensions of Structural Glued Laminated Timber
AITC 117 Standard Specifications for Structural Glued Laminated Timber of Softwood Species
AITC 119 Structural Standard Specifications for Glued Laminated Timber of Hardwood Species
AITC A190.1 Structural Glued Laminated Timber
AITC 200 Inspection Manual

American Society of Agricultural Engineers.

ASAE EP 484.2 Diaphragm Design of Metal -Clad, Post-Frame Rectangular Buildings
ASAE EP 486.1 Shallow Post Foundation Design
ASAE 559 Design Requirements and Bending Properties for Mechanically Laminated Columns

APA—The Engineered Wood Association.

Panel Design Specification
Plywood Design Specification Supplement 1 - Design & Fabrication of Plywood Curved Panel
Plywood Design Specification Supplement 2 - Design & Fabrication of Glued Plywood-Lumber Beams
Plywood Design Specification Supplement 3 - Design & Fabrication of Plywood Stressed-Skin Panels
Plywood Design Specification Supplement 4 - Design & Fabrication of Plywood Sandwich Panels
Plywood Design Specification Supplement 5 - Design & Fabrication of All-Plywood Beams
EWS T300 Glulam Connection Details

EWS R540 Builders Tips: Proper Storage and Handling of Glulam Beams

Truss Plate Institute, Inc.

TPI 1 National Design Standard for Metal Plate Connected Wood Truss Construction

2306.1.1 Joists and rafters. The design of rafter spans is permitted to be in accordance with the *AF&PA Span Tables for Joists and Rafters*.

2306.1.2 Plank and beam flooring. The design of plank and beam flooring is permitted to be in accordance with the *AF&PA Wood Construction Data No. 4*.

2306.1.3 Treated wood stress adjustments. The allowable unit stresses for preservative-treated wood need no adjustment for treatment, but are subject to other adjustments. The allowable unit stresses for fire-retardant-treated wood, including fastener values, shall be developed from an approved method of investigation that considers the effects of anticipated temperature and humidity to which the fire-retardant-treated wood will be subjected, the type of treatment and the redrying process. Other adjustments are applicable except that the impact load duration shall not apply.

2306.1.4 Lumber decking. The capacity of lumber decking arranged according to the patterns described in Section 2304.8.2 shall be the lesser of the capacities determined for flexure and deflection according to the formulas in Table 2306.1.4.

**TABLE 2306.1.4
ALLOWABLE LOADS FOR LUMBER DECKING**

No change to table contents

~~2306.2 Wind provisions for walls.~~

~~2306.2.1 Wall stud bending stress increase.~~ The AF&PA NDS fiber stress in bending (F_b) design values for sawn lumber wood studs resisting out of plane wind loads shall be increased by the factors in Table 2306.2.1, in lieu of the 1.15 repetitive member factor. These increases take into consideration the load sharing and composite actions provided by the wood structural panels as defined in Section 2302.1. The increases shall apply where the studs are designed for bending and are spaced no more than 16 inches (406 mm) o.c., covered on the inside with a minimum of 1/2-inch (12.7 mm) gypsum board fastened in accordance with Table 2306.4.5 and sheathed on the exterior with a minimum of 3/8-inch (9.5mm) wood structural panel sheathing. All panel joints shall occur over studs or blocking and shall be attached using a minimum of 8d common nails spaced a maximum of 6 inches o.c. (152 mm) at panel edges and 12 inches o.c. (305mm) at intermediate framing members.

**~~TABLE 2306.2.1
WALL STUD BENDING STRESS INCREASE FACTORS~~**

2306. 3 Wood diaphragms.

2306. 3.1 Wood structural panel diaphragms. Wood structural panel diaphragms shall be designed and constructed in accordance with AF&PA SDPWS. Wood structural panel diaphragms are permitted to resist horizontal forces using the allowable shear capacities set forth in Table 2306.3.1 or Table 2306.3.2. The allowable shear capacities in Table 2306.3.1 and Table 2306.3.2 are permitted to be increased 40 percent for wind design, calculated by principles of mechanics without limitations by using values for fastener strength in the AF&PA NDS, structural design properties for wood structural panels based on DOC PS-1 and DOC PS-2 or wood structural panel design properties given in the *APA Panel Design Specification (PDS)*.

**TABLE 2306.3.1
RECOMMENDED SHEAR FOR WOOD STRUCTURAL PANEL DIAPHRAGMS WITH FRAMING OF DOUGLAS FIR LARCH OR SOUTHERN PINE FOR WIND AND SEISMIC LOADING.**

(No change to table contents)

**TABLE 2306.3.2
ALLOWABLE SHEAR IN POUNDS PER SUQRE FOOT FOR HORIZONTAL BLOCKED DIAPHRAGMS UTILIZING MULTIPLE ROWS OF FASTENERS WITH FRAMING OF DOUGLAS FIR LARCH OR SOUTHERN PINE FOR WIND OR SEISMIC LOADING.**

(No change to table contents)

~~2306.3.2 Shear capacities modifications.~~ The allowable shear capacities in Tables 2306.3.1 and 2306.3.2 for horizontal wood structural panel diaphragms shall be increased 40 percent for wind design.

~~2306.3.3 Diagonally sheathed lumber diaphragms.~~ Diagonally sheathed lumber diaphragms shall be nailed in accordance with Table 2306.3.3.

TABLE 2306.3.3

DIAGONALLY SHEATHED LUMBER DIAPHRAGM NAILING SCHEDULE

~~2306.3.4 Single diagonally sheathed lumber diaphragms.~~ Single diagonally sheathed lumber diaphragms shall be designed and constructed in accordance with AF&PA SDPWS. Single diagonally sheathed lumber diaphragms shall be constructed of minimum 1-inch (25 mm) thick nominal sheathing boards laid at an angle of approximately 45 degrees (0.78 rad) to the supports. The shear capacity for single diagonally sheathed lumber diaphragms of southern pine or Douglas fir-larch shall not exceed 300 plf (4378N/m) of width. The shear capacities shall be adjusted by reduction factors of 0.82 for framing members of species with a specific gravity equal to or greater than 0.42 but less than 0.49 and 0.65 for species with a specific gravity of less than 0.42, as contained in the AF&PA NDS.

~~2306.3.4.1 End joints.~~ End joints in adjacent boards shall be separated by at least one stud or joist space and there shall be at least two boards between joints on the same support.

~~2306.3.4.2 Single diagonally sheathed lumber diaphragms.~~ Single diagonally sheathed lumber diaphragms made up of 2-inch (51 mm) nominal diagonal lumber sheathing fastened with 16d nails shall be designed with the same shear capacities as shear panels using 1-inch (25 mm) boards fastened with 8d nails, provided there are not splices in adjacent boards on the same support and the supports are not less than 4 inch (102mm) nominal depth or 3 inch (76 mm) nominal thickness.

~~2306.3.5 Double diagonally sheathed lumber diaphragms.~~ Double diagonally sheathed lumber diaphragms shall be designed and constructed in accordance with AF&PA SDPWS. Double diagonally sheathed lumber diaphragms shall be constructed of two layers of diagonal sheathing boards at 90 degrees (1.57 rad) to each other on the same face of the supporting members. Each chord shall be considered as a beam with uniform load per foot equal to 50 percent of the unit shear due to diaphragm action. The load shall be assumed as acting normal to the chord in the plan of the diaphragm in either direction. The span of the chord or portion thereof shall be the distance between framing members of the diaphragm, such as the joists, studs and blocking that serve to transfer the assumed load to the sheathing. The shear capacity of double diagonally sheathed diaphragms of Southern pine or Douglas fir-larch shall not exceed 600 plf (8756 kN/m) of width. The shear capacity shall be adjusted by reduction factors of 0.82 for framing members of species with a specific gravity equal to or greater than 0.42 but less than 0.49 and 0.65 for species with a specific gravity of less than 0.42, as contained in the AF&PA NDS. Nailing of diagonally sheathed lumber diaphragms shall be in accordance with Table 2306.3.3.

~~2306.3.6 Gypsum board diaphragm ceilings.~~ Gypsum board diaphragm ceilings shall be in accordance with Section 2508.5.

~~2306.4 Shear walls.~~ Panel sheathing joints in shear walls shall occur over studs or blocking. Adjacent panel sheathing joints shall occur over and be nailed to common framing members (see Section 2305.3.1 for limitations on shear wall bracing materials).

~~2306.4.1 Wood structural panel shear walls.~~ Wood structural panel shear walls shall be designed and constructed in accordance with AF&PA SDPWS. Wood structural panel shear walls are permitted to resist horizontal forces using The the allowable shear capacities set forth in for wood structural panel shear walls shall be in accordance with Table 2306.4.1. These Allowable capacities in Table 2306.4.1 are permitted to be increased 40 percent for wind design. Shear walls are permitted to be calculated by principles of mechanics without limitations by using values for nail strength given in the AF&PA NDS and wood structural panel design properties given in the *APA Panel Design Specification*.

TABLE 2306.4.1

ALLOWABLE SHEAR (POUNDS PER FOOT) FOR WOOD STRUCTURAL PANEL SHEAR WALLS WITH FRAMING OF DOUGLAS FIR-LARCH OR SOUTHERN PINE FOR WIND OR SEISMIC LOADING

(No change to table contents)

~~2306.4.2 Lumber sheathed shear walls.~~ Single and double diagonally sheathed lumber diaphragms shear walls shall be designed and constructed in accordance with AF&PA SDPWS. are permitted using the construction and allowable load provisions of Sections 2306.3.4 and 2306.3.5. Single and double diagonally sheathed lumber walls shall not be used to resist seismic loads in structures in Seismic Design Category E or F.

2306.4.3 Particleboard shear walls. ~~Particleboard shear walls shall be designed and constructed in accordance with AF&PA SDPWS. Particleboard shear walls shall be permitted to resist horizontal forces using The design the allowable shear capacity of capacities particleboard shear walls shall be in accordance with set forth in Table 2306.4.3. Allowable capacities in Table 2306.4.3 are permitted to be increased 40 percent for wind design. Shear panels shall be constructed with particleboard sheets not less than 4 feet by 8 feet (1219 mm by 2438 mm), except at boundaries and changes in framing. Particleboard panels shall be designed to resist shear only, and chords, collector members and boundary elements shall be connected at all corners. Panel edges shall be backed with 2-inch (51 mm) nominal or wider framing. Sheets are permitted to be installed either horizontally or vertically. For 3/8-inch (9.5 mm) particleboard sheets installed with the long dimension parallel to the studs spaced 24 inches (610 mm) o.c., nails shall be spaced at 6 inches (152 mm) o.c. along intermediate framing members. For all other conditions, nails of the same size shall be spaced at 12 inches (305mm)o.c. along intermediate framing members. Particleboard panels less than 12 inches (305 mm) wide shall be blocked. Particleboard shall not be used to resist seismic forces in structures in Seismic Design Category D, E or F.~~

TABLE 2306.4.3
ALLOWABLE SHEAR FOR PARTICLEBOARD SHEAR WALL SHEATHING
 (No change to table contents)

2306.4.4 Fiberboard shear walls. ~~Fiberboard shear walls shall be designed and constructed in accordance with AF&PA SDPWS. Fiberboard shear walls are permitted to resist horizontal forces using The design the allowable shear capacity of capacities fiberboard shear walls shall be in accordance with set forth in Table 2306.4.4. Allowable capacities in Table 2306.4.4 are permitted to be increased 40 percent for wind design. The fiberboard sheathing shall be applied vertically or horizontally to wood studs not less than 2 inch (51 mm) in nominal thickness spaced 16 inches (406 mm) o.c. Blocking not less than 2 inch (51 mm) nominal in thickness shall be provided at horizontal joints. Fiberboard shall not be used to resist seismic forces in structures in Seismic Design Category D, E or F.~~

TABLE 2306.4.4
ALLOWABLE SHEAR VALUES (plf) FOR WIND OR SEISMIC LOADING ON VERTICAL DIAPHRAGMS OF FIBERBOARD SHEATHING BOARD CONSTRUCTION FOR TYPE V CONSTRUCTION ONLY
 (No change to table contents)

2306.4.5 Shear walls sheathed with other materials. ~~Shear walls sheathed with portland cement plaster, gypsum lath, gypsum sheathing, or gypsum board shall be designed and constructed in accordance with AF&PA SDPWS. Shear walls sheathed with these materials are permitted to resist horizontal forces using the allowable Shear shear capacities for walls sheathed with lath, plaster or gypsum board shall be in accordance with set forth in Table 2306.4.5. Shear walls sheathed with lath, plaster or gypsum board shall be constructed in accordance with Chapter 25 and Section 2306.4.5.1. Walls resisting seismic loads shall be subject to the limitations in Section 12.2.1 of ASCE 7. Shear walls sheathed with portland cement plaster, gypsum lath, gypsum sheathing, or gypsum board shall not be used to resist seismic loads in structures in Seismic Design Category E or F.~~

TABLE 2306.4.5
ALLOWABLE SHEAR FOR WIND OR SEISMIC FORCES FOR SHEAR WALLS OF LATH AND PLASTER OR GYPSUM BOARD WOOD FRAMED WALL ASSEMBLIES
 (No change to table contents)

2306.4.5.1 Application of gypsum board or lath and plaster to wood framing.

2306.4.5.1.1 Joint staggering. ~~End joints of adjacent courses of gypsum board shall not occur over the same stud.~~

2306.4.5.1.2 Blocking. ~~Where required in Table 2306.4.5, wood blocking having the same cross-sectional dimensions as the studs shall be provided at joints that are perpendicular to the studs.~~

2306.4.5.1.3 Fastening. ~~Studs, top and bottom plates and blocking shall be fastened in accordance with Table 2304.9.1.~~

2306.4.5.1.4 Fasteners. ~~The size and spacing of fasteners shall be set forth in Table 2306.4.5. Fasteners shall be spaced not less than 3/8 inch (9.5 mm) from edges and ends of gypsum boards or sides of studs, blocking and top and bottom plates.~~

2306.4.5.1.5 Gypsum lath. ~~Gypsum lath shall be applied perpendicular to the studs. Maximum allowable shear values shall be as set forth in Table 2306.4.5.~~

~~**2306.4.5.1.6 Gypsum sheathing.** Four foot wide (1219 mm) pieces of gypsum sheathing shall be applied parallel or perpendicular to studs. Two-foot wide (610 mm) pieces of gypsum sheathing shall be applied perpendicular to the studs. Maximum allowable shear values shall be as set forth in Table 2306.4.5.~~

~~**2306.4.5.1.7 Other gypsum boards.** Gypsum board shall be applied parallel or perpendicular to studs. Maximum allowable shear values shall be as set forth in Table 2306.4.5.~~

Reason: Provisions being deleted from Section 2306 of the IBC are also contained in the AF&PA *Special Design Provisions for Wind and Seismic* (AF&PA SDPWS) which is currently adopted by reference. Deleted provisions are primarily for the building designer and duplication of the provisions is not necessary and causes confusion. However; this proposed change retains tabulated values of ASD unit shear capacity for shear walls and diaphragms as the building code has been the primary source of this information for many years. ASD unit shear capacities for shear walls and diaphragms can also be obtained directly from the SDPWS-05. Over time, it is desired that all the design provisions, including tabulated ASD unit shear capacities, be obtained by reference to the SDPWS. Provisions of the IBC Section 2306 are covered in SDPWS-05 as shown in Table 2306.

Table 2306. Comparison of IBC Section 2306 and SDPWS-05

IBC Section 2306	SDPWS-05	Comment
2306.2.1	3.1.1.1	Same
Table 2306.2.1	Table 3.1.1.1	Same
2306.3.1	4.1.2	Same
2306.3.2	Table 4.2A-C	Same except increase for wind is incorporated in SDPWS design value tables.
2306.3.3	4.2.7.2, 4.2.7.3	Same
2306.3.4	4.2.7.2	Same except 40% increase is recognized for wind design consistent with SDPWS.
2306.3.4.1	4.2.7.2	Same
2306.3.4.2	4.2.7.2	Same
2306.3.5	4.2.7.3	Same except 40% increase is recognized for wind design consistent with SDPWS.
2306.4	4.3.7	Same

2306.4.5.1.6	4.3.7.4.2	Same
2306.4.5.1.7	4.3.7.4	Same

With removal of duplicate information, it is suggested that remaining sections be numbered as follows:

SECTION 2306

ALLOWABLE STRESS DESIGN

2306.1 Allowable stress design.

2306.1.1 Joists and rafters.

2306.1.2 Plank and beam flooring.

2306.1.3 Treated wood stress adjustments.

2306.1.4 Lumber decking.

2306.2 Wood diaphragms.

2306.2.1 Wood structural panel diaphragms.

2306.2.2 Single diagonally sheathed lumber diaphragms.

2306.2.3 Double diagonally sheathed lumber diaphragms.

2306.2.4 Gypsum board diaphragm ceilings.

2306.3 Shear walls.

2306.3.1 Wood structural panel shear walls.

2306.3.2 Lumber sheathed shear walls.

2306.3.3 Particleboard shear walls.

2306.3.4 Fiberboard shear walls.

2306.3.5 Shear walls sheathed with other materials.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: Relying on a referenced standard for the technical provisions for allowable stress design of wood is consistent with the action taken on S82-06/07.

Assembly Action:

None

Code Change No: **S90-06/07**

Original Proposal

Sections: 2305.3.11, 2308.6, 2308.12.8, 2308.12.9; IRC 403.1.6.1, R602.11.1

Proponent: Randall Shackelford, Simpson Strong-Tie Co.

PART I – IBC STRUCTURAL

Revise as follows:

2305.3.11 Sill plate size and anchorage in Seismic Design Category D, E or F. Shear wall sill plates shall be anchored with a Anchor bolts for shear walls shall include with steel plate washers, between the sill plate and nut or with approved anchor straps load rated in accordance with section 1715.1 and spaced to provide equivalent anchorage. Steel plate washers shall be a minimum of 0.229 inch by 3 inches by 3 inches (5.82 mm by 76 mm by 76 mm) in size, between the sill plate and nut. The hole in the plate washer is permitted to be diagonally slotted with a width of up to 3/16 inch (4.76 mm) larger than the bolt diameter and a slot length not to exceed 13/4 inches (44 mm), provided a standard cut washer is placed between the plate washer and the nut. Sill plates resisting a design load greater than 490 plf (7154 N/m) using load and resistance factor design or 350 plf (5110 N/m) using allowable stress design shall not be less than a 3-inch (76 mm) nominal member. Where a single 3- inch (76 mm) nominal sill plate is used, 2- 20d box end nails shall be substituted for 2-16d common end nails found in line 8 of Table 2304.9.1.

Exception: In shear walls where the design load is greater than 490 plf (7151 N/m) but less than 840 plf (12 264 N/m) using load and resistance factor design or greater than 350 plf (5110 N/m) but less than 600 plf (8760 N/m) using allowable stress design, the sill plate is permitted to be a 2-inch (51 mm) nominal member if the sill plate is anchored by two times the number of bolts or anchor straps required by design and 0.229-inch by 3-inch by 3-inch (5.82mmby 76mmby 76mm) plate washers are used.

2308.6 Foundation plates or sills. Foundations and footings shall be as specified in Chapter 18. Foundation plates or sills resting on concrete or masonry foundations shall comply with Section 2304.3.1. Foundation plates or sills shall be bolted or anchored to the foundation with not less than 1/2-inch-diameter (12.7 mm) steel bolts or approved anchors spaced to provide equivalent anchorage as the steel bolts. Bolts shall be embedded at least 7 inches (178 mm) into concrete or masonry, and spaced not more than 6 feet (1829 mm) apart. There shall be a minimum of two bolts or anchor straps per piece with one bolt or anchor strap located not more than 12 inches (305 mm) or less than 4 inches (102 mm) from each end of each piece. A properly sized nut and washer shall be tightened on each bolt to the plate.

2308.12.8 Steel plate washers Sill plate anchorage. Sill plates shall be anchored with anchor bolts with steel plate washers shall be placed between the foundation sill plate and the nut, or approved anchor straps load rated in accordance with Section 1715.1. Such washers shall be a minimum of 0.229 inch by 3 inches by 3 inches (5.82 mm by 76 mm by 76 mm) in size. The hole in the plate washer is permitted to be diagonally slotted with a width of up to 3/16 inch (4.76 mm) larger than the bolt diameter and a slot length not to exceed 1 3/4 inches (44 mm), provided a standard cut washer is placed between the plate washer and the nut.

2308.12.9 Sill plate anchorage in Seismic Design Category E. Steel bolts with a minimum nominal diameter of 5/8 inch (15.9 mm) or approved foundation anchor straps load rated in accordance with Section 1715.1 and spaced to provide equivalent anchorage shall be used in Seismic Design Category E.

PART II – IRC**Revise as follows:**

R403.1.6.1 Foundation anchorage in Seismic Design Categories C, D₀, D₁ and D₂. In addition to the requirements of Section R403.1.6, the following requirements shall apply to wood light-frame structures in Seismic Design Categories D₀, D₁ and D₂ and wood light-frame townhouses in Seismic Design Category C.

1. Plate washers conforming to Section R602.11.1 shall be provided for all anchor bolts over the full length of required braced wall lines except where approved anchor straps are used. Properly sized cut washers shall be permitted for anchor bolts in wall lines not containing braced wall panels.
2. Interior braced wall plates shall have anchor bolts spaced at not more than 6 feet (1829 mm) on center and located within 12 inches (305 mm) of the ends of each plate section when supported on a continuous foundation.
3. Interior bearing wall sole plates shall have anchor bolts spaced at not more than 6 feet (1829 mm) on center and located within 12 inches (305 mm) of the ends of each plate section when supported on a continuous foundation.
4. The maximum anchor bolt spacing shall be 4 feet (1219 mm) for buildings over two stories in height.
5. Stepped cripple walls shall conform to Section R602.11.3.
6. Where continuous wood foundations in accordance with Section R404.2 are used, the force transfer shall have a capacity equal to or greater than the connections required by Section R602.11.1 or the braced wall panel shall be connected to the wood foundations in accordance with the braced wall panel-to-floor fastening requirements of Table R602.3(1).

R602.11.1 Wall anchorage. Braced wall line sills shall be anchored to concrete or masonry foundations in accordance with Sections R403.1.6 and R602.11. For all buildings in Seismic Design Categories D₀, D₁ and D₂ and townhouses in Seismic Design Category C, plate washers, a minimum of 0.229 inch by 3 inches by 3 inches (5.8mm by 76mm by 76 mm) in size, shall be installed between the foundation sill plate and the nut, except where approved anchor straps are used. The hole in the plate washer is permitted to be diagonally slotted with a width of up to 3/16 inch (5 mm) larger than the bolt diameter and a slot length not to exceed 1 3/4 inches (44 mm), provided a standard cut washer is placed between the plate washer and the nut.

Reason: (IBC) Revise the code to allow strap anchors in higher seismic regions, or clarify code that strap anchors are permitted in higher seismic regions, depending on how you look at it.

Recent cyclic testing of foundation anchor straps on long and short walls by Simpson Strong-Tie has shown that they perform very well under cyclic loading. This is partly because they wrap around the sill plate at the sheathing nailing location, thereby helping to prevent cross-grain bending of the sill plate. Since prevention of cross-grain bending is the primary reason for using plate washers, anchor straps can be substituted for anchor bolts with plate washers. However, most anchor straps are not a one-for-one substitution for anchor bolts, so it is necessary to add the wording "spaced as required to provide equivalent anchorage". For shear walls, the designer will determine the required spacing based on the tested allowable load of the strap anchor. For conventional construction, builders can refer to manufacturer's literature for equivalent spacing to anchor bolts.

(IRC) Some building officials have interpreted this section as prohibiting the use of anchor straps to anchor sill plates when the 3 by 3 washer is required. Recent cyclic testing of foundation anchor straps on long and short shear walls by Simpson Strong-Tie has shown that they perform very well under cyclic loading. This is partly because they wrap around the sill plate at the sheathing nailing location, thereby helping to prevent cross-grain bending of the sill plate. Since prevention of cross-grain bending is the primary reason for using plate washers, anchor straps can be substituted for anchor bolts with plate washers. Although it is true that most anchor straps are not a one-for-one substitution for anchor bolts, the IRC already contains the wording "spaced as required to provide equivalent anchorage to 1/2-inch diameter anchor bolts" in Section R403.1.6. Builders and building officials can refer to manufacturer's literature for equivalent spacing to anchor bolts. This change limits the permission to "anchor straps" because that is what has been tested.

Cost Impact: The code change proposal will not increase the cost of construction. It will allow additional options.

Public Hearing Results

Committee Action:**Approved as Modified****Modify proposal as follows:**

2305.3.11 Sill plate size and anchorage in Seismic Design Category D, E or F. Shear wall sill plates shall be anchored with anchor bolts with steel plate washers, between the sill plate and nut or with approved anchor straps load rated in accordance with section 1715.1 and spaced to provide equivalent anchorage. Steel plate washers shall be a minimum of 0.229 inch by 3 inches by 3 inches (5.82 mm by 76 mm by 76 mm) in size. The hole in the plate washer is permitted to be diagonally slotted with a width of up to 3/16 inch (4.76 mm) larger than the bolt diameter and a slot length not to exceed 1 3/4 inches (44 mm), provided a standard cut washer is placed between the plate washer and the nut. Sill plates resisting a design load greater than 490 plf (7154 N/m) using load and resistance factor design or 350 plf (5140 N/m) using allowable stress design shall not be less than a 3-inch (76 mm) nominal member. Where a single 3-inch (76 mm) nominal sill plate is used, 2-20d box end nails shall be substituted for 2-16d common end nails found in line 8 of Table 2304.9.1.

Exception: In shear walls where the design load is greater than 490 plf (7151 N/m) but less than 840 plf (12 264 N/m) using load and resistance factor design or greater than 350 plf (5110 N/m) but less than 600 plf (8760 N/m) using allowable stress design, the sill plate is permitted to be a 2-inch (51 mm) nominal member if the sill plate is anchored by two times the number of bolts or anchor straps required by design and 0.229-inch by 3-inch by 3-inch (5.82mm by 76mm by 76mm) plate washers are used.

2308.6 Foundation plates or sills. Foundations and footings shall be as specified in Chapter 18. Foundation plates or sills resting on concrete or masonry foundations shall comply with Section 2304.3.1. Foundation plates or sills shall be bolted or anchored to the foundation with not less than 1/2-inch-diameter (12.7 mm) steel bolts or approved anchors spaced to provide equivalent anchorage as the steel bolts. Bolts shall be embedded at least 7 inches (178 mm) into concrete or masonry, and spaced not more than 6 feet (1829 mm) apart. There shall be a minimum of two bolts or anchor straps per piece with one bolt or anchor strap located not more than 12 inches (305 mm) or less than 4 inches (102 mm) from each end of each piece. A properly sized nut and washer shall be tightened on each bolt to the plate.

2308.12.8 Sill plate anchorage. Sill plates shall be anchored with anchor bolts with steel plate washers between the foundation sill plate and the nut, or approved anchor straps load rated in accordance with Section 1715.1. Such washers shall be a minimum of 0.229 inch by 3 inches by 3 inches (5.82 mm by 76 mm by 76 mm) in size. The hole in the plate washer is permitted to be diagonally slotted with a width of up to 3/16 inch (4.76 mm) larger than the bolt diameter and a slot length not to exceed 1 3/4 inches (44 mm), provided a standard cut washer is placed between the plate washer and the nut.

2308.12.9 Sill plate anchorage in Seismic Design Category E. Steel bolts with a minimum nominal diameter of e inch (15.9 mm) or approved foundation anchor straps load rated in accordance with Section 1715.1 and spaced to provide equivalent anchorage shall be used in Seismic Design Category E.

Committee Reason: The code change allows the use of anchor straps as an alternative for foundation anchorage. The modification is for consistency with the action taken on S82-06/07.

Assembly Action: **None**

PART II — IRC

Committee Action: **Approved as Submitted**

Committee Reason: This change, allowing the use of anchor straps, provides a technique that adds versatility to the code.

Assembly Action: **None**

S90-06/07, Part II	AS

Code Change No: S95-06/07

Original Proposal

Table 2306.3.1, Table 2306.4.1

Proponent: Edwin T. Huston, Smith & Huston Inc., representing National Council of Structural Engineering Associations

Revise as follows:

**TABLE 2306.3.1
ALLOWABLE SHEAR (POUNDS PER FOOT) FOR WOOD STRUCTURAL PANEL DIAPHRAGMS WITH
FRAMING OF DOUGLAS-FIR-LARCH, OR SOUTHERN PINE ^a FOR WIND OR SEISMIC LOADING ^h**

- c. Framing at adjoining panel edges shall be 3 inches nominal or wider, and nails shall be staggered where ~~nails are spaced~~ panel edge nailing is specified at 2-inches o.c. or 2-1/2 inches o.c. or less.
- d. Framing at adjoining panel edges shall be 3 inches nominal or wider, and nails shall be staggered where both of the following conditions are met: (1) 10d nails having penetration into framing of more than 1-1/2 inches and (2) ~~nails are spaced~~ panel edge nailing is specified at 3 inches o.c. or less.

(Portions of table and footnotes not shown remain unchanged)

TABLE 2306.4.1
ALLOWABLE SHEAR (POUNDS PER FOOT) FOR WOOD STRUCTURAL PANEL SHEAR WALLS WITH
FRAMING OF DOUGLAS-FIR-LARCH, OR SOUTHERN PINE ^a FOR WIND OR SEISMIC LOADING ^{b, h, i, j, l}

- e. Framing at adjoining panel edges shall be 3 inches nominal or wider, and nails shall be staggered where ~~nails are spaced~~ panel edge nailing is specified at 2 inches on center or less.
- f. Framing at adjoining panel edges shall be 3 inches nominal or wider, and nails shall be staggered where both of the following conditions are met: (1) 10d (3" x 0.148") nails having penetration into framing of more than 1-1/2 inches and (2) ~~nails are spaced~~ panel edge nailing is specified at 3 inches on center or less.

(Portions of table and footnotes not shown remain unchanged)

Reason: Substitute revised material for current provision of the Code.

The purpose of the proposal is to establish technically sound language in the footnotes that require the staggering of nails based on their spacing. The allowable shear values in Tables 2306.3.1 and 2306.4.1 are based on specified spacing of panel edge nailing. The in-place spacing, however, can vary substantially. The requirements for staggering are intended to be based on the specified spacing from which allowable shear values are determined. The current language in the footnotes, however, implies that the requirements are based on the in-place spacing. The proposed revisions will establish that the requirements are based on the specified spacing.

The term "or less" is added to Footnotes (e) and (f) of Table 2306.4.1 for consistency with Footnote (d) of Table 2306.3.1. It is also done to eliminate the possibility of specifying, for example, panel edge nailing at 1.9 inches o.c. to avoid the requirements in Footnote (e) of Table 2306.4.1 for 3-inch nominal framing members and staggered nailing. Footnote (c) of Table 2306.3.1 is revised for a similar reason: eliminate the possibility of specifying panel edge nailing at 2.4 or 1.9 inches o.c. to avoid the requirements for 3-inch nominal framing members and staggered nailing.

Cost Impact: The code change proposal will not increase the cost of construction

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal was disapproved based on the approval of code change S83-06/07.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Edwin T. Huston, P.E., S.E., Smith & Huston, Inc., Consulting Engineers, representing National Council of Structural Engineering Associations, Code Advisory Committee, requests Approval as Submitted.

Commenter's Reason: At the Orlando hearings, disapproval of Proposal S95 was requested due to committee action on Proposals S82 and S83, which were for approval as amended and approval as submitted, respectively. Proposals S82 and S83, however, do not delete Tables 2306.3.1 and 2306.4.1. Consequently, the proposed revisions to Tables 2306.3.1 and 2306.4.1 in Proposal S95 remain valid.

Final Hearing Results

S95-06/07

AS

Code Change No: **S97-06/07**

Original Proposal

Table 2306.3.1, Table 2306.4.1, 2307.1.1

Proponent: Edwin T. Huston, Smith & Huston, Inc., representing National Council of Structural Engineering Associations

Revise as follows:

TABLE 2306.3.1

ALLOWABLE SHEAR (POUNDS PER FOOT) FOR WOOD STRUCTURAL PANEL DIAPHRAGMS WITH FRAMING OF DOUGLAS-FIR-LARCH, OR SOUTHERN PINE^a FOR WIND OR SEISMIC LOADING^h

- c. Framing at adjoining panel edges shall be 3 inches nominal or wider, and nails at all panel edges shall be staggered where nails are spaced 2 inches o.c. or 2-1/2 inches o.c.
- d. Framing at adjoining panel edges shall be 3 inches nominal or wider, and nails at all panel edges shall be staggered where both of the following conditions are met: (1) 10d nails having penetration into framing of more than 1-1/2 inches and (2) nails are spaced 3 inches o.c. or less.

(Portions of table and footnotes not shown remain unchanged)

TABLE 2306.4.1

ALLOWABLE SHEAR (POUNDS PER FOOT) FOR WOOD STRUCTURAL PANEL SHEAR WALLS WITH FRAMING OF DOUGLAS-FIR-LARCH, OR SOUTHERN PINE^a FOR WIND OR SEISMIC LOADING^{b, h, i, j, l}

- e. Framing at adjoining panel edges shall be 3 inches nominal or wider, and nails at all panel edges shall be staggered where nails are spaced 2 inches on center.
- f. Framing at adjoining panel edges shall be 3 inches nominal or wider, and nails at all panel edges shall be staggered where both of the following conditions are met: (1) 10d (3" x 0.148") nails having penetration into framing of more than 1-1/2 inches and (2) nails are spaced 3 inches on center.
- h. Where panels are applied on both faces of a wall and nail spacing is less than 6 inches o.c. on either side, panel joints shall be offset to fall on different framing members. Or framing shall be 3-inch nominal or thicker at adjoining panel edges and nails ~~on each side~~ at all panel edges shall be staggered.
- i. In Seismic Design Category D, E or F, where shear design values exceed 350 pounds per lineal foot, all framing members receiving edge nailing from abutting panels shall not be less than a single 3-inch nominal member, or two 2-inch nominal members fastened together in accordance with Section 2306.1 to transfer the design shear value between framing members. Wood structural panel joint and sill plate nailing shall be staggered ~~in all cases~~ at all panel edges. See Section 2305.3.11 for sill plate size and anchorage requirements.

(Portions of table and footnotes not shown remain unchanged)

2307.1.1 Wood structural panel shear walls. In Seismic Design Category D, E or F, where shear design values exceed 490 pounds per foot (7154 N/m), all framing members receiving edge nailing from abutting panels shall not be less than a single 3-inch (76 mm) nominal member or two 2-inch (51 mm) nominal members fastened together in accordance with AF&PA NDS to transfer the design shear value between framing members. Wood structural panel joint and sill plate nailing shall be staggered ~~in all cases~~ at all panel edges. See Section 2305.3.11 for sill plate size and anchorage requirements.

Reason: Substitute revised material for current provision of the code. There is confusion among designers, code officials and contractors concerning application of the requirement for staggering of nails at the panel edges of wood structural panel sheathing. The intent is to stagger the nails transversely and longitudinally along each panel edge at a recommended spacing of 3/8 to 1/2 inch, thus creating two lines of resistance along each panel edge. The confusion comes from the mistaken assumption that the staggering can occur transversely back and forth at the edges of abutting panels, rather than along each panel edge. The proposed revisions will clarify that the staggering of the nails is required at each panel edge.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Disapproved

Committee Reason: This proposal was disapproved based on the approval of code change S83-06/07.

Assembly Action:

None

Public Comments

Individual Consideration Agenda

This item is on the agenda for individual consideration because a public comment was submitted.

Public Comment:

Edwin T Huston, P.E., S.E., Smith & Huston, Inc., Consulting Engineers, representing National Council of Structural Engineering Associations, Code Advisory Committee, requests Approval as Submitted.

Commenter's Reason: At the Orlando hearings, disapproval of Proposal S97 was requested due to committee action on Proposals S82 and S83, which were for approval as amended and approval as submitted, respectively. Proposals S82 and S83, however, do not delete Tables 2306.3.1 and 2306.4.1 and Section 2307.1.1. Consequently, the proposed revisions to Tables 2306.3.1 and 2306.4.1 and Section 2307.1.1 in Proposal S97 remain valid.

Final Hearing Results

S97-06/07

AS

Code Change No: S98-06/07

Original Proposal

Table 2306.4.5

Proponent: Ben L. Schmid, Consulting Structural Engineer

Revise as follows:

**TABLE 2306.4.5
ALLOWABLE SHEAR FOR WIND OR SEISMIC FORCES FOR SHEAR WALLS OF LATH
AND PLASTER OR GYPSUM BOARD WOOD FRAMED WALL ASSEMBLIES**

TYPE OF MATERIAL	THICKNESS OF MATERIAL	WALL CONSTRUCTION	FASTENER SPACING ^b MAXIMUM (inches)	SHEAR VALUE ^{a, e} (plf)	MINIMUM FASTNER SIZE ^{c, d, j, k}
Gypsum lath, plain or perforated	3/8" lath and 1/2" plaster	Unblocked	5	400 <u>180</u>	No. 13 gage, 1 1/8" long, 19/64" head, plasterboard nail 16 Ga. Galv. Staple, 1 1/4" long 0.120" Nail, min 3/8" head, 1 1/4" long

(Portions of table not shown do not change)

Reason: The purpose of this proposal is to revise the outdated Shear Value for 3/8" gypsum lath and 1/2" plaster from 100 (plf) to 180 (plf).

All the sheathing material listed in Table 2306.4.5 with shear values for Seismic Force-Resisting Systems are contained in ASCE 7-05 Table 12.2.1 Bearing Wall Systems A.14-Light-framed walls with shear panels of all other materials, resulting with a Response Modification Coefficient, R of 2 (Limited Ductility).

CODE CHANGES RESOURCE COLLECTION – INTERNATIONAL BUILDING CODE

The current code shear value for 3/8" Gypsum lath and 1/2" plaster is greatly undervalued and has been for over 50 years. Comparison is made of 1/2" thick Gypsum board, unblocked, with nails at 4 inches on center with a shear value of 125 (plf), listed as Item 4 Table 2306.4.5 with Item 2: 7/8" thick Gypsum lath and plaster, with similar nails at 5 inches on center. In an 8 foot by 8 foot panel, there would be 180 nails in the 1/2" thick Gypsum board versus 260 similar nails in the 7/8" thick Gypsum lath and plaster.

Factoring 260 nails x 0.375" nail bearing x 0.875" gypsum thickness x 125 (plf) for 1/2" Gypsum
180 0.50" 0.50"

board results in 236 (plf) for 7/8" thick Gypsum lath and plaster.

As an accredited expert on wood frame structures, the Author has observed and reported on damage to such sheathed wood framed structures in the past 9 earthquakes in California. The 1971 San Francisco and 1994 Northridge Earthquakes provided comparison of damage to one and two story residences sheathed with stucco exterior walls and 1/2" Gypsum board versus 7/8" Gypsum lath and plaster on interior walls due to each earthquake. In each geographic area with equal Modified Mercalli (MMI) shaking of between 7 and 9 intensity, the 1/2" Gypsum board sheathed residences has extensive and severe damage as compared to 7/8" lath and plaster. Combined with the required Cornerite 2" x 2" expanded metal reinforcing at each intersecting wall and ceiling, each room becomes a box and supports its tributary lateral loading including walls, ceilings or floor joists and roof area due to the continuity furnished by 7/8" lath and plaster.

Immediately after the 1994 Northridge Earthquake, the City and County of Los Angeles funded cyclic load testing of plywood, stucco and Gypsum board sheathing at the Civil Engineering Laboratory at the University of California an Irvine. The tests verified that the Allowable Stress Design values should have been reduced 50 per cent per note 1 in Table 25-I in the 1994 UBC.

The Board of Directors of the Structural Engineers Association of Southern California authorized and funded cyclic testing, using the testing protocol developed for the sheathing testing at UC Irvine, for 7/8" Gypsum lath and plaster. The three 8 foot by 8 foot tested panels developed an average of 205 (plf). The testing was done at the Specialized Testing Laboratory, ICC-ES certified. Ben Schmid, S.E. and Ted Christensen, S.E. continuously observed the tests. The test allowed the conclusion that the existing Shear Value shown in Table 2306.4.5 is overly restrictive.

Data for cyclic tests and resulting Load/Deflection curves are submitted for 7/8" thick Gypsum lath and plaster, 1/2" and 5/8" Gypsum Board. Allowable Stress Design (ASD) values are developed from the curve data at effective Strength Limit State multiplied by 0.65 for Load and Resistance Factor Design (LRFD), then divided by 1.4 for ASD.

Bibliography:

1. Gypsum Board tests number 7 and 8 reported in Final Report of a Testing Program of Light-framed Walls with Wood Sheathed Shear Panels by the Structural Engineers Association of Southern California and Department of Civil and Environmental Engineering, University of California, Irvine, dated December, 2001. Research Award Number "FEMA-DR-1008-8011."

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Modified

Modify proposal as follows:

**TABLE 2306.4.5
ALLOWABLE SHEAR FOR WIND OR SEISMIC FORCES FOR SHEAR WALLS OF LATH AND PLASTER
OR GYPSUM BOARD WOOD FRAMED WALL ASSEMBLIES**

TYPE OF MATERIAL	THICKNESS OF MATERIAL	WALL CONSTRUCTION	FASTENER SPACING ^b MAXIMUM (inches)	SHEAR VALUE ^a , e (plf)	MINIMUM FASTENER SIZE ^{c,d,j,k}
2. Gypsum lath, plain or perforated with vertical joints staggered	d" lath and 1/2" plaster	Unblocked	5	180	No. 13 gage, 1c" long, 19/64" head, plasterboard nail 0.120" Nail, min d" head, 1 1/4" long
3. Gypsum lath, plain or perforated	d" lath and 1/2" plaster	Unblocked	5	100	16 Ga. Galv. Staple, 1 c" long 0.120" Nail, min d" head, 1 1/4" long

(Portions of table not shown remain unchanged)

Committee Reason: The proposal adds a valuable option for shear wall buildings. The proponent provided adequate testing and verification for increasing the allowable shear. The modification clarifies that the vertical joints must be staggered since that is what was tested in justifying the higher shear values. In addition the modification retains the current allowable shear values since these would still be permissible if joints are not staggered.

Assembly Action:

None

Final Hearing Results

S98-06/07

AM

Code Change No: S99-06/07

Original Proposal

Section: 2307.1

Proponent: Jeffrey B. Stone, American Forest & Paper Association

Revise as follows:

2307.1 Load and resistance factor design. The structural analysis and construction of wood elements and structures using load and resistance factor design shall be in accordance with AF&PA NDS and AF&PA SDPWS.

Reason: Adds reference to the AF&PA Special Design Provisions for Wind and Seismic (SDPWS) to Section 2307 pertaining to load and resistance factor design (LRFD) for wood elements and structures. The AF&PA SDPWS is currently adopted by reference.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This change adds a cross-reference to the standard that was adopted for lateral design by S82-06/07.

Original Proposal

Sections: 2308.2; IRC R301.3

THIS PROPOSAL IS ON THE AGENDA OF THE IBC STRUCTURAL AND THE IRC BUILDING/ENERGY CODE DEVELOPMENT COMMITTEES. SEE THE TENTATIVE HEARING ORDERS FOR THESE COMMITTEES.

Proponent: Kirk Grundahl, Wood Truss Council of America, representing the Structural Building Components Industry

PART I – IBC

Revise as follows:

2308.2 Limitations. Buildings are permitted to be constructed in accordance with the provisions of conventional light-frame construction, subject to the following limitations, and to further limitations of Sections 2308.11 and 2308.12.

1. Buildings shall be limited to a maximum of three stories above grade plane. For the purposes of this section, for buildings in Seismic Design Category D or E as determined in Section 1613, cripple stud walls shall be considered to be a story.

Exception: Solid blocked cripple walls not exceeding 14 inches (356 mm) in height need not be considered a story.

2. Bearing wall ~~floor-to-floor heights~~ story height shall not exceed a stud height of 10 feet (3048 mm) plus a height of floor framing not to exceed 16 inches (406 mm). Floor framing height shall be permitted to exceed this limit provided the story height limit is not exceeded.

(No changes to items 3 through 7)

PART II – IRC

Revise as follows:

R301.3 Story height. Buildings constructed in accordance with these provisions shall be limited to story heights of not more than the following:

1. For wood wall framing, the laterally unsupported bearing wall stud height permitted by Table R602.3(5) plus a height of floor framing not to exceed 16 inches.

Exception: For wood framed wall buildings with bracing in accordance with Table R602.10.1, the wall stud clear height used to determine the maximum permitted story height may be increased to 12 feet without requiring an engineered design for the building wind and seismic force resisting systems provided that the length of bracing required by Table R602.10.1 is increased by multiplying by a factor of 1.20. Wall studs are still subject to the requirements of this section.

2. For steel wall framing, a stud height of 10 feet, plus a height of floor framing not to exceed 16 inches.
3. For masonry walls, a maximum bearing wall clear height of 12 feet plus a height of floor framing not to exceed 16 inches.

Exception: An additional 8 feet is permitted for gable end walls.

4. For insulating concrete form walls, the maximum bearing wall height per story as permitted by Section 611 tables plus a height of floor framing not to exceed 16 inches.

Individual walls or walls studs shall be permitted to exceed these limits as permitted by Chapter 6 provisions, provided story heights are not exceeded. Floor framing height shall be permitted to exceed these limits provided the story height limit is not exceeded An engineered design shall be provided for the wall or wall framing members when they exceed the limits of Chapter 6. Where the story height limits are exceeded, an engineered design shall be provided in accordance with the International Building Code for the overall wind and seismic force resisting systems.

Reason: (IBC) The purpose of this proposed code change is to clarify the code language regarding story height limitations and how stud height limitations and floor framing limitations are to be interpreted.

The current story height requirements were introduced in the 2003 code cycle into the IRC by BCCS (RB39-02). The final proposal was extensively modified from the original proposal which dealt only with the stud height issue. The committee reason for accepting RB39-02 as modified was given as follows:

Committee Reason: Based on proponent's published reason. This code change has been modified from that originally submitted to the ICC in order to coordinate with the material limits currently contained in (and, in the case of wood, currently being added to) the IRC. The exception to Item 1 has been added at the request of other interested parties to accommodate the high ceilings that are currently common in some parts of the country.

No technical supporting documentation was provided on the 16 inch limitation on floor framing. Our assumption is that the intent of the code modification was to arrive at a maximum story height by setting a maximum floor framing depth to be used with a maximum stud height. However, the way the current language has been interpreted, there becomes a limit of 16 inches on floor framing regardless of stud height. Both I-joist and floor truss depths can exceed a 16 inches. Unless technical justification can be provided otherwise, there is no reason to limit the depth of the floor framing if the story height is not exceeded.

The IRC 16 inch floor framing limitation was brought into the IBC Conventional Light-Frame Construction section in the 2006 code change cycle in S191 with the following reasoning and was accepted as submitted:

Reason: Table 2308.9.1 of the IBC contains the spacing requirement for 10 foot studs, and it is assumed that 10 foot studs can be used for walls in buildings built under the conventional construction provisions of Section 2308. However, the current wording of Section 2308.2 of the code limits the floor-to-floor height to 10 feet, which precludes the use of 10-foot studs in bearing walls. The proposed change will make the scope of the section consistent with the requirements contained therein and also limit floor-to-floor heights for conventional light-frame construction provisions. A similar limitation can be found in Section R301.3 of the International Residential Code.

As in the case of the IRC, the intention was to limit story height not to limit floor framing height. Chapter 5 defines story height as follows: HEIGHT, STORY. The vertical distance from top to top of two successive finished floor surfaces; and, for the topmost story, from the top of the floor finish to the top of the ceiling joists or, where there is not a ceiling, to the top of the roof rafters.

There are no general limits on floor framing height elsewhere in the IBC, nor are there any limitations on floor framing height in chapter 23.

(IRC) Current limitations are based on a floor height of 16 inches. The current story height requirements were introduced in the 2003 code cycle by BCCS (RB39-02). The final proposal was extensively modified from the original proposal which dealt only with the stud height issue. The committee reason for accepting RB39-02 as modified was given as follows:

Committee Reason: Based on proponent's published reason. This code change has been modified from that originally submitted to the ICC in order to coordinate with the material limits currently contained in (and, in the case of wood, currently being added to) the IRC. The exception to Item 1 has been added at the request of other interested parties to accommodate the high ceilings that are currently common in some parts of the country.

No technical supporting documentation was provided for the 16 inch limitation on floor framing. Our assumption is that the intent of the code modification was to arrive at a maximum story height by setting a maximum floor framing depth to be used with a maximum stud height. However, the way the current language has been interpreted, a limit of 16 inches on floor framing regardless of stud height. Both I-joist and floor truss depths can exceed a 16 inches. Unless technical justification can be provided otherwise, there is no reason to limit the floor framing if the story height is not exceeded.

Chapter 2 defines story height as follows: HEIGHT, STORY. The vertical distance from top to top of two successive tiers of beams or finished floor surfaces; and, for the topmost story, from the top of the floor finish to the top of the ceiling joists or, where there is not a ceiling, to the top of the roof rafters.

Chapter 5 includes no limits on floor framing height, nor are there any limitations on floor framing in any of the individual material requirement sections.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

PART I — IBC

Committee Action:

Approved as Modified

Modify proposal as follows:

2308.2 Limitations. Buildings are permitted to be constructed in accordance with the provisions of conventional light-frame construction, subject to the following limitations, and to further limitations of Sections 2308.11 and 2308.12.

- Buildings shall be limited to a maximum of three stories above grade plane. For the purposes of this section, for buildings in Seismic Design Category D or E as determined in Section 1613, cripple stud walls shall be considered to be a story.

Exception: Solid blocked cripple walls not exceeding 14 inches (356 mm) in height need not be considered a story.

- ~~Maximum floor-to-floor height shall not exceed 11 feet 7 inches (mm). Bearing wall story-height shall not exceed a stud height of 10 feet (3048 mm), plus a height of floor framing not to exceed 16 inches (406 mm). Floor framing height shall be permitted to exceed this limit provided the story height limit is not exceeded.~~

(No changes to items 3 through 7)

Committee Reason: This proposal clarifies the limitation on story height under the conventional construction provisions. The modification states the maximum floor to floor height directly.

Assembly Action:

None

PART II — IRC

Committee Action:

Approved as Modified

Modify the proposal as follows:

R301.3 Story height. Buildings constructed in accordance with these provisions shall be limited to story heights of not more than the following:

(No change to items 1 - 4)

Individual walls or walls studs shall be permitted to exceed these limits as permitted by Chapter 6 provisions, provided story heights are not exceeded. Floor framing height shall be permitted to exceed these limits provided the story height ~~limit is not exceeded.~~ **does not exceed 11'-7"**. An engineered design shall be provided for the wall or wall framing members when they exceed the limits of Chapter 6. Where the story height limits are exceeded, an engineered design shall be provided in accordance with the International Building code for the overall wind and seismic force resisting systems.

Committee Reason: This change passed IBC Structural. Passing this keeps the code language the same in the IBC and the IRC. The added language allows more design flexibility and would allow I joists in garages and others where a longer uninterrupted span is desired or required.

Assembly Action:

None

Code Change No: **S101-06/07**

Original Proposal

Section: 2308.2

Proponent: Randall Shackelford, Simpson Strong-Tie Co.

Revise as follows:

2308.2 Limitations. Buildings are permitted to be constructed in accordance with the provisions of conventional light-frame construction, subject to the following limitations, and to further limitations of Sections 2308.11 and 2308.12.

1. Buildings shall be limited to a maximum of three stories above grade plane. For the purposes of this section, for buildings in Seismic Design Category D or E as determined in Section 1613, cripple stud walls shall be considered to be a story.

Exception: Solid blocked cripple walls not exceeding 14 inches (356 mm) in height need not be considered a story.

2. Bearing wall floor-to-floor heights shall not exceed a stud height of 10 feet (3048 mm) plus a height of floor framing not to exceed 16 inches (406 mm).
3. Loads as determined in Chapter 16 shall not exceed the following:
 - 3.1. Average dead loads shall not exceed 15 psf (718 N/m²) for combined roof and ceiling, exterior walls, floors and partitions.

Exceptions:

1. Subject to the limitations of Sections 2308.11.2 and 2308.12.2, stone or masonry veneer up to the lesser of 5 inches (127 mm) thick or 50 psf (2395 N/m²) and installed in accordance with Chapter 14 is permitted to a height of 30 feet (9144 mm) above a noncombustible foundation, with an additional 8 feet (2438 mm) permitted for gable ends.
2. Concrete or masonry fireplaces, heaters and chimneys shall be permitted in accordance with the provisions of this code.
- 3.2. Live loads shall not exceed 40 psf (1916 N/m²) for floors.
- 3.3. Ground snow loads shall not exceed 50 psf (2395 N/m²).
4. Wind speeds shall not exceed 100 miles per hour (mph) (44 m/s) (3-second gust).

Exception: Wind speeds shall not exceed 110 mph (48.4 m/s) (3-second gust) for buildings in Exposure Category B that are not located in a hurricane prone region.

5. Roof trusses and rafters shall not span more than 40 feet (12 192 mm) between points of vertical support.
6. The use of the provisions for conventional light-frame construction in this section shall not be permitted for Occupancy Category IV buildings assigned to Seismic Design Category B, C, D, E or F, as determined in Section 1613.
7. Conventional light-frame construction is limited in irregular structures in Seismic Design Category D or E, as specified in Section 2308.12.6.

Reason: The purpose of this proposal is to revise wind limitation in the IBC to match the IRC

Studies conducted by the Institute for Business and Home Safety show that the conventional construction requirements of the IBC and IRC are frequently inadequate for wood buildings built where the design windspeed exceeds 100 mph. The IRC was revised to reflect this last code change cycle, but the IBC was not. This change will make the IRC and IBC have the same limitations.

Cost Impact: The code change proposal will increase the cost of construction in areas between 100 and 110 miles per hour if the buildings are currently being built without consideration of wind forces.

Public Hearing Results

Committee Action:**Approved as Submitted****Committee Reason:** This code change aligns the wind limitations for the IBC conventional construction provisions with those in the IRC.**Assembly Action:****None**

Final Hearing Results

S101-06/07**AS**
Code Change No: S102-06/07

Original Proposal

Sections: 2308.11.2, 2308.12.2**Proponent:** David W. Ware, Owens Corning**Revise as follows:**

2308.11.2 Concrete or masonry. Concrete or masonry walls and stone or masonry veneer shall not extend above the basement.

Exceptions:

1. Stone and masonry veneer is permitted to be used in the first two stories above grade plane or the first three stories above grade plane where the lowest story has concrete or masonry walls in Seismic Design Category B, provided that structural use panel wall bracing is used and the length of bracing provided is one- and one-half times the required length as determined in Table 2308.9.3(1).
2. Stone and masonry veneer is permitted to be used in the first story above grade plane or the first two stories above grade plane where the lowest story has concrete or masonry walls in Seismic Design Category B or C.
3. Stone and masonry veneer is permitted to be used in the first two stories above grade plane in Seismic Design Categories B and C, provided the following criteria are met:
 - 3.1. Type of brace per Section 2308.9.3 shall be Method 3 and the allowable shear capacity in accordance with Table 2306.4.1 shall be a minimum of 350 plf (5108 N/m).
 - 3.2. The bracing of the top story shall be located at each end and at least every 25 feet (7620 mm) o.c. but not less than 40 percent of the braced wall line. The bracing of the first story shall be located at each end and at least every 25 feet (7620 mm) o.c. but not less than 35 percent of the braced wall line.
 - 3.3. Hold-down connectors shall be provided at the ends of braced walls for the second floor to first floor wall assembly with an allowable design of 2,000 pounds (8896 N). Hold-down connectors shall be provided at the ends of each wall segment of the braced walls for the first floor to foundation with an allowable design of 3,900 pounds (17 347 N). In all cases, the hold-down connector force shall be transferred to the foundation.
 - 3.4. Cripple walls shall not be permitted.

2308.12.2 Concrete or masonry. Concrete or masonry walls and stone or masonry veneer shall not extend above the basement.

Exception: ~~M~~ Stone and masonry veneer is permitted to be used in the first story above grade plane in Seismic Design Category D, provided the following criteria are met:

1. Type of brace in accordance with Section 2308.9.3 shall be Method 3 and the allowable shear capacity in accordance with Table 2306.4.1 shall be a minimum of 350 plf (5108 N/m).
2. The bracing of the first story shall be located at each end and at least every 25 feet (7620 mm) o.c. but not less than 45 percent of the braced wall line.
3. Hold-down connectors shall be provided at the ends of braced walls for the first floor to foundation with an allowable design of 2,100 pounds (9341 N).
4. Cripple walls shall not be permitted.

Reason: This proposal ensures that requirements for masonry and stone materials are equally applied to all veneer type materials and provides consistency of terminology throughout relevant code sections. The intent of this code change is coordination and clarification. Past code language for stone and masonry materials has not clearly delineated specific provisions applying to adhered versus anchored systems. These proposed code changes build on approved modifications to these and ancillary code sections approved last year. The type of veneer is broadened to include stone and masonry, consistent with IBC Chapter 14 and IRC Section 703; and is consistent with changes approved last year to IBC Section 2308.2.

Cost Impact: The code change proposal will not increase the cost of construction.

Public Hearing Results

Committee Action:

Approved as Submitted

Committee Reason: This proposal clarifies the conventional construction provisions pertaining to the use of stone or masonry veneer. The necessary weight limitations are currently stated in Section 2308.2.

PART I – IBC

1. Revise as follows:

2406.1.1 CPSC 16 CFR 1201. Impact test. Except as provided in Sections 2406.1.2 through 2406.1.4, all glazing shall pass the impact test requirements of CPSC 16 CFR 1201, listed in Chapter 35 Section 2406.2. ~~Glazing shall comply with the CPSC 16 CFR, Part 1201 criteria, for Category I or II as indicated in Table 2406.1.~~

2. Add new text as follows:

2406.2 Impact test. Where required by other sections of the Code, glazing shall be tested in accordance with CPSC 16 CFR 1201. Glazing shall comply with the test criteria for Category I or II as indicated in Table 2406.2(1)

Exception: Glazing not in doors or enclosures for hot tubs, whirlpools, saunas, steam rooms, bathtubs and showers shall be permitted to be tested in accordance with ANSI Z97.1. Glazing shall comply with the test criteria for Class A or B as indicated in Table 2406.2(2).

3. Revise table as follows:

TABLE 2406.1-2406.2(1)
MINIMUM CATEGORY CLASSIFICATION OF GLAZING USING CPSC 16 CFR 1201

(No change to table entries)

4. Add new table as follows:

TABLE 2406.2(2)
MINIMUM CATEGORY CLASSIFICATION OF GLAZING USING ANSI Z97.1

<u>EXPOSED SURFACE AREA OF ONE SIDE OF ONE LITE</u>	<u>GLAZING IN STORM OR COMBINATION DOORS</u> (Category class)	<u>GLAZING IN DOORS</u> (Category class)	<u>GLAZED PANELS REGULATED BY ITEM 7 OF SECTION 2406.3</u> (Category class)	<u>GLAZED PANELS REGULATED BY ITEM 6 OF SECTION 2406.3</u> (Category class)	<u>DOORS AND ENCLOSURES REGULATED BY ITEM 5 OF SECTION 2406.3</u> (Category class)	<u>SLIDING GLASS DOORS PATIO TYPE</u> (Category class)
9 square feet or less	B	B	No requirement	B	A	A
More than 9 square feet	A	A	A	A	A	A

5. Revise Chapter 35 as follows:

ANSI

Z97.1-84 (R1994) 04

PART II – IRC

1. Revise as follows:

R308.3 Human impact loads. Individual glazed areas, including glass mirrors in hazardous locations such as those indicated as defined in Section R308.4, shall pass the test requirements of CPSC 16 CFR, Part 1201 Section 308.3.1. ~~Glazing shall comply with CPSC 16 CFR, Part 1201 criteria for Category I or Category II as indicated in Table R308.3.~~

Exception: Louvered windows and jalousies shall comply with Section R308.2.

2. Add new text as follows:

R308.3.1 Impact Test. Where required by other sections of the Code, glazing shall be tested in accordance with CPSC 16 CFR 1201. Glazing shall comply with the test criteria for Category I or II as indicated in Table R308.3.1(1).

Exception: Glazing not in doors or enclosures for hot tubs, whirlpools, saunas, steam rooms, bathtubs and showers shall be permitted to be tested in accordance with ANSI Z97.1. Glazing shall comply with the test criteria for Class A or B as indicated in Table R308.3.1 (2).

3. Revise table as follows:

TABLE R308.3 R308.3.1(1)
MINIMUM CATEGORY CLASSIFICATION OF GLAZING USING CPSC 16 CFR 1201

(Portions of table not shown do not change)

3. Add new table as follows:

TABLE R308.3.1(2)
MINIMUM CATEGORY CLASSIFICATION OF GLAZING USING ANSI Z97.1

<u>EXPOSED SURFACE AREA OF ONE SIDE OF ONE LITE GLAZING IN</u>	<u>GLAZING IN STORM OR COMBINATION DOORS (Category class)</u>	<u>GLAZING IN DOORS (Category class)</u>	<u>GLAZED PANELS REGULATED BY ITEM 7 OF SECTION 2406.3 (Category class)</u>	<u>GLAZED PANELS REGULATED BY ITEM 6 OF SECTION 2406.3 (Category class)</u>	<u>DOORS AND ENCLOSURES REGULATED BY ITEM 5 OF SECTION 2406.3 (Category class)</u>	<u>SLIDING GLASS DOORS PATIO TYPE (Category class)</u>
9 square feet or less	B	B	No requirement	B	A	A
More than 9 square feet	A	A	A	A	A	A

For SI: 1 square foot = 0.0929 m².

Reason: In 1977, the U.S. Consumer Products Safety Commission (“CPSC”) adopted as a mandatory federal safety regulation *Safety Standard for Architectural Glazing Materials*, codified at 16 CFR Part 1201. The CPSC amended its *Safety Standard for Architectural Glazing Materials* on several occasions subsequent to its initial adoption, the last time on June 28, 1982.

Set forth below are the more significant differences between these two standards, both standards applicable to safety glazing materials used in architectural applications. This reason statement makes no attempt to summarize all pertinent provisions of the two standards, only their significant differences.

The principal differences between the CPSC’s 16 CFR 1201 standard and the ANSI Z97.1-2004 standard relate to their scope and function. The CPSC standard is not only a test method and a procedure for determining the safety performance of architectural glazing, but also a federal standard that mandates where and when safety glazing materials must be used in architectural applications and preempts any non-identical state or local standard. In contrast, ANSI Z97 is only a voluntary safety performance specification and test method. It does not purport to indicate where and when safety glazing materials must be used, leaving those determinations up to the building codes and to glass and fenestration specifiers. In this instance, the IBC provides the requirements regarding the safety performance of architectural glazing beyond that which is covered by the federal standard.

The CPSC requires the installation of safety glazing materials meeting 16 CFR 1201 only in storm doors, combination doors, entrance-exit doors, sliding patio doors, closet doors, and shower and tub doors and enclosures. Other than that, meeting CPSC’s requirements is necessary only when and if a building code authority or other jurisdiction adopting safety glazing laws specifically mandates that safety glazing comply with the CPSC standard, 16 CFR 1201 -- and most building codes do. ANSI Z97, as a voluntary standard, applies only when, where, and if it is adopted by a building code authority or is specified in the approved plans and specifications of the architect, building contractor, or other glass specifier.

Test Specimens: For impact testing, the CPSC requires only one specimen of each nominal thickness be submitted for testing and specifies it must be the largest size the manufacturer produces up to a maximum of size of 34” by 76”. ANSI Z97 requires that four specimens of each nominal thickness and size must be impact-tested. The manufacturer has the option of testing either 34” by 76” specimens or the largest size it commercially produces less than 34” by 76”, but with a minimum size of 24” by 30”. A nominal thickness is defined as +/- 1/8-inch.

Types of Glass: The CPSC standard has no performance tests for plastics or for bent glass. ANSI Z97 has specific tests for both. The CPSC standard does not prohibit the use of ordinary annealed glass in hazardous locations as long as it passes the appropriate impact tests, consistent with the concept of a performance based impact test. (Thick, heavy annealed glass is likely to pass the CPSC 18-inch drop-height and 48-inch drop-height impact tests for Category I and II locations.) ANSI Z97.1-2004 contains an express limitation on annealed glass: “Monolithic annealed in any thickness is not considered safety glazing material under this standard.”

Asymmetrical Glazing Material: The CPSC standard requires all asymmetrical glazing materials to be impacted on both sides of each specimen and then evaluated under the pass-fail criteria. There is no exception. ANSI Z97 requires that, with the exception of mirror glazing, all asymmetrical glass specimens must be impacted on both sides, two on one side and two on the other. With respect to mirror glazing products using reinforced or non-reinforced organic adhesive backing, all four specimens must be impacted only on the non-reinforced side “and with no other material applied.”

Impact Categories or Levels: The CPSC standard has two distinct impact levels or categories, Category I and Category II, and specifies which defined hazardous location must contain Category II safety glazing materials and which may use Category I glazing materials. Glazing material successfully passing the impact test of a 48-inch drop height, a 400 foot-pound impact, is classified as “Category II” glass. Glazing material passing the 18-inch drop height, a 150 foot-pounds impact, is classified as “Category I” glass. ANSI Z97 has adopted three separate impact categories or classes, based upon impact performance. ANSI Z97’s Class A glazing materials are comparable to the CPSC’s Category II glazing materials, passing a 48-inch drop height test, and its Class B glazing materials are comparable to the CPSC’s Category I glazing materials, passing the 18-inch drop height test. ANSI Z97 also has a product-specific Class C impact test, a 12-inch drop height test, applicable only for fire-resistant glazing materials. However, the proposed code change does not identify Class C as an acceptable product for use in hazardous locations.
